10.2 Modification to Guidelines 32

11. SUSTAINABILITY 33

11.1 Nonresidential Projects 33
11.2 Other Projects 33

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project site.

e. Ensure compliance with the Development Objectives.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve Capitol Records Tower and Gogerty Building.

b. Preserve public views to the Capitol Records Tower by creating grade level open space, civic

plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.

c. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban node; creating The Hollywood Walk of Fame Plaza. Reinforce the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

d. Preserve existing view corridors to the Hollywood hills.

e. Encourage street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces which permit active and passive recreational facilities for both the on-site and off-site population.

g. Create a 24 hr community by the creation of a Thriving Mixed-Use Development.

h. Eliminate the visual impact of the current on site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in the area.

j. Establish of a standard intended to promote architectural excellence.

k. Provide designs that take into account the context and make an effort to respect it and fit in visually.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood Boulevard from the Hollywood Freeway.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict compliance or measures for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 They are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement between the City of Los Angeles and _____ ("Millennium Development Agreement").

1.4.2 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") the Regulations that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site.

The East Site and the West Site make up the Project Site.

2.1.2 The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

2.2 Site Zoning and Permitted Floor Area

2.2.1 Project Site is zoned Commercial (C2). City General Plan land use designation: Regional Center commercial.

2.2.2 Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Floor Area Ratio: 6:1

2.2.4 Height District: No. 2

proposed

3:1 under d limit

zoning when approved.

3. DENSITY

3.1 Transfer of Floor Area

Owner may transfer floor area from one site to the other, as long as the minimum and maximum building heights are maintained. Either site can exceed the 6:1 FAR, as long as the FAR of the combined sites averaged together is no more than 6:1.

3.2 Maximum OESF Density Per Area

[To be completed as part of the EIR.]

3.3 Use Coordination / Use Compatibility

[To be completed.]

We have done as part of unified

4. HEIGHT

4.1 Building Height Standards

The maximum permitted height for any building on the Project Site is _____. Refer to Figure __. Bulk Control Plan for specific permitted maximum building heights on each parcel.

4.2 Projections

The following are obstructions that can exceed the maximum building height: roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building, skylights, towers, steeples, flagpoles, wireless masts, water tanks, silos, solar energy devices, or similar structures.

use code def?.

screening

height varies on site

5. BUILDING AND STREET EXPERIENCE

5.1 Tower Massing Standards

5.1.1 The Tower Standards apply to the portion of a building located 150 feet above curb level.

5.1.2 Maximum lot coverage of tower floor plate:

a. 150 – 220 feet: 48%

b. 221 – 400 feet: 28%

c. 221 – 550 feet: 15%

d. 221 – 585 feet: 11.5%

drawing for each w/ dimensions so we can see

5.1.3 At least 50% of total floor area must be located below 220 feet.

5.1.4 Setback and articulation of tower walls and crown:

a. Towers are not required to step back.

b. Minimum 10% of tower to articulate

where did articulation elements on tower go?

5.2 Street Walls

A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

5.3 Street Wall Standards

5.3.1 Location of a required street wall:

a. Parcels with a grade level open space: the required street wall shall be located minimum 5 feet from the property line. (S)

b. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line. (S)

Setback stepback

5.3.2 Height of required street wall and dimension of initial setback:

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) below.

b. 40% of aggregate width of required street wall frontage on each street can exceed maximum street wall height up to the maximum tower height.

5.3.3 Amount of articulation of required street wall:

The aggregate width of required street wall articulation at the level of any story above the level of the second story ceiling or 28'-0" above curb level, whichever is less, shall not exceed 50% of the required street wall.

5.3.4 Types of permitted articulation of a required street wall:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

5.3.5 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices; eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0". The maximum height of

these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

5.4 Street Wall Guidelines

5.4.1 Pedestrian pass-through, public plazas, entry forecourts, permitted vehicular access driveways, hotel drop-offs and loading entries and exits are permitted; steps, ramps, marquees, canopies, awnings and retail storefronts are permitted.

5.4.2 [Insert new guidelines.]

5.5 Yard Standards

5.5.1 [Insert definition of yard.]

5.5.2 Commercial Use: no front, side or rear yard set backs are required

5.5.3 Residential Use:

a. Front Yard: none

b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet, for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

5.6 Building Materials and Color Guidelines

5.6.1 Building materials and color will be subject to the following guidelines. These guidelines also address the façade treatment for both residential and commercial portions of buildings.

5.6.2 Building shall Feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane.

5.6.3 Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

5.6.4 Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas.

5.6.5 The building's skin, especially for towers, should be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required achieving energy efficiency standards.

5.6.6 In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.

5.6.7 To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

5.6.8 Rooftop mechanical equipment: shall be screened with materials and design consistent with the building architecture.

5.6.9 Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

5.7 Grade Level Standards

5.7.1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and should be integral to the architecture of the building.

5.7.2 Ground floor height

a. Minimum 12'-0" height floor to ceiling.

5.7.3 Building entrances:

a. The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be

provided from a courtyard, *grade level open space*, or *PAP*. Entries <18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries >18" from property line shall be within 30 inches of the adjacent grade level along the street frontages. Where possible entries shall be marked through the use of architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.

5.7.4 Ground floor glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet of grade.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing should constitute a minimum of 30% of the area of a building face and should not exceed 80% of the area of a building face.

5.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

5.7.6 Service and refuse

a. Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible to a curb cut.

5.7.7 Retail storefronts

a. Storefronts shall comprise a minimum of 70% of the building's street level façade and be recessed where necessary.

b. Storefront glazing should comprise a minimum of 60 percent of the storefront area along Vine Street and 40% glazing along all other streets.

Specify 3-8 feet? Height bands.

? CRA guidelines?

c. Ground floor retail space will be a minimum of 40 feet deep along Vine Street and 25 feet deep along all other streets; all retail shall have a minimum 12 feet clearance in height.

d. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.

e. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Security grills will be located behind glass and be at minimum 70% open.

g. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

5.8 Podium Standards

5.8.1 The purpose of the Podium Standards it to provide a modern interpretation of the historical context of Hollywood by establishing different treatment from the building's base, middle and top; through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

5.8.2 Podium height

Minimum 30'-0" to a maximum of 150 feet.

5.9 Podium Guidelines

5.9.1 Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means.

5.9.2 Podium level windows shall be vertically oriented.

5.9.3 Podium levels shall be predominantly light in color.

5.9.4 Expression band shall be provided at the highest story within the podium.

5.9.5 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (using cut outs,

insets or pop-outs). It should employ different scales of elements as viewed when seeing the entire building massing.

5.9.6 Louvers and wall openings shall be designed to integrate with building architecture.

5.10 Street and Sidewalk Standards

5.10.1 The cohesiveness and variety of public open spaces and streets are key features of the Project. The combination of landscaped plazas, PAP and landscaped streets creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

5.10.2 Hotel and Commercial / Office / Retail that abut an alley Code language

a. Every required loading space shall be located and arranged that delivery vehicles may be driven upon or into said space from the alley. Such loading space shall have a minimum height of 14 feet and directly accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet, a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

5.10.3 Condominiums

a. None

5.10.4 Rental

a. None

5.11 Screening Standards

a. Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

b. Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

6. TOWERS

can come back to this section

6.1 Purpose

6.1.1 Towers should have their massing designed to reduce overall bulk and to appear slender.

6.1.2 Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over-manipulated elements.

6.1.3 Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

6.1.4 If a project has more than one tower, the towers should be complementary to each other and employ the same architectural design approach.

6.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

6.2 General Tower Standards

6.2.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

6.2.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

6.3 Wall Standards

6.3.1 wall required to be articulated.

6.3.2 Types of permitted articulation of a tower wall:

a. Recess

b. Balcony: a balcony shall be integral to the façade and shall not create a relentless horizontal and vertical stacking pattern. They are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations.

c. Standard balconies may be projecting or recessed or a combination of both.

d. Bay windows

6.4 Spacing Standards

6.4.1 Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

6.4.2 Generally, the portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except the following which will meet code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled.

Q: reasoning behind to ensure towers spaced ok?

6.5 Rooftops Guidelines

6.5.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and to be visually attractive when viewed from locations adjacent and above.

6.5.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, [Insert Section No.__].

6.5.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

6.5.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

6.6 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

6.6.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

6.6.2 Materials and design for roof mechanical equipment to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building.

6.6.3 Roof mechanical equipment shall be screened.

6.6.4 Enclosures for bulkheads shall not count against building height.

what does this mean?

ties into projections & recesses.

7. OPEN SPACE

7.1 Grade Level Open Space Standards

7.1.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records and accentuate the low scale character.

7.1.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet.

7.1.3 An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet.

7.1.4 An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet

7.1.5 An additional 7% (total 12%) of open space required for buildings taller than 550 feet.

7.1.6 Location

a. East site: adjacent to the Jazz Mural and Capitol Records Tower; West site: across from the Capitol Records Tower along Vine Street.

b. Minimum depth: no horizontal dimension less than 5 feet when measured perpendicular from any point on each of the boundaries of the open space area.

7.2 Residential Open Space Standards

7.2.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above.

a. Requirements:

(i) Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

(ii) Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

7.3 Common Open Space Standards

LAmC

7.3.1 [Insert definition.]

7.3.2 Be open to the sky and have no structures that project into the common open space area, except as permitted in the zoning code.

7.3.3 Be readily accessible to all the residents of the site.

7.3.4 Have a minimum area of 400 sq. ft. with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area,

7.3.5 Constitute at least 50% of the total required usable open space in developments built.

passage + plazas at jazz mind, etc.

7.3.6 Common open space areas shall incorporate recreational amenities including but not limited to, swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

7.3.7 Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as common open space.

7.4 Private Open Space Standards

LAmC

7.4.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit. [Is it open to the sky?]

7.4.2 Contain a minimum of 50 square feet of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

7.4.3 Have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

code language?

7.4.4 Provide a minimum eight foot vertical clearance under any projection, except as provided in zoning code.

7.4.5 That portion of a balcony which extends or projects into a required front yard in compliance with zoning code may qualify as usable open space provided it meets each of the above specified requirements noted in items i-iii.

7.5 Passageway Standards

7.5.1 *A publicly accessible passageway (PAP)**[rename PAP]*** is a continuous through block public connection between two parallel streets, located on privately owned land. The passageway may either be enclosed or open to the sky or a combination of both.

7.5.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

7.5.3 Location and Size standards:

a. The major portion of a *PAP* is the largest area of the *PAP* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total PAP area and shall not be less than 20'-0" wide.

b. Minor portions of *PAP* are secondary areas that allow for additional flexibility in the shape and configuration of a *PAP*. Minor portions shall not occupy more than 25 percent of the total area of the *PAP*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

7.5.4 Permitted Obstructions:

a. *PAP* open air minimum requirements shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within major portion of an open air *PAP*: any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies, bay windows; awnings, canopies and marquees; stairs, ramps and bollards.

7.5.5 Kiosk

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not exceed 3% of the total area of the *PAP* and no one kiosk shall occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open air cafes, flower stands or public service/information booths.

7.5.6 Open Air Cafe

a. Where an open air cafe is provided it shall be an unenclosed restaurant or eating or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *PAP*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open air cafe may occupy an aggregate area not more than 20% of the total area of the *PAP*. No cooking equipment shall be installed within an

open air cafe. Cooking equipment may be contained in a kiosk adjoining the open air cafe. An open air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

7.5.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on *PAP* through open windows.

7.5.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No buildings refuse storage areas or refuse storage from a kiosk or open air café are permitted on any *PAP*.

b. No exhaust vents are permitted on any PAP or on any building wall of the development fronting upon the PAP except where such vents are more than 10'•6" above the level of the *PAP*.

7.5.9 Frontages

a. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *PAP* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *PAP* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

7.5.10 Maintenance:

a. Responsibility: the building owner shall be responsible for the maintenance of the *PAP* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk: area adjacent to the parcel.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *PAP* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000

square feet of *PAP* in connection with outdoor eating services or other uses permitted on *PAP* which generate litter.

7.6 Observation Deck Standards

7.6.1 Buildings above 550 feet to include an observation deck.

7.6.2 Observation to include roof-top open space and viewing deck accessible to the public.

8. LANDSCAPE

8.1 Grade Level Open Space Standards

8.1.1 Planting requirements: Minimum 10% of grade level open space shall be landscaped with softscape or water features.

8.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material.

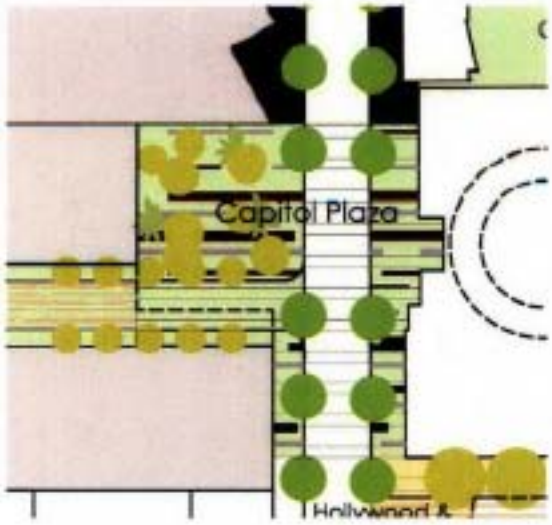
8.1.3 The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

8.1.4 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"



8.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

8.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining; and

b. retail storefronts.

8.1.7 Open air publicly accessible passageways (PAP) are not to be included in the grade level open space requirements.

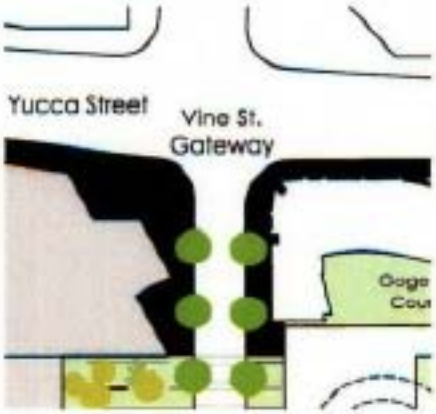
8.2 Common Open Space Standards

8.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

8.2.2 At least one 24-inch box tree for every four dwelling units shall be provided on site and may include street trees in the parkway.

8.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

residents? not common to all?



8.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

8.3 Standards For Open Air Portions of *PAP*

8.3.1 The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

8.3.2 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

Standards for non-open parts of passage

8.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

8.3.4 Planting requirements:

a. Minimum of 10% of open air *PAP* shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor ornamental trees.

- add Standards for non open air parts

9. PARKING

9.1 Automobile Standards

9.1.1 Commercial / Office / Retail/Sports Club:

At least two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot.

9.1.2 Condominiums

a. At least two parking spaces per each dwelling unit

b. One quarter parking spaces per each dwelling unit for guest parking

c. One quarter parking spaces per each dwelling unit for guest parking

d. Development is located within in a parking congested area

9.1.3 Rental

At least one parking space for each dwelling unit of less than three habitable rooms, one and one-half parking space for each dwelling unit of three habitable rooms, and two parking spaces for each dwelling unit of more than three habitable rooms.

9.1.4 Combination of uses

Where there is a combination of uses of a lot, the number of parking spaces required shall be the sum of the requirements of the various uses.

9.1.5 Shared parking

a. Shared parking may be applied on the site when the uses have different parking requirements and different demand patterns in a 24-hour cycle. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses.

b. Calculating Shared Parking:

(i) Step I: Determine the aggregate minimum number of spaces required pursuant to the Code requirements for all land uses.

(ii) Step II: Based on the hourly variation in parking demand, determine the peak parking demand for the combined demand of all the land uses in the development.

(iii) Step III: Compare the calculations in Steps I and II, and the lesser of the two parking demands shall be used as the minimum number of parking spaces to be provided.

c. When a sports club is located in an office building with 50,000 square feet of office space, the general commercial use parking requirements apply and one parking space is required for 500 square feet of floor area for the building.

9.1.6 Additional regulations:

a. Location of accessory commercial / office / retail off-street spaces: may be located on the same parcel as the use to which they are accessory, or on the opposing development.

b. The automobile parking spaces required by Paragraphs (b), (c), (d) and (e) hereof, shall be provided either on the same lot as the use for which they are intended to serve or on another lot not more than 750 feet distant there from; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

c. Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

d. Access driveways to parking facilities will not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

e. Parking and loading access will be shared where feasible.

9.1.7 Screening

a. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and designed to look

like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks.

9.2 Bicycle Standards

9.2.1 Requirements for each use:

a. Commercial / Office / Retail:

Any portion of a building used for non-residential purposes which contains a floor area in excess of 10,000 square feet, bicycle parking spaces shall be provided at the rate of two percent of the number of automobile parking spaces required by this section for such non-residential uses; provided, however, that at least one bicycle parking space shall be provided for any such building having a floor area in excess of 10,000 square feet of non-residential use. If the calculation of the number of required spaces results in a number including a fraction, the next highest whole number shall be the number of spaces required.

shared shower facility—office retail etc...

b. Condominiums

At least one secure bicycle parking space shall be provided for every two residential units.

c. Rental

None

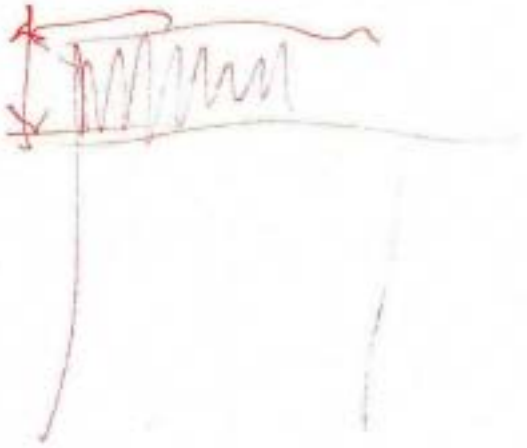
10. SIGNAGE

10.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

10.2 Modification to Guidelines

Notwithstanding Section 10.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted.



11. SUSTAINABILITY

11.1 Nonresidential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

silver?

11.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

Design Guidelines
March 1, 2010
Revised April 8, 2010

1. INTRODUCTION

1.1. Purpose of Guidelines

1.1.1. The Design Guidelines ("Guidelines") have been prepared to regulate new development on the site with design guidelines and controls for development.

a. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project. The Design Guidelines establish basic site-wide design standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole

b. Permit design flexibility while establishing a vocabulary which will guide the development for the Project site

c. Consolidate and illustrate the implications of the established practices which will govern the physical development of the two sites, defining the standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

1.2 Goals and Objectives

1.2.1. The Design Guidelines serve to reinforce the design principles which will contribute to the shape of a successful project.

1.2.2. These principles are as follows:

a. Preservation of the Capitol Records Tower and Gogerty Building.
b. Preserve public views to the Capitol Records Tower by creating *grade level* setbacks, civic plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.
c. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban room; creating The Hollywood Walk of Fame Plaza.
d. The reinforcement of the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.
e. The preservation of existing view corridor to the Hollywood hills.
f. The encouragement of street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue
g. The creation of vibrant urban spaces which permit active and passive recreational facilities for both the on site and off-site population.
h. The creation of a 24 hr community by the creation of a Thriving Mixed-Use Development.
i. Eliminate the visual impact of the current on site parking.
j. [TRANSPORTATION – awaiting comments from CPDI]
k. The establishment of a standard intended to promote architectural excellence.
l. Provide designs that take into account the context and make an effort to respect it and fit in visually.

m. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space
n. The creation of two buildings that emphasize the vertical architecture and become a visible icon and gateway to Hollywood Boulevard from the Hollywood Freeway.

1.3 Relationship to the Los Angeles Municipal Code

1.3.1. The Guidelines were prepared in coordination with the Los Angeles City Planning Department and approved by the City Council.

1.3.2. Wherever the Guidelines contain provisions which establish regulations that are different from or more or less restrictive than allowed in the Los Angeles Municipal Code (LAMC) the Guidelines shall prevail pursuant to the Development Agreement approved by the City Council for the Project.

2. PROJECT BACKGROUND

2.1. Existing Site

2.1.1. The Project site consists of eight parcels on 4.47acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site. The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site. The East Site and the West Site make up the Project Site. The Project site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

2.2. Zoning Classification

2.2.1. Classification: C2-2-SN (Proposed) within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.
- Currently zoned as a C4-2D-SN

2.2.2. The City General Plan land use designation: Regional Center commercial.

2.2.3. FAR: 6:1 (proposed)
- FAR 3:1 under "D" development limitation
- 4.5:1 under CRA Redevelopment Plan

2.3. Transfer of Floor Area

2.3.1. Owner may transfer floor area from one site to the other, as long as the minimum and maximum building heights are maintained. Either parcel can exceed the 6:1 FAR, as long as the FAR of the combined sites averaged together is no more than 6:1

2.4. Maximum OESF Density Per Area

2.5. Use Coordination / Use Compatibility

3. BUILDING HEIGHT AND MASSING

3.1. Street Wall

3.1.1. Definition of *street wall*: a wall or portion of a wall of a building facing a street or *a grade level setback*.

3.1.2. Design intent: required *street walls* determine the scale and character of the pedestrian environment. Articulation of the required *street wall* within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

3.1.3. Location of a required *street wall*:

a. Parcels with a *grade level setback*: the required *street wall* shall be located minimum 5 feet from the property line.
b. Parcels or portions of parcels without a *grade level setback*: the required *street wall* shall be located on the property line.

3.1.2. Height of required *street wall* and dimension of initial setback:

a. *Street walls* shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) and (c) below.
b. 40% of aggregate width of required *street wall* frontage on each street can exceed maximum *street wall* height up to the maximum *tower* height.
c. 40% of aggregate width of required *street wall* frontage on a *publicly accessible private space* can exceed maximum *street wall* height up to the maximum *tower* height.

3.1.3. Amount of articulation of required *street wall*:

a. The aggregate width of required *street wall* articulation at the level of any story shall not exceed 30% of the required *street wall* above the level of the second story ceiling or 28'-0" above curb level, whichever is less, to the floor level of the penultimate floor within the required *street wall* height. Within the lesser of 2 stories or 28'-0" above curb level, recesses, balconies and bay windows shall not be permitted. Pedestrian pass-through, public plazas, entry forecourts, permitted vehicular access driveways, hotel drop-offs and loading entries and exits are permitted; steps, ramps, marquees, canopies, awnings and retail storefronts are permitted.

3.1.4 Types of permitted articulation of a required *street wall*:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0" with a 1:2 maximum depth to width ratio.

b. Balcony: a balcony may project a minimum of 3'-0" from a required *street wall* over a *grade level setback*.
c. Bay window: a bay window may project from a required *street wall* over a grade level setback.
d. Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

3.1.5. Other permitted projections: elements which project beyond the property line from a required *street wall* shall comply with the Building Code.

a. Architectural façade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required *street wall* over a *grade level setback*.
b. Steps and ramps may project from a required street wall over a *grade level setback*.
c. Marquees, canopies and awnings.
d. Retail storefronts may project from a required street wall over a *grade level setback* by a maximum depth of 5'-0". The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

3.2. Yards

3.2.1. Commercial Use: no front, side or rear yard set backs are required.

3.2.2. Residential Use:
a. Front Yard – none (proposed)
   - Code requires: There shall be a front yard of not less than 15 feet; provided, however, that on key lots the minimum front yard shall be 10 feet.
b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.
c. Rear Yard: Minimum 15 feet, for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

3.3. Maximum Building Height

3.3.1. Height District No. 2

3.3.2. The total floor area contained in all the buildings on a lot in Height District No. 2 shall not exceed six times the buildable area of said lot.
   - FAR 3:1 under "D" development limitation
   - 4.5:1 under CRA Redevelopment Plan

3.3.3. Refer to Figure xx Bulk Control Plan for permitted maximum building height on each parcel.

3.3.4. The following are permitted obstructions which may penetrate the maximum building height: roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building, skylights, towers, steeples, flagpoles, wireless masts, water tanks, silos, solar energy devices, or similar structures.

- [discuss] LAMC SEC. 12.21.B.2: "for each foot such structure exceeds the height limit, an equal setback from the roof perimeter is provided, except that stairways, chimneys and ventilation shafts shall not be required to be set back from the roof perimeter. No portion of any roof structure as provided for above shall exceed the specified height limit by more than five feet."

(Insert) Figures for Tower Zone and Massing Diagrams

3.4. Tower Controls

3.4.1. Definition of *tower*: the portion of a building located 150 feet above curb level.

3.4.2. Maximum lot coverage of *tower*:
a. 150 – 220 feet: 48%
b. 221 – 400 feet: 28%
c. 221 – 550 feet: 15%
d. 221 – 585 feet: 14.5%

3.4.3. Refer to 4.1.3 open space requirements for corresponding ground level open space that is determined by tower height.

3.4.4 50% of total floor area must be located below 220 feet.

3.4.5 Tower location: a tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

3.4.6. Setback and articulation of *tower* walls and crown:

a. *Towers* are not required to setback.
b. Minimum 10% of *tower* wall required to be articulated.
c. Distinctive *tower* crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

3.4.7 Types of permitted articulation of a *tower* wall:

a. Recess
b. Balcony: a balcony shall be integral to the façade and shall not create a relentless horizontal and vertical stacking pattern. They are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations.
   i) Standard balconies may be projecting or recessed or a combination of both.
c. Bay windows

3.4.8 Tower spacing

e. Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.
b. Generally, the portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except the following which will meet code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled.

4. OPEN SPACE

4.1. Grade Level Setback

4.1.1. Definition of *grade level setback*: a continuous open space fronting the street.

4.1.2. Design intent: the purpose of a *grade level setback* is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records and accentuate the low scale character.

4.1.3 Open space requirements:

a. Minimum ground floor open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet.
b. An additional 3% of open space (total: 8%) required for buildings between 221 feet and 400 feet.
c. An additional 3% (total: 10%) of open space to be required for buildings between 401 feet and 550 feet.
d. An additional 2% (total: 12%) of open space required for buildings taller than 550 feet.

4.1.4. Location

a. East site: adjacent to the Jazz Mural and Capitol Records Tower; West site: across from the Capitol Records Tower along Vine Street.
b. Minimum depth: no horizontal dimension less than 5 feet when measured perpendicular from any point on each of the boundaries of the open space area.

4.1.5. Landscape requirements:

a. Planting requirements: Minimum 10% of *grade level setback* shall be landscaped.
b. Landscaped area(s) shall be planted with seasonally diverse plant material.
c. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
d. The minimum soil depths for planting are:
   (1) Shrubs: 30"
   (2) Lawns, ground cover: 18"
e. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

4.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level setback*.

a. Building entries, steps, ramps, balconies, bay windows, architectural façade details, marquees, canopies, awnings, outdoor dining, and retail storefronts

4.2. Residential Open Space

4.2.1. Design intent: a common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children, and to be visually attractive when viewed from apartments adjacent and above.

a. Requirements.
(i) Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.
(ii) Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

4.2.2. Common Open Space

a. Requirements:
(i) Be open to the sky and have no structures that project into the common open space area, except as permitted in the zoning code.
(ii) Be readily accessible to all the residents of the site.
(iii) Have a minimum area of 400 sq. ft. with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area,
(iv) Constitute at least 50% of the total required usable open space in developments built.
(v) Common open space areas shall incorporate recreational amenities including but not limited to, swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center
(vi) A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.
(i) At least one 24 inch box tree for every four dwelling units shall be provided on site and may include street trees in the parkway.
(ii) For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.
(iii) All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

b. Location of common open space:

(i) Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as common open space.

4.2.3. Private Open Space

a. Definition: a private open space area contiguous to and immediately accessible from a single dwelling unit.

b. Requirements:
   (i) Contain a minimum of 50 square feet of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.
   (ii) Have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.
   (iii) Provide a minimum eight foot vertical clearance under any projection, except as provided in zoning code.
   (iv) That portion of a balcony which extends or projects into a required front yard in compliance with zoning code may qualify as usable open space provided it meets each of the above specified requirements noted in items 1-3.

4.3. Publicly Accessible Private Space (PAPS)

4.3.1. Definition of *publicly accessible private space (PAPS)*: a continuous through block connection, located on privately owned land.

4.3.2. Design intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

4.3.3. Location and size requirements:

a. The major portion of a *PAPS* is the largest area of the *PAPS* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total PAPS area and shall not be less than 20'-0" wide.
b. Minor portions of *PAPS* are secondary areas that allow for additional flexibility in the shape and configuration of a *PAPS*. Minor portions shall not occupy more than 25 percent of the total area of the *PAPS*. The minor portion shall have a minimum average width of 10 feet.
c. The minor portion must be directly adjacent to the major portion.

4.3.4. Permitted obstructions:

a. *PAPS* open air minimum requirements shall be as follows:

(i)	Development with maximum building height of 150 feet:	0%
(ii)	Development with maximum building height of 220 feet:	20%
(iii)	Development with maximum building height of 400 feet:	30%
(iv)	Development with maximum building height of 550 feet:	40%
(v)	Development with maximum building height of 585 feet:	50%

b. Permitted obstructions within open air *PAPS*: any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art,

arbors, trellises, benches, seats, trees, planting beds, other receptacles, drinking fountains, and bicycle racks; open air cafes; kiosks, outdoor furniture; lights and lighting stanchions, flag poles, public telephones, temporary exhibitions; balconies, bay windows; awnings, canopies and marquees; stairs, ramps and bollards. Metro station access?

4.3.5. Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not exceed 3%of the total area of the PAPS and no one kiosk shall occupy an area of more than 250 square feet. A kiosk may be freestanding or may be attached on only one side to a wall of the building. Any area occupied by a kiosk shall be excluded from the definition of floor area [needs to be confirmed with CPD], and may be occupied by news or magazine stands, candy stores, food preparation for open air cafes, flower stands or public service/information booths.

4.3.6. Open air cafe

a. Where an open air cafe is provided it shall be an unenclosed restaurant or eating or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the PAPS. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers. An open air cafe may occupy an aggregate area not more than 20%of the total area of the PAPS. No cooking equipment shall be installed within an open air cafe. Cooking equipment may be contained in a kiosk adjoining the open air cafe. An open air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

4.3.7. Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on PAPS through open windows.

4.3.8. Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No buildings refuse storage areas or refuse storage from a kiosk or open air cafe are permitted on any PAPS.
b. No exhaust vents are permitted on any PAPS or on any building wall of the development fronting upon the PAPS except where such vents are more than 10'-6" above the level of the PAPS.

4.3.9. Landscape requirements

a. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
b. The minimum soil depths for planting are:
   (i) Trees: 36"

(ii) Shrubs: 30"
(iii) Lawns, ground cover: 18"

c. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

d. Planting requirements.
(i) Minimum of 10% of open air PAPS shall be landscaped.
(ii) For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor trees.
(iii) The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

e. Seating.
1. There shall be a minimum of one linear foot of seating for each 300 square feet of PAPS excluding the area of an open air cafe.
(i) One seat shall equal two linear feet
2. Not more than 50% of the linear seating capacity may be in moveable seats which may be stored between the hours of 7 p.m. and 7 a.m. Seating shall meet the following standards:
(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides.
(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.
(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.
(iv) Moveable seating or chairs, excluding seating of open air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open air cafes do not count toward meeting the seating requirements.

4.3.10. Lighting:

a. A PAPS shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade. Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

4.3.11. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of all building walls of the development fronting on a PAPS shall be allocated for occupancy by permitted retail, restaurants and cultural uses. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the PAPS with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

4.3.12. Maintenance:

a. Responsibility: the building owner shall be responsible for the maintenance of the PAPS including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk area adjacent to the parcel.
b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of PAPS area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of PAPS in connection with outdoor eating services or other uses permitted on PAPS which generate litter.

4.4. Rooftop Observation Deck

4.4.1. Buildings above 550 feet to include a public roof-top open space and viewing deck.

5 ARCHITECTURAL ELEMENTS

5.1. Building Materials and Color

5.1.1. Design intent: define the general design objectives for the material and color of distinct portions of the buildings and prescribe the treatment required for both residential and commercial portions of the building.

5.1.2. Guidelines:

a. Feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane.
b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.
c. Podium levels up to 150 feet ~~must include surfaces of masonry~~ will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas.
d. The building's skin, especially for towers, should be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.
e. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.
f. To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.
g. Rooftop mechanical equipment: shall be screened with materials and design consistent with the building architecture; ~~see Section 10, Tower crown~~.
h. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

5.2. Grade Level Controls

5.2.1. Design intent: street wall massing, articulation and detail, street level building entrances and storefront windows and doors, as well as the use of quality materials and decorative details, shall be used to promote pedestrian-scaled architecture along the street. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and should be integral to the architecture of the building.

5.2.2. Ground floor height:

a. Minimum 12' 0" height floor to ceiling.

5.2.3. Building entrances:

a. The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, *grade level setback*, or *PAPS*. Entries shall not be higher than 4 feet above the elevation of the sidewalk at its nearest point to the entry. Where possible entries shall be marked through the use of architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.
b. Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.
~~c. See Section xx marquees, canopies, awnings; Section xx for signage controls, and Section xx for lighting controls~~

5.2.4. Ground floor glazing. [CPD sending text from CRA]

5.2.5. Arcades:

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

5.2.6. Service and refuse:

a. Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible to a curb cut; refer to Section xx Loading.

5.2.7 Retail storefronts:

a. Openings for storefronts, windows and doors shall comprise a minimum of 40% of the building's street level façade and be recessed where necessary.
b. Ground floor retail space will be a minimum of 20 feet deep and 12 feet clearance in height and have storefronts openings a minimum of 10 feet in height. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.
c. Security grills will be located behind glass and be at minimum 80% open.
d. Storefront glazing will be transparent.

5.3. Podium Controls

5.3.1. Design intent: provide a modern interpretation of the historical context of Hollywood by establishing different treatment from the building's base, middle and top through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

5.3.2 Podium height:

a. Minimum 30'-0" to a maximum of 150 feet, ~~exclusive of the ground floor level.~~

5.3.3. Guidelines:

a. Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means
b. Podium level windows shall be vertically oriented
c. Podium levels shall be predominantly light in color.
d. Expression band shall be provided at the highest story within the podium.
e. While blank street wall façades are prohibited, an exception may be made for integration of public art or a graphic based façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (using cut outs insets or pop-outs). It should employ different scales of elements as viewed when seeing the entire building massing.

5.4. Fenestration

5.4.1. Louvers, wall openings shall be designed to integrate with building architecture

5.5. Tower

5.5.1. Design Intent:

a. Towers should have their massing designed to reduce overall bulk and to appear slender.
b. Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over articulated elements.
c. Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.
d. If a project has more than one tower, they should be complementary to each other and employ the same architectural design approach.
e. Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

5.6. Rooftops and Setbacks

5.6.1. General requirements:

AR0067498

a. Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and to be visually attractive when viewed from locations adjacent and above.
b. For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section xxx
c. All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colours. All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

5.7. Parapets, Handrails, Roof Mechanical Equipment Screening

5.7.1. Parapets and handrails: if part of an expression band or expression line, shall be finished in a distinctive manner.

5.7.2. Roof mechanical equipment shall be screened, materials and design to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building. Enclosures for bulkheads shall not count against building height.

6. STREETSCAPE

6.1. Streets and Sidewalks

6.1.1. Design intent: the cohesiveness and variety of public open spaces and streets are key features of the Project. The combination of landscaped plazas and *PAPS* and landscaped streets creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings

(i) Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

(ii) Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree planting pattern

6.1.2 Tree planting guidelines

a. It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module

for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

7. PARKING

7.1. Automobile Parking

7.1.1 Requirements for each use:

a. Commercial / Office / Retail.
   i) At least two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot.

b. Condominiums
   i) At least two parking spaces per each dwelling unit
   ii) One quarter parking spaces per each dwelling unit for guest parking
   iii) One quarter parking spaces per each dwelling unit for guest parking
      - Development is located within a parking congested area

c. Rental
   i) At least one parking space for each dwelling unit of less than three habitable rooms, one and one half parking spaces for each dwelling unit of three habitable rooms, and two parking spaces for each dwelling unit of more than three habitable rooms.

d. Combination of uses:
   i) Where there is a combination of uses of a lot, the number of parking spaces required shall be the sum of the requirements of the various uses.

7.1.2. Additional regulations:

a. Location of accessory commercial / office / retail off street spaces: may be located on the same parcel as the use to which they are accessory, or on the opposing development.
   (i) (g) Location of Parking Area. The automobile parking spaces required by Paragraphs (b), (c), (d) and (e) hereof, shall be provided either on the same lot as the use for which they are intended to serve or on another lot not more than 750 feet distant there from; said distance to be measured horizontally along the streets between the two lots, except that; where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

b. Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

c. Access driveways to parking facilities will not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

d. Parking and loading access will be shared where feasible.

7.1.3 Screening

a. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and designed to look like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks

7.2. Employee Bicycle Parking

7.2.1 Requirements for each use:

a. Commercial / Office / Retail:
   (i) Any portion of a building used for non-residential purposes which contains a floor area in excess of 10,000 square feet, bicycle parking spaces shall be provided at the rate of two percent of the number of automobile parking spaces required by this section for such non-residential uses, provided, however, that at least one bicycle parking space shall be provided for any such building having a floor area in excess of 10,000 square feet of non-residential use. If the calculation of the number of required spaces results in a number including a fraction, the next highest whole number shall be the number of spaces required.

b. Condominiums
   (i) At least one secure bicycle parking space shall be provided for every two residential units.

c. Rental
   (i) None

7.3 Circulation

8. SERVICE AND LOADING

8.1. Requirements

a. Hotel and Commercial / Office / Retail that abut an alley
   (i) Every required loading space shall be located and arranged that delivery vehicles may be driven upon or into said space from the alley. Such loading space shall have a minimum height of 14 feet and directly accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.
   (ii) Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.
   (iii) Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet, a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

b. Condominiums

(i) None
c. Rental
(i) None

8.2. Screening

a. Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.
b. Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

8.3. Circulation

9. SIGNAGE

9.1. Guidelines

a. Refer to Ordinance No. 176171 Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code

9.2. Modification to Guidelines

a. High-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted.

10. SUSTAINABILITY

10.1. LEED Certification

10.1.1 Standard of Sustainability (Mandatory for large projects)

a. Threshold: The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.
b. Requirement: The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level Formal certification by the USGBC is not required.

10.1.2 Standard of Sustainable Excellence (Voluntary for projects of any size - large and small)

a. Threshold: The Standard of Sustainable Excellence establishes an incentive program for projects that register with the USGBC's LEED® program, maintain

AR0067502

with a LEED® AP, and can demonstrate how the project will achieve LEED® certification at a Silver or higher level.

c. Incentives: The ordinance will establish expedited service within the Department of City Planning and the Bureau of Engineering. Other incentives already in place including those from the Department of Water and Power and the Department of Building and Safety, remain unchanged.

11. LIGHTING

11.1. Design intent. Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, illumination, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually articulate the night time streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

11.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade *level setback and open PAPS*.
b. Lighting will be operated from dusk to dawn.
c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.
d. Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.
e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

11.3 Responsibility for maintenance: building owner is responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

11.4 Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner.

11.5. Lighting for areas located inside the lot line and visible from the street: such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

11.6. Lighting for above-grade parking garage facilities, shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

12. NOISE

13. OPERATIONAL STANDARDS

13.1 Pet Controls

13.2. Antennas
a. Transmission facilities
b. Cable antennas

13.3 Wireless Facilities

Vine Street & Yucca Street - Design Guideline Outline

1. Introduction

a. Purpose of Guidelines

The Design Guidelines have been prepared to provide information describing the Project's design intent and specific controls affecting the two sites as a whole as well as its individual development. The Design Guidelines serve two functions:

i. They establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project. The Design Guidelines establish basic site-wide design standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole. These Design Guidelines are intended to permit design flexibility while establishing a vocabulary which will guide the development team for each of the two sites.

ii. They consolidate and illustrate the implications of the established practices which will govern the physical development of the two sites, defining the standards for use, bulk, parking and loading, architectural features, landscape treatment, signage and lighting. The Design Guidelines are to be approved by the Los Angeles City Planning Department. Once accepted the Design Guidelines will apply in lieu of the City of Los Angeles Municipal Code & the City of Los Angeles Planning and Zoning Code. Compliance with the Design Guidelines will replace the usual zoning review by the Los Angeles City Planning Department. Compliance with the current City of Los Angeles Building Code will continue to be reviewed by the City of Los Angeles Department of Buildings and Safety.

b. Goals and Objectives

The Design Guidelines serve to reinforce the design principles which will contribute to the shape of a successful project. These principles are as follows:

1. *Preservation of the Capitol Records Tower and Gogerty Building.*
2. *Preserve public views to the Capitol Records Tower.*
3. *Civic plazas located on the east site adjacent to Vine Street to preserve views of the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.*
4. *The establishment of a standard intended to promote architectural excellence.*
5. *The creation of two iconic towers as the entrance to Hollywood Boulevard from the Hollywood Freeway.*
6. *The reinforcement of the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.*
- *The enhancement of the Hollywood Walk of Fame by providing it an urban node with the creation of The Hollywood Walk of Fame Plaza.*
- *The encouragement of street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.*
- *The creation of vibrant urban spaces which permit active and passive*

Want taller building in exchange for more open space relationship w/ adjacent bldgs - setback height, buffer, landscaping

DRAFT

recreational facilities for both the on-site and off-site population.

- *The creation of a 24 hour community by the creation of a thriving Mixed-Use Development.*
- *The preservation of existing view corridor to the Hollywood Hills.*
- *Eliminate the visual impact of the current parking on site parking.*
- *Insure sustainability by the creation of two development sites that offer flexibility to respond to market conditions and development phasing.*

Substantial portion of open space is contiguous

2. Location

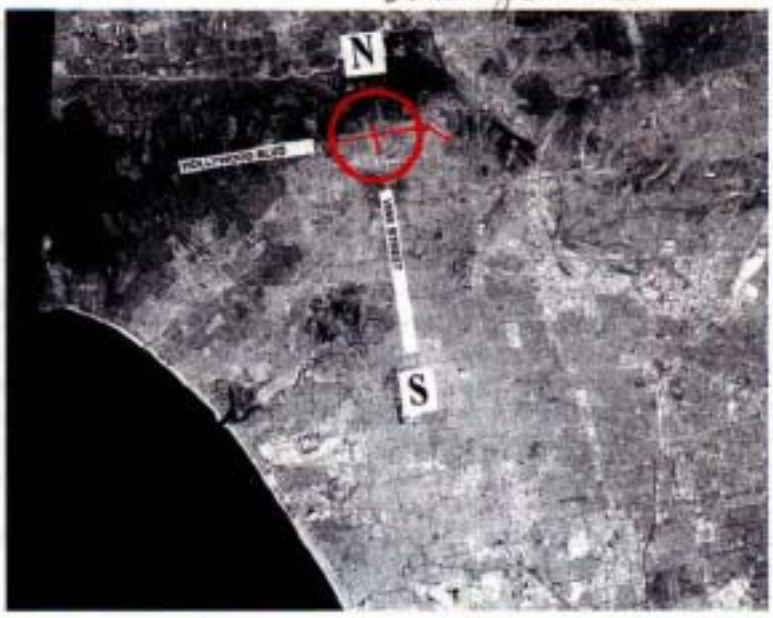

Figure 2.1

Figure 2.2

DRAFT

3. Building Height and Massing

a. Street wall

(a) Design intent: required street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

(b) Location of a required street wall:

- *The required street wall shall be located within 3'-0" from the street line, except as noted in Item 4. Open Space and or through block passages.*

(c) Height of required street wall and dimension of initial setback:

- *Street walls shall be built to a height of at least 30 feet.*

b. Yards and Setbacks

Notwithstanding the requirements set forth in the LA Municipal Code, no building shall be required to provide front, side or rear yards or building setbacks.

c. Tower width controls

Tower location: a tower 400 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets. why 400 feet?

d. Tower height

Designated Tower Zones, see Figure 3.1.

4. **Open Space**

a. **Public open space**

Minimum ground floor open space will be 5% of total lot area of the Development Site for buildings up to a height of 220 feet. An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet. An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet and an additional 7% (total 12%) of open space required for buildings taller than 550 feet.

6. Articulation and Fenestration

a. Grade Level

i. Building Entries: The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, plaza, or through block passage. Entries shall not be higher than 9 feet above the elevation of the sidewalk at its nearest point to the entry. Where possible entries shall be marked through the use of architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

ii. Canopies and Awnings: Canopies will be provided for primary residential entrances. 10 feet minimum and 20 feet maximum clearance will be maintained above sidewalks, plazas, or walkways. A minimum of 2 feet will be provided from the face of canopy to the face of curb. The maximum width of a single canopy will be 30 feet.

iii. Arcades: Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

iv. Drop-offs: Drop-offs shall be located along the curb or entirely within the site to maintain sidewalk continuity.

v. Exhaust: Building exhaust will be located at least 10 feet above a public side walk, plaza, or through block passages where possible.

vi. Public Walkways: Public walkways will be a minimum of 15 feet wide and be at least 50% open to the sky. Walkways will be lined with public open space or commercial spaces used for retail, restaurants, cultural uses, and lobbies along at least 40% of its frontage.

vii. Storefront: Openings such as storefronts, windows and doors shall comprise a minimum of 40% of the building's street level façade and be recessed where necessary. Ground floor retail space will be a minimum of 10 feet clearance in height and have storefronts openings a minimum of 10' feet in height. Security grills will be located behind glass and be at minimum 80% open. Storefront glazing will be transparent.

b. Podium – Up to 150 feet

i. Modulation: New building facades, located directly on a property line and facing a street, will predominantly incorporate the use of regular modulation horizontally along a street wall. Modulation might be incorporated by the use of recesses, projecting bays, changes in massing, color, material or fenestration. Extensive blank walls will be avoided. Ground floors shall have a different architectural expression than upper floors and feature durable materials that add scale, texture and variety.

ii. Materials and Colors: Materials, color, and fenestration of building frontages, located on or within 3' of a lot line facing a street, shall be similar to those found elsewhere in Hollywood. The buildings masonry surfaces will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather that the application of color to the surface.

Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas.

iii. *Windows and Glazing: Window proportion, grouping and arrangement will be an integral aspect of the design of the buildings. Above the ground floor the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of* reflectivity or tinting required to achieve energy efficiency standards. what does ed mean?

c. Tower – Over 150 feet

what about under 150 feet?

i. *Design intent: Buildings over 150' will not be historicized. They will be treated as contemporary interventions in the skyline and will appear simple yet elegant. Towers will be complementary to one another and may employ the same architectural design approach. Tower's primary entrances shall be scaled appropriately to the overall size of the tower and mediate the transition to the pedestrian scale. Buildings tops will be articulated with a change in massing or detail.*

ii. *Windows and Glazing: In buildings other than curtain wall buildings windows will be recessed, except where inappropriate to a building's architectural style.*

iii. *Roofs and Bulkheads: Roofs used for mechanical purposes will be designed to minimize attention by incorporating non reflective and low contrasting colors. Mechanical equipment shall be screened from lateral and pedestrian views. Mechanical penthouses will be designed to be consistent with the buildings architecture and will utilize similar colors and materials as in other portions of the building. Enclosures for bulkheads shall not count against building height.*

7. Landscape

a. Street Elements

i. *New trees, planting beds, and grates will be provided along Vine Street, Ivar Avenue, Yucca Street, and Argyle Avenue. Jacaranda Mimosifiolias will be interspaced with Washingtonia Robusta palms along Vine Street. Palms will be spaced on 40 foot centers. Jacaranda Mimosifiolias will also be planted along Yucca Street frontages. Evergreen trees will be planted along Ivar and Argyle Avenues.*

ii. *Sizable and healthy existing trees not conforming to the above will be removed and relocated on site if possible.*

Softscape

b. Public Areas

i. *Plant material will be selected for diversity, neat appearance, suitability to solar orientation, and relationship to fenestration. The mature size of any plants shall not project more than 12 feet beyond the face of planters below the height of 10 feet relative to the adjacent sidewalk.*

ii. *Kiosks, carts and temporary structures may be permitted within public open spaces. No roofs of such structure shall extend more than 4' in any one direction.*

DRAFT

8. **Pedestrian Linkage**

a. **Through block connections**

i. Provide through block connections on both sites along Vine Street.

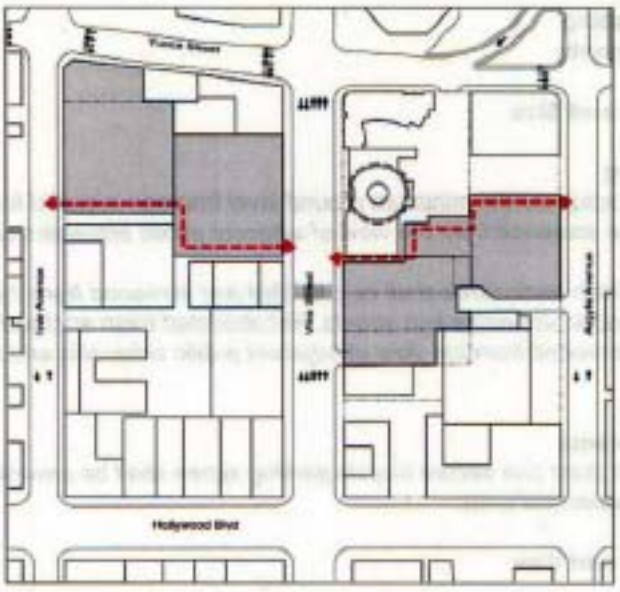

Figure 8.1

b. **Circulation**

i. Ingress into buildings

ii. Connection between city and site

9. **Parking**

a. **Requirements**

i. Required commercial parking may be transferred to an adjacent site located within 1000 feet.

ii. Shared parking strategies may be employed.

b. **Location and Size**

i. Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

ii. Access driveways to parking facilities will not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

iii. Parking and loading access will be shared where feasible.

iv. The maximum floor to floor height of above grade parking shall not be greater than 9 feet except where parking is screened with dwelling units.

c. **Screening**

i. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and designed to look like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks.

DRAFT

d. Circulation

i. Ingress into parking facility

ii. Connection between city and site

10. Service and Loading

a. Requirements

b. Location and Size

c. Screening

i. Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

ii. Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

11. Bicycle Parking

a. Requirements

i. At least one secure bicycle parking space shall be provided for every two residential units.

b. Location and Size

12. Signage

a. Types

i. Retail tenants shall be allowed to install one exterior sign limited to name and logo only.

ii. No pole type signage shall be used.

iii. No more than one rooftop/skyline sign shall be used per building.

iv. Opaque message surfaces shall be avoided.

Knock out panel

Add minimal logo sign

b. Location

i. Retail Sign: shall be located within a permitted signage band and limited to area of 20 square feet. The total length of the sign shall not exceed 3/4 of the width of the tenant exterior wall surface and shall be equally spaced. One logo or emblem will be allowed. Interior signs shall permit an unobstructed view into tenant space.

ii. Projecting Sign: shall align with major building elements. The width of projecting signs shall not exceed 4 feet. The spacing of such signs shall be no less than 20 feet with the exception that each individual retail tenant may be allowed one projecting sign not to exceed 2 feet in width.

iii. Rooftop Signs: shall be setback at least 10 feet from property lines or building lines. Spacing between rooftop signs shall be at least 50 feet. Signs shall be oriented towards and parallel to Hollywood Boulevard or at corners at 45 degree angels to the Boulevard district grid.

c. Heights/Sizes

d. Illumination

DRAFT

13. Green / LEED

LEED Certification

Standard of Sustainability (Mandatory for large projects)

Threshold:

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

Requirement: The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

Standard of Sustainable Excellence (Voluntary for projects of any size - large and small)

Threshold:

The Standard of Sustainable Excellence establishes an incentive program for projects that register with the USGBC's LEED® program, contract with a LEED® AP, and can demonstrate how the project will achieve LEED® certification at a Silver or higher level.

Incentives:

The ordinance will establish expedited service within the Department of City Planning and the Bureau of Engineering. Other incentives already in place, including those from the Department of Water and Power and the Department of Building and Safety, remain unchanged.

14. Lighting

a. *Exterior building lighting will be provided on all sides of the development to supplement street lighting.*
b. *Lighting will be operated from dusk to dawn.*
c. *Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater.*
d. *Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.*
e. *Lighting approach will be consistent on each parcel with not more than 30 feet between elements.*
f. *Building owner will be responsible for maintaining all lighting used to meet these requirements. No luminaires used to meet these requirements shall be out of commission for more than 10 days.*
g. *Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner.*

15. Noise Controls

16. Land Use

a. **FAR**
b. **Equivalency / Transfer of floor area**
   Owner may transfer floor area from one site to the other, as long as the minimum and maximum building heights are maintained.
c. **Maximum OESF Density Per Area**
d. **Maximum Height**
e. **Use Coordination / Use Compatibility**

AR0067529

17. Operational Standards
    a. Pets
    b. Antennas
    c. Wireless Facilities (facades and parapets)

2 weeks from Today @ 10:30

From: Kevin Keller
To: Alan Bell; Tanner Blackman
CC: Blake Lamb
Date: 8/21/2009 4:47 PM
Subject: PUD tool

Hi Alan, Hi Tanner

Following up on our meeting a few weeks ago on the "flexible entitlements" issue, I had a call with the Milenium folks. We advised them to draft a DA which basically tracks the same entitlements they are requesting, and leave the only "new" aspects in the DA as potentially some design review process language and an equivalency table. This leaves the bigger "flexibility" question for the future, and lets the project proceed using the standard entitlements.

How exactly the DA handles the design review process and the equivalency process (possibly 2-3 different variations of the same square footages) remains to be seen. Part of this language may drift over from the actual DA to become part of the enabling ordinance. This minimizes the "newness" factor of the proposal and tracks normal entitlements to the best of our ability.

I recommended that Milleni um may want to meet with you folks at some point to discuss the option of the new PUD tool to keep that option moving forward as well. Alfred Frelio says they abbolutely would like to do that when you are ready. We are meeting with them in about 3 weeks to go over a draft of the DA and that might be a good time to check in again on this.

Just wanted to keep everyone in the loop. Please let me know if you have any thoughts or ideas as we vigorously coordinate on all things planning!

Thanks,
Kevin

Subject: Transfer of DIR-2010-1131-RAO (3455 Percy St) to ZA's Office
Attachments: 3455 E Percy St.pdf

Alan,

Thank you for meeting with me earlier today. Following on our chat, I have transferred the subject file on PCTS to your office, and have initiated a hold on PCTS pending the determination of the appropriate regulatory pathway for the requested actions.

The two prior variances for the property will be requested from Piper Tech (I'll bring them by you as soon as they are delivered to Auto Records). In case they may be useful to you, below is some draft background information for the subject property and attached are some aerial photographs (note: the Zoning Investigator will need to verify this information against primary records, as necessary).

Please let me know if I can provide further information / input from my end. Thanks.

-Rogelio

Background Information
3455 Percy St, LA CA 90023

2007 to present
Facility operates as a 68-room state licensed residential care facility providing a residential treatment program for up to 136 individuals with mental disabilities.

May 5, 2010
Applicant's representative files request for Reasonable Accommodation (pursuant to LAMC 12.22.A.27) in order to conform the Variance on the property (ZA-1992-707-ZV) to the existing use.

March 17th, 2010
LADBS Inspector John Stephens (213-252-3051) begins investigation re: 'Building or Property Converted to Another Use.'

2007
Owner modifies State License to adult residential care facility.

2005
Owner obtains State License for residential care facility for the elderly

1995
Certificate of Occupancy issued, allowing for a 68-room rest home.

May 5th, 1993 (ZA-1992-707-ZV):
"a variance to permit the construction, use and maintenance of a 20,000 square foot addition containing 20 rooms, plus 17 additional parking spaces, in conjunction with an existing 48 room retirement hotel for senior citizens, as not permitted in the R3 Zone under Sections 12.10-A and 12.21-A,4(b) and (u) of the Municipal Code. (This facility was previously approved as a retirement hotel under Case No. ZA 21469)."

Feb 27th, 1991

Zone change (pursuant to AB283) from R3-1 to RD1.5-1 becomes effective (this zone change may not have been implemented until after ZA-1992-707-ZV was issued, since that variance is dated 1993 and references R3 rather than RD1.5 as the subject zone).

1982-1988
Owner obtains State License to provide residential care for 96 elderly persons.

Nov 18, 1976
Building Permit No. 76LA35556 - for a one and two-story apartment home for the aged.
Building permit No. 76LA35557 issued November 18, 1976 for an application for a grading permit.
Building Permit No. 76LA35558 issued November 18, 1976 for a retaining wall.

Nov. 9, 1976:
Affidavit No. 42753 recorded for covenant and agreement to hold property as one parcel that includes Lots 20-23 of the Schmitt Tract.

October 29, 1974: (ZA-21463):
'conditionally approved on October 29, 1974, for the construction, use and maintenance of a two-story, 48 bedroom hotel for senior citizens including central dining facilities, lounge, reading room, beauty shop and with provisions for only 15 parking spaces instead of the approximate 48 spaces required.'

MILLENNIUM PARTNERS/ARGENT VENTURES

The following Sections take the general concepts described above and propose a basic template for application to the Project proposed by Millennium/Argent. We recognize that the development of a plan for this approach requires greater discussion among the stakeholders and greater definition to the elements that will enable the proposed flexibility. The intent is to encourage a meaningful dialogue regarding how these general concepts may apply to a specific development. Further, we acknowledge that both the development agreement and the Design Guidelines for the Project would be developed and finalized by the City after significant community input.

I. The Contract

Taking the general concepts discussed above, a development agreement for the Project would consist of the following major components setting forth the terms of development for the Site:

1. Enabling Statute and Definition of Terms
2. Property Description
3. Project Description
   a. Major Project Components
   b. Permitted Uses and Equivalency Program (See Section V)
   c. Mandatory Infrastructure Improvements
   d. Permitted Density to 6.0 F.A.R.
   e. Maximum Height to 585 feet in Specified Zones
4. Time of Performance
   a. Development Schedule
   b. Minimum Performance by Developer based on Time Certain
5. CEQA Review
   a. Environmental Impact Report
   b. Equivalency Thresholds
6. Community Redevelopment Agency Approval/Owner Participation Agreement
7. Public Objectives
   a. Comprehensive Planning

b. Public Benefits

c. Mitigation Measures

8. Agreement and Assurances on the part of Applicant

a. Inclusionary Housing

b. Prevailing Wage

c. Public Art

d. Public Street Improvements

e. No Off-site Advertisement

f. Publicly-accessible Open Space

g. Conditions on Development

h. Minimum LEED Certification

i. Public Parking

9. Agreement and Assurances on the part of the City

a. Cooperation and Implementation

b. Entitlements to Develop

c. Consistency with Existing Rules

d. Subsequent Development Review

10. General Provisions

a. Effective Date

b. Term of 30 years

11. Exhibits

e. Scope of Development

f. Design Guidelines (see Section IV)

II. The Guidelines

A comprehensive list of design guidelines and standards in the development agreement will serve as the overarching plan that controls development on the Site, from permitted density, massing and zoning standards to design and architecture. They are intended to maximize flexibility while preserving and promoting urban planning goals for the City. Rigorous design principles underlie the Design Guidelines, including historic preservation, public open space and civic space, pedestrian circulation, preservation of view corridors, maintenance of setbacks from Vine Street and establishment of zones where height is appropriate.

The Design Guidelines will include minimum design and development standards applicable to all new development, no matter the density, height or type of use (the "Development Guarantees"). Additionally, the Guidelines will include standards that are triggered depending, on the height and density of the new structures. Below is an overview of the Guidelines:

1. Development Guarantees

   a. Preservation of Capitol Records Tower and Gogerty Building

   b. Preserve public views to Capitol Records

   c Create unique retail at ground level to enliven all sidewalks and open space

   d. Minimum set backs from Vine Street to preserve views of Capitol Records and create public open space

   e. Civic plazas located on the east site adjacent to Vine Street and west site across from Capitol Records Tower

   f. Open space preserved along Vine Street frontage of east site to preserve views of the Jazz Mural and Capitol Records Tower

   g. Through-block connections on both sites

   h. Create a genuine Hollywood environment with lush landscaping for locals and visitors

   i Minimum ground floor open space will be 5% of lot area

2. General Open Space Strategy

   a. Emphasize green space networks

   b. Open space connections to existing open space

3. Based on Height Datum's

   a. Building Heights Up to 150 Feet

      i. Massing established by protected view corridors and fire access

      ii Subject to Zoning Standards (Section 4) and Building Design Parameters (Section 5)

   b. Building Heights Up to 220 Feet

      i. Permitted for buildings with a maximum floor plate of 42% to 48% of lot coverage in designated zones up to 220 feet

      ii. Subject to Zoning Standards (Section 4) and Architectural Guidelines (Section 5)

   c. Building Heights Up to 400 Feet

      i. An additional 3% of open space must be provided

      ii. At least 50% of the floor area must be located below 220 feet

      iii. Permitted for buildings with a maximum floor plate of approximately 22% to 28% of lot coverage between 220 feet and 400 feet

      iv Subject to Zoning Standards (Section 4) and Building Design Parameters (Section 5)

   d. Building Heights Up to 510 Feet

      i. An additional 2% of open space must be provided

      ii. Permitted for buildings with a maximum floor plate of approximately 10% to 15% of lot coverage between 220 feet and 550 feet

      iii. Building above 550 feet to include roof-top open space and viewing deck

iv. Subject to Zoning Standards (Section 4) and Building Design Parameters (Section 5)

e. Building Heights Up to 585 Feet

i. An additional 2% of open space must be provided

ii. Permitted for buildings with a maximum floor plate of approximately 6.5% to 11.5% of lot coverage between 220 feet and 585 feet

iii. Buildings above 550 feet to include roof-top open space and viewing deck

iv. Subject to Zoning Standards (Section 4) and Building Design Parameters (Section 5)

4. Zoning Standards

EXAMPLE A

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

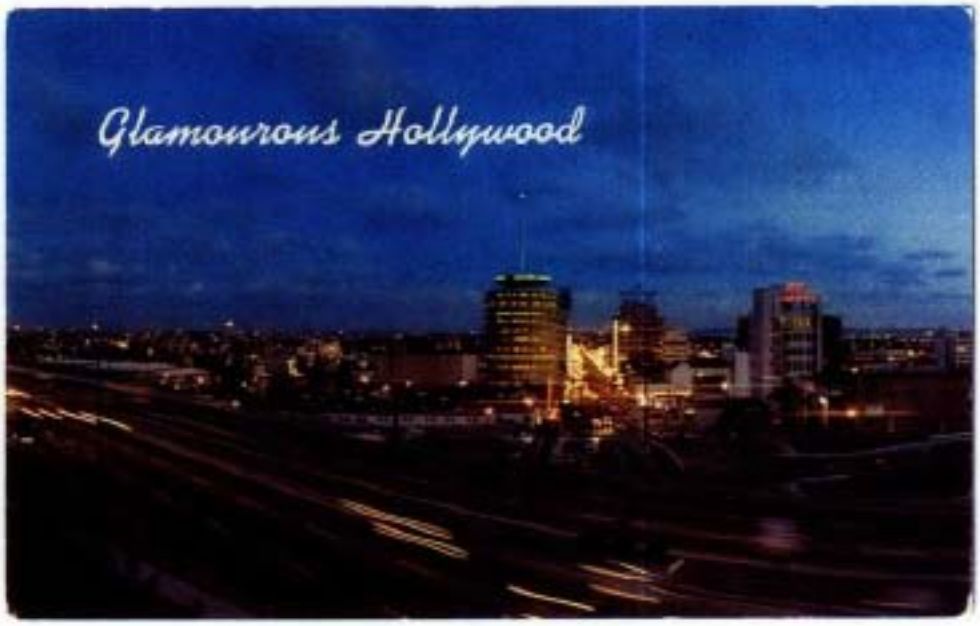
d. Permit design flexibility while establishing a set of controls that will guide the development for the Project site.

e. Ensure compliance with the Development Objectives, below.

EXAMPLE B

1.2 Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure new development on the Project Site is consistent with these objectives.



1.2.2. The objectives for new development on the Project Site are to:

a. Preserve Capitol Records Tower and Gogerty Building.

b. Preserve public views to the Capitol Records Tower by creating grade level open space, civic plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.

c. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban node; creating The Hollywood Walk of Fame Plaza.

d. Reinforce the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Preserve existing view corridors to the Hollywood hills.

f. Encourage street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

g. Create vibrant urban spaces which permit active and passive recreational facilities for both the on-site and off-site population.

h. Create a 24 hr community by the creation of a Thriving Mixed-Use Development.

j. Eliminate the visual impact of the current on site parking.

k. Establish of a standard intended to promote architectural excellence.

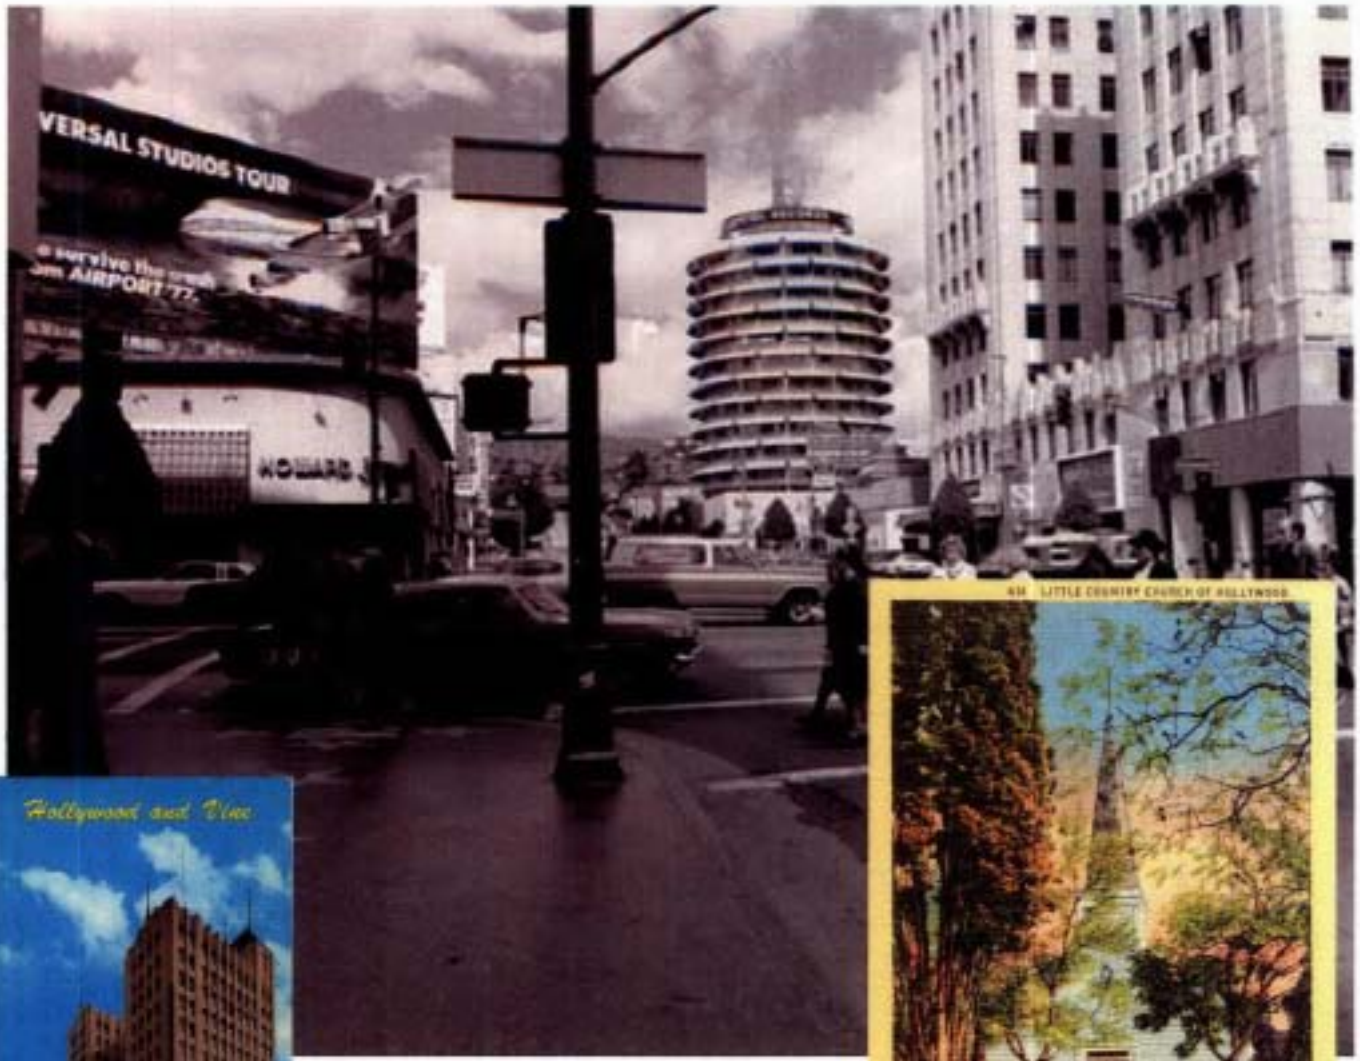
l. Mention transportation priority with linkages to public transportation.

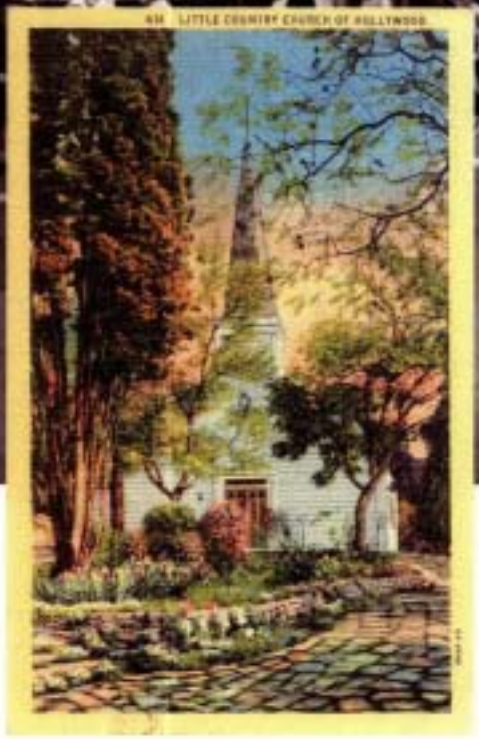
m. Provide designs that take into account the context and make an effort to respect it and fit in visually.

n. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

o. Create buildings that emphasize the vertical architecture and become visible icons.

p. Develop a visual gateway to Hollywood Boulevard from the Hollywood Freeway.

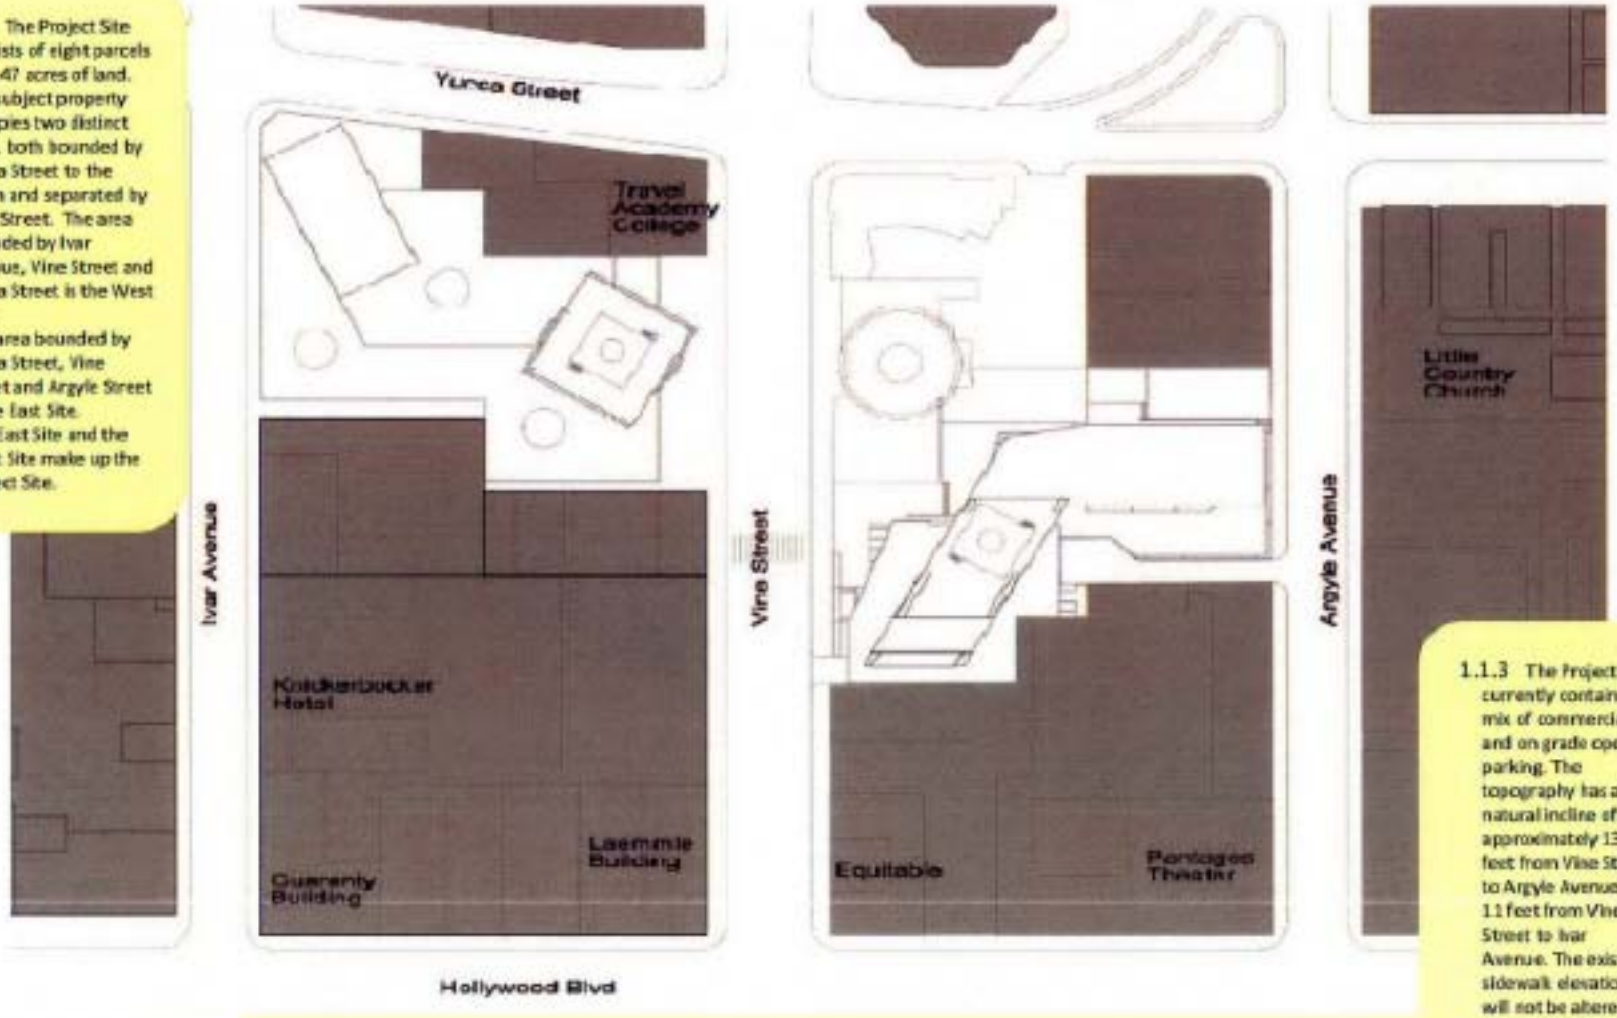




EXAMPLE C

1. PROJECT SITE

1.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.
The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site.
The East Site and the West Site make up the Project Site.



1.1.3 The Project site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

1.2 Site Zoning and Permitted Floor Area

- 1.2.1 Project Site is zoned Commercial (C2). City General Plan land use designation: Regional Center commercial.
- 1.2.2 Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.
- 1.2.3 Floor Area Ratio: 6:1
- 1.2.4 Height District: No. 2

Meeting w/ Sen De Leon staff
(Dayasar Thomasian)

- DCP (Michael La Grande, Lisa Webber)
- DoT (me)

- meeting to ~~expand to~~ discuss 7/11/13 letter from Sen. De Leon

- we described issues w/ Caltrans on Millennium & most projects, which are:
  - Caltrans traffic study guide not practical
  - City & County define "significant" traffic impacts but Caltrans does not
  - Caltrans guide not administered consistently
  - freeway studies often become subjective exercise to extract funds for improvements w/o proven nexus
  - CEQA clearly defines lead agency's roles but Caltrans often tries to overstep
  - Caltrans does not accept the State-mandated CMP methodology which is used by all cities to assess impacts on SHS
  - Caltrans ignored 2001/2002 Task Force recommendations to fix their guide (issues pointed out 10+ yrs ago)

- IDEAS: → Caltrans should update their guidelines as LA City does to reflect technical updates, case law, policy changes, state legislation, etc.

→ LADOT/Caltrans should establish filter to determine which projects need fwy analysis & should be sent to Caltrans & which projects should just prepare CMP

→ Caltrans should establish impact thresholds

→ " should receive training to better understand trip generation and impact studies in urban areas (Caltrans' current guide was established for Fresno in the early '90's then adopted for entire state w/o consideration of land use, environment, urban setting, transit availability, etc.)

RE: Millennium Hollywood Project
Vic. LA-101, PM 7.37
SCH#2100041094

Dear Mr. LoGrande:

My office has been in communications with the California Department of Transportation regarding concerns the agency has expressed about the impact of the proposed Millennium Hollywood Project to the 101 Freeway.

I understand that Caltrans has made several attempts to communicate their concerns to the City in an effort to ensure an appropriate focus of environmental study and to identify adequate mitigations. They have indicated no response has been received.

It is paramount that consistent and clear communications occur amongst government entities. I would like to set up a meeting as soon as possible for all relevant parties of the Millennium Hollywood Project to resolve concerns.

Please contact my Deputy, Baydsar Thomasian, to arrange the meeting. She can be reached at (213) 483-9300

Sincerely,

Kevin de Leon
Senator, Twenty Second District

Millennium Hollywood Project

Traffic Study Summary

- LADOT guided the preparation of the traffic study for the Millennium Hollywood project – the study was prepared by a transportation engineering and planning firm hired by the developer
- The study was prepared consistent with LADOT's traffic study policies and procedures
- The study evaluated to potential impacts of the project's traffic on City streets and intersections, on the transit system, on freeway ramp and on the 101 freeway
- To off-set the traffic impacts resulting from the project's anticipated traffic, LADOT developed a comprehensive and multi-modal transportation mitigation program (summarized below)

Transportation Mitigation Program Summary

As conditions of project approval, the applicant will implement the following transportation mitigation measures:

- Implement a Transportation Demand Management Plan (i.e., Trip Reduction Program) which includes the following key measures:

    1. Internal Transportation Management Coordination Program with on-site transportation coordinator
    2. On-site car share services
    3. Parking as an option only for all leases and sales (unbundled parking)
    4. On-site bike repair area with shared tools for residents/employees
    5. Coordinate with DOT to provide space for a future Integrated Mobility Hub (car-share, bike-share and secure bike parking services)
    6. Contribute $250,000 to City Bike Plan Trust Fund
    7. On-demand van or shuttle services connecting project residents, employees and visitors to major transit stops
    8. To expand the reach of this plan beyond the project site, the applicant will also join or help create a Transportation Management Organization for the Hollywood area

- Improve sidewalk conditions (pavement reconstruction and added amenities) along Ivar Street and Argyle Avenue linking the project to the Hollywood/Vine Red Line Station.

- Improve the operations and safety of the intersection of Franklin Avenue and Argyle Avenue.

- Upgrade the traffic signal equipment at 33 intersections surrounding the project including along Highland Avenue, Hollywood Boulevard, Sunset Boulevard and Vine Street.

7/19/13

LADOT / Caltrans / Millennium Hollywood

(*) → adjust guidelines to include unsignalized I/S if it is a fwy ramp

→ analyze fwy ramps in our guidelines
↳ apply LADOT's filter in an off-line analysis

→ developer proposing to provide funds to Caltrans to prepare analysis &/or implement improvements

↳ $400K* offered to Caltrans for studies / mitigation →

↳ does Caltrans already know where deficiencies are?

(*) — how many cars is Millennium adding to the fwy system?

CURRENT HOLLYWOOD FAULT ZONE PROJECTS

1 Reports reviewed but not approved:
1600 Argyle Ave (correction letter issued requiring fault investigation)

1605 Highland Ave (correction letter issued for fault investigation report)

1720 Vine St. Millenium project; subdivision reviewed; however waiting for additional fault investigation for building

1769 Sycamore Ave; (correction letter issued requiring fault investigation)

2. Reports approved, but project not submitted for plan check:

6200 Hollywood Blvd (soil report approved; fault investigation will be required before issuance of permit)

7930 Hollywood Blvd (soil report approved, fault investigation will be required before issuance of permit)

1840 Highland Ave (has approved fault investigation)

3 Reports approved and in plan check: No projects
4 Permits issued, but construction not started: No projects

5 Permits issued and under construction(no fault investigation and no action recommended):
4454 Avocado St (3-story cut-grade; soil engineer site inspection only, without geologist, so no opinion of fault activity possible) (has approved inspections for framing (12/17/13), drywall and insulation(both 1/9/14))

2131 Hilhurst Ave (2 story – basement) (OK for TCO; 7/30/13)(soil engineer inspection only, without geologist, so no opinion of fault activity possible)

6201 Hollywood Blvd (6 story – several basement levels) (letter from on-site geologist states no evidence of Hollywood fault)

1751 Las Palmas Ave (all of the site except for the northern 24 feet is located outside of the A-P study zone, so no fault evaluation required) (foundation is partially completed)

6. Permits issued and under construction with approved fault investigation:

1811 Orchid Ave

CURRENT HOLLYWOOD FAULT ZONE PROJECTS

1 Reports reviewed but not approved:
1500 Argyle Ave (correction letter issued requiring fault invest gation)

1805 High and Ave (correction letter issued for fault investigation report)

1720 Vine St. MIlenium project; subdivision reviewed; however waiting for additional fault investigation for building

1769 Sycamore Ave; (correction letter issued requiring fault invest gation)

2 Reports approved, but project not submitted for plan check:

6200 Hollywood Blvd (soil report approved; fault investigation wi l be required before issuance of permit)

7930 Hollywood Blvd (soil report approved; fau t investigation will be required before issuance of permit)

1840 Highland Ave (has aporoved fau t investigation)

3 Reports approved and in plan check

No projects

4. Permits issued, but construct on not started:
No oro,erts

5. Permits issued and under construction(no fault investigation):
4414 Averacn St (3-story on-grade) (has aporoved inspections for framing (12/17/13), drywall and insulation(both 1/9/14))

2131 Hilhurst Ave (2-story + basement) (OK for TCO, 7/30/13)

6201 Ho lywood Bl (6-story - several basement leve s) (letter from on-site geologist states no evidence of Hol ywood fault)

6 Permits issued and under construction with approved fault investigat on

1811 Orchid Ave

In April 2012 Langan submitted a soil report (dated 11/22/12) for LADBS review The report was prepared for the purpose of the tentative tract process.

In May 2012, LADBS issued a correction letter requesting detail geotechnical study and geologic investigation for potential surface displacement on the Hollywood Fault

In October 2012, Langan proposed to use the boring method to do the fault investigation. The boring method is one of the few most commonly used methods for this type of investigation LADBS agreed with using the boring method

In Dec 2012, Langan submitted two reports addressing the fault investigation (dated 11/30/12) and soil report (dated 12/0/12).

In Jan 2013, LADBS issued approval letter for both reports with a condition requiring a detailed geotechnical study to be provided at or to the building permits and/or recordation of the final tract map.

In June 2013, Dr James Dolan requested for a copy of the fault investigation report for his review. Subsequently, Dr Dolan expressed his concern to LADBS that based on his interpretation of the data, there is a lack of correlation between bore holes. Please note that Dr Dolan concerns are related to interpretation of the data and not any new evidence that there is an active Hollywood Fault crossing the property which would otherwise invalidate our approval.

As is often the case, technical concerns can arise from other interested parties after the issuance of an approval (building permit, grading reports, etc.). It has always been LADBS' practice to investigate the concerns, refer the concerns to the project consultant, and meet with the consultant to evaluate the validity of the concerns. If it appears that the concerns may be valid, then LADBS will request additional information from the project consultant. If concerns are not addressed, then the approval will be rescinded

In this case, the Chief of LADBS Grading Division, Dana Prevost reviewed the concerns and left a message for Langan about the concerns and request for a discussion on 6/13/13

During Mr. Prevost's vacation (from 6/14/13 to 6/23/13), Langan called and spoke to the LADBS geologist who reviewed and approved the report. Langan did not agree with the concerns raised by Dr Dolan and LADBS.

Mr Prevost came back from his vacation on 6/24/13 and left a message with Langan explaining that if no additional information or explanation is provided to address the concern, then we would rescind our approval, which is our common practice

The traffic analysis in the EIR for the project studied 37 intersections. Under existing traffic conditions, (2011), all 37 intersections during the AM Peak Hour operate at acceptable levels of service (LOS) of A through D, as determined by DOT. During the PM Peak Hour, one intersection operates at a LOS E, defined as "Severe congestion with some long-standing lines on critical approaches. Blockage of intersection may occur if traffic signal does not provide for protected turning movements." Levels of Service of E or F are considered unacceptable. The addition of the project will increase the value of the Critical Movement Analysis (CMA) in the future at all study intersections during one or both peak hours. Per DOT policy, a significant impact is defined as an increase in the CMA value due to project-related traffic as 0.010 or more when the final LOS is E or F.

With and without the project (2020), levels of service at 22 of the 37 studied intersections would continue to operate at acceptable levels of A through D. The remaining 15 intersections are anticipated to operate at Levels of E or F during one or both peak hours with or without the project. With the addition of project and the project-related traffic mitigation measures, however, the intersections operating at LOS E or F would decrease from 15 to 13. Of these, five study intersections would remain significant project impacts ~~at a significant level~~ even with the implementation of mitigation measures, meaning there was minimal improvement to the CMA (less than 0.010).

In the Horizon Year 2035 Development Agreement analysis, 16 intersections would have significant project traffic impacts during one or both peak hours. In addition to the 13 intersections that would be impacted by the project (with mitigation) in 2020, three additional intersections, including Cahuenga Boulevard/Yucca Street, Vine Street/Selma Avenue, and Vine Street/De Longpre Avenue.

Although the study intersections are anticipated to operate with diminished levels of service ~~are anticipated to diminish~~ with and without the project, the traffic analysis has concluded that the implementation of traffic mitigation would reduce the affected intersections that operate with a level of service of E or F from 15 to 13 in the year 2020, and would only increase the number of affected intersections from 15 intersections (without the project) to 16 intersections with the project and project-related traffic and mitigation.

Subject: Millennium Hollywood Development Balcony Discussion

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the

natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Hi Charmie.

See if this helps. I have made a quick indication on "sketch 3" how the unit type distributions may work. Generally we are locating a living room at the end of each of the projecting "miradors". Other function may ultimately end up within that area. One possibility is an open loft style kitchen that would flow out to the primary living space.

Let me know if this helps or if you need further clarification.

Thanks

Best regards

EDWARD H TACHIBANA

Hi Ed,

Thanks for the pdf. Can you also email me the full level floor plan for the projecting living room and a full level floor plan for the balcony beneath it?

Thanks

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on an existing ZA's interpretation.

Please let me know if you have any questions.

Thanks

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining

balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

possibly tomorrow or next week - really busy today dealing with signs. I can provide you with my opinion, but I still think that technically it has to be DBS's "call" as to how to apply the ZAI to a specific project, since DBS is responsible for interpreting and enforcing the city's zoning ordinances under 12.26. that said, we should talk, and of course I'd be happy to give you my 2 cents.

>>> Charmie Huynh 11/25/2008 11:31 AM >>>
Hi Alan,

I sent this email out yesterday regarding the Millenium Hollywood high rise project and the issue of FAR and Balconies. The topic at hand is regarding the wood louvers and glass wind breaks. I understand from a voicemail message from Alfredo that you feel that LADBS should make the call on this one. I've already spoken with Jameson and we've made the decision to consider these "screens" as enclosures for the balconies and thus creating FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The lawyers want LADBS to consider their interpretation on the ZAI (ZA2007-3430), however, LADBS cannot make an interpretation on a ZA's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back in on Monday. I'd love to get your feedback on this. Jameson and Alfredo are cc'd to this email as well.

Thanks and have a Happy Thanksgiving!

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not

enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Charmie,

On the issue of space under a projection (i.e., ground floor or balcony space under a habitable room) that would be counted as FAR, can you refer us to the related Building or Zoning Code section for reference?

Thanks in advance.

Subject: Fwd: Re: Millennium Hollywood Development: Balcony Discussion

>>> Alan Bell 12/1/2008 10:49 AM >>>
Hi Charmie - I've reviewed the material you sent me concerning the Millennium Hollywood Development. The Department of Building & Safety's interpretation and application of ZA 2007-3430 (ZAI) concerning FAR and private open space is correct. As the ZAI clearly states, balconies and decks shall not be considered "floor area" for purposes of calculating FAR, only so long as three conditions are met, including condition #2, which is that the balcony or deck remains "unenclosed except for the guard rails required by the Building Code."

The proposed additional screening above the guard rail encloses space that would otherwise be open. The proposed screens, which are parallel to the building wall, do not serve the same purpose as the perpendicular wing walls and privacy screens discussed on p. 4 of the ZAI, which are intended to divide large balconies or decks shared by two or more residential dwelling units.

If you have any questions, please let me know.

Subject: Fwd: Re: Millennium Hollywood Development: Balcony Discussion

Hi Charmie - I've reviewed the material you sent me concerning the Millennium Hollywood Development. The Department of Building & Safety's interpretation and application of ZA 2007-3430 (ZAI) concerning FAR and private open space is correct. As the ZAI clearly states, balconies and decks shall not be considered "floor area" for purposes of calculating FAR, only so long as three conditions are met, including condition #3, which is that the balcony or deck remains "unenclosed except for the guardrails required by the Building Code."

The proposed additional screening above the guardrail encloses space that would otherwise be open. The proposed screens, which are parallel to the building wall, do not serve the same purpose as the perpendicular end walls and privacy screens discussed on p. 4 of the ZAI, which are intended to divide large balconies or decks shared by two or more residential dwelling units.

If you have any questions, please let me know.

possibly tomorrow or next week - really busy today dealing with signs. I can provide you with my opinion, but I still think that technically it has to be LADBS's call as to how to apply the ZAI to a specific project, since LADBS is responsible for interpreting and enforcing the city's zoning ordinances (refer 12.26). That said, we should talk, and of course I'd be happy to give you my 2 cents.

>>> Charmie Huynh 11/25/2008 11:31 AM >>>
Hi Alan,

I sent this email out yesterday regarding the Millennium Hollywood high rise project and the issue of FAR and balconies. The report basically is regarding the wood louvers and glass wind breaks. I understand from a voicemail message from Arnaldo that you feel that LADBS should make the call on this one. I've already spoken with Jameson and we've made the decision to consider these "screens" as enclosures for the balconies and thus creating FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The lawyers want LADBS to consider their interpretation on the ZAI (ZA2007-3430), however, LADBS cannot make an interpretation on a ZAI's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back on Monday. I'd love to get your feedback on this. Jameson and Arnaldo are cc'd on this email as well.

Thanks and have a Happy Thanksgiving!

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification of these screens for your project. Basically, LADBS cannot provide clarification on an existing ZAI interpretation.

Please let me know if you have any questions.

Thanks

Hi Channie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting. On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrators memo (ZAI) we reviewed at the pre-development meeting states that balcony wall not be included in FAR if it remains unenclosed except for the guardrails required by the Building Code. The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed on two or three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03). Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balconies as leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a barrier against the natural elements and enhancing balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo (ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4). Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden planks (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the projects biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve views from the units. Accordingly,

the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the FAR regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are considered in addition to the required guardrails. The glass wind break can not be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2005 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements."
As discussed above, the intent of the FAR was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are partially open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening

must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

WC,

Would it be possible for you or your staff to attend this predevelopment meeting this Wednesday from 1PM to 3PM. Our group has a scheduled meeting with Councilmember Alarcon at the same time and I won't be able to attend the predev meeting. Please let me or Charmie know.

Charmie, I will forward the water info as soon as I get it from the water engineer.

Thanks!

Rene

Subject: Request for Pre-Development Meeting for Millennium Hollywood -1750 N Vine St (East Site) and 1751 N Vine St (West Site)(Email 1)
When: Wednesday, October 22, 2008 1:00 PM-3:00 PM (GMT-08:00) Pacific Time (US & Canada).
Where: 221 N Figueroa St., Suite 180, LA, CA 90012

Hello,

You are invited to a case management pre-development meeting for the proposed Millennium Hollywood High Rise projects at 1750 N Vine St (East Site) and 1751 N Vine St (West Site). The Project Narrative is attached to this email.

Date: Wednesday, October 22, 2008

Time: 1:00pm - 3:00pm

Location: 221 N Figueroa St., Suite 180, Los Angeles, CA 90012

Applicant: Alfredo Fraijo, Attorney at Law, Allen Matkins, 213-955-5607

Questionand Issues for the City Departments:

1.) Planning/Building & Safety:Confirmation of required entitlements with respect to the proposed

project (are any other entitlements required?); Confirmation of setbacks provided Are there minimum distance requirements between the two towers? Are there minimum distance requirements regarding light and air for windows facing windows, alleys or lot lines? Confirm loading spaces required for the project and their required dimensions Discuss balcony encroachment and screening issues (ZA 2007-3430(ZAI) Memo)

2.) Public Works:Are any offsite improvements required such as street widening, other than what a traffic study might suggest? Confirm sidewalk and street dedication requirements Sewer facility charge and credit Adequacy of storm drain system near project Confirmation of sewer capacity availability Are there any requirements for onsite storm water retention, treatment, discharge during construction and/or operation? What are the required public improvements regarding street trees etc? What are the required public improvements regarding street lights? How will the Walk of Fame be handled during construction? Task force to determine viability of underground tunnel and obtaining a franchise

3.) LAFD & Fire Hydrants and Access What are the type and location of desired Fire Dept turnarounds? Where should on-site hydrants be located? What fire lane access is required to the buildings? How do hydrant and fire equipment access requirements impact the layout of units? General review of and input related to the proposed site plan regarding Fire Department requirements. Observation deck fire access issues, including capacity, fire escape and elevator.

4.) DWP:Will we be required to provide public or private utilities? Requirements for undergrounding utilities, if any. How will project be metered relative to the air lot subdivision? Potential relocation of traffic island and right-hand turn lane at corner of Yucca and Argyle to create a park General review and input regarding the proposed site plan and DWP requirements, including water and power service availability, water and power connections and clear distance from existing or future power lines.

Your attendance is greatly appreciated. If you cannot attend, please reply to me via email with your comments and any information you can pass along to the Applicant to address their concerns/issues

Attached are some of the project files. I will be sending an additional 4 other emails containing the project files

Thank you

Charmie Huynh, P.E.

Subject: Millennium Hollywood Development: Balcony Discussion

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to

mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like

those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

possibly tomorrow or next week - really busy today dealing with signs. I can provide you with my opinion, but I still think that technically it has to be DBS's call as to how to apply the ZAI to a specific project, since DBS is responsible for interpreting and enforcing the city's zoning ordinances under 12.26. That said, we should talk, and of course I'd be happy to give you my 2 cents.

>>> Charmie Huynh 11/25/2008 11:31 AM >>>
Hi Alan,

I sent this email out yesterday regarding the Miller Hollywood high rise project and the issue of FAR and balconies. The report at hand is regarding the wood louvers and glass wind breaks. I understand from a voicemail message from Alfredo that you feel that LADBS should make the call on this one. I've already spoken with Jameson and we've made the decision to consider these "screens" as enclosures for the balconies and thus creating FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The owners want LADBS to consider their interpretation on the ZAI (ZA2007-3401). However, LADBS cannot make an interpretation on a ZA's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back in on Monday. I'd love to get your feedback on this. Jameson and Alfredo are cc'd to this email as well.

Thanks and have a Happy Thanksgiving!

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3401(ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on another ZA's interpretation.

Please let me know if you have any questions.

Thanks

Hi Glenn,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that balcony walls not be included in FAR if the walls are enclosed except for the guardrails required by the Building Code. The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with mesh screening." Since mesh screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean "closed in on all sides or surrounded on all sides." The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed on two or three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03). Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4). Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics of the buildings in line with similar concepts for other world-class structures (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical height of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (not unlike Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the projects biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve views from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered external walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain wall is provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately five feet (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and do not form to the required guardrails. The glass wind break can not be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let us know how we should proceed on this issue. And thanks again for your attention to the project.

Hi Charmie - I've reviewed the material you sent me concerning the Millennium Hollywood Development. The Department of Building & Safety's interpretation and application of ZA 2007-3430 (ZAI) concerning FAR and private open space is correct. As the ZAI clearly states, balconies and decks shall not be considered "floor area" for purposes of calculating FAR, only so long as three conditions are met, including condition #2, which is that the balcony or deck remains "unenclosed except for the guard rails required by the Building Code."

The proposed additional screening above the guard rail encloses space that would otherwise be open. The proposed screens, which are parallel to the building wall, do not serve the same purpose as the perpendicular wing walls and privacy screens discussed on p. 4 of the ZAI, which are intended to divide large balconies or decks shared by two or more residential dwelling units.

If you have any questions, please let me know.

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line

with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Subject: 1750 N Vine St - Millennium Hollywood

Hi Alfred,

Hope you're doing well. It's been a while.

Just wanted to check in with you on the status of this project. Is it moving forward? And if so, do you know if they have an approximate plan check submittal date to LADBS?

Thanks

Charmie Huynh, P.E.

FW: Millennium Hollywood Development - revise WSA request letter

7 messages

From: Hwang, Jin
Sent: Monday, December 22, 2008 9:30 AM
To: 'wujor@cra.lacity.org'
Subject: Millennium Hollywood Development - revise WSA request letter

Ono,

Thank you for the Water Supply Assessment (WSA) request letter for the Millennium Hollywood Development Project. I have reviewed the letter and I would need some more information in order to be able to work on the WSA. Since some of the critical information are missing in the letter, I recommend sending a revised WSA request letter to DWP rather than providing the missing information in a separate letter or by e-mail. Please include the following information in the new revised letter:

1. Explain whether the project complies with the General Plan. You can provide a table similar to the one shown below. The purpose of comparing the General Plan to the proposed development is to see if the developer is proposing to build more than what is allowed. If the development will result in building more than what is allowed, that can translate into proposing more water demand than what is allowed. DWP is working on a fee structure for such "new unplanned water".

	Existing	Proposed Development
General Plan Land Use		
General Plan Land Use Max SF or FAR		
Zoning		
Zoning Max SF or FAR		

2. Please state what community plan this project is within.

3. Do the numbers in Tables 1 and 2 (Existing On-Site Water Consumption for West and East Sites) already include 18% and 28% of indoor water usage to calculate outdoor water usage? DWP has recently decided to stop using the 18 and 28 % method to calculate outdoor water usage. We're now using the actual square footage of landscaping to calculate outdoor water usage. Please revise Tables 1 and 2 (and also Table 3) to reflect this new method and include the square footage of landscaping for both existing and proposed.

4. Please provide the project location map and the address. The letter states that a vicinity map is attached, but there was no map attached to the letter.

Please call me if you have any questions. Thank you.

Jin Hwang

Civil Engineering Associate

Ono,

Please be reminded that I'm still waiting for the revised WSA request letter. The previously submitted WSA request letter is deemed incomplete, and I cannot start working on the WSA without the requested information. The date of the new submittal of the WSA request letter will be considered the official date the request letter was received by DWP. Thank you.

Hi Jin,

This is to acknowledge the receipt of your letter calling for revisions to the WSA request letter for the above referenced project. I was told by the consultant that the project is currently on hold because of the economic condition. Consequently, we hope to revise the WSA request letter whenever the developer is ready to proceed.

Thanks,

Ono

Hello Ono,

I am sorry that I have not returned your call, but I am in a jury this week.

I have been directed by the applicant to place my work on hold while they evaluate the current economic conditions. Please ask DWP to hold off on any additional analysis for the present time. I will let you know when I have been directed to proceed.

Yes they are some of the Millennium properties! Some financing, bank thing? Even though they are asking for discretionary actions this person must want to know what they can build by right. Which, as Kevin said, he can research himself with our help pointing him to the correct documents.

Blake

>>> Jon Tanury 3/25/2010 10:46 AM >>>
I'm a little lost, these are the Millenium properties, aren't they....?

Subject: Re: fee recovery issue

Thanks Eva.

Jan, Eva's email sparked a lead- the DA was recently filed as part of an existing CPC case: CPC-2008-3440. Hopefully the new fee cost recovery number can be based on the case?

Many thanks,

Kevin

>>> Eva Yuan-McDaniel 12/4/09 8:53 AM >>>
Kevin,

We need a separate work order number for the M. project. I assume you do not yet have a case number. Let me check with Jan next week and get back to you.

You are correct; we definitely need to tighten up fee recovery for large projects. Much staff time is spent before we have a case, and sometimes that cost is not charged to the developer. We will include this in our discussion.

Thanks.

>>> Kevin Keller 12/3/2009 6:07 PM >>>
Hi Eva, Hi Vince-

There are a couple of issues on the horizon I wanted to flag re: fee recovery. For information only. I can assist on the Millenium issue.

Wilshire Grand Project
DOT would like to work in a fee recovery mode to expedite Wilshire Grand, but cannot. My understanding is that they only can recover costs through our supplemental fee agreement and through our expedited section. The project is not in expedited. Planning is full cost recovery using the EIR process.

I agree with Maya that it would be problematic to use expediting for only fee recovery on this project. She and I are in conversations on this. DOT is looking for help. It may be that DOT will need to solve this using their own resources.

Millenium Hollywood Project
This is a major Development Agreement project for Hollywood that community planning staff will begin spending time on. Currently the CRA is preparing the EIR, but as a development agreement project I believe we can still use full cost recovery.

Eva- Can we issue a E###### number for this type of situation for FMIS, or should we work to establish a stand alone new number? Please point me in the right direction and I will take care of the rest.

Next Steps
I'm eager to look for ways to help us better implement better fee recovery for community planning's work on these large projects- especially after the recent budget talks. I would be happy to work to streamline the establishment and transfer of EIR fee numbers generated at the counter at time of case filing to community planning staff- currently I think we miss many opportunities to charge our time on these larger cases.

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project Site.

e. Ensure compliance with the Development Objectives.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve the Capitol Records Building and the Gogerty Building according to established preservation guidelines (the *Secretary of the Interior's Standards for Rehabilitation* and guidance provided by Office of Historic Resources).

b. Preserve public views from certain key vantage points to the Capitol Records Tower by creating grade level open space / civic plazas on the East Site adjacent to the Jazz Mural and Capitol Records Building and West Site across from the Capitol Records Building.

c. Preserve existing view corridors from certain key vantage points to the Hollywood Hills.

fig. 1.2.2.b-c: Capitol Records View Corridors

d. Create civic plazas that are activated by retail, landscaped, and enhance the Hollywood Walk of Fame by providing it as an urban node. Reinforce the urban and historical

importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Encourage street life by the creation of a new pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces that permit open and green spaces for both the on-site and off-site population.

fig 1.2.2.d: View North Along Vine Street

g. Create a 24 hr community by the creation of a Thriving Mixed-Use Development.

h. Eliminate the visual impact of current on-site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in proximity to the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street, and existing bus routes.

j. Establish standards to address architectural excellence.

k. Provide designs that address, respect and complement the existing context, including standards for ground-level open space, podium heights and massing setbacks that minimize impacts to the historic setting.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood from the Hollywood Freeway.

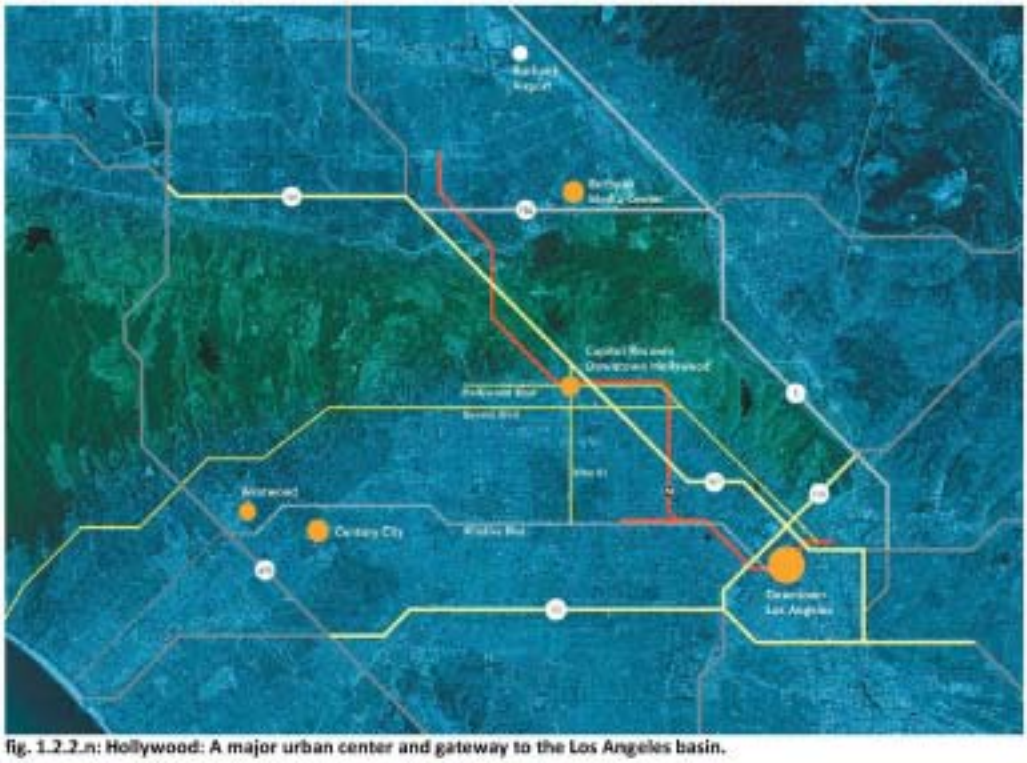

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict requirements for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and _____ ("Millennium Development Agreement") on _____.

1.4.2 The following sections in the Regulations differ from corresponding provisions (as written at the time of approval) in the LAMC: 2.2.1, 2.2.3, 5.5.3.a, 7.3.4.b, 9.1.6.a and 10.2.

1.4.3 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street.

The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and on-grade open parking. The topography has a natural incline of approximately 21 feet (NE to SW) from Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Vine Street. The existing sidewalk elevations will not be altered as part the Project.

fig. 2.1. Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 The Project Site is zoned Commercial (C2). The City General Plan land use designation is Regional Center commercial.

2.2.2 The Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Floor Area Ratio: 6:1

2.2.4 Height District: No. 2

3. HISTORIC RESOURCES AND SETTING

3.1 Overview

The Project Site is located in a historically rich area of Hollywood that contains a number of recognized historic resources. This Project is a preservation project in that its ambition is to respect, respond to, and preserve the Capitol Records Building and to continue the urban character of Vine Street on the Project Site. The Project is designed to be observant of historic settings and buildings. Two buildings located on the Project Site, the Capitol Records Building and the Gogerty Building, are historically significant. Other historic buildings, located on adjacent parcels, are the Pantages Theater, the Equitable Building, the Hollywood Palace, and the Art Deco commercial building at 6316-6324 Yucca Street. Several of these historic resources are located within the Hollywood Boulevard Commercial and Entertainment District, a National Register listed historic district located just south of the Project Site.

Composed of commercial properties from the first half of the 20th Century, contributing properties to the Hollywood Boulevard Commercial and Entertainment District include a wide variety of property types including single-story storefronts, two-story commercial blocks, department stores, theaters, high-rise office buildings and hotels.

The Capitol Records Building is a unique building whose cylindrical form has always been visible from portions of Hollywood, Vine Street from the south, and the freeway from the north. The Capitol Records Building and the iconic buildings in the Hollywood Boulevard Commercial and Entertainment District (the Hollywood Palace, Pantages Theater, Equitable Building) will maintain their prominence after implementation of the Project. Portions of the Hollywood Walk of Fame (L.A. Historic Cultural Monument #194) are located along Vine Street between Yucca Street and Sunset Boulevard and will be protected.
The protection of Hollywood's historic resources and unique character is an important objective of the Project. The guidelines and standards contained in this document were created in part to ensure the protection of historic resources within the Project Site and minimize potential adverse affects to historic resources from new development. Key Project objectives regarding historic resources include:

1) Preservation, maintenance, and rehabilitation of the Capitol Records Building and the Gogerty Building in accordance with the Secretary of the Interior's Standards. See sections 1.2.2a and 1.2.2b of this document.

2) Protection and preservation of the portions of the Hollywood Walk of Fame (LA Historic Cultural Monument #194) will need to be temporarily removed during construction and replaced after construction is completed. A preservation plan, outlined in the Hollywood Walk of Fame Terrazzo Pavement and Repair Guidelines (March, 2011) will be prepared for this aspect of the Project.

3) Incorporation of ground-floor open space and building setback requirements to moderate the overall massing of new development in a manner that preserves important views to and from the Capitol Records Building, the Hollywood Boulevard Commercial and Entertainment District, and important view corridors to the Hollywood Hills. See sections 1.2.2 c, 6.1, 6.9, 7.1, 7.5, 8.1 and 8.2 of this document.

4) Incorporation of ground-floor open space and building setback requirements to reduce massing at the street level and limit the visual crowding of adjacent historic resources. See sections 1.2.2c, 6.1, 7.1, 7.5,

5) 8.1 and 8.2 of this document.

6) Requirement that design of new buildings be in a manner that is differentiated from but compatible with adjacent historic resources. See sections 6.6, 6.8, 7.1.5, and 7.4 of this document.

One means of creating compatible new buildings in an urbanized setting is to incorporate qualities of vertical and horizontal visual complexity in world class design. The general characteristics, proportions, and details of older buildings may serve as a reference for the Project. The Project's intent is to allow old and new to mix, recognizing that Hollywood sustains its image through both the rehabilitation of existing historic structures and the design of creative and contemporary architecture.

4. DENSITY

4.1 Floor Area Ratio Averaging and Density Transfer

The Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the sum of the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

4.2 Maximum OEGSF Density Per Area

A land use equivalency program ("Equivalency Program") to provide flexibility for a thoughtful range of modifications to the land use and square footages within the West Site and East Site and across the Sites will be developed in connection with the environmental review for the Project and is authorized by the Regulations. The Equivalency Program would permit a transfer of floor area among parcels in the West Site and East Site whereby square footage increases in one land use category can be exchanged for corresponding decreases in other permitted land use categories as long as the environmental considerations of land uses in the ultimate development scenario was analyzed in the Environmental Impact Report for the Project. Rate of conversation between land uses will be based on a maximum office-equivalent gross square feet ("OEGSF") to maintain vehicular trip totals equivalent to and not exceeding those studied in the Environmental Impact Report for the Project. The total density permitted in the West Site and East Site is further limited by the development zones A, B, C and D (see Fig. 5.1).

4.3 Use Coordination / Use Compatibility

[To be completed.]

5. HEIGHT

5.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capital Records Building.

Fig. 5.1 Height Zones

6. BUILDING AND STREET EXPERIENCE

6.1 Tower Massing Standards

6.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 6.1.1.

Tower Height (feet)	Maximum Tower Lot Coverage (%)	Minimum Floor Area Below 220 Feet (%)	Maximum Tower Floor Plate (sq. ft.)	Minimum Tower Setback (feet)	Minimum Public Open Space (%)	Figures
151 – 585	11.5	50	13,325 East Site 9,042 West Site	10 15[1]	12	6.1.2.d.1 6.1.2.d.2
151 – 550	15	50	17,380 East Site 11,794 West Site	10 15[1]	10	6.1.2.c.1 6.1.2.c.2
151 – 400	28	50	22,745 East Site 22,016 West Site	10 15[1]	8	6.1.2.b.1 6.1.2.b.2
150 – 220	48	n/a	55,616 East Site 37,742 West Site	10 15[1]	5	6.1.2.a.1 6.1.2.a.2

Table 6.1.1

Note 1: 15' tower setback required for any tower fronting Vine Street on West parcel. See Figure 6.3.2.

6.1.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 6.1.2.a.1 – 2.)

6.1.3 At least 50% of total floor area must be located below 220 feet.

6.1.4 Tower wall articulation:

a. Minimum 10% of tower aggregate area shall be articulated.

6.1.5 Types of permitted articulations for tower walls:

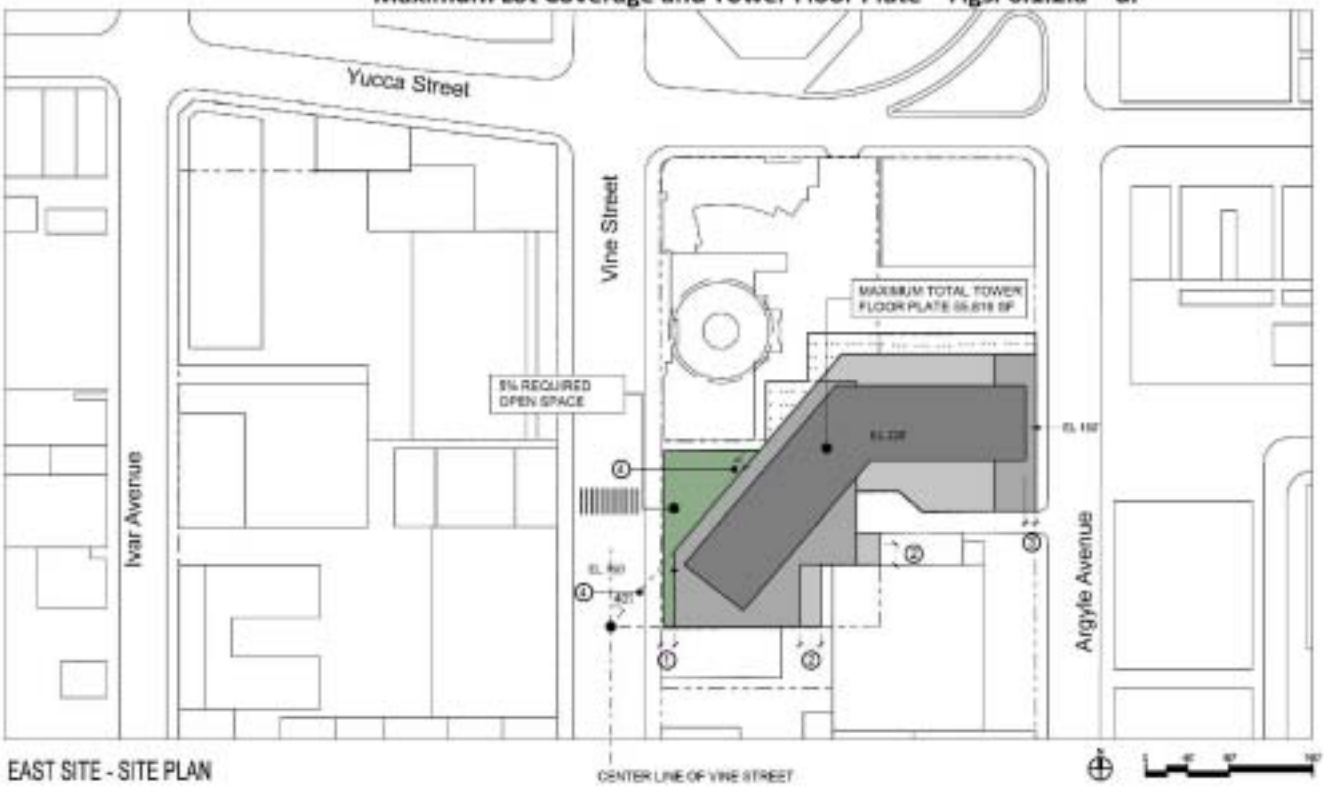
a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

The following developments are for illustrative purposes only.
Maximum Lot Coverage and Tower Floor Plate – Figs. 6.1.2.a – d.



EAST SITE - SITE PLAN

① MINIMUM 10' SETBACK ALONG VINE STREET
② MINIMUM 20' SETBACK ABOVE 150'
③ MINIMUM 10' SETBACK ABOVE 150'
④ 10' EASEMENT FROM CAPITOL RECORDS TOWER

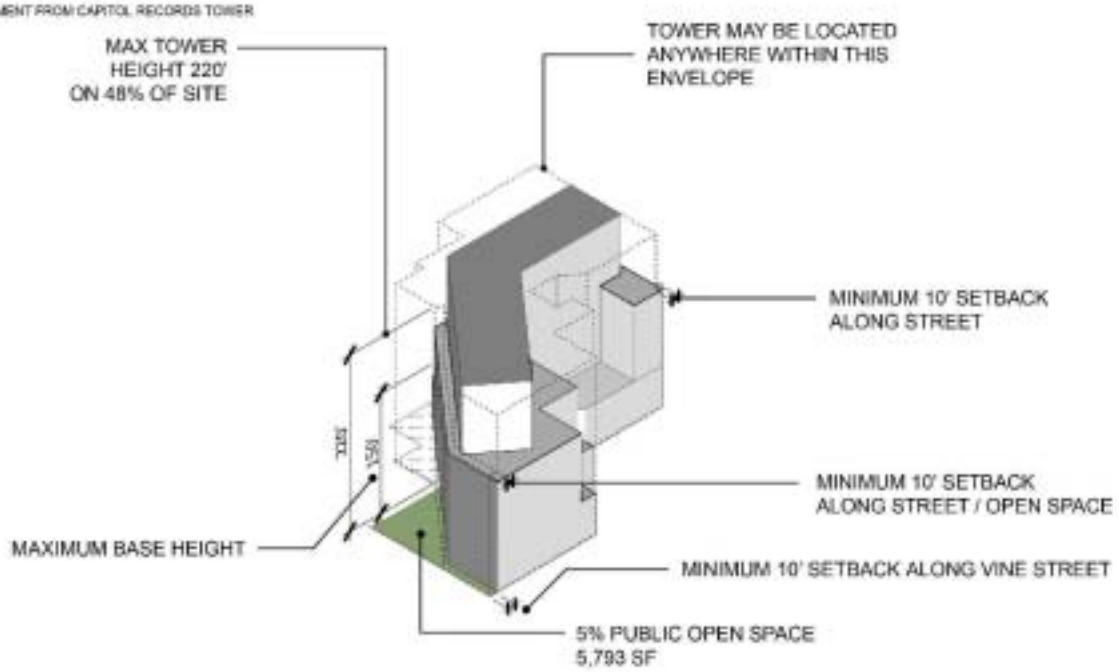


fig. 6.1.2.a.1: East Site – 220 Feet Maximum Tower Height

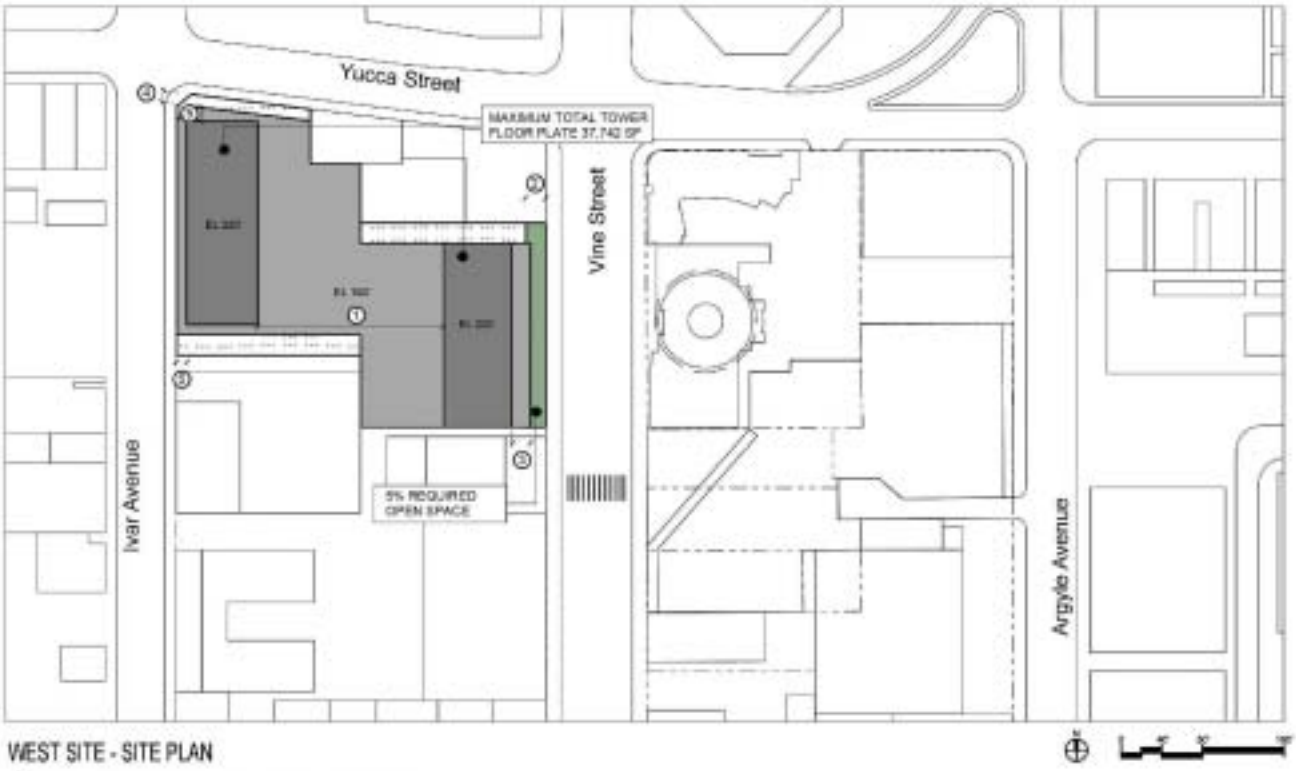

WEST SITE - SITE PLAN

① MINIMUM 60' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 15' SETBACK ALONG VINE STREET
③ MINIMUM 15' SETBACK ABOVE 40'
④ MINIMUM 10' SETBACK ALONG YUCCA STREET
⑤ MINIMUM 10' SETBACK ABOVE 150'

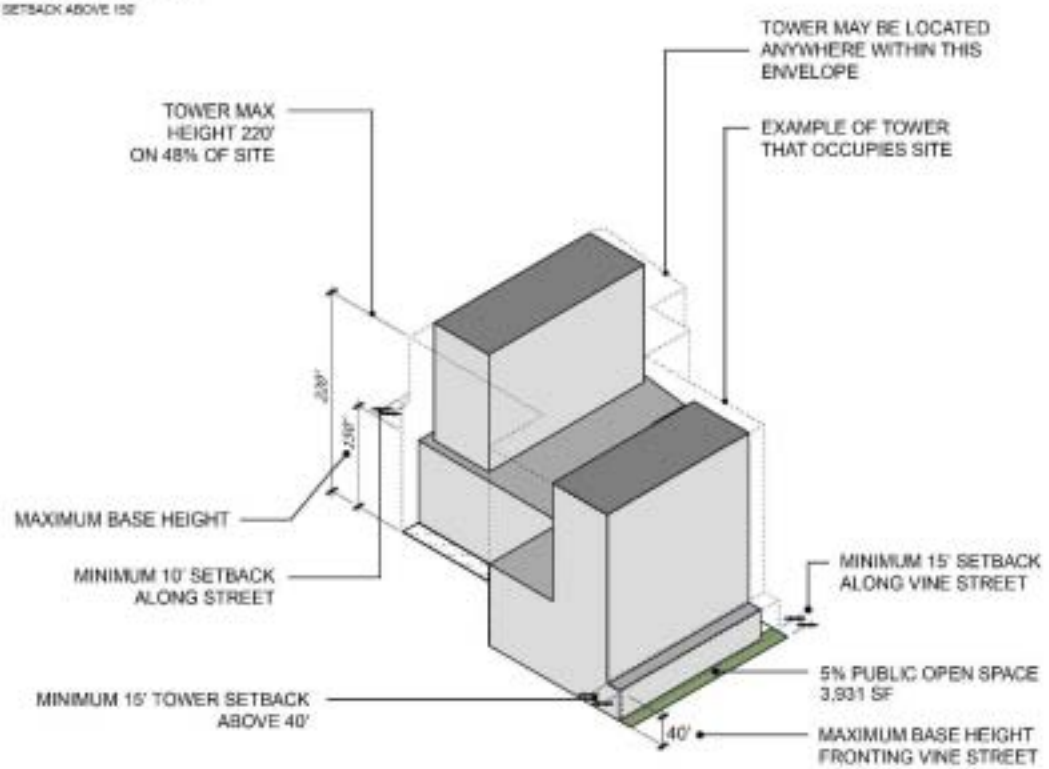

fig. 6.1.2.a.2: West Site - 220 Feet Maximum Tower Height.

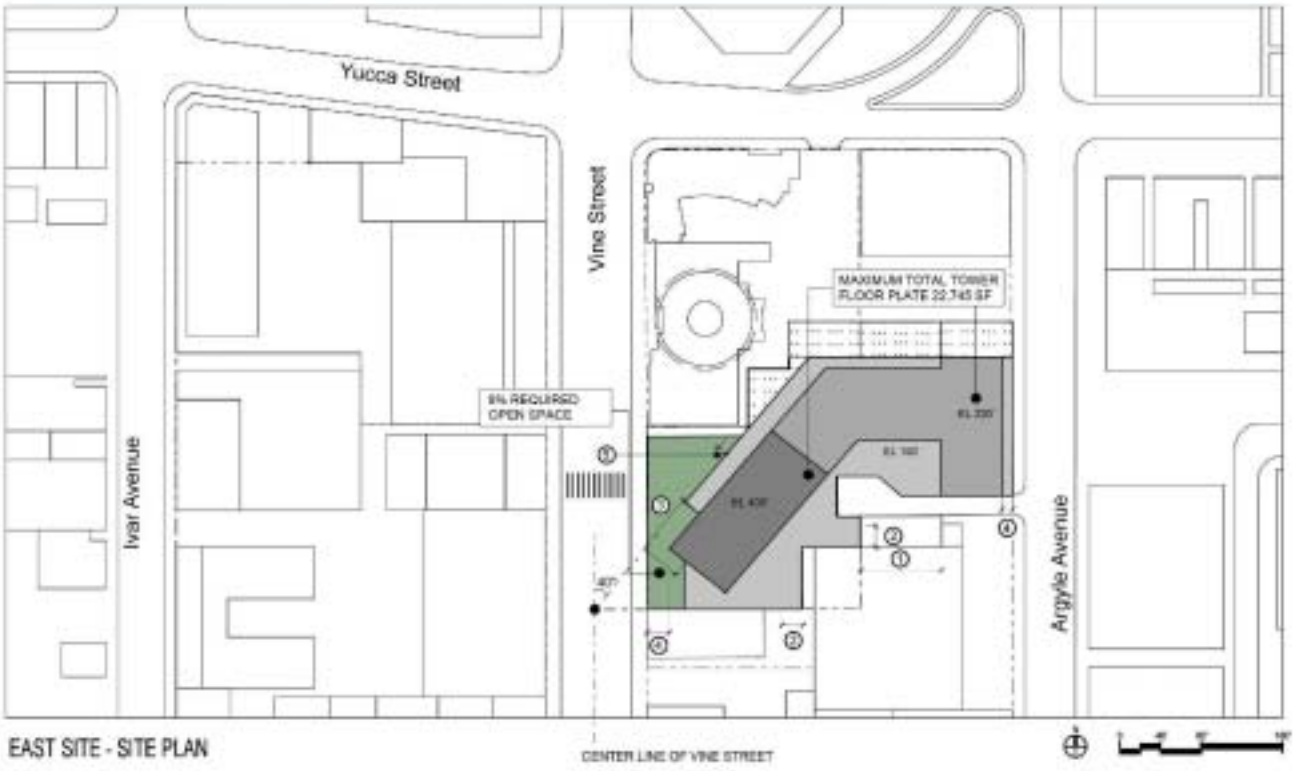

EAST SITE - SITE PLAN

① MINIMUM 60' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 20' SETBACK ABOVE 155'
③ MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
④ MINIMUM 10' SETBACK ABOVE 155'
⑤ 10' EASEMENT FROM CAPITOL RECORDS TOWER

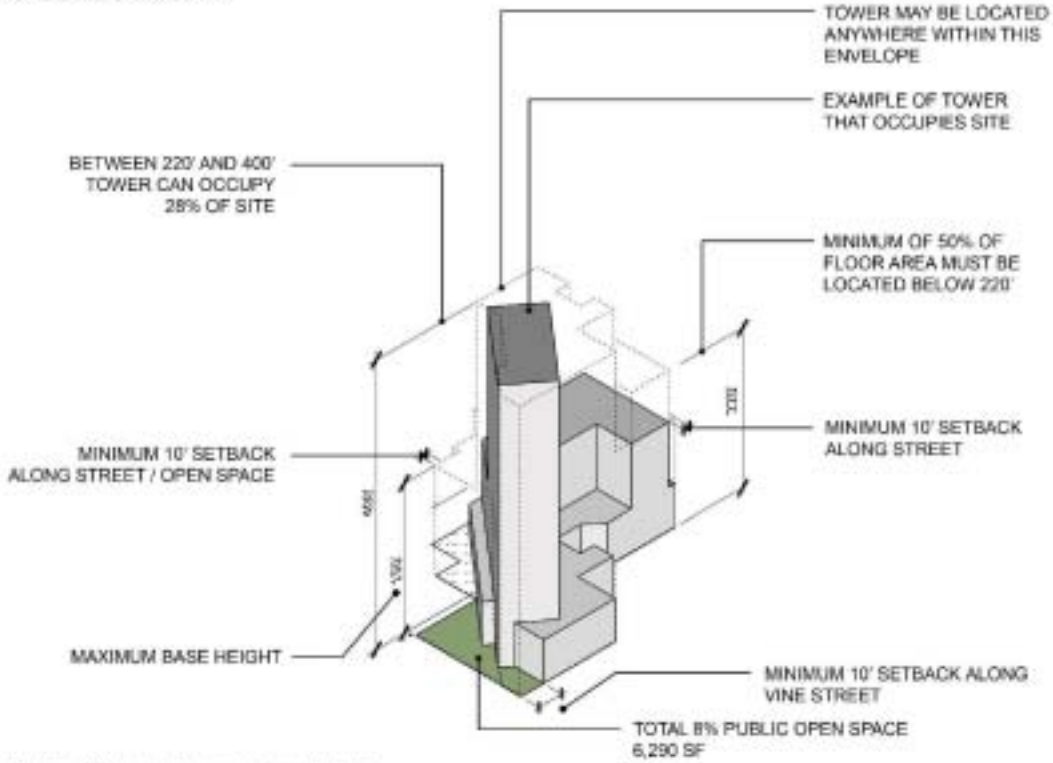

fig. 6.1.2.b.1: East Site – 400 Feet Maximum Tower Height

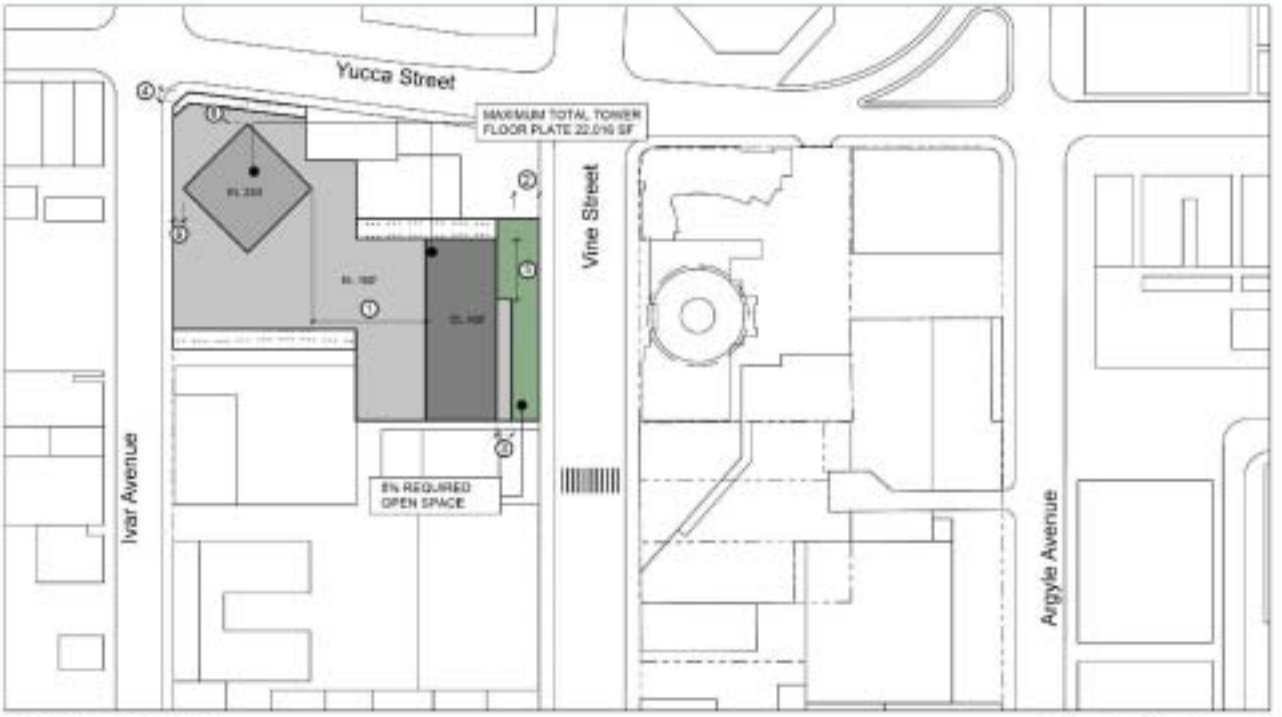

WEST SITE - SITE PLAN

① MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 15' SETBACK ALONG VINE STREET
③ MINIMUM 15' SETBACK ABOVE 40'
④ MINIMUM 10' SETBACK ALONG YUCCA STREET
⑤ MAXIMUM 40% OF STREET WALL CAN EXCEED MAXIMUM STREET WALL HEIGHT
⑥ MINIMUM 15' SET BACK ABOVE 150'

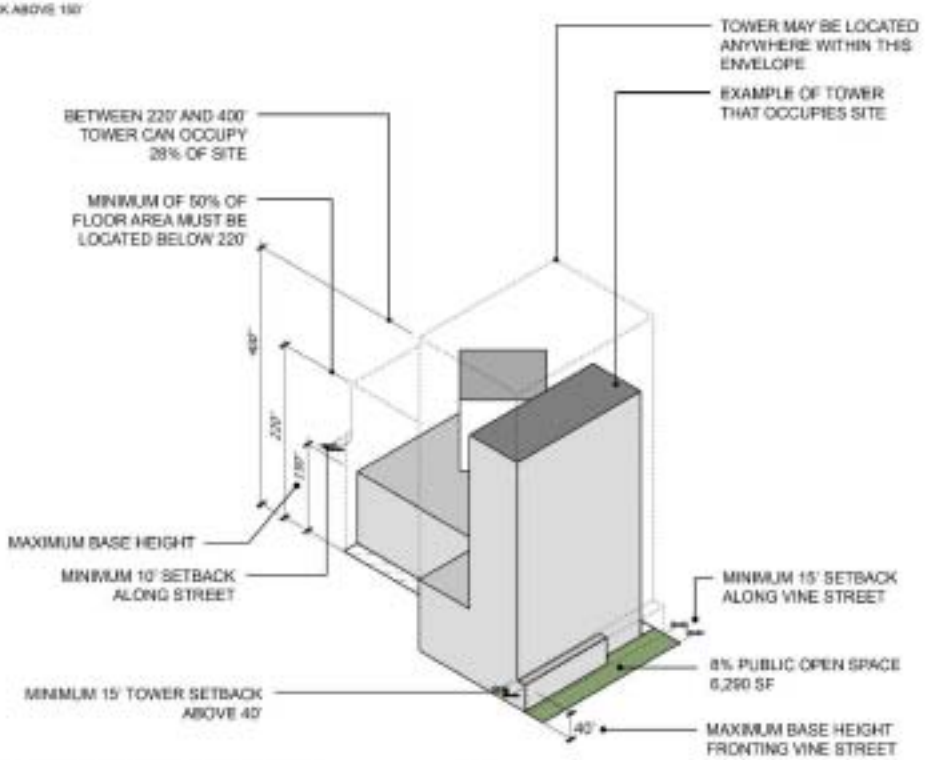

fig. 6.1.2.b.2: West Site – 400 Feet Maximum Tower Height

EAST SITE - SITE PLAN

① MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON BASE SITE
② MINIMUM 20' SETBACK ABOVE 150'
③ MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
④ MINIMUM 10' SETBACK ABOVE 150'
⑤ 10' EASEMENT FROM CAPITOL RECORDS TOWER

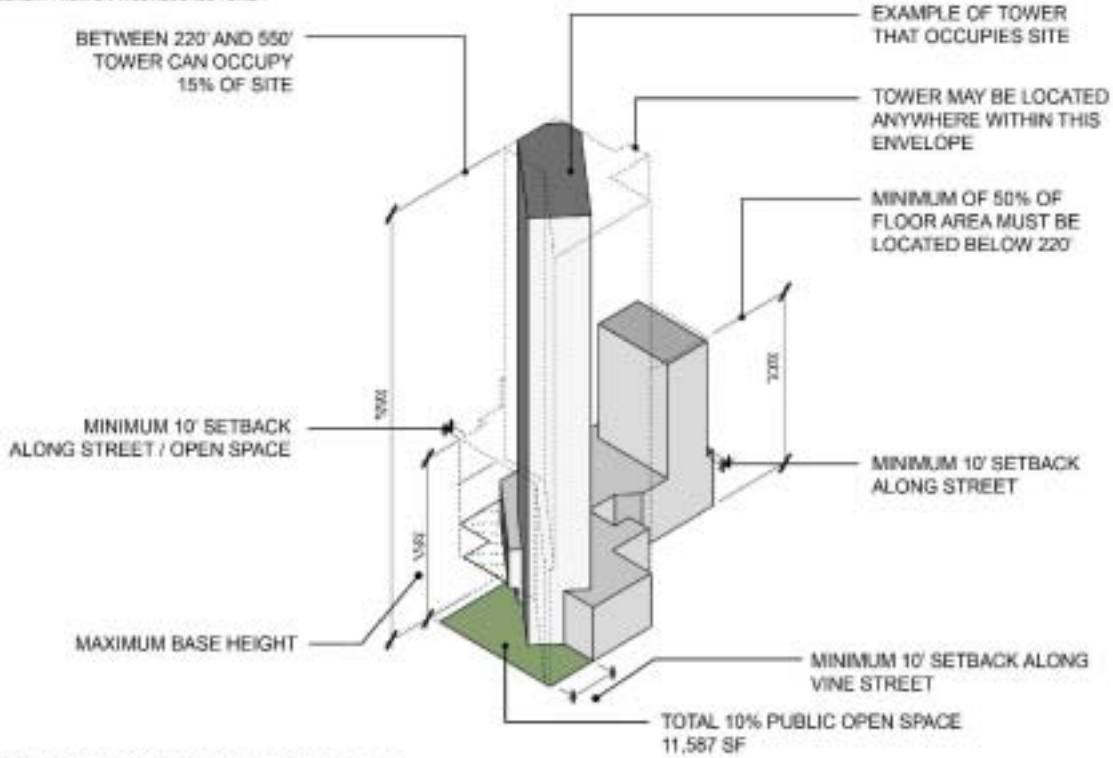

fig. 6.1.2.c.1: East Site – 550 Feet Maximum Tower Height

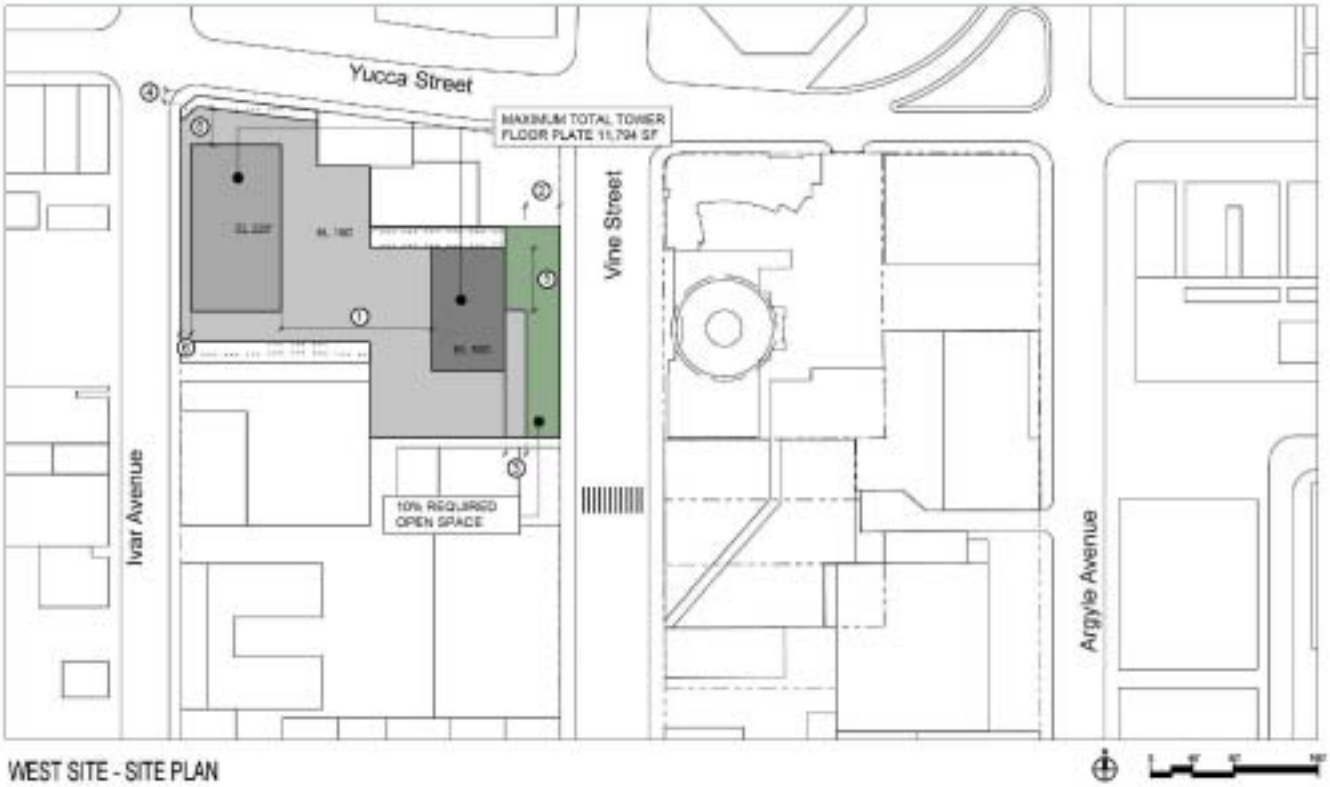

WEST SITE - SITE PLAN

① MINIMUM 60' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 15' SETBACK ALONG VINE STREET
③ MINIMUM 15' SETBACK ABOVE 40'
④ MINIMUM 10' SETBACK ALONG YUCCA STREET
⑤ MAXIMUM 40% OF STREET WALL CAN EXCEED MAXIMUM STREET WALL HEIGHT
⑥ MINIMUM 10' SETBACK ABOVE 150'

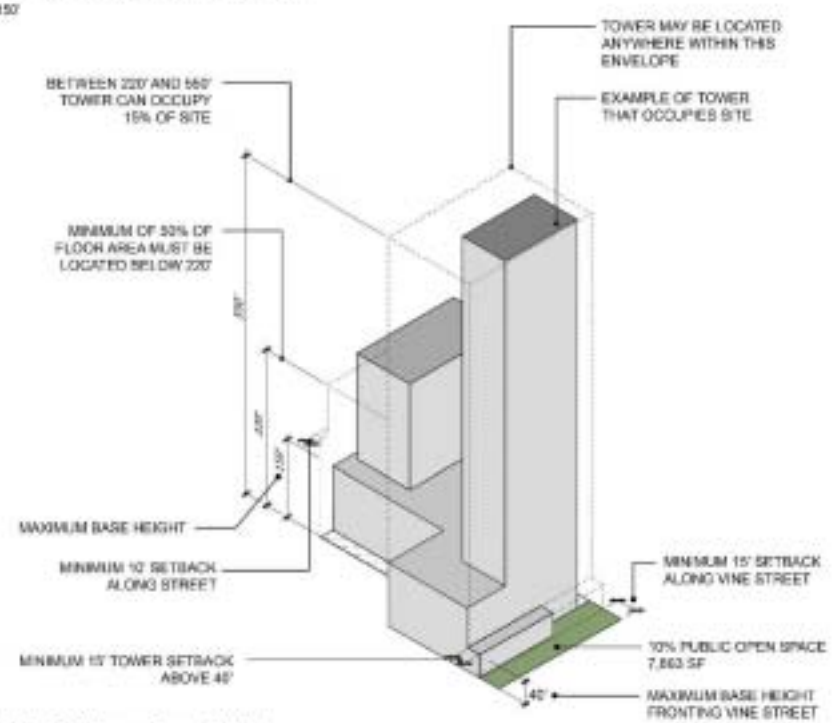

fig. 6.1.2.c.2: West Site – 550 Feet Maximum Tower Height

EAST SITE - SITE PLAN

① MINIMUM 90' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 25' SETBACK ABOVE 150'
③ MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
④ MINIMUM 10' SETBACK ABOVE 150'
⑤ 10' EASEMENT FROM CAPITOL RECORDS TOWER

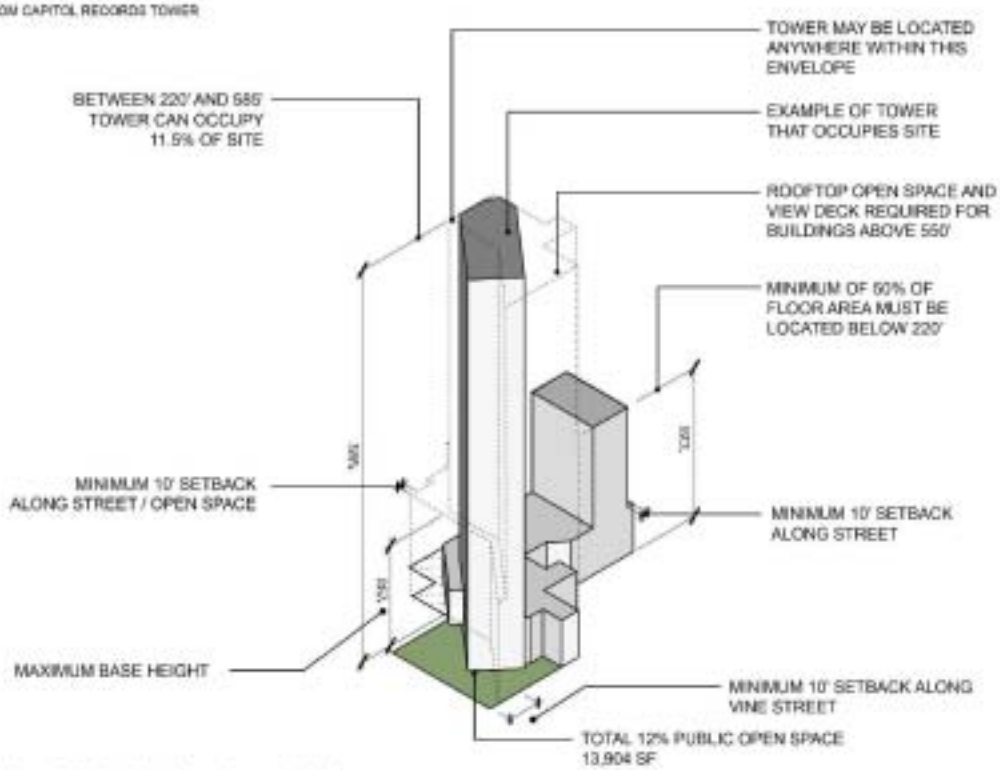

fig. 6.1.2.d.1: East Site – 585 Feet Maximum Tower Height

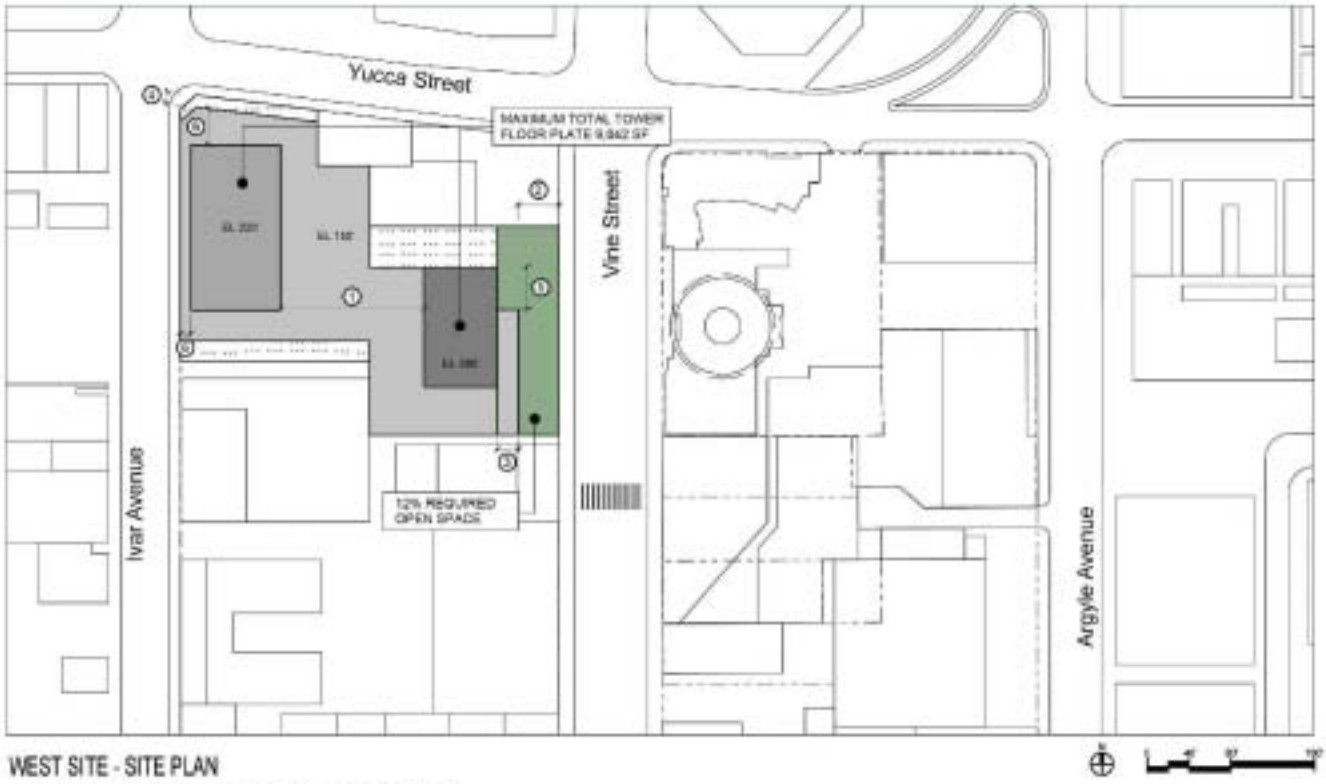

WEST SITE - SITE PLAN

① MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 15' SETBACK ALONG VINE STREET
③ MINIMUM 15' SETBACK ABOVE 40'
④ MINIMUM 10' SETBACK ALONG YUCCA STREET
⑤ MAXIMUM 40% OF STREET WALL CAN EXCEED MAXIMUM STREET WALL HEIGHT
⑥ MINIMUM 10' SETBACK ABOVE 150'

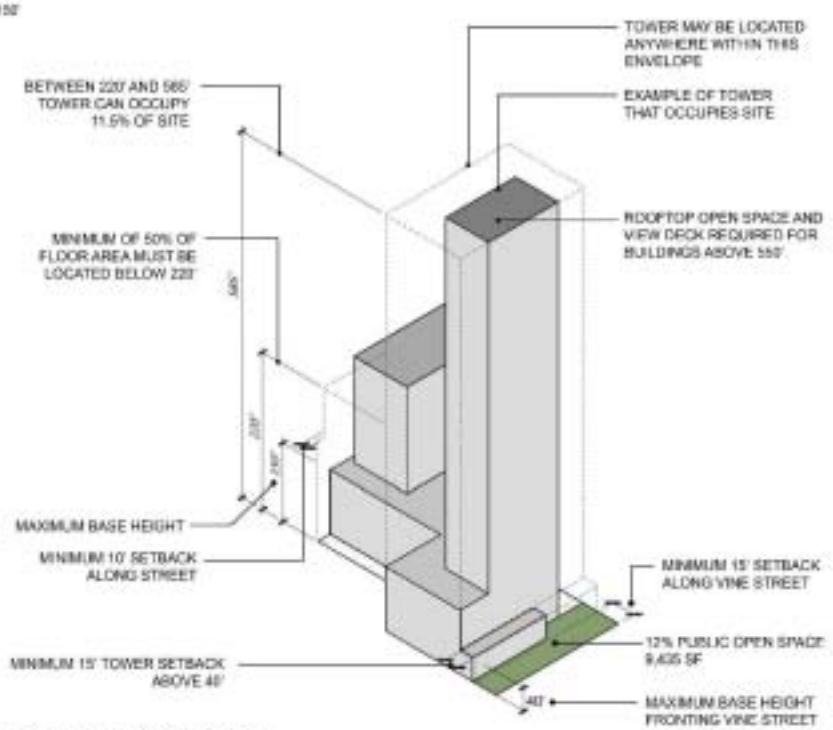

fig. 6.1.2.d.2: West Site – 585 Feet Maximum Tower Height

6.2 Street Walls

6.2.1 A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation. The street wall shall have proportions and architectural building details which emphasize and reflect the presence and importance of the pedestrian environment; massing offsets, fenestration, varied textures, openings, recesses, and design accents are strongly encouraged to ensure there are no un-articulated walls and monolithic roof forms, and architectural elements such as balconies, verandas, and porches that add architectural character are encouraged.

6.3 Street Wall Standards

6.3.1 Location of a required street wall:

a. Parcels with a grade level open space: the required street wall shall be located a minimum 10 feet from the property line along Vine Street on the East Site and 15 feet along Vine Street on the West Site.

b. A grade level open space is required for any building fronting Yucca Street with a minimum 10 feet setback from the property line.

c. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

6.3.2 Height of required street wall:

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) and (c) below.

b. Street walls fronting Vine Street on the East Site shall be built to a maximum height of 40 feet above curb level except as noted in item (c) below.

c. 40% of the aggregate width of the required street wall frontage on each street can exceed the maximum street wall height up to the maximum tower height.

fig 6.3.2: Street Wall

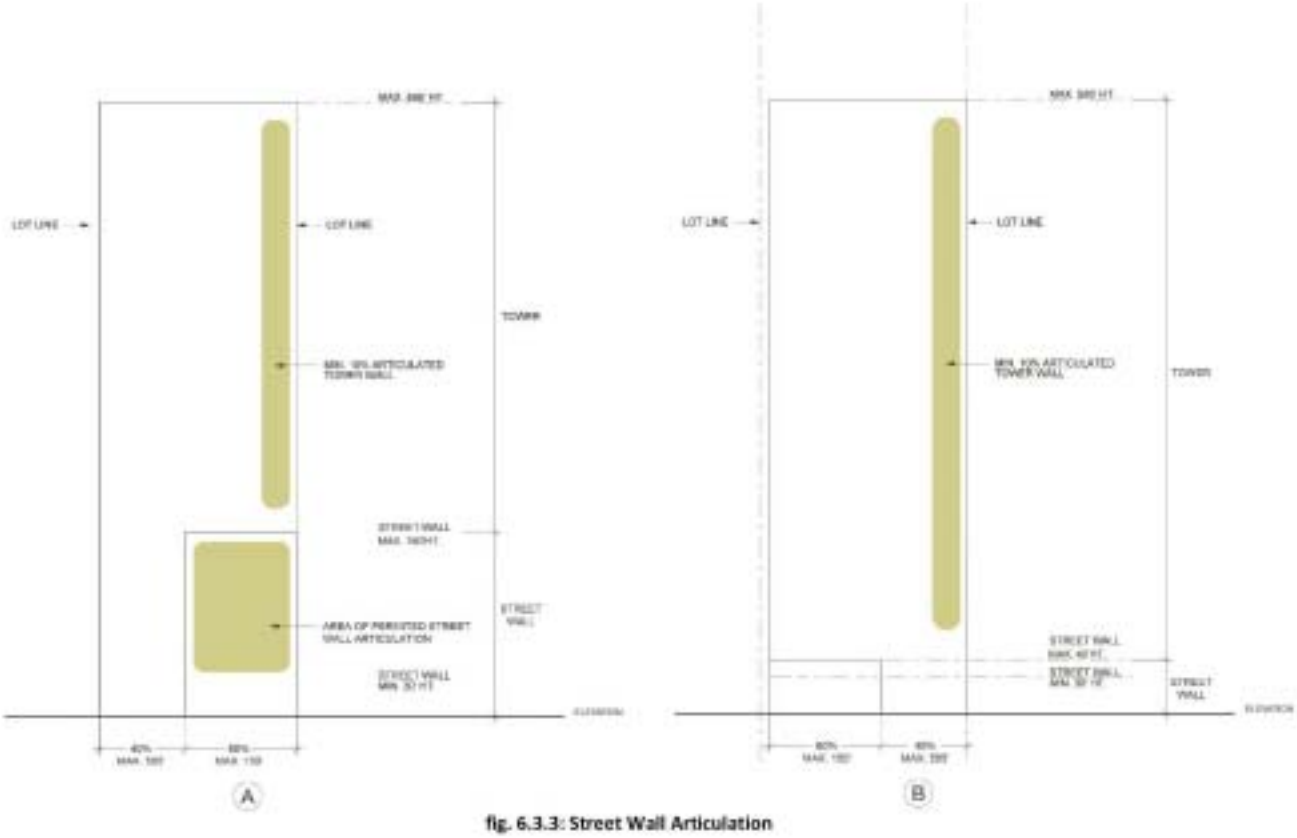

fig. 6.3.3: Street Wall Articulation

6.3.3 Types of permitted articulation of a required street wall:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

6.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Commercial marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0'. The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

6.4 Street Wall Guidelines

6.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

6.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop-offs and loading entries and exits and vehicular access driveways are also permitted within the street wall area on the Project Site.

6.5 Yard Standards

6.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

6.5.2 Commercial Use: no front, side or rear yard setbacks are required.

6.5.3 Residential Use:

a. Front Yard: none.

b. Side Yard: Minimum 5 feet; for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet; for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

6.6 Building Materials and Color Guidelines

6.6.1 The goal of the building materials and colors is to reinforce the character of the Hollywood area and provide a design that is compatible yet avoids any appearance that the building is being historicized. These guidelines will address the façade treatment for both residential and commercial portions of buildings.

a. Buildings shall feature long-lived and sustainable materials. The material palette shall provide variety, reinforce massing and changes in the horizontal or vertical plane.

b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

c. Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents.

d. The architecture of the building shall clearly delineate an architectural style, and shall not appear as a simplified version thereof, with appropriate fenestration patterns, architectural features, proportions and materials.

e. The building's skin, especially for towers, shall be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

f. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style. There will be clear contrast between the building's surface material and the building's glazed areas.

g. In general, the overall massing, roof forms, materials, and architectural style of new structures shall provide a variety of forms, depth and texture, and encourage a cohesive character. Building massing shall include a variation in wall planes and height as well as roof forms to promote architectural excellence, a pedestrian friendly environment and take into account the context.

h. To provide visual variety and depth, the building skin shall be layered and designed with a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin shall reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

i. Rooftop mechanical equipment shall be screened with materials and the design shall be consistent with the building's architecture.

j. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

6.7 Grade Level Standards

6.7.1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground floor street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and shall be integral to the architecture of the building.

6.7.2 Ground floor height:

a. Minimum 12'-0" height floor to ceiling.

6.7.3 Building entrances:

a. The primary entrance to a street level tenant space that has frontage along a public street shall be provided from that street. The primary entrance to a tenant space that does not have its frontage along a public street shall be provided from a courtyard, *grade level open space*, or *publicly accessible passageway*. Entries less than 18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries greater than 18 inches from the property line shall be within 30 inches of the adjacent grade level along street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. All retail spaces shall be accessed primarily from a ground floor, single-tenant entry along a street, plaza or passageway. Where reasonably practicable given architecture and tenant requirements, access to different tenant spaces shall occur at a maximum interval of 60 feet.

c. Main building entrances shall read differently from retail storefronts, restaurants and commercial entrances.

d. In addition to the building's required primary entrance(s), there may be ancillary entrances to the building from parking garages.

6.7.4 Ground Floor Glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet above curb level.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing shall constitute a minimum of 30% of the area of a building face and shall not exceed 80% of the area of a building face.

6.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0-foot candles.

6.7.6 Service and Refuse Requirements

Hotel and Commercial / Office / Retail that abuts an alley

a. Every required loading space shall be located and arranged such that delivery vehicles may be driven upon or into said space from an alley. Such loading space shall have a minimum height of 14 feet and be accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet; a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet; and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

Condominiums (Residential)

d. None

Rental (Residential)

e. None

6.7.7 Service and Refuse Guidelines

a. Storage areas shall be provided within the building of a size sufficient for the development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible from a curb cut.

b. Service, utility, and mechanical functions, including retail loading, shall be located in alleys whenever present. When alleys are not present, service functions shall be placed within buildings.

c. Service, utility, and mechanical equipment that is visible from the street shall be screened from view with landscaping or enclosures. Back flow and fire standpipes, along with utility box transformers, shall be screened.

d. All screening devices shall be compatible with the architecture, materials and colors of adjacent buildings.

e. Trash and storage enclosures shall be architecturally compatible with the project design and landscaping shall be provided adjacent to the enclosure(s) to screen them and deter graffiti.

f. Trash enclosures and retail loading areas shall be sited to minimize nuisance to adjacent properties.

g. The location of trash enclosures shall be easily accessible for trash collection and should not impede general site circulation patterns during loading operations.

h. Mechanical equipment shall vent to an alley wherever possible.

i. Roof-vent penetrations and mechanical equipment shall be located at least 10 feet from any exterior Building Face.

j. Gutters and downspouts shall be made of galvanized steel, copper (not copper coated), or aluminum.

6.7.8 Retail Storefronts

a. Storefronts shall comprise a minimum of 70% of the building's street level façade and be recessed where necessary.

b. Storefront glazing shall comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets.

c. All retail space shall have a minimum 12 feet finished ceiling clearance.

d. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

e. Storefront openings shall be no shorter than 12 feet above the adjoining grade for 90% of the required storefront frontage.

f. Security grilles will be located behind glass and be at minimum 70% open.

g. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

h. Awnings shall not obscure storefront signage. Vinyl awnings are not permitted.

6.8 Podium Standards

6.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment of the building's base, middle and top through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

6.9 Podium Guidelines

6.9.1 Podiums shall have fenestration that establishes a clear pattern on the façade (with special attention paid to facades that are visible from a public street) and that provides depth and additional articulation.

6.9.2 An identifiable break between the building's ground floors and upper floors shall be provided. This break may include a change in material, change in fenestration pattern or similar means.

6.9.3 Podium level windows shall be vertically oriented.

6.9.4 Podium levels shall be predominantly light in color.

6.9.5 An expression band shall be provided at the highest story within the podium.

6.9.6 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade shall be a maximum of four floors high, and shall have variation in its surface plane (using cutouts, insets or pop-outs). It shall employ different scales of elements as viewed when seeing the entire building massing.

6.9.7 Louvers and wall openings shall be designed to integrate with building architecture.

6.10 Street and Sidewalk Standards

6.10.1 The Site is comprised of a variety of public elements that include open spaces, streets and sidewalks. The Hollywood Walk of Fame is an integral element that fronts open spaces on both East and West Sites. Its adjacency to the public plazas requires a compatibility and cohesiveness.

6.10.2 The combination of landscaped plazas, publicly accessible passageways and landscaped streets and sidewalks creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

6.11 Screening Standards

6.11.1 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

6.11.2 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

7. TOWERS

7.1 Purpose

7.1.1 Towers shall have their massing designed to reduce overall bulk and to appear slender.

7.1.2 Towers shall be designed to achieve a simple faceted geometry and exhibit big, simple moves. They shall not appear overwrought or to have over-manipulated elements.

7.1.3 Towers that emulate a more streamlined modern style shall provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

7.1.4 If a project has more than one tower, the towers shall be complementary to each other and employ the same architectural design approach.

7.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) shall not be historicized. They are contemporary forms in the skyline and shall appear as such.

7.2 Projections

7.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. Roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building;

b. Skylights, towers, steeples, flagpoles, water tanks, silos;

c. Wireless masts; and

d. Solar energy devices and similar structures.

7.2.2 Permitted building elements or equipment in Section 7.2.1 shall be screened as practical and based on building design except if such projections – e.g., flagpoles or steeples – are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

7.2.3 Enclosures for bulkheads shall not count against building height.

7.3 General Standards

7.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

7.3.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

7.4 Wall Standards

7.4.1 All walls are required to be articulated.

7.4.2 The following types of articulation of a tower wall are permitted:

a. Recess;

b. Standard balconies may be projecting or recessed or a combination of both; and

c. Bay windows.

fig. 7.4.2.a: Balcony/Recess

fig. 7.4.2.b: Bay Window

7.4.3 Balcony: a balcony shall be integral to the façade (see figs. 7.4.3.a and b) and shall not create a relentless horizontal and vertical stacking pattern. Balconies are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations and shall be a minimum 75% transparent.. Balconies are encouraged on buildings facing major public spaces such as plazas, passageways and open spaces. Long balconies resembling corridors are prohibited.

fig. 7.4.3.a: Recess/Balcony: Integral Balcony

fig. 7.4.3.b: Bay Window: Integral Balcony

7.5 Spacing Standards

7.5.1 Towers shall be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

7.5.2 Generally, any portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except for the following which will meet Planning Code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 7.5.2.

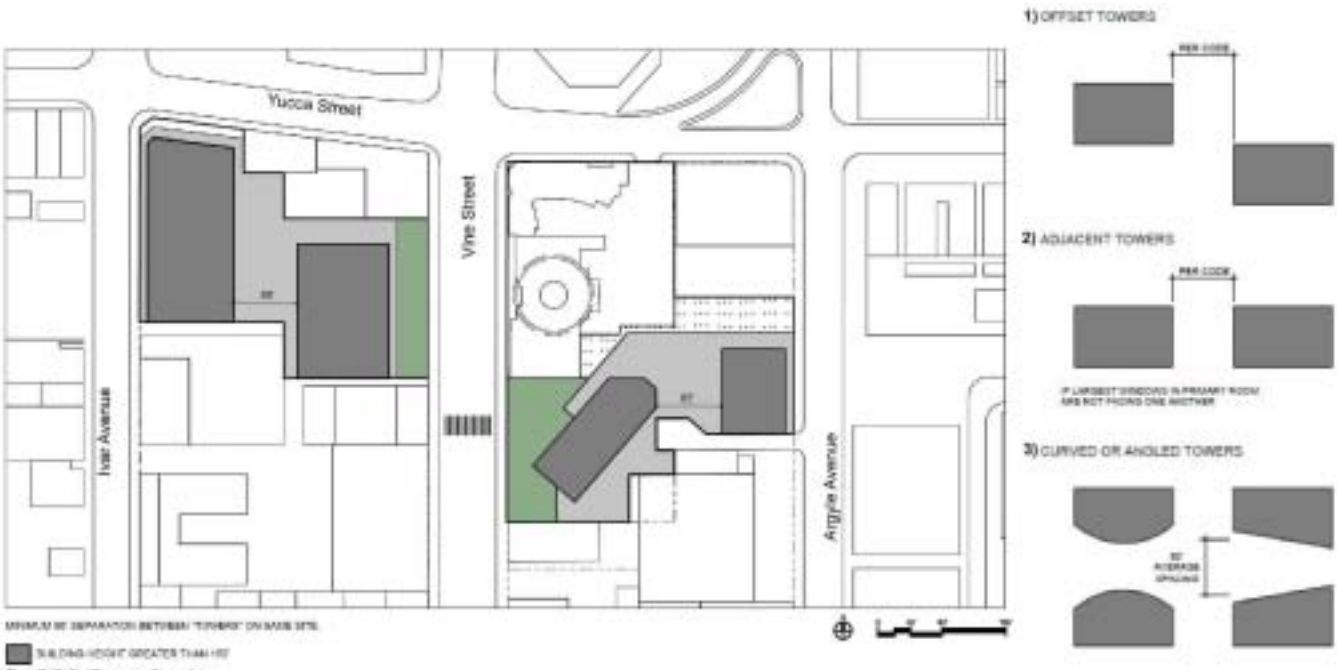

Fig. 7.5.2: Tower Spacing

7.6 Rooftops Guidelines

7.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

7.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 8.5.

7.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

7.6.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

7.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

7.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

7.7.2 Materials and design for roof mechanical equipment shall be consistent with the building architecture and shall utilize similar colors and materials as in other portions of the building.

7.7.3 Roof mechanical equipment shall be screened.

8. OPEN SPACE

8.1 Overview

The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Building and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

8.2 Grade Level Open Space Standards

8.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records Building and accentuate the low scale character.

8.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Fig. 6.1.2.a.1 – 2)

8.2.3 An additional 3% of open space (total 8%) shall be required for buildings between 221 feet and 400 feet. (See Fig. 6.1.2.b.1 – 2)

8.2.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 550 feet (See Fig. 6.1.2.c.1 – 2)

8.2.5 An additional 7% (total 12%) of open space shall be required for buildings taller than 550 feet. (See Fig. 6.1.2.d.1 – 2)

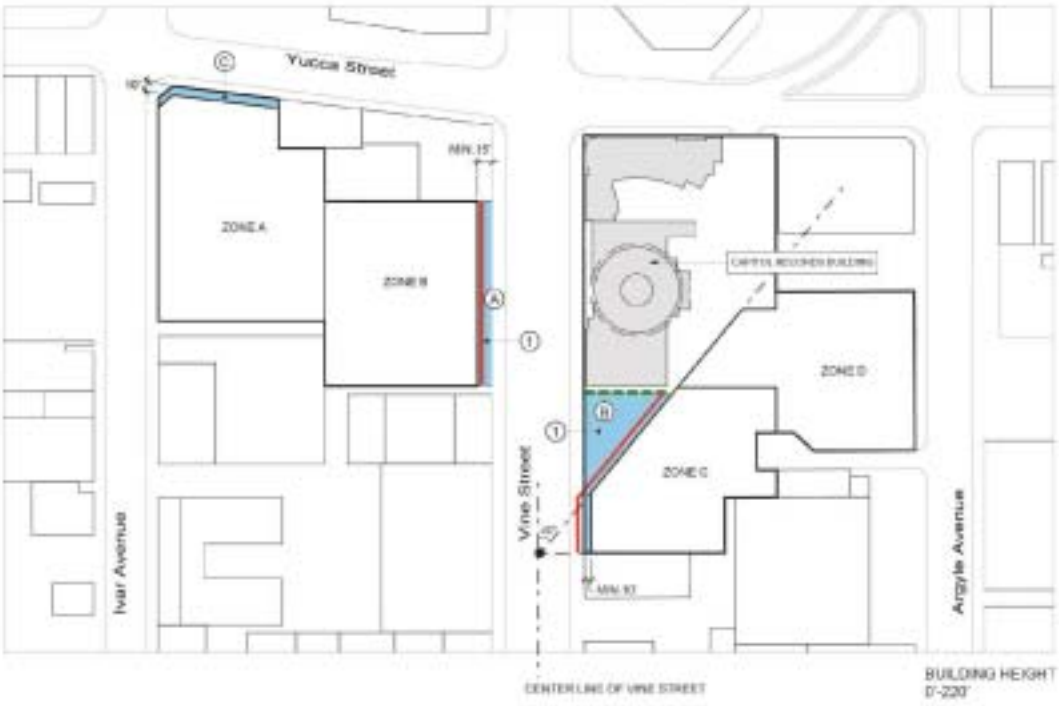
8.2.6 Location

a. East Site: adjacent to the Jazz Mural and Capitol Records Building; West Site: across from the Capitol Records Building along Vine Street.

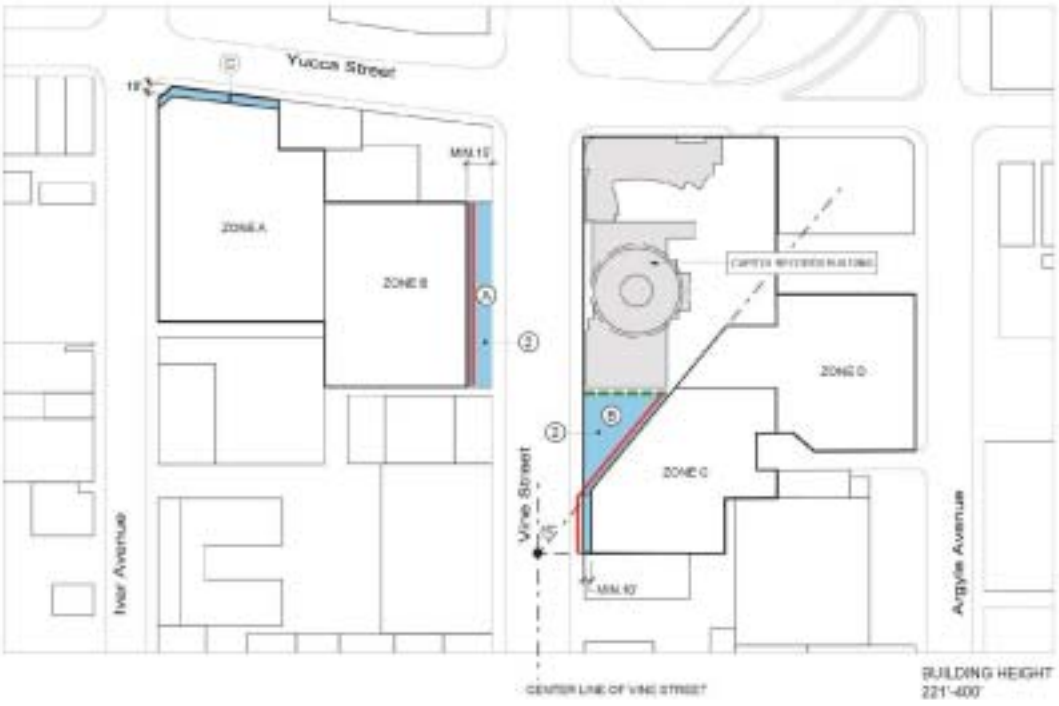
b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular from any point on each of the boundaries of the open space area, except when contiguous with larger open space a portion can be less than 10 feet but for a distance no longer than 7 feet.

Figs 8.1.1 – 8.1.4: Grade Level Open Space

figs 8.1.1 Open Space Requirements for Maximum Building Height at 220 Feet

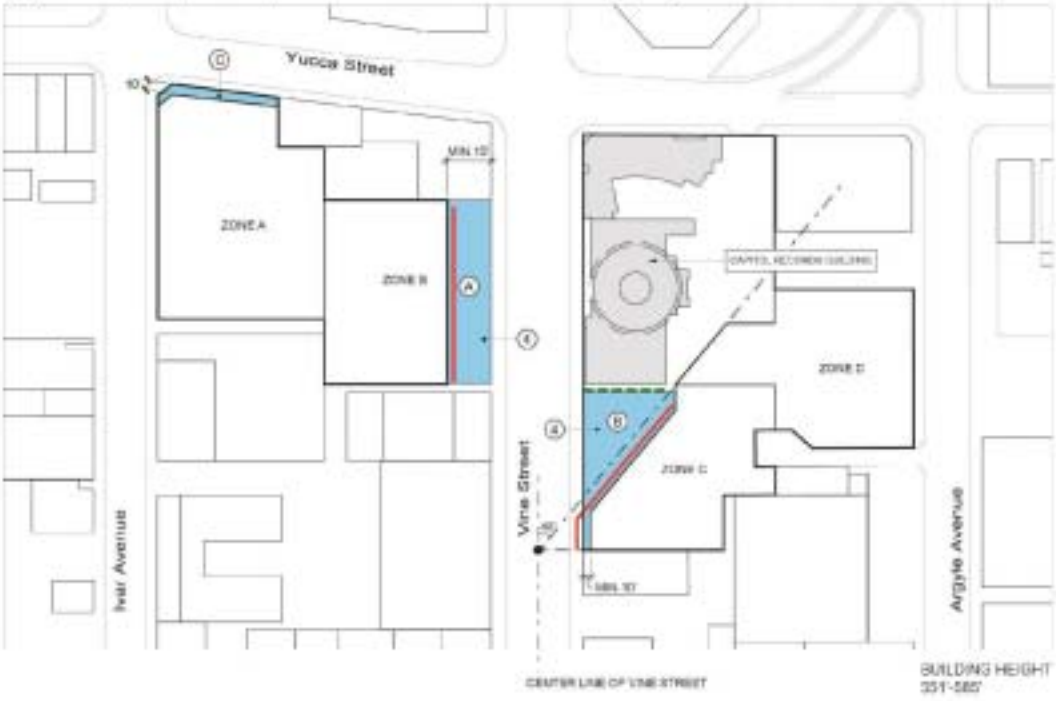


figs 8.1.2 Open Space Requirements for Maximum Building Height at 400 Feet



figs 8.1.3 Open Space Requirements for Maximum Building Height at 550 Feet

figs 8.1.4 Open Space Requirements for Maximum Building Height at 585 Feet



8.3 Passageway Standards

8.3.1 *A publicly accessible passageway* is a continuous through-block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

8.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

8.3.3 Location and Size standards:

a. The major portion of a *publicly accessible passageway* is the largest area of the *passageway* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total passageway area and shall not be less than 20'-0" wide.

b. Minor portions of *publicly accessible passageway* are secondary areas that allow for additional flexibility in the shape and configuration of a passageway. Minor portions shall not occupy more than 25 percent of the total area of the *passageway*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

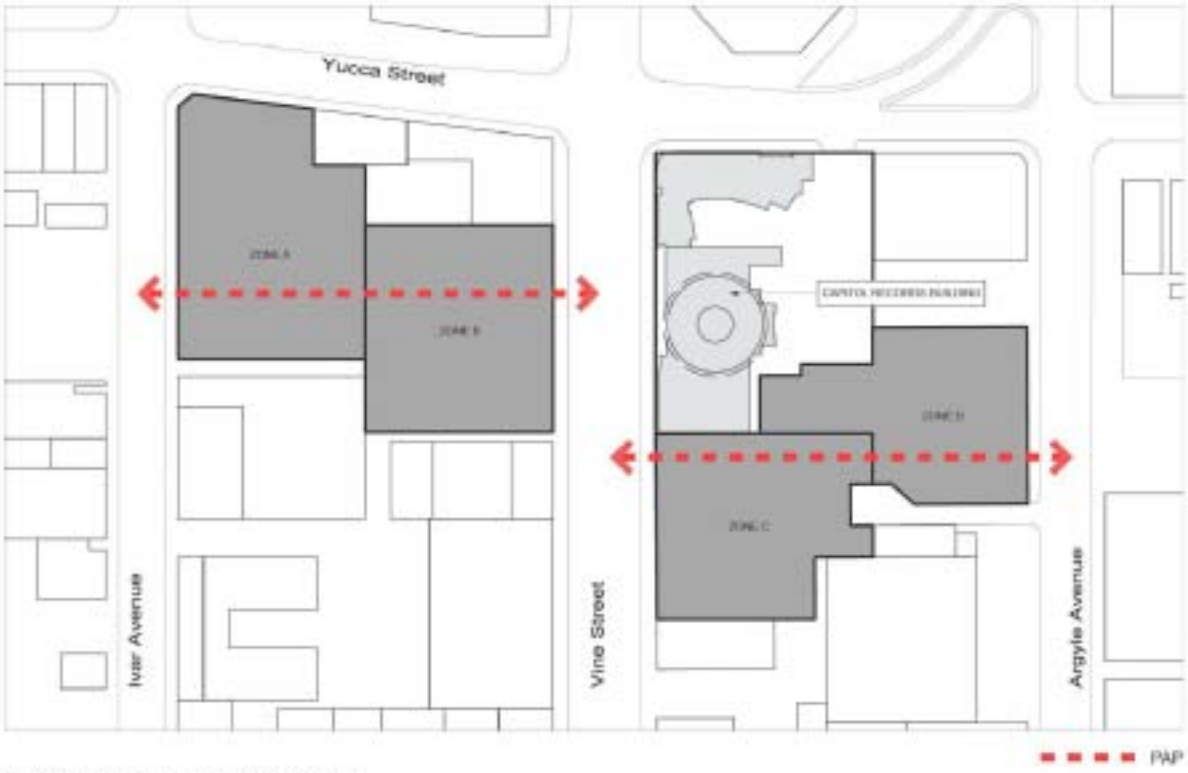


fig. 8.3.3: Publicly Accessible Passageway

8.3.4 Permitted Obstructions:

a. The minimum percentage of *publicly accessible passageway* area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within the major portion of an open air *publicly accessible passageway* are any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open-air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies and bay windows; awnings, canopies and marquees; stairs, ramps

fig. 8.3.4: View from Argyle Avenue Along PAP Towards Capitol Records

and bollards.

8.3.5 Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Building in conformance with the Building Code. Kiosks, including roofed areas, shall not count as floor area, exceed 3% of the total area of the *publicly accessible passageway*, or occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open-air cafes, flower stands or public service/information booths.

d. All kiosks greater than 250 square feet are permitted but will count as floor area.

8.3.6 Open-Air Café:

a. Where an open-air cafe is provided it shall be an unenclosed restaurant or open-air seating for an enclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open-air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *publicly accessible passageway*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *publicly accessible passageway*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

8.3.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on the *publicly accessible passageway* through open windows.

8.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No building refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *publicly accessible passageway*.

b. No exhaust vents are permitted on any *publicly accessible passageway* or on any building wall of the development fronting upon the passageway except where such vents are more than 10'-6" above the level of the *passageway*.

8.3.9 Frontages:

a. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *publicly accessible passageway* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *publicly accessible passageway* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

8.3.10 Maintenance:

a. The building owner shall be responsible for the maintenance of the *publicly accessible passageway* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the passageway and in the street sidewalk area adjacent to the passageway.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *publicly accessible passageway* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *passageway* in connection with outdoor eating services or other uses permitted on *passageway* which generate litter.

8.4 Roof-top Open Space

8.4.1 Buildings above 550 feet shall include roof-top open space.

8.4.2 Roof-top open space shall include an observation area (i.e., viewing deck) accessible to the public.

8.4.3 Roof-top open space may include a café.

8.5 Residential Common Open Space

8.5.1 Common open space is intended to be: a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential common open space requirements.

8.5.2 Common Open Space Standards

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

c. Open space shall be open to the sky and have no structures that project into the common open space area, except as permitted in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the Site.

e. Common open space shall have a minimum area of 400 square feet with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f. Common open space shall constitute at least 50% of the total required usable open space in the built development.

g. Common open space areas shall incorporate recreational amenities including but not limited to swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use may be considered as common open space.

i. Refer to LAMC 12.21.G for additional open space requirements.

8.6 Residential Private Open Space

8.6.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

8.6.2 Residential Open Space Standards:

a. Private open space shall contain a minimum area of 50 square feet, of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

b. Private open space shall have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c. Private open space shall provide a minimum eight-foot vertical clearance under any projection, except as permitted in the Zoning Code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with Zoning Code may qualify as usable open space provided it meets each of the above specified requirements noted in items a-c.

9. LANDSCAPE

9.1 Grade Level Open Space Standards

9.1.1 Planting requirements: a minimum of 10% of grade level open space shall be landscaped with softscape or water features.

9.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material. [LACP to provide language 30% California native]

9.1.3 The landscaped portion of open space may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.1.4 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

9.1.7 Open-air *publicly accessible passageways* are not to be included in the grade level open space requirements.

9.2 Common Open Space Standards

9.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

9.2.2 At least one 36-inch box tree for every four dwelling units shall be provided on-site and may include street trees in the parkway, sidewalks adjoining the property, open space, *publicly accessible passageway* and common roof decks.

9.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

9.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

fig. 9.3.a: Movable Seating

fig. 9.3.b: Open Air Café

9.3 Standards For Open Air Portions of Publicly Accessible Passageway

9.3.1 The landscaped portion of open air passageways may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.3.2 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.3.4 Planting requirements:

a. A minimum of 10% of open air *publicly accessible passageway* shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

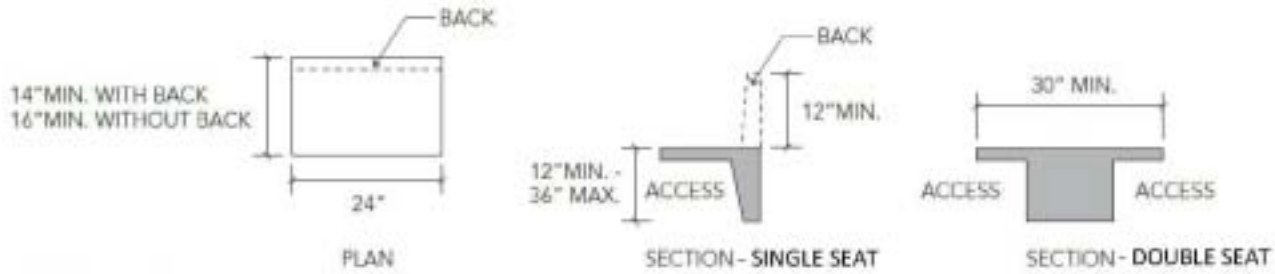

fig. 9.3.5: Seating Standards

9.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *publicly accessible passageway* excluding the area of an open-air cafe.

b. One seat shall equal 2 linear feet.

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count as double seating provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating of open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open-air cafes do not count toward meeting the seating requirements.

9.4 Tree Planting Guidelines

9.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

9.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

9.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree-planting pattern.

9.5 Lighting Standards

9.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

9.5.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open *publicly accessible passageway*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0-foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

f. All exterior lighting shall be shielded or directed toward the areas to be lit to limit spill-over onto off-site uses.

g. Light quality shall not be harsh, glaring, blinking or shed beyond property boundaries.

9.5.3 Responsibility for maintenance:

a. The Building Owner shall be responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building Owner.

9.5.4 Lighting for areas located inside the lot line and visible from the street, such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

9.5.5 Lighting for above-grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

9.6 Publicly Accessible Passageway Lighting Standards

9.6.1 A *publicly accessible passageway* shall be illuminated throughout with an overall minimum average level of illumination of not less than 1.0 maintained foot candle (lumens per square foot) on the horizontal plane at grade.

9.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

9.7 Continuity of Design

9.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

9.7.2 Where possible, materials, lighting, site elements and landscape shall be similar between different open and enclosed public spaces at the grade level.

10. PARKING

10.1 Automobile Standards

10.1.1 Base Standards

The following standards shall apply for the base level of parking to be provided as the minimum for each use in the project area. The Regulations set forth below incorporate the parking requirements in the LAMC, where applicable, and supersede the LAMC requirements for development in the Development Agreement area.

a. Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulation incorporate applicable parking requirements in the LAMC as set forth below.

b. Sports Club:

When a sports club is located in a building with 50,000 office equivalent square feet of non-sports club space, the general commercial use parking requirements apply and two parking spaces are required for every one thousand square feet of floor area for the building. If the sports club is not in such a building, one space is required for one hundred square feet of floor area for the sports club portion of the building.

c. Condominiums (Residential):

Two parking spaces per dwelling unit.

One-quarter parking space per dwelling unit for guest parking.

d. Rental (Residential):

One parking space for each dwelling unit of less than three habitable rooms; one-and-one-half parking spaces for each dwelling unit of three habitable rooms; and two parking spaces for each dwelling unit of more than three habitable rooms.

e. Combination of Uses:

Where there is a combination of uses on a lot, the base number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking:

a. Shared parking may be applied to the Section 10.1.1 base rates for the Site when the uses have different parking requirements and different demand patterns in a 24-hour cycle or between weekends and weekdays. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses. The calculation of the parking requirements shall be based on a detailed assessment prior to its construction.

b. Calculating Shared Parking:

(i) The individual land use parking requirements for each component of a phase of development shall be calculated from Section 10.1.1. above to establish the "Base Demand."

(ii) The Base Demand will be adjusted by the number of bicycle spaces required per section 10.4. The following internal use reduction factors shall also be applied when 10,000 office equivalent square feet each of office, residential and other commercial uses will all be active on the Site:

Internal Use Reduction Factors	
Residential	5%
Hotel	5%
Office	15%
Other Commercial	15%

The resulting minimum automobile parking rates shall be applied to the proposed building(s) to be constructed in each phase of development.

(iii) For parking spaces that are to be shared between uses, the calculated minimum parking requirement for the Site, including that new phase of construction, is to be adjusted based on the procedures in *Shared Parking*, Urban Land Institute, 2nd Edition (2005).

10.2 Additional Regulations

10.2.1 The automobile parking spaces required shall be provided either on the same lot as the use for which they are intended to serve or on another lot located within 750 feet of the lot; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

10.2.2 Curb cuts for driveways shall be located no closer than 50 feet to the intersection of two streets unless approved by The Department of Transportation to be a leg of the intersection.

10.2.3 Access driveways to parking facilities not at signalized intersections shall not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

10.2.4 Parking and loading access shall be shared where feasible.

10.2.5 Priority placement within parking structures shall be given to bike parking, car-share parking, and other alternative ride vehicles.

10.2.6 Pedestrian entrances to all parking shall be directly from the street, except that underground parking garages may be entered directly from a building.

10.3 Screening

10.3.1 Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible, or shall be designed to blend in with the form and massing and to look like an integral part of the building, or by landscaping, or a combination thereof. The interior of a parking structure shall be designed to be screened from the view of streets and sidewalks.

10.4 Bicycle Standards

10.4.1 Requirements for each use:

a. Commercial / Office / Retail:

For uses listed below a minimum of 2 short-term and 2 long-term bicycle parking spaces shall be provided.

Land Use	Short Term Bicycle Parking	Long Term Bicycle Parking
Office	1 per 10,000 sq. ft.	1 per 5,000 sq. ft.
Health Clubs	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Restaurant and Bars	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Restaurant (less than 1,000 square feet)	2 per restaurant	2 per restaurant
Retail (General)	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Retail (Furniture)	1 per 10,000 sq. ft.	1 per 10,000 sq. ft.
Hotel	1 per 20 guestrms	1 per 20 guestrms
All other commercial uses	1 per 10,000 sq. ft.	1 per 10,000 sq. ft.

COMBINATION OF USES. Where there is a combination of uses on a lot, the number of bicycle parking spaces required shall be the sum of the requirements of the various uses.

b. Residential:

For all residential buildings containing more than three dwelling units, or more than five guest rooms, long- and short-term bicycle parking shall be provided. Long-term bicycle parking shall be provided at a rate of one space per dwelling unit or guest room. In

addition, short-term bicycle parking shall be provided at one space per ten dwelling units or guest rooms. A minimum of two short-term bicycle parking spaces shall be provided in such cases.

(i) In instances where a building may contain both dwelling units and guest rooms, the sum of dwelling units and guest rooms shall be used to determine the amount of long and short-term parking. Any combination that results in more than five combined dwelling units and guest rooms will require bicycle parking.

10.5 Transportation Demand Management Plan

10.5.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.5.2 The transportation demand management plan shall set forth best practices that relate to the Project Site and the Project's building design features in order to:

a. Promote bicycle and pedestrian circulation within the Project Site.

b. Promote alternative modes of transportation.

c. Create pedestrian linkages to public and private amenities outside the Project Site.

d. Provide convenient and attractive onsite pedestrian linkages for routes to the Metro Red Line Station at Hollywood Boulevard and Vine Street.

e. Provide adequate parking, but provide incentives to tenants and residents to utilize alternative modes of travel. The incentives shall include bicycle facilities, car sharing, discounted subway passes, and parking spaces as an only optional part of all lease and sale agreements.

11. SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 11.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig. 11.2.

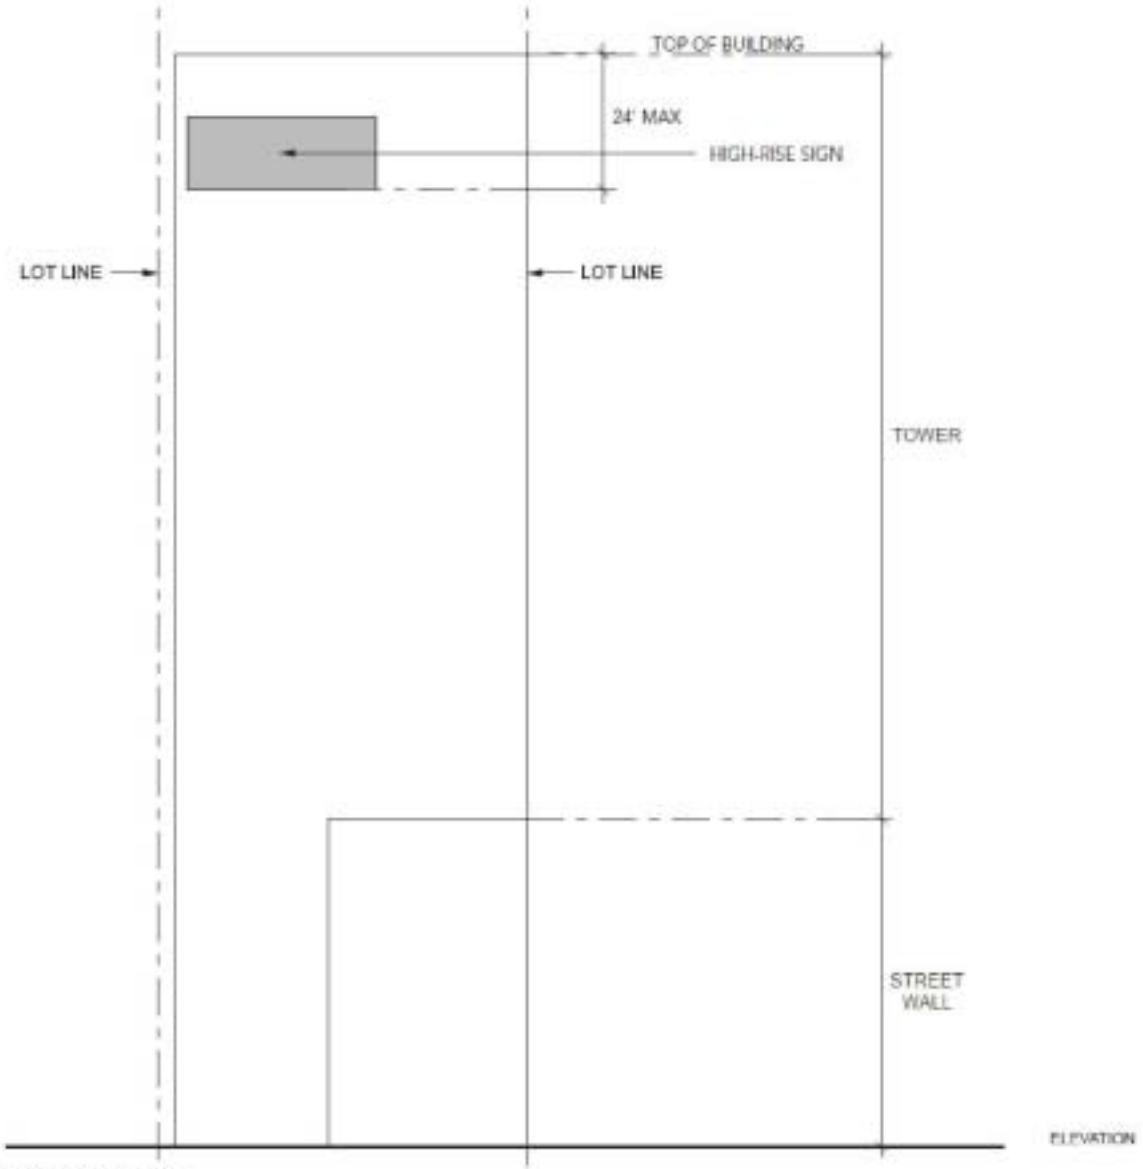

fig. 11.2: High Rise Sign

12. SUSTAINABILITY

12.1 Non-Residential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

12.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13. DEFINITIONS

Awning: glazing or fabric on metal frame structure supported entirely by the building to provide weather protection at doors, windows and/or storefronts; may be retractable.

Base: the lower portion of a building located at or within 150' above curb level.

Canopy: glazing, fabric and/or metal structure with vertical supports located on the sidewalk to provide weather protection at a building's primary entrance.

Expression band: a distinctive linear architectural element occurring on the building base facade at the highest floor. The band shall be contrasting in color, texture, material and/or fenestration from the adjacent building base facade. Projections may occur within an expression band.

Grade level open space: a continuous open space fronting the street and open to the sky.

Maximum building height: the maximum height permitted, measured from the adjacent street curb level.

Maintenance: the ongoing repair, care and upkeep of a property.

Open space use: active and passive recreational areas accessible to the general public, and as noted herein. Open spaces can occur in publicly accessible passageways, grade level open space, residential common open space and residential private open space, which are defined herein.

Preservation: the act or process of applying measures necessary to sustain the existing form, integrity, and materials of an historic property.

Publicly accessible passageway: a continuous through-block public connection between two parallel streets, located on privately owned land and designated for and designed to encourage public pedestrian circulation and other appropriate public uses.

Rehabilitation: the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values.

Required street wall: a wall or portion of a wall of a building facing a street or grade level open space which must be built to a minimum height above curb level.

Required street wall articulation, aggregate width of: the sum of the maximum widths of all segments of required street wall articulation on a street at the level of any story. The width of a required street wall articulation is measured in plan as the width of the street line from which perpendicular lines may be drawn to such required street wall articulation.

Residential common open space: a "rear yard" providing light and air to apartments on the interior of a parcel located at any story above curb level, and accessible only to residents.

Residential private open space: open space that is contiguous to and immediately accessible only from a single dwelling unit.

Setting: the area or environment in which a historic property is found. It may be an urban or suburban neighborhood or a natural landscape in which a building has been constructed. Elements of setting can include the relationship of buildings to each other, setbacks, views, sidewalks, and street trees.

Storefront: the architectural facade, including doorways, of any tenant-leased premise perimeter adjacent to public circulation areas. Storefronts refers to all permitted retail uses including retail, service, restaurants and cultural establishments.

Tower: the portion of a building located above 150' above curb level.

Notes:

All images and figures used in the Regulations were prepared for exclusive use by Millennium Hollywood LLC unless otherwise noted.

13. DEFINITIONS 55

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project Site.

e. Ensure compliance with the Development Objectives.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve the Capitol Records Building and the Gogerty Building according to established preservation guidelines (the *Secretary of the Interior's Standards for Rehabilitation* and guidance provided by Office of Historic Resources).

b. Preserve public views from certain key vantage points to the Capitol Records Tower by creating grade level open space / civic plazas on the East Site adjacent to the Jazz Mural and Capitol Records Building and West Site across from the Capitol Records.

c. Preserve existing view corridors from certain key vantage points to the Hollywood Hills.

fig. 1.2.2.b-c: Capitol Records View Corridors

d. Create civic plazas that are activated by retail, landscaped, and enhance the Hollywood Walk of Fame by providing it as an urban node. Reinforce the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Encourage street life by the creation of a new pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces that permit open and green spaces for both the on-site and off-site population.

fig 1.2.2.d: View North Along Vine Street

g. Create a 24 hr community by the creation of a Thriving Mixed-Use Development.

h. Eliminate the visual impact of current on-site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in proximity to the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street, and existing bus routes.

j. Establish standards to address architectural excellence.

k. Provide designs that address, respect and complement the existing context, including standards for ground-level open space, podium heights and massing setbacks that minimize impacts to the historic setting.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood from the Hollywood Freeway.

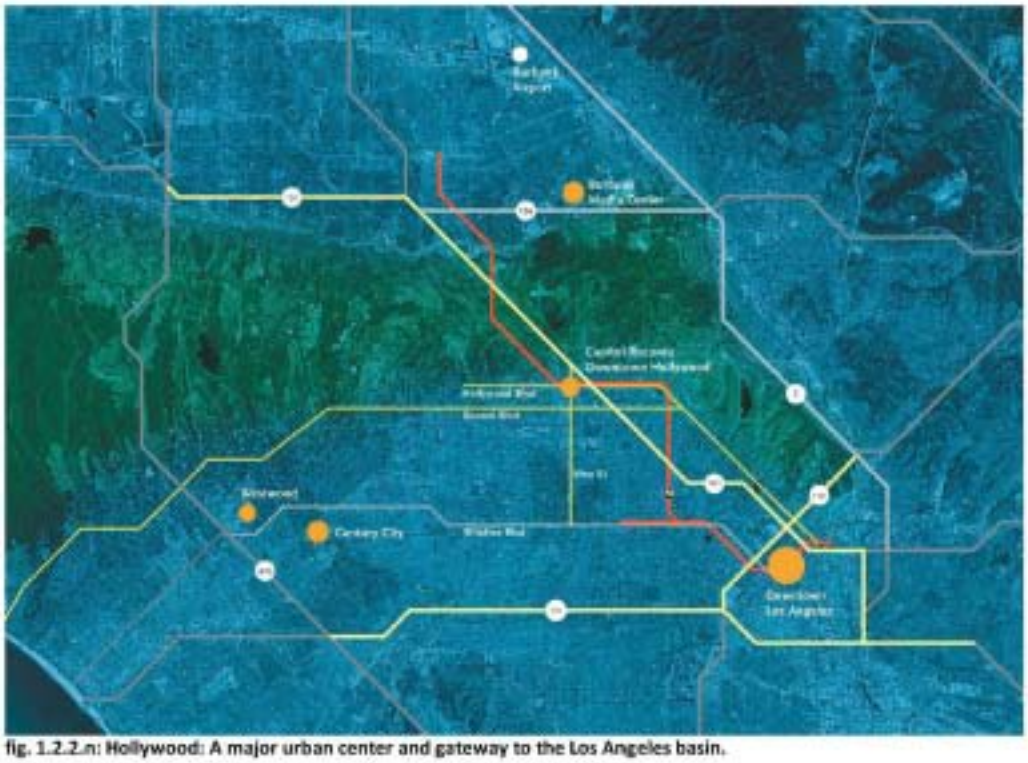

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict requirements for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and _____ ("Millennium Development Agreement") on _____.

1.4.2 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street.

The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 21 feet (NE to SW) from Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Vine Street. The existing sidewalk elevations will not be altered as part the Project.

fig. 2.1. Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 The Project Site is zoned Commercial (C2). The City General Plan land use designation is Regional Center commercial.

2.2.2 The Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Notwithstanding any provision in these Regulations, residential floor area is not permitted within 500 feet of any freeway .

2.2.4 Floor Area Ratio: 6:1

2.2.5 Height District: No. 2

3. HISTORIC RESOURCES AND SETTING

3.1 Overview

The Project Site is located in a historically rich area of Hollywood that contains a number of recognized historic resources. This Project is a preservation project in that its ambition is to respect, respond to, and preserve the Capitol Records Building and to continue the urban character of Vine Street on the Project Site. The Project is designed to be observant of historic settings and buildings. Two buildings located on the Project Site, the Capitol Records Tower and the Gogerty Building, are historically significant. Other historic buildings, located on adjacent parcels, are the Pantages Theater, the Equitable Building, the Hollywood Palace, and the Art Deco commercial building at 6316-6324 Yucca Street. Several of these historic resources are located within the Hollywood Boulevard Commercial and Entertainment District, a National Register listed historic district located just south of the Project Site.

Composed of commercial properties from the first half of the 20th Century, contributing properties to the Hollywood Boulevard Commercial and Entertainment District include a wide variety of property types including single-story storefronts, two-story commercial blocks, department stores, theaters, high-rise office buildings and hotels.

The Capitol Records Building is a unique building whose cylindrical form has always been visible from portions of Hollywood and Vine from the south and the freeway from the north. The Capitol Records Tower and the iconic buildings in the Hollywood Boulevard Commercial and Entertainment District (the Hollywood Palace, Pantages Theater, Equitable Building) will maintain their prominence after implementation of the Project.
Portions of the Hollywood Walk of Fame (L.A. Historic Cultural Monument #194) are located along Vine Street between Yucca Street and Sunset Boulevard and will be protected.
The protection of Hollywood's historic resources and unique character is an important objective of the Project. The guidelines and standards contained in this document were created in part to ensure the protection of historic resources within the Project Site and minimize potential adverse affects to historic resources from new development. Key Project objectives regarding historic resources include:

1) Preservation, maintenance, and rehabilitation of the Capitol Records Building and the Gogerty Building in accordance with the Secretary of the Interior's Standards. See sections 1.2.2a and 1.2.2b of this document.

2) Protection and preservation of the portions of the Hollywood Walk of Fame (LA Historic Cultural Monument #194) will need to be temporarily removed during construction and replaced after construction is completed. A preservation plan, outlined in the Hollywood Walk of Fame Terrazzo Pavement and Repair Guidelines (March, 2011) will be prepared for this aspect of the Project.

3) Incorporation of ground-floor open space and building setback requirements to moderate the overall massing of new development in a manner that preserves important views to and from the Capitol Records Building, the Hollywood Boulevard Commercial and Entertainment District, and important view corridors to the Hollywood Hills. See sections 1.2.2 c, 6.1, 6.9, 7.1, 7.5, 8.1 and 8.2 of this document.

4) Incorporation of ground-floor open space and building setback requirements to reduce massing at the street level and limit the visual crowding of adjacent historic resources. See sections 1.2.2c, 6.1, 7.1, 7.5,

8.1 and 8.2 of this document.

5) Requirement that design of new buildings be in a manner that is differentiated from but compatible with adjacent historic resources. See sections 6.6, 6.8, 7.1.5, and 7.4 of this document.

One means of creating compatible new buildings in an urbanized setting is to incorporate qualities of vertical and horizontal visual complexity in world class design. The general characteristics, proportions, and details of older buildings may serve as a reference for the Project. The Project's intent is to allow old and new to mix, recognizing that Hollywood sustains its image through both the rehabilitation of existing historic structures and the design of creative and contemporary architecture.

4. DENSITY

4.1 Floor Area Ratio Averaging and Density Transfer

The Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the sum of the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

4.2 Maximum OEGSF Density Per Area

A land use equivalency program ("Equivalency Program") to provide flexibility for a thoughtful range of modifications to the land use and square footages within the West Site and East Site and across the Sites will be developed in connection with the environmental review for the Project and is authorized by the Regulations. The Equivalency Program would permit a transfer of floor area among parcels in the West Site and East Site whereby square footage increases in one land use category can be exchanged for corresponding decreases in other permitted land use categories as long as the environmental considerations of land uses in the ultimate development scenario was analyzed in the Environmental Impact Report for the Project. Rate of conversation between land uses will be based on a maximum office-equivalent gross square feet ("OEGSF") to maintain vehicular trip totals equivalent to and not exceeding those studied in the Environmental Impact Report for the Project. The total density permitted in the West Site and East Site is further limited by the development zones A, B, C and D (see Fig. 5.1).

5. HEIGHT

5.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capital Records Tower.

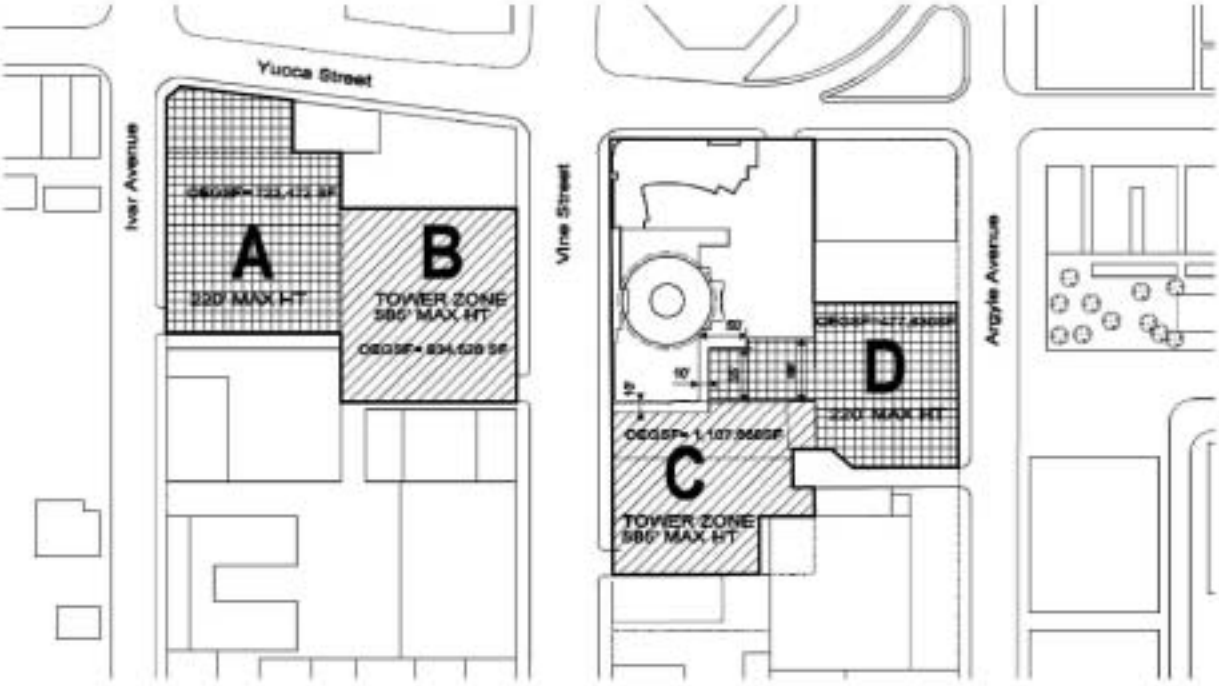

Fig. 5.1 Height Zones

6. BUILDING AND STREET EXPERIENCE

6.1 Tower Massing Standards

6.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 6.1.1.

Tower Height (feet)	Maximum Tower Lot Coverage (%)	Minimum Floor Area Below 220 Feet (%)	Maximum Tower Floor Plate (sq. ft.)	Minimum Tower Setback (feet)	Minimum Public Open Space (%)	Figures
151 – 585	11.5	50	13,325 East Site 9,042 West Site	10 15[1]	12	6.1.2.d.1 6.1.2.d.2
151 – 550	15	50	17,380 East Site 11,794 West Site	10 15[1]	10	6.1.2.c.1 6.1.2.c.2
151 – 400	28	50	22,745 East Site 22,016 West Site	10 15[1]	8	6.1.2.b.1 6.1.2.b.2
150 – 220	48	n/a	55,616 East Site 37,742 West Site	10 15[1]	5	6.1.2.a.1 6.1.2.a.2

Table 6.1.1

Note 1: 15' tower setback required for any tower fronting Vine Street on West parcel. See Figure 6.3.2.

6.1.2 For the purpose of calculating the maximum lot coverage the total lot area is equal to the total lot area for each of the sites, the West Site and the East Site. If there is more than one tower on a site, the maximum lot coverage requirement in Table 6.1.1 is calculated based on the combined area of all towers on each site. The total lot coverage applies to the aggregate floor plate(s) of the tower or towers on each site.

6.1.3 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 6.1.2.a.1 – 2.)

6.1.4 At least 50% of total floor area must be located below 220 feet.

6.1.5 Tower wall articulation:

a. Minimum 10% of tower aggregate area shall be articulated.

6.1.6 Types of permitted articulations for tower walls:

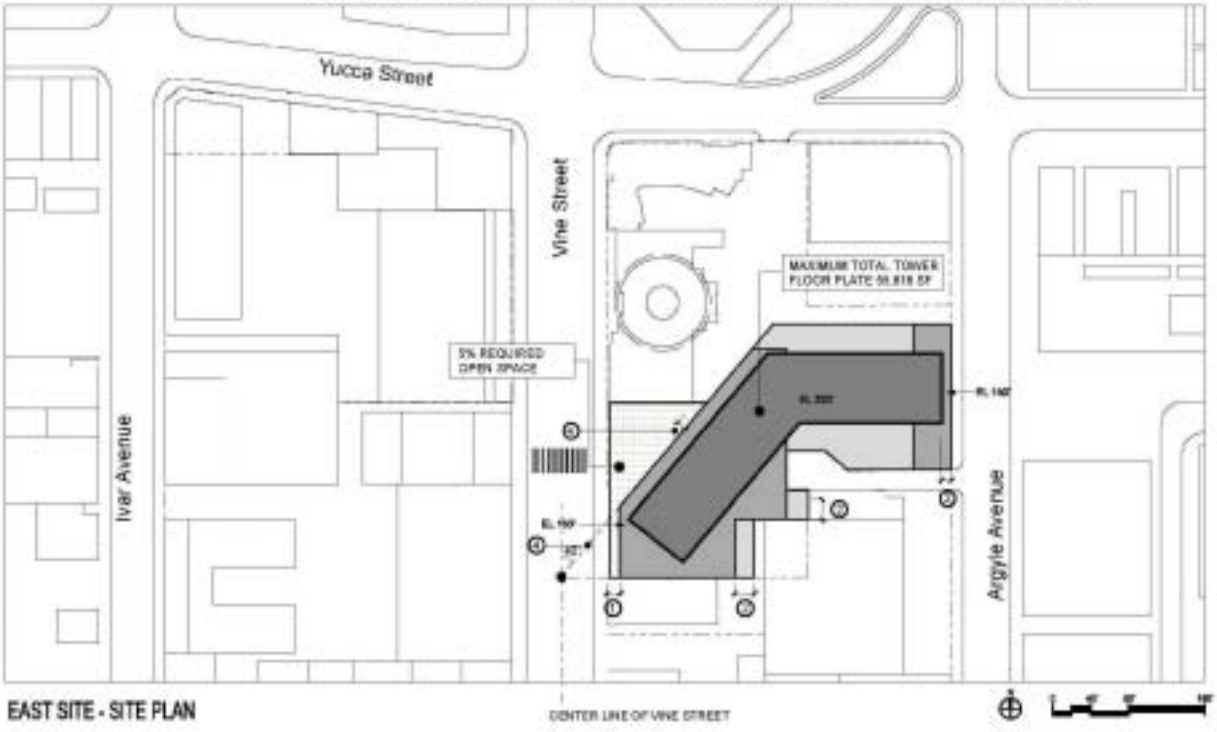
a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

The following developments are for illustrative purposes only.
Maximum Lot Coverage and Tower Floor Plate – Figs. 6.1.2.a – d.



EAST SITE - SITE PLAN

① MINIMUM 10' SETBACK ALONG VINE STREET
② MINIMUM 20' SETBACK ABOVE 150'
③ MINIMUM 10' SETBACK ABOVE 150'
④ 10' EASEMENT FROM CAPITOL RECORDS TOWER

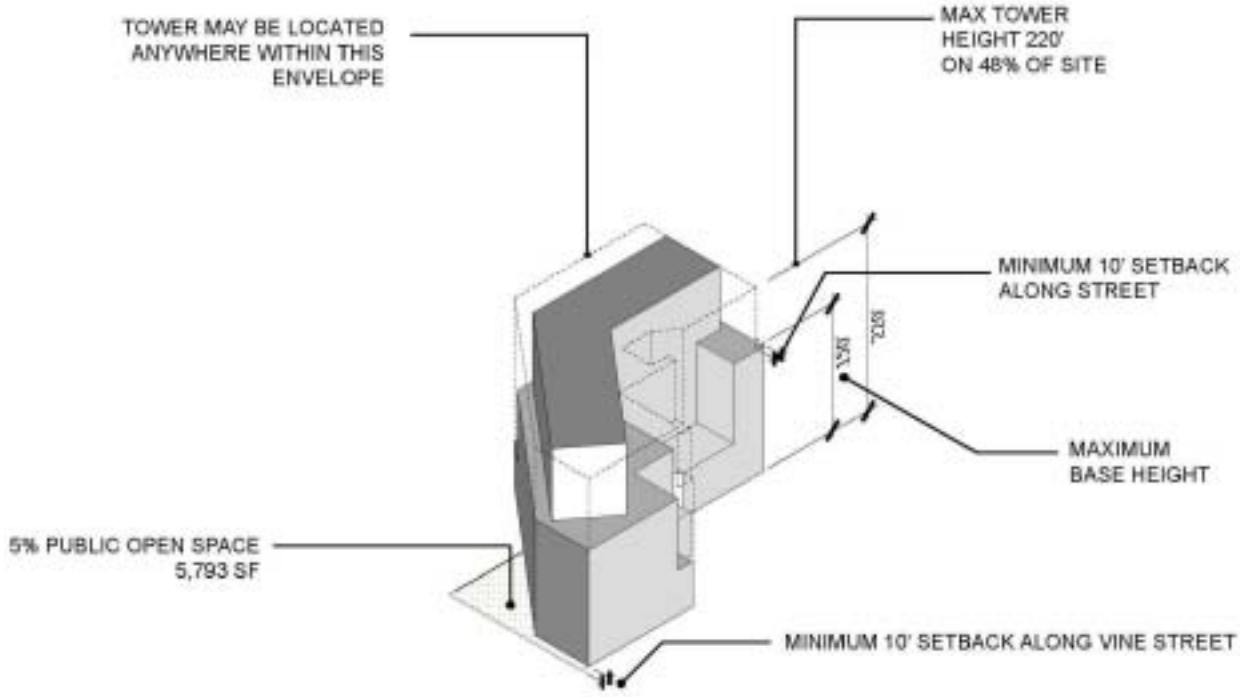


fig. 6.1.2.a.1: East Site – 220 Feet Maximum Tower Height

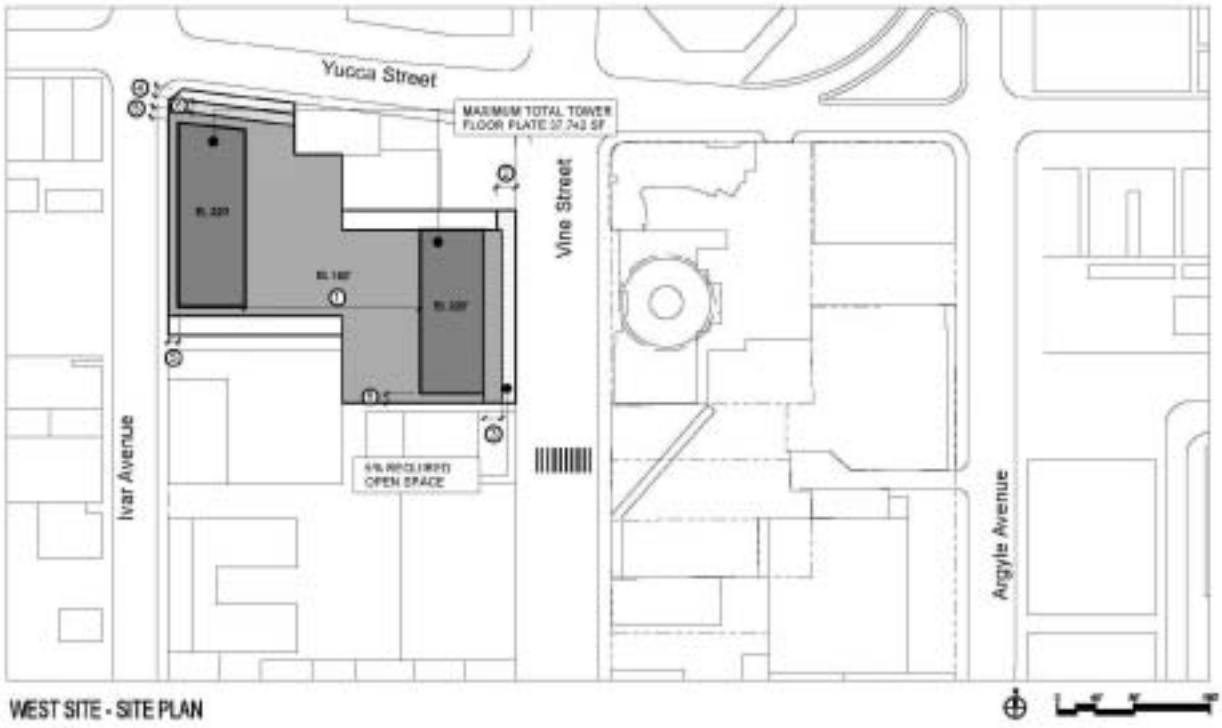

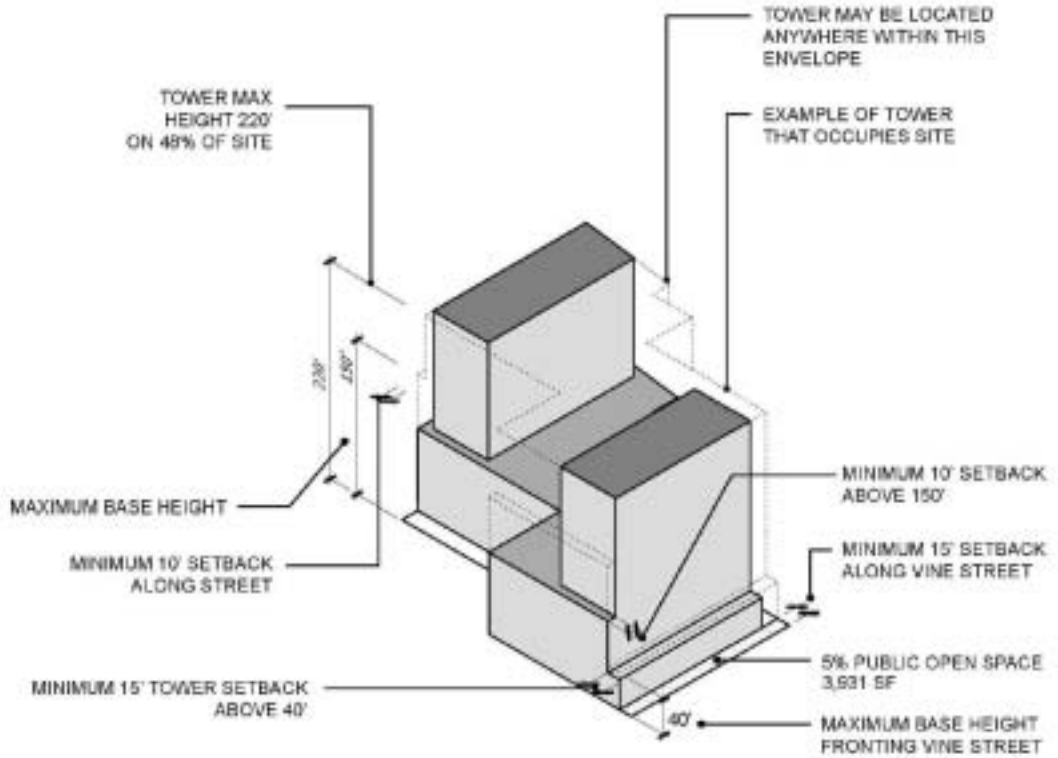

fig. 6.1.2.a.2: West Site - 220 Feet Maximum Tower Height.

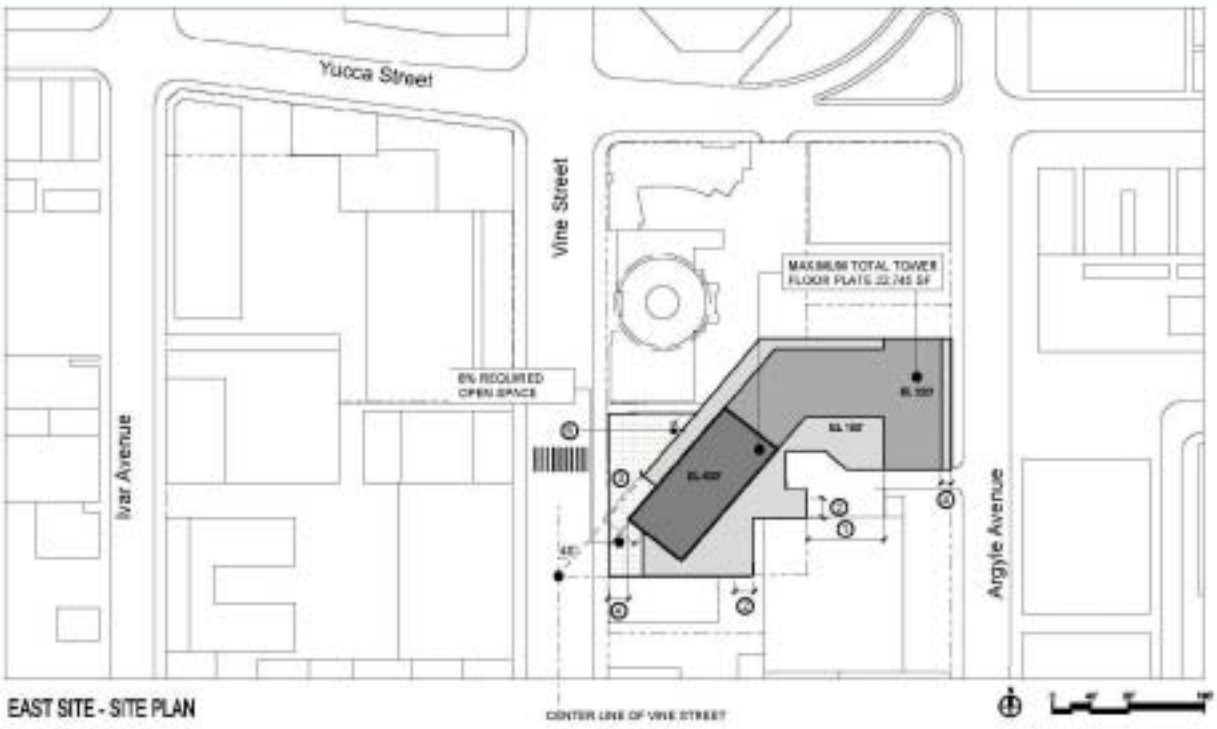

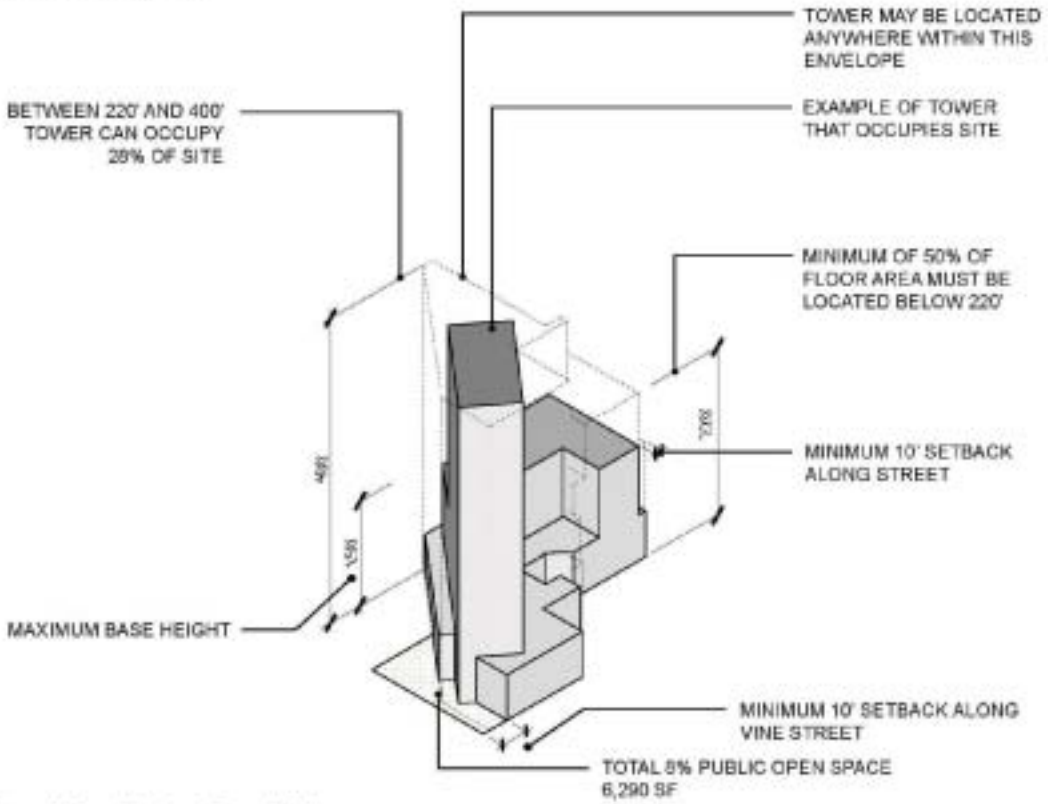

fig. 6.1.2.b.1: East Site – 400 Feet Maximum Tower Height

WEST SITE - SITE PLAN

1. MINIMUM 60' SEPARATION BETWEEN "TOWERS" ON SAME SITE
2. MINIMUM 15' SETBACK ALONG VINE STREET
3. MINIMUM 15' SETBACK ABOVE 40'
4. MINIMUM 10' SETBACK ALONG YUCCA STREET
5. MAXIMUM 40% OF STREET WALL CAN EXCEED MAXIMUM STREET WALL HEIGHT
6. MINIMUM 10' SET BACK ABOVE 150'
7. MINIMUM 10' SET BACK ABOVE 30'

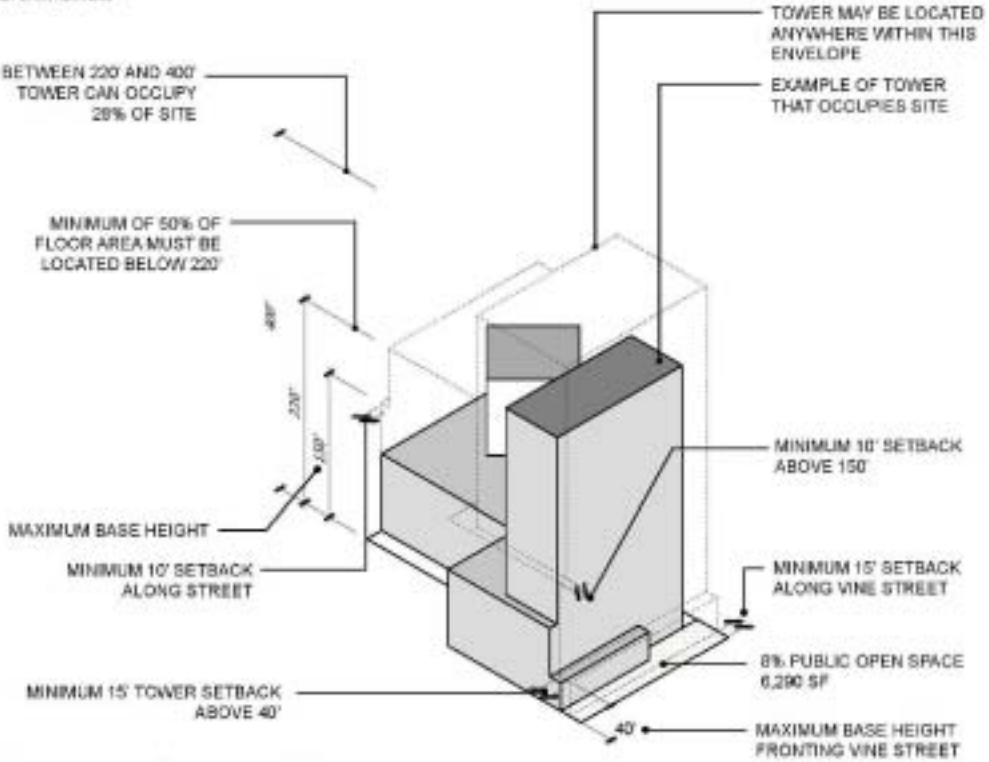

fig. 6.1.2.b.2: West Site – 400 Feet Maximum Tower Height

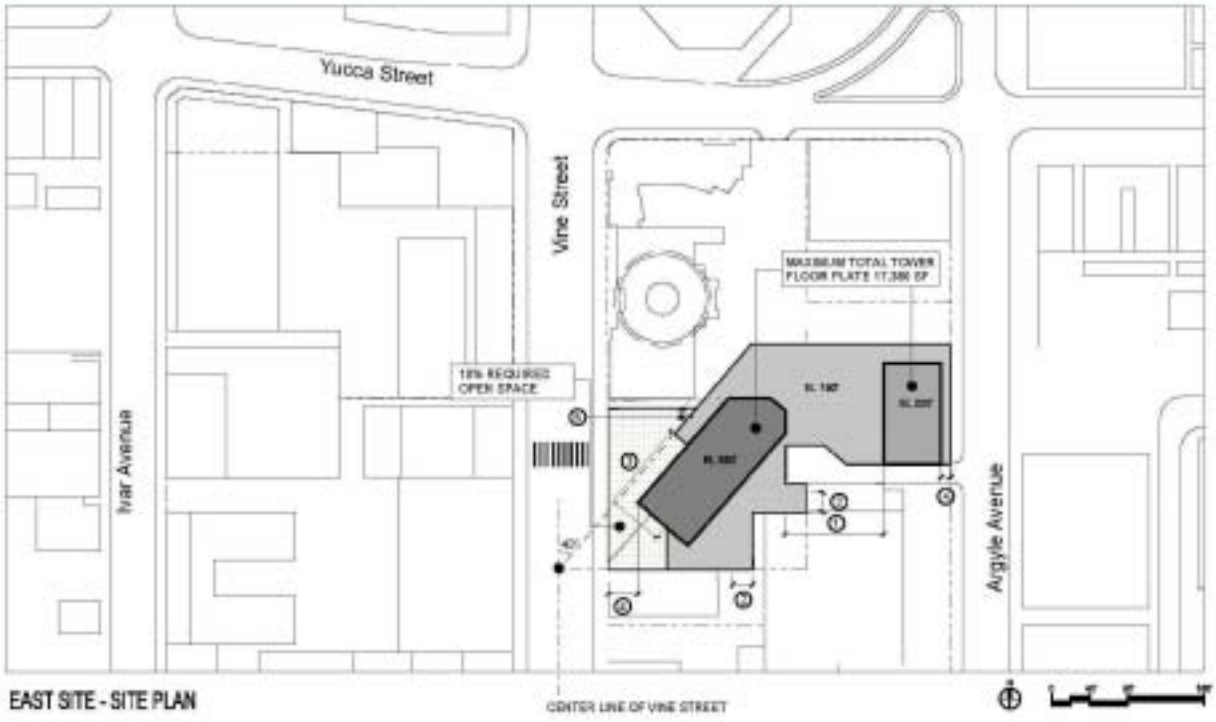

EAST SITE - SITE PLAN

① MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON SAME SITE
② MINIMUM 25' SETBACK ABOVE 150'
③ MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
④ MINIMUM 10' SETBACK ABOVE 150'
⑤ 10' EASEMENT FROM CAPITOL RECORDS TOWER

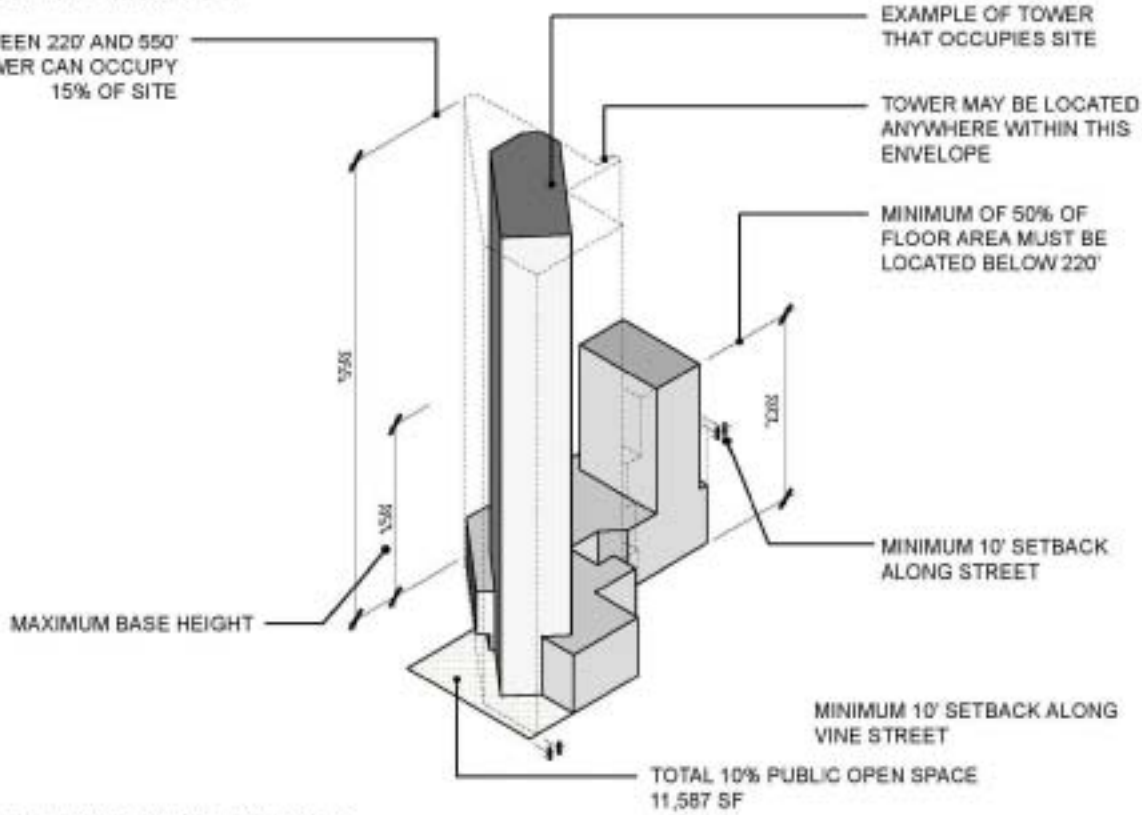

fig. 6.1.2.c.1: East Site – 550 Feet Maximum Tower Height

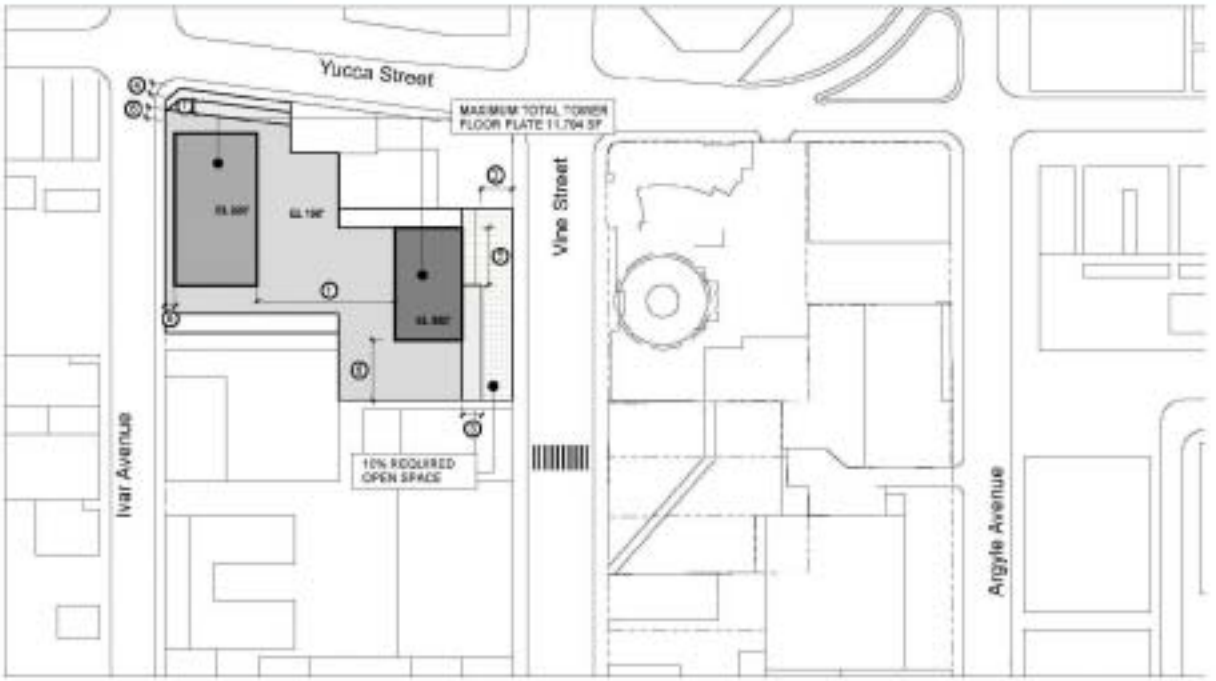

WEST SITE - SITE PLAN

1. MINIMUM 90' SEPARATION BETWEEN "TOWERS" ON SAME SITE
2. MINIMUM 15' SETBACK ALONG VINE STREET
3. MINIMUM 15' SETBACK ABOVE 40'
4. MINIMUM 10' SETBACK ALONG YUCCA STREET
5. MAXIMUM 40% OF STREET WALL CAN EXCEED MAXIMUM STREET WALL HEIGHT
6. MINIMUM 10' SETBACK ABOVE 156'
7. MINIMUM 10' SETBACK ABOVE 30'

EAST SITE - SITE PLAN

- (C) MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON SAME SITE
- (E) MINIMUM 20' SETBACK ABOVE 180'
- (F) MAXIMUM 48% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
- (G) MINIMUM 10' SETBACK ABOVE 180'
- (H) 10' EASEMENT FROM CAPITOL RECORDS TOWER

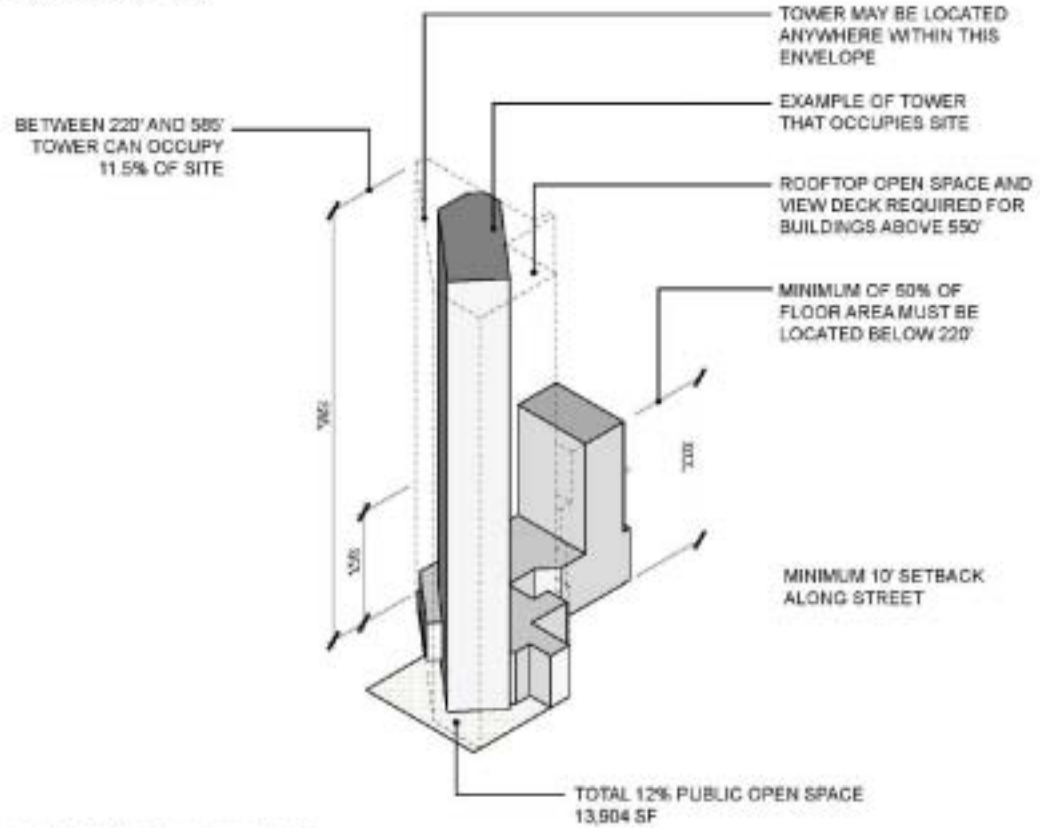

fig. 6.1.2.d.1: East Site – 585 Feet Maximum Tower Height

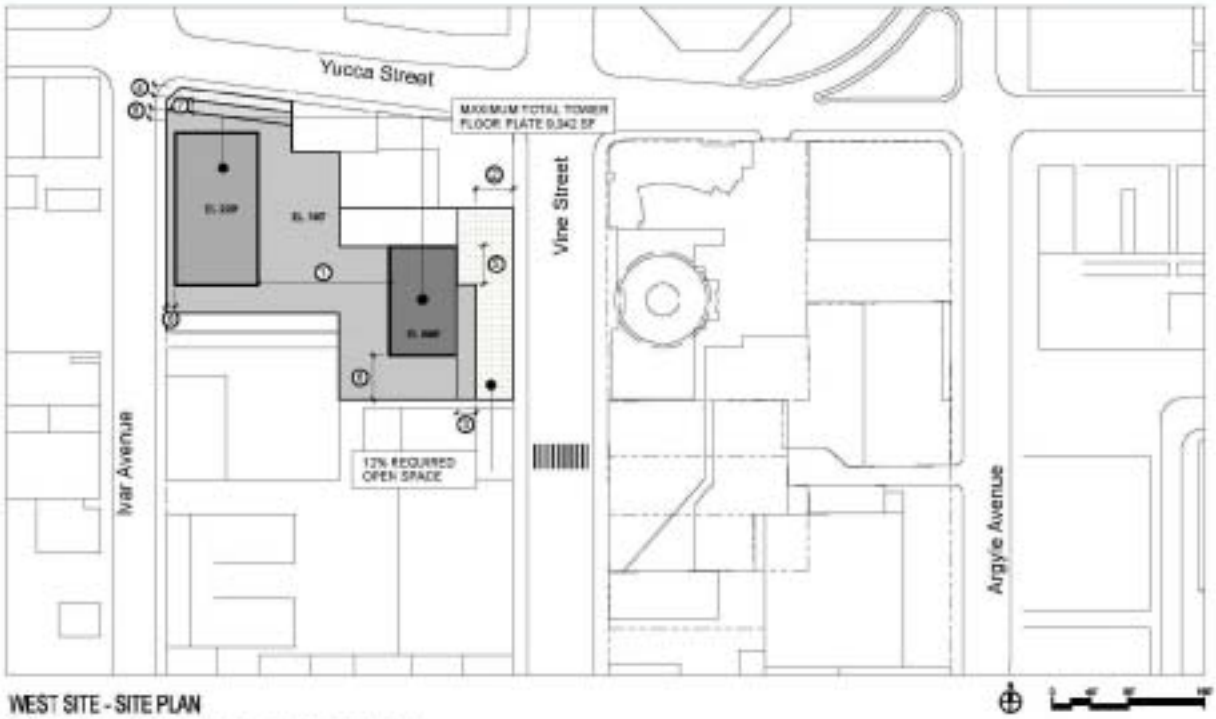

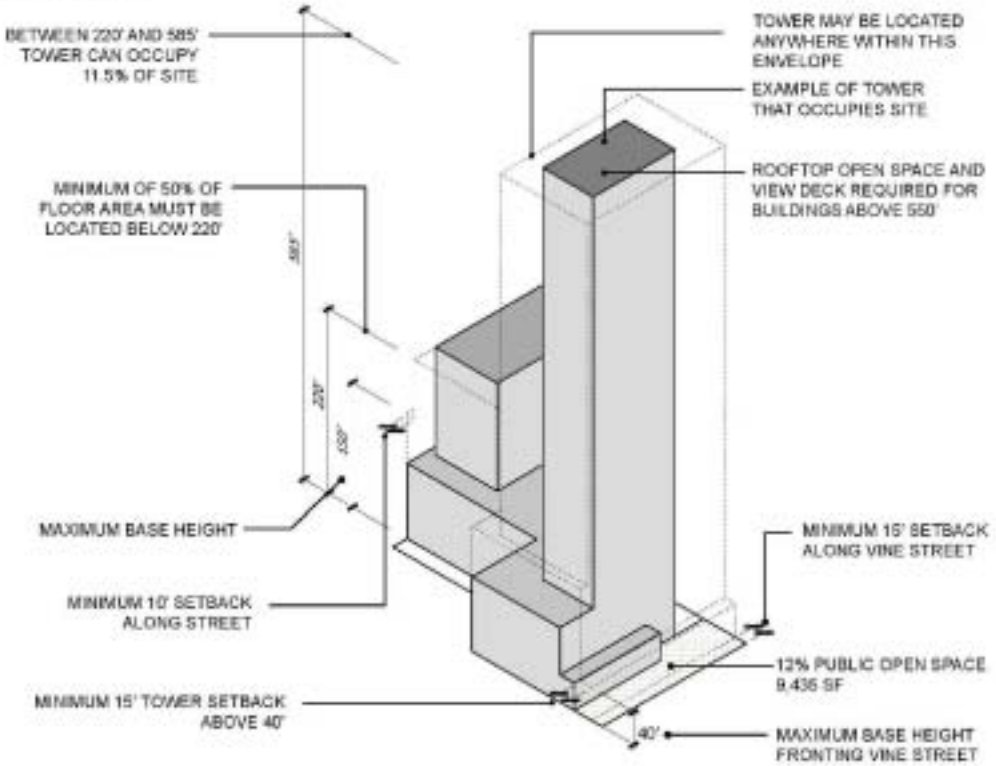

fig. 6.1.2.d.2: West Site – 585 Feet Maximum Tower Height

6.2 Street Walls

6.2.1 A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation. The street wall shall have proportions and architectural building details which emphasize and reflect the presence and importance of the pedestrian environment. Massing offsets, fenestration, varied textures, openings, recesses, and design accents are strongly encouraged to ensure there are no un-articulated walls and monolithic roof forms, and architectural elements such as balconies, verandas, and porches that add architectural character are encouraged.

6.3 Street Wall Standards

6.3.1 Location of a required street wall:

a. Parcels with a grade level open space: the required street wall shall be located a minimum 10 feet from the property line along Vine Street on the East Site and 15 feet along Vine Street on the West Site.

b. A grade level open space is required for any building fronting Yucca Street with a minimum 10 feet setback from the property line.

c. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

6.3.2 Height of required street wall:

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b), (c) and (d) below.

b. Street walls fronting Vine Street on the West Site shall be built to a maximum height of 40 feet above curb level except as noted in item (d) below.

c. Street walls fronting Yucca Street shall be built to a maximum height of 30 feet. Building can extend to a maximum height of 150 feet with a 10 foot setback above 30 feet except as noted in item (d) below.

d. 40% of the aggregate width of the required street wall frontage on each street can exceed the maximum street wall height up to the maximum tower height.

fig 6.3.2: Street Wall

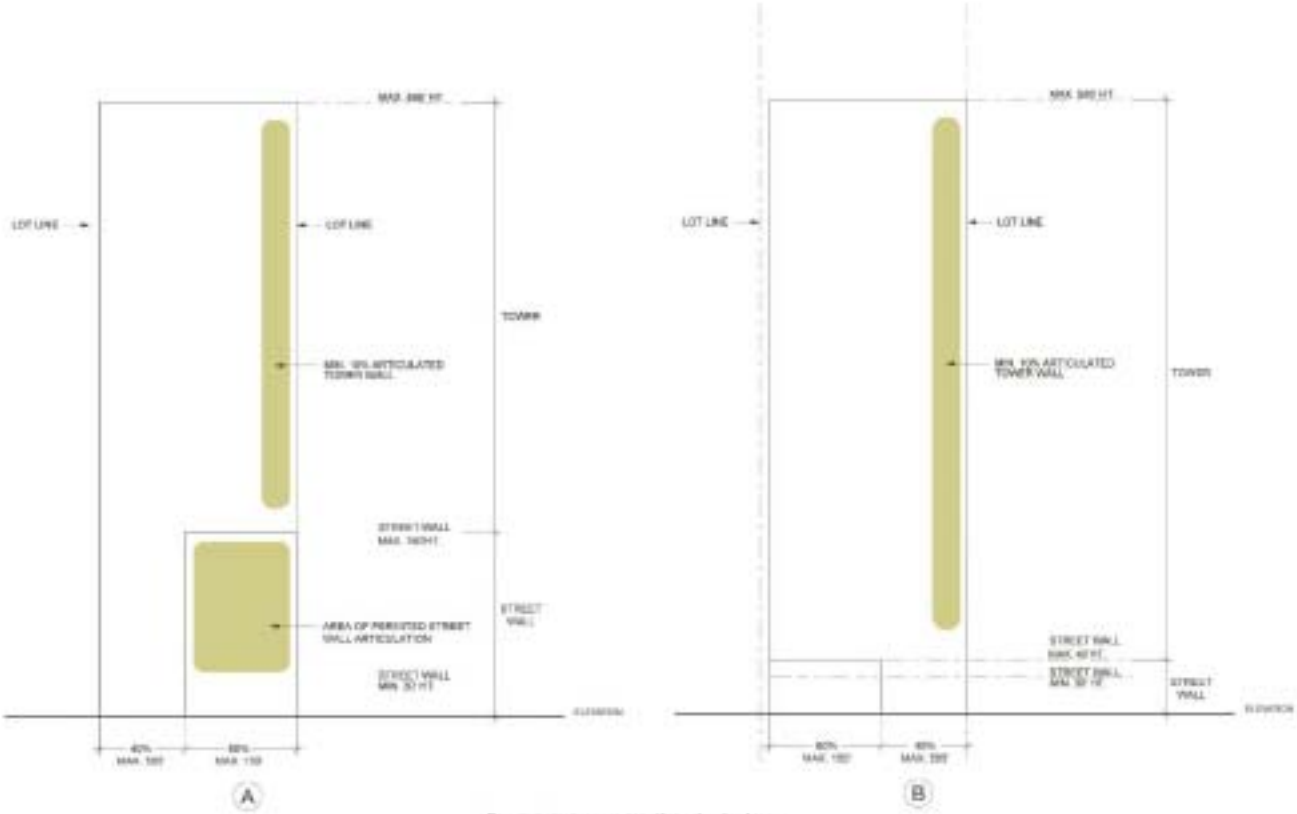

fig. 6.3.3: Street Wall Articulation

6.3.3 Types of permitted articulation of a required street wall:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

6.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Commercial marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0'. The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

6.4 Street Wall Guidelines

6.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

6.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop-offs and loading entries and exits and vehicular access driveways are also permitted within the street wall area on the Project Site.

6.5 Yard Standards

6.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

6.5.2 Commercial Use: no front, side or rear yard setbacks are required.

6.5.3 Residential Use:

a. Front Yard: none.

b. Side Yard: Minimum 5 feet; for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet; for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

6.6 Building Materials and Color Guidelines

6.6.1 The goal of the building materials and colors is to reinforce the character of the Hollywood area and provide a design that is compatible yet avoids any appearance that the building is being historicized. These guidelines will address the façade treatment for both residential and commercial portions of buildings.

a. Buildings shall feature long-lived and sustainable materials. The material palette shall provide variety, reinforce massing and changes in the horizontal or vertical plane.

b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

c. Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents.

d. The architecture of the building shall clearly delineate an architectural style, and shall not appear as a simplified version thereof, with appropriate fenestration patterns, architectural features, proportions and materials.

e. The building's skin, especially for towers, shall be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

f. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style. There will be clear contrast between the building's surface material and the building's glazed areas.

g. In general, the overall massing, roof forms, materials, and architectural style of new structures shall provide a variety of forms, depth and texture, and encourage a cohesive character. Building massing shall include a variation in wall planes and height as well as roof forms to promote architectural excellence, a pedestrian friendly environment and take into account the context.

h. To provide visual variety and depth, the building skin shall be layered and designed with a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin shall reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

i. Rooftop mechanical equipment screening shall be designed to be integral with the building architecture and the visual impact shall be minimized by using materials that are complimentary or consistent with the building.

j. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

6.7 Grade Level Standards

6.7.1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground floor street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and shall be integral to the architecture of the building.

6.7.2 Ground floor height:

a. Minimum 12'-0" height measured from floor to ceiling.

6.7.3 Building entrances:

a. The primary entrance to a street level tenant space that has frontage along a public street shall be provided from that street. The primary entrance to a tenant space that does not have its frontage along a public street shall be provided from a courtyard, *grade level open space*, or *publicly accessible passageway*. Entries less than 18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries greater than 18 inches from the property line shall be within 30 inches of the adjacent grade level along street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. All retail spaces shall be accessed primarily from a ground floor, single-tenant entry along a street, plaza or passageway. Where reasonably practical given architecture and tenant requirements, access to different tenant spaces shall occur at a maximum interval of 60 feet.

c. Main building entrances shall read differently from retail storefronts, restaurants and commercial entrances which could include but are not limited to material change, architectural elements or elevation change.

d. In addition to the building's required primary entrance(s), there may be ancillary entrances to the building from parking garages.

6.7.4 Ground Floor Glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet above curb level.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing shall constitute a minimum of 30% of the area of a building face and shall not exceed 80% of the area of a building face.

6.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0-foot candles.

6.7.6 Service and Refuse Requirements

Hotel and Commercial / Office / Retail that abuts an alley

a. Every required loading space shall be located and arranged such that delivery vehicles may be driven upon or into said space from an alley. Such loading space shall have a minimum height of 14 feet and be accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet; a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet; and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

Condominiums (Residential)

d. None

Rental (Residential)

e. None

6.7.7 Service and Refuse Guidelines

a. Storage areas shall be provided within the building of a size sufficient for the development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible from a curb cut.

b. Service, utility, and mechanical functions, including retail loading, shall be located in alleys whenever present. When alleys are not present, service functions shall be placed within buildings.

c. Service, utility, and mechanical equipment that is visible from the street shall be screened from view with landscaping or enclosures. Back flow and fire standpipes, along with utility box transformers, shall be screened.

d. All screening devices shall be compatible with the architecture, materials and colors of adjacent buildings.

e. Trash and storage enclosures shall be architecturally compatible with the project design and landscaping shall be provided adjacent to the enclosure(s) to screen them and deter graffiti.

f. Trash enclosures and retail loading areas shall be sited to minimize nuisance to adjacent properties.

g. The location of trash enclosures shall be easily accessible for trash collection and should not impede general site circulation patterns during loading operations.

h. Mechanical equipment shall vent to an alley wherever possible.

i. Roof-vent penetrations and mechanical equipment shall be located at least 10 feet from any exterior Building Face.

j. Gutters and downspouts shall be made of galvanized steel, copper (not copper coated), or aluminum.

6.7.8 Storefronts

a. Storefront (residential, retail, restaurant and commercial) requirements shall include frontage along streets and grade level open spaces.

b. Storefronts shall comprise a minimum of 70% of the building's street level façade along Vine Street and 40% along all other streets and be recessed where necessary.

c. Storefront glazing shall comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets.

d. All retail space shall have a minimum 12 feet finished ceiling clearance.

e. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Storefront openings shall be no shorter than 12 feet above the adjoining grade for 90% of the required storefront frontage.

g. Security grilles will be located behind glass and be at minimum 70% open.

h. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

i. Awnings shall not obscure storefront signage. Vinyl awnings are not permitted.

6.8 Podium Standards

6.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment of the building's base, middle and top

through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

6.9 Podium Guidelines

6.9.1 Podiums shall have fenestration that establishes a clear pattern on the façade (with special attention paid to facades that are visible from a public street) and that provides depth and additional articulation.

6.9.2 An identifiable break between the building's ground floors and upper floors shall be provided. This break may include a change in material, change in fenestration pattern or similar means.

6.9.3 Podium level windows shall be vertically oriented.

6.9.4 Podium levels shall be predominantly light in color.

6.9.5 An expression band shall be provided at the highest story within the podium.

6.9.6 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade shall be a maximum of four floors high, and shall have variation in its surface plane (using cutouts, insets or pop-outs). It shall employ different scales of elements as viewed when seeing the entire building massing.

6.9.7 Louvers and wall openings shall be designed to integrate with building architecture.

6.10 Street and Sidewalk Standards

6.10.1 The Site is comprised of a variety of public elements that include open spaces, streets and sidewalks. The Hollywood Walk of Fame is an integral element that fronts open spaces on both East and West Sites. Its adjacency to the public plazas requires compatibility and cohesiveness.

6.10.2 The combination of landscaped plazas, publicly accessible passageways and landscaped streets and sidewalks creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

6.11 Screening Standards

6.11.1 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

6.11.2 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

7. TOWERS

7.1 Purpose

7.1.1 Towers shall have their massing designed to reduce overall bulk and to appear slender.

7.1.2 Towers shall be designed to achieve a simple faceted geometry and exhibit big, simple moves. They shall not appear overwrought or to have over-manipulated elements.

7.1.3 Towers that emulate a more streamlined modern style shall provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

7.1.4 If a project has more than one tower, the towers shall be complementary to each other and employ a similar architectural design approach.

7.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) shall not be historicized. They are contemporary forms in the skyline and shall appear as such.

7.2 Projections

7.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. Roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building;

b. Skylights, towers, steeples, flagpoles, water tanks, silos;

c. Wireless masts; and

d. Solar energy devices and similar structures.

7.2.2 Permitted building elements or equipment in Section 7.2.1 shall be screened as practical and based on building design except if such projections – e.g., flagpoles or steeples – are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

7.2.3 Enclosures for bulkheads shall not count against building height.

7.3 General Standards

7.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

7.3.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

7.3.3 Towers shall be set back from maximum street wall height a minimum of 10 feet except for towers fronting Vine Street on the West site, these towers shall be setback 15 feet from the maximum street wall height.

7.3.4 Towers shall be setback on West Site from shared property line with Hollywood Playhouse a minimum of 10 feet above 150 feet.

7.4 Wall Standards

7.4.1 All walls are required to be articulated.

7.4.2 The following types of articulation of a tower wall are permitted:

a. Recess;

b. Standard balconies may be projecting or recessed or a combination of both; and

c. Bay windows.

fig. 7.4.2.a: Balcony/Recess

fig. 7.4.2.b: Bay Window

7.4.3 Balcony: a balcony shall be integral to the façade (see figs. 7.4.3.a and b) and shall not create a relentless horizontal and vertical stacking pattern. Balconies are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations and shall be a minimum 75% *transparent*. Balconies are encouraged on buildings facing major public spaces such as plazas, passageways and open spaces. Long balconies resembling corridors are prohibited.

fig. 7.4.3.a: Recess/Balcony: Integral Balcony

fig. 7.4.3.b: Bay Window: Integral Balcony

7.5 Spacing Standards

7.5.1 If two towers are located on a single site the towers shall be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

7.5.2 Generally, any portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except for the following which will meet Planning Code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 7.5.2.

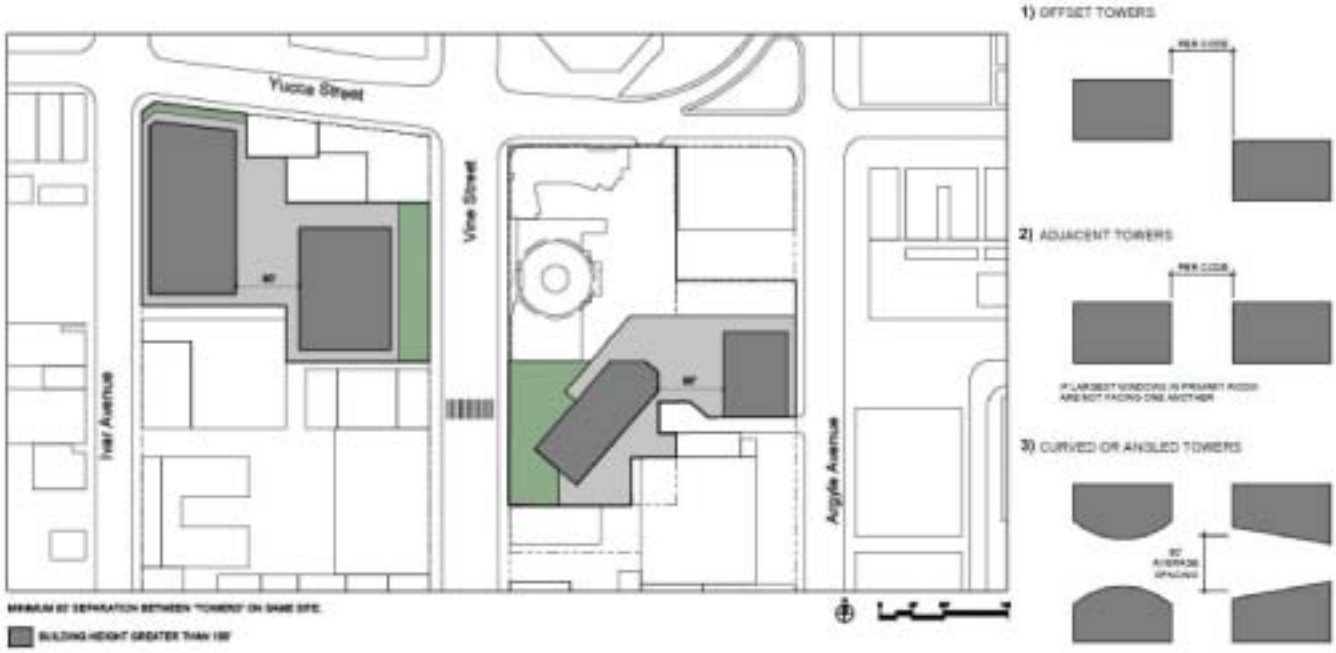

Fig. 7.5.2: Tower Spacing

7.5.3 Since a tower is defined as any building above 150 feet, all buildings above 150 feet shall be spaced at least 80 feet from any portion of any adjacent or separate building on the site, exceeding 150 feet, excluding a project within the height range of 150 to 220 feet, as shown in figures 6.1.2.a.1 and 6.1.2.a.2.

7.5.4 Spires, signage, parapets, and mechanical enclosures are excluded from the tower spacing regulations.

7.6 Rooftops Guidelines

7.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

7.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 8.5.

7.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

7.6.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

7.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

7.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

7.7.2 Materials and design for roof mechanical equipment shall be consistent with the building architecture and shall utilize similar colors and materials as in other portions of the building.

7.7.3 Roof mechanical equipment shall be screened.

8. OPEN SPACE

8.1 Overview

The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Building and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

8.2 Grade Level Open Space Standards

8.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records Building and accentuate the low scale character.

8.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Fig. 6.1.2.a.1 – 2)

8.2.3 An additional 3% of open space (total 8%) shall be required for buildings between 221 feet and 400 feet. (See Fig. 6.1.2.b.1 – 2)

8.2.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 550 feet (See Fig. 6.1.2.c.1 – 2)

8.2.5 An additional 7% (total 12%) of open space shall be required for buildings taller than 550 feet. (See Fig. 6.1.2.d.1 – 2)

8.2.6 Location

a. East Site: adjacent to the Jazz Mural and Capitol Records Building; West Site: across from the Capitol Records Building along Vine Street and along Yucca Street.

b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular from any point on each of the boundaries of the open space area. Open space on West Site fronting Vine Street shall have a horizontal dimension no less than 15 feet when measured perpendicular from any point.

② MINIMUM 8% OPEN

③ MINIMUM 10% OPEN

④ MINIMUM 12% OPEN

8.3 Passageway Standards

8.3.1 *A publicly accessible passageway* is a continuous through-block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

8.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

8.3.3 Location and Size standards:

a. The major portion of a *publicly accessible passageway* is the largest area of the *passageway* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total passageway area and shall not be less than 20'-0" wide.

b. Minor portions of *publicly accessible passageway* are secondary areas that allow for additional flexibility in the shape and configuration of a passageway. Minor portions shall not occupy more than 25 percent of the total area of the *passageway*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

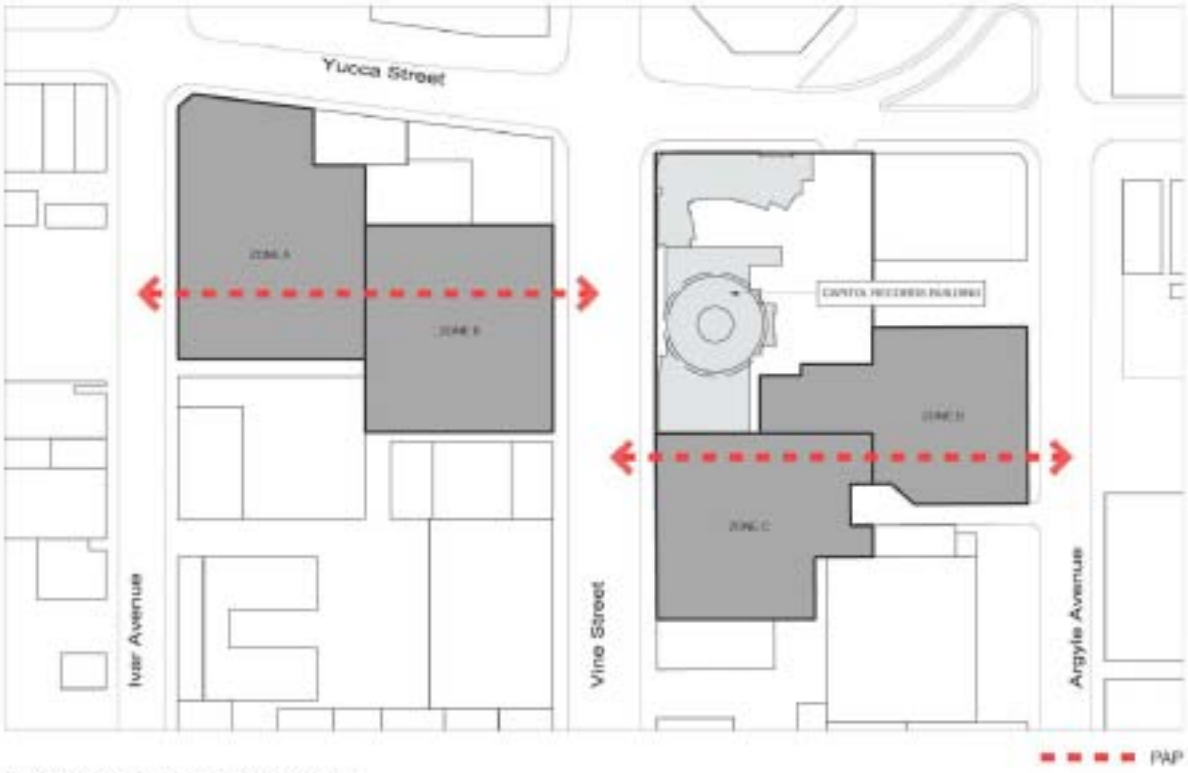

fig. 8.3.3: Publicly Accessible Passageway

8.3.4 Permitted Obstructions:

a. The minimum percentage of *publicly accessible passageway* area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within the major portion of an open air *publicly accessible passageway* are any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open-air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies and bay windows; awnings, canopies and marquees; stairs, ramps

fig. 8.3.4: View from Argyle Avenue Along PAP Towards Capitol Records

and bollards.

8.3.5 Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Building and Safety in conformance with the Building Code. Kiosks, including roofed areas, shall not count as floor area, exceed 3% of the total area of the *publicly accessible passageway*, or occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open-air cafes, flower stands or public service/information booths.

d. All kiosks greater than 250 square feet are permitted but will count as floor area.

8.3.6 Open-Air Café:

a. Where an open-air cafe is provided it shall be an unenclosed restaurant or open-air seating for an enclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open-air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *publicly accessible passageway*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *publicly accessible passageway*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

8.3.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on the *publicly accessible passageway* through open windows.

8.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No building refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *publicly accessible passageway*.

b. No exhaust vents are permitted on any *publicly accessible passageway* or on any building wall of the development fronting upon the passageway except where such vents are more than 10'-6" above the level of the *passageway*.

8.3.9 Frontages:

a. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *publicly accessible passageway* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *publicly accessible passageway* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

8.3.10 Maintenance:

a. The building owner shall be responsible for the maintenance of the *publicly accessible passageway* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the passageway and in the street sidewalk area adjacent to the passageway.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *publicly accessible passageway* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *passageway* in connection with outdoor eating services or other uses permitted on *passageway* which generate litter.

8.4 Roof-top Open Space

8.4.1 Buildings above 550 feet shall include roof-top open space.

8.4.2 Roof-top open space shall include an observation area (i.e., viewing deck) accessible to the public.

8.4.3 Roof-top open space may include a café.

8.5 Residential Common Open Space

8.5.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential common open space requirements.

8.5.2 Common Open Space Standards

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

c. Open space shall be open to the sky and have no structures that project into the common open space area, except as permitted in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the Site.

e. Common open space shall have a minimum area of 400 square feet with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f. Common open space shall constitute at least 50% of the total required usable open space in the built development.

g. Common open space areas shall incorporate recreational amenities including but not limited to swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use may be considered as common open space.

i. Refer to LAMC 12.21.G for additional open space requirements.

8.6 Residential Private Open Space

8.6.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

8.6.2 Residential Open Space Standards:

a. Private open space shall contain a minimum area of 50 square feet, of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

b. Private open space shall have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c. Private open space shall provide a minimum eight-foot vertical clearance under any projection, except as permitted in the Zoning Code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with Zoning Code may qualify as usable open space provided it meets each of the above specified requirements noted in items a-c.

9. LANDSCAPE

9.1 Grade Level Open Space Standards

9.1.1 Planting requirements: a minimum of 10% of grade level open space shall be landscaped with softscape or water features.

9.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material and 30% of all landscaping shall be California Natives or drought tolerant.

9.1.3 The landscaped portion of open space may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.1.4 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

9.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

9.1.7 Open-air *publicly accessible passageways* are not to be included in the grade level open space requirements.

9.2 Common Open Space Standards

9.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

9.2.2 At least one 36-inch box tree for every four dwelling units shall be provided on-site and may include street trees in the parkway, sidewalks adjoining the property, open space, *publicly accessible passageway* and common roof decks.

9.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

9.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

fig. 9.3.a: Movable Seating

fig. 9.3.b: Open Air Café

9.3 Standards For Open Air Portions of Publicly Accessible Passageway

9.3.1 The landscaped portion of open air passageways may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.3.2 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.3.4 Planting requirements:

a. A minimum of 10% of open air *publicly accessible passageway* shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

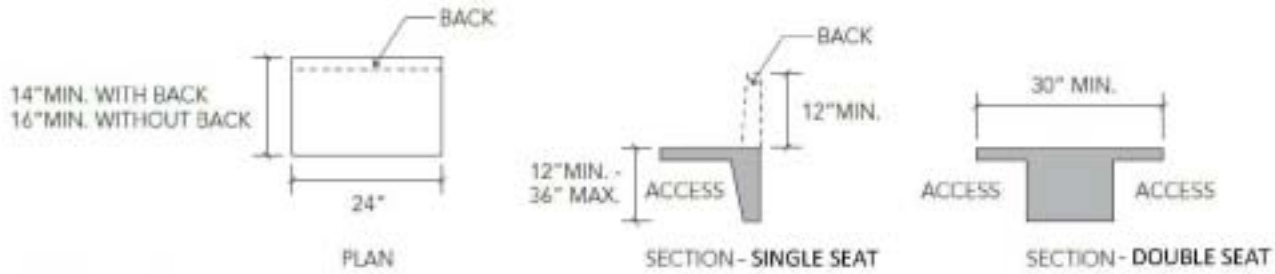

fig. 9.3.5: Seating Standards

9.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *publicly accessible passageway* excluding the area of an open-air cafe.

b. One seat shall equal two linear feet.

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count as double seating provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating of open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open-air cafes do not count toward meeting the seating requirements.

9.4 Tree Planting Guidelines

9.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

9.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

9.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree-planting pattern.

9.5 Lighting Standards

9.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

9.5.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open *publicly accessible passageway*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0-foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

f. All exterior lighting shall be shielded or directed toward the areas to be lit to limit spill-over onto off-site uses.

g. Light quality shall not be harsh, glaring, blinking or shed beyond property boundaries.

9.5.3 Responsibility for maintenance:

a. The Building Owner shall be responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building Owner.

9.5.4 Lighting for areas located inside the lot line and visible from the street, such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

9.5.5 Lighting for above-grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

9.6 Publicly Accessible Passageway Lighting Standards

9.6.1 A *publicly accessible passageway* shall be illuminated throughout with an overall minimum average level of illumination of not less than 1.0 maintained foot candle (lumens per square foot) on the horizontal plane at grade.

9.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

9.7 Continuity of Design

9.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

9.7.2 Where possible, materials, lighting, site elements and landscape shall be similar between different open and enclosed public spaces at the grade level.

10. PARKING

10.1 Automobile Standards

10.1.1 Base Standards

The following standards shall apply for the base level of parking to be provided as the minimum for each use in the project area. The Regulations set forth below incorporate the parking requirements in the LAMC, where applicable, and supersede the LAMC requirements for development in the Development Agreement area.

a. Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulations incorporate applicable parking requirements in the LAMC as set forth below.

b. Sports Club:

Two parking spaces for every one thousand square feet of combined gross floor area.

c. Hotel

One parking space for each individual guest room or suite of rooms for the first 30;

One additional parking space for each two guest rooms or suites of rooms in excess of 30 but not exceeding 60; and

One additional parking space for each three guest rooms or suites of rooms in excess of 60.

d. Condominiums (Residential):

Two parking spaces per dwelling unit.

One-quarter parking space per dwelling unit for guest parking.

e. Rental (Residential):

One parking space for each dwelling unit of less than three habitable rooms; one-and-one-half parking spaces for each dwelling unit of three habitable rooms; and two parking spaces for each dwelling unit of more than three habitable rooms.

f. Combination of Uses:

Where there is a combination of uses on a lot, the base number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking:

a. Shared parking may be applied to the Section 10.1.1 base rates for the Site when the uses have different parking requirements and different demand patterns in a 24-hour cycle or between weekends and weekdays. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses. The calculation of the parking requirements shall be based on a detailed assessment prior to its construction.

b. Calculating Shared Parking:

(i) The individual land use parking requirements for each component of a phase of development shall be calculated from Section 10.1.1. above to establish the "Base Demand."

(ii) The Base Demand will be adjusted by the number of bicycle spaces required per section 10.4. The following internal use reduction factors shall also be applied when 10,000 office equivalent square feet each of office, residential and other commercial uses will all be active on the Site:

Internal Use Reduction Factors	
Residential	**5%**
Hotel	**5%**
Office	**15%**
Other Commercial	**15%**

The resulting minimum automobile parking rates shall be applied to the proposed building(s) to be constructed in each phase of development.

(iii) For parking spaces that are to be shared between uses, the calculated minimum parking requirement for the Site, including that new phase of construction, is to be adjusted based on the procedures in *Shared Parking*, Urban Land Institute, 2nd Edition (2005) or another source as determined by the Director of Planning.

10.2 Additional Regulations

10.2.1 The automobile parking spaces required shall be provided either on the same lot as the use for which they are intended to serve or on another lot located within 750 feet of the lot; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

10.2.2 Curb cuts for driveways shall be located no closer than 50 feet to the intersection of two streets unless approved by The Department of Transportation to be a leg of the intersection.

10.2.3 Access driveways to parking facilities not at signalized intersections shall not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

10.2.4 Parking and loading access shall be shared where feasible.

10.2.5 Priority placement within parking structures shall be given to bike parking, car-share parking, and other alternative ride vehicles.

10.2.6 Pedestrian entrances to all parking shall be directly from the street, except that underground parking garages may be entered directly from a building.

10.3 Screening

10.3.1 Above grade parking for the first 20 feet shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible and shall be designed to blend in with the form and massing and to look like an integral part of the building, with the use of windows and/or cladding, or by landscaping, or green screens, or a combination thereof. The interior of a parking structure shall be designed to be screened from the view of streets and sidewalks.

10.4 Bicycle Standards

10.4.1 Requirements for each use:

a. Commercial / Office / Retail:

For uses listed below a minimum of 2 short-term and 2 long-term bicycle parking spaces shall be provided.

Land Use	Short Term Bicycle Parking	Long Term Bicycle Parking
Office	1 per 10,000 sq. ft.	1 per 5,000 sq. ft.
Health Clubs	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Restaurant and Bars	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Restaurant (less than 1,000 square feet)	2 per restaurant	2 per restaurant
Retail (General)	1 per 2,000 sq. ft.	1 per 2,000 sq. ft.
Retail (Furniture)	1 per 10,000 sq. ft.	1 per 10,000 sq. ft.
Hotel	1 per 20 guestrooms	1 per 20 guestrooms
All other commercial	1 per 10,000 sq. ft.	1 per 10,000 sq. ft.

uses

COMBINATION OF USES. Where there is a combination of uses on a lot, the number of bicycle parking spaces required shall be the sum of the requirements of the various uses.

b. Residential:

For all residential buildings containing more than three dwelling units, or more than five guest rooms, long- and short-term bicycle parking shall be provided. Long-term bicycle parking shall be provided at a rate of one space per dwelling unit or guest room. In addition, short-term bicycle parking shall be provided at one space per ten dwelling units or guest rooms. A minimum of two short-term bicycle parking spaces shall be provided in such cases.

(i) In instances where a building may contain both dwelling units and guest rooms, the sum of dwelling units and guest rooms shall be used to determine the amount of long and short-term parking. Any combination that results in more than five combined dwelling units and guest rooms will require bicycle parking.

10.5 Transportation Demand Management Plan

10.5.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.5.2 The transportation demand management plan shall set forth best practices that relate to the Project Site and the Project's building design features in order to:

a. Promote bicycle and pedestrian circulation within the Project Site.

b. Promote alternative modes of transportation.

c. Create pedestrian linkages to public and private amenities outside the Project Site.

d. Provide convenient and attractive onsite pedestrian linkages for routes to the Metro Red Line Station at Hollywood Boulevard and Vine Street.

e. Provide adequate parking, but provide incentives to tenants and residents to utilize alternative modes of travel. The incentives shall include bicycle facilities, car sharing, discounted subway passes, and parking spaces as an only optional part of all lease and sale agreements.

11. SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 11.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig. 11.2.

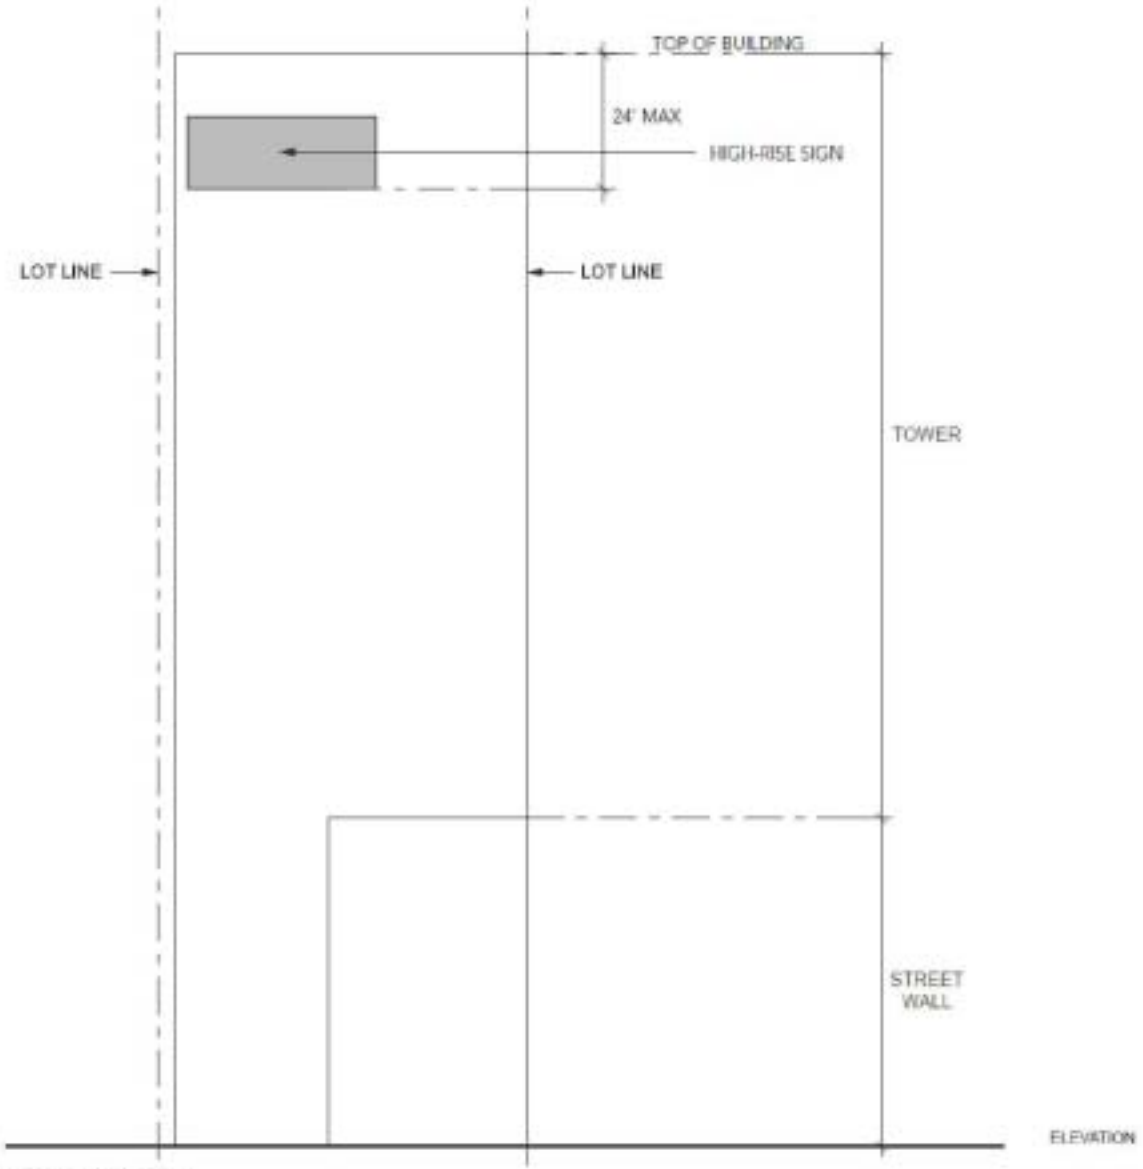

fig. 11.2: High Rise Sign

12. SUSTAINABILITY

12.1 Non-Residential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

12.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13. DEFINITIONS

Awning: glazing or fabric on metal frame structure supported entirely by the building to provide weather protection at doors, windows and/or storefronts; may be retractable.

Base: the lower portion of a building located at or within 150' above curb level.

Canopy: glazing, fabric and/or metal structure with vertical supports located on the sidewalk to provide weather protection at a building's primary entrance.

Expression band: a distinctive linear architectural element occurring on the building base facade at the highest floor. The band shall be contrasting in color, texture, material and/or fenestration from the adjacent building base facade. Projections may occur within an expression band.

Grade level open space: a continuous open space fronting the street and open to the sky.

Maximum building height: the maximum height permitted, measured from the adjacent street curb level.

Maintenance: the ongoing repair, care and upkeep of a property.

Open space use: active and passive recreational areas accessible to the general public, except as noted herein. Open spaces can occur in publicly accessible passageways, grade level open space, residential common open space and residential private open space which are defined herein.

Preservation: in conformance with standards and guidelines of the Secretary of the Interior, the act or process of applying measures necessary to sustain the existing form, integrity, and materials of an historic property.

Publicly accessible passageway: a continuous through-block public connection between two parallel streets, located on privately owned land and designated for and designed to encourage public pedestrian circulation and other appropriate public uses.

Rehabilitation: in conformance with standards and guidelines of the Secretary of the Interior, the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values.

Required street wall: a wall or portion of a wall of a building facing a street or grade level open space which must be built to a maximum height above curb level.

Required street wall articulation, aggregate width of: the sum of the maximum widths of all segments of required street wall articulation on a street at the level of any story. The width of a required street wall articulation is measured in plan as the width of the street line from which perpendicular lines may be drawn to such required street wall articulation.

Residential common open space: a "rear yard" providing light and air to apartments on the interior of a parcel located at any story above curb level.

Residential private open space: open space that is contiguous to and immediately accessible only from a single dwelling unit.

Setting: the area or environment in which a historic property is found. It may be an urban or suburban neighborhood or a natural landscape in which a building has been constructed. Elements of setting can include the relationship of buildings to each other, setbacks, views, sidewalks, and street trees.

Storefront: the architectural facade, including doorways, of any tenant-leased premise perimeter adjacent to public circulation areas. Storefronts refers to all permitted residential, retail uses including retail, service, restaurants and cultural establishments and commercial uses, including but not limited to hotels and sports clubs.

Tower: the portion of a building located above 150' above curb level.

Transparent: architectural elements that can be seen through or allows light to emit through, including but not exclusively glass, trellis and wire mesh.

Notes:

All images and figures used in the Regulations were prepared for exclusive use by Millennium Hollywood LLC unless otherwise noted.

DEPARTMENT OF BUILDING AND SAFETY

Development Services "Concierge" Program

We are with you all the way to build safe, build well, and build fast!

CO-0001-001

AR0067859

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

Every year LADBS issues approximately 130,000 permits:

- 85,000 permits are Express Permits
  - No plan review required
  - Minor alterations (reroof, replace AC, kitchen remodel, etc.)
  - Issued at Express Counter or through e-Permit
- 45,000 permits require plans to be drawn and reviewed

These 45,000 projects can be categorized into five project types:

- Major (high rise building, shopping center, hotel, etc.)
- Midsize (35-unit apartment, low rise office building, etc.)
- Small Business (tenant improvement, retail shop, etc.)
- Small Residential (single family addition and alteration)
- Special (restaurant, high tech facilities, etc.)

All five types of projects have to go through three phases of the development process:

- Design Phase
- Permitting Phase
- Construction Phase

CO-0001-003

AR0067861

Mission Statement Prior to 2009

"The mission of the Department of Building and Safety is to protect the lives and safety of the residents and visitors of Los Angeles, preserve the City's quality of life, and contribute to the City's economic development. This is accomplished through implementation of the Zoning, Building, Plumbing, Mechanical, and Electrical Codes, as well as Engineering, Energy, and Disabled Access regulations, and local and State laws for construction and maintenance of commercial, industrial, and residential buildings."

Then, the culture of LADBS focused around safety more than quality customer assistance.

CO-0001-004

AR0067862

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

In 2009, LADBS modified our mission statement to foster a change in culture and place emphasis on customer assistance:

Mission Statement Since 2009

"The mission of the Department of Building and Safety is to protect the lives and safety of the residents and visitors of the City of Los Angeles and enhance the quality of life, housing, economic prosperity, and ***job creation****. This is accomplished through* ***advising, guiding, and assisting customers to achieve compliance*** *with the Building, Zoning, Plumbing, Mechanical, Electrical, Disabled Access, Energy, and Green Codes; and local and State laws,* ***through a timely, cooperative, and transparent process for the facilitation*** *of construction and maintenance of commercial, industrial, and residential buildings throughout the City"*

CO-0001-005

AR0067863

Our commitment to this mission is evident in our three added programs:

1. **Development Services Case Management (DSCM)**
   We plan your project with you!
2. **Parallel Design-Permitting Process (PDPP)**
   We issue your permit when you complete the design!
3. **Restaurant & Hospitality Express Program (RHEP)**
   Open on Schedule!

CO-0001-006

AR0067864

CO-0001-007

AR0067865

Prior to the establishment of the Development Services Case Management (DSCM), case management functions were housed in different departments and not formally coordinated.

On July 2011, the citywide DSCM was formed and comprised of staff from:

- 7 Building & Safety
- 3 Planning
- 1 Bureau of Engineering (part-time)
- 1 Water & Power (part-time)
- 1 Transportation (part-time)
- 1 Bureau of Street Lighting (part-time)
- 1 Urban Forestry Division (part-time)

CO-0001-008

AR0067866

In collaboration with the Construction Liaison Network (representatives from Fire, Bureau of Street Services, Bureau of Street Lighting, Housing, and Recreation and Park), DSCM act as advisors and pathfinders to provide consultation facilitation, and problem solving services to major projects:

- Performing project feasibility studies.
- Conducting pre-development meetings with other agencies.
- Conducting preliminary plan reviews to identify potential building site and code issues.
- Resolving code issues from design considerations.
- Assisting applicants with plan check corrections and the citywide clearance processes process.

8. Open Space (12.21G)	# of Habitable Rooms	# of Units	Req'd Open Space (sf)	Total Open Space Req'd:	Need to comply with 12.21G (there is exception for affordable housing incentive)	☐
	< 3		X 100sf =			
	= 3		X 125sf =			
	> 3		X 175sf =			
9. Passageway, Space bet Bldgs						☐
10. Loading Area	Per section 12.21C6					☐
11. Trash & Recycling	Per section 12.21A19					☐

Others:

- ☐ Coastal Zone (CZCA)
- ☐ Alley, Street vacation action required
- ☐ Commercial Corner/Mini Mall (12.22A23)(a mixed use project as defined in 13.09B3 or residential project conforms to Downtown Design Guide are exempted)
- ☐ Ch 34, all (E) CMU bldg is treated as ordinary shear wall
- ☐ Landscape
- ☐ Yards for Churches, Institutions, Schools etc in RA or R zones (12.21C3)

Others:

- ☑ Site Plan review (16.05)(>=50,000sf; >=50 units; and Increase "trips" and any **residential project in Greater downtown housing incentive area (unless complies with downtown design guide 12.22A30 per 16.05D (7)**
- ☐ Major development (12.24U14)(>=250,000sf warehouse; >=250 guest rooms; >=100,000sf for other non residential, non warehouse area in C2,C4,CS,CM,M1,M2,M3 and **Home improvement store,**
- ☑ Subdivision Action Required
- ☐ ANY Grading on a Site > 60,000sf requires Planning Department Signoff

Inform applicant that project requires planning entitlement action needs to follow the "City Design Guidelines" developed by Planning Department. Refer to Planning website: select "Policy Initiatives", then "Urban Design Studio"

Additional Comments:

1. Project needs to comply with Broadway CDO.
2. total lot area = (2740 + 328) + 1205 + 6261 = 34,338.
3. Broadway street scape compliance.
4. Applicant may seek "street vacation" for the area along 4th St & Broadway due to the street width standards is less

DEPARTMENT OF BUILDING AND SAFETY

Pre-development Meeting

All relevant agencies meet with project representatives to:

- Establish department contacts for the project.
- Provide a clear, transparent road map of the permitting process.
- Identify and resolve foreseeable issues with each agency.

CO-0001-014

AR0067872

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

Since its inception in July 2011, DSCM has assisted more than 2,400 projects including many significant job creation projects:

- LAX Modernization
- Emerson College
- Lucky Brand Jeans – West Coast Headquarter
- Forever 21 Headquarter
- Conversion of Old Post Office on Jefferson Blvd
- Hercules Campus at Playa Vista
- USC Health Science Building
- Gensler 's Office
- Caruso's Nordstrom at Grove
- Mini Cooper of Universal City and more dealerships
- Many High-Rises

Due to the consultation, facilitation, and problem solving services that DSCM provided, these projects were **completed with significant time and cost savings.**

Testimonials

Brad Box, Senior Managing Director, Trammell Crow

"The case management approach has transformed our experience of working with the City. You go to one place, have one point person, and get answers quickly. We're moving forward faster thanks to this change."

William McGregor, Project Director, McGregor Company

"It is no overstatement to say that had it not been for Case Management, One Santa Fe would not be a reality today"

Ronald Kaleta, Project Director, Brookfield Properties

"The case management's suggestions and scheduling help in resolving signage issues has allowed the project to maintain its momentum with leasing, which is the life-blood of the project."

Jonathan Lonner, Project Director, Burns & Bouchard

"Both the developer and I felt that saving this enormous investment of public subsidy was impossible. However, in large part due to the work and coordination of case management, we were proved wrong and the City was able to maintain $20M in subsidy and gain 63 new affordable units in South Los Angeles."

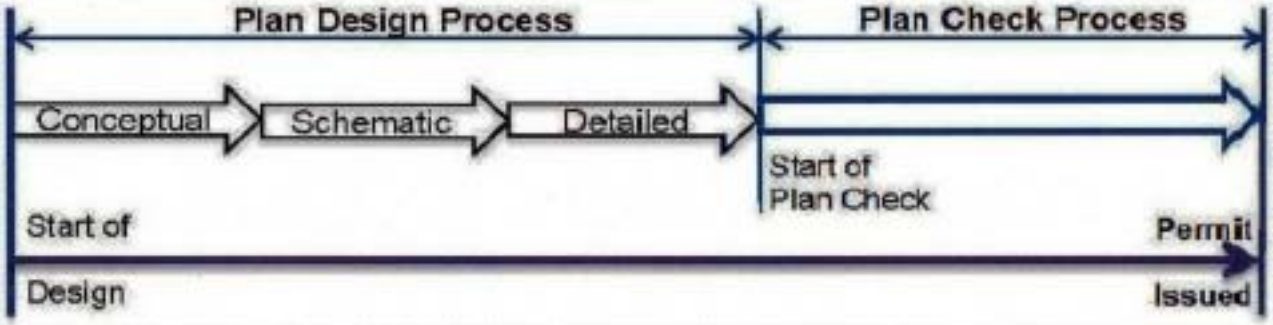
Parallel Design-Permitting Process (PDPP)

We issue your permits when you complete the design!

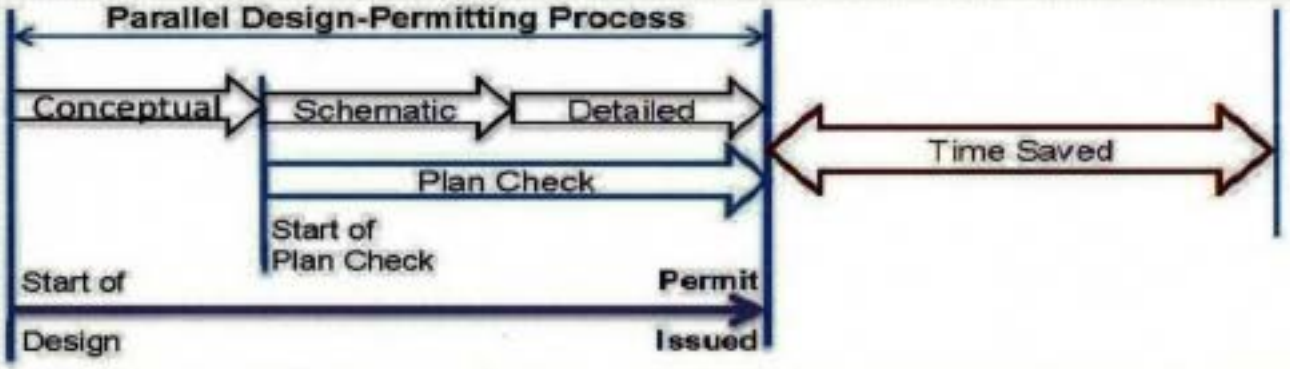
AR0067876

CO-0001-018

Traditionally, the plan design process and the plan check process are **sequential**; that is, projects are submitted to LADBS for plan check only after the project design is entirely complete.



PDPP allows the design process to run **concurrently** with the plan check process. We issue the permit when the design in complete.



CO-0001-019

AR0067877

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

1st Step – Zoning Plan Check & Clearances

- Only require plot plan, elevations, floor plans and parking.
- The Plan Check Engineer reviews conceptual plans:
  - generates correction Sheet identifying major issues
  - generates clearance sheet for other agencies' signoffs
- Resolve major issues and process clearances at early stage.

2nd Step – Architectural & Fire Life-safety Plan Check

- "Same" Plan Check Engineer reviews architectural plans:
  - identify all detail violations
  - issue modification for code deviations
- Building code issues are resolved at Design Phase.

3rd Step – Engineering Plan Check

- "Same" Plan Check Engineer reviews engineering plans.
- Building code issues are resolved at Design Phase.

NO MORE LATE HIT!

Benefits for PDPP Projects

- No more "late hits:"
  - Code issues are identified and resolved during Design Phase to avoid late revisions.
  - Early start on clearances and avoid unexpected "*Got You.*"
- LADBS Plan Check engineer acts as "Project Consultant" throughout Design-Permitting Phase.
- Reduce permitting time by 6 to 12 months.
- Start and complete construction ahead of schedule.
- Reduce significant project cost due to time savings.

CO-0001-024

Testimonials

Arpy Hatzikian, Principal, Gensler Group

"I think that this procedure is a hit. 15% were saved for the last project."

David Weaver, Architect, DRW ASSOCIATES

"It does away with a lot is scheduling frustration beginning with releasing the clearance summary worksheet early in the plan checking process."

Mark Armbruster, Armbruster Goldsmith & Delvac LLP

"By decreasing the amount of time spent on corrections-resubmittals, this does save time and money, at least 30% in savings."

Tina Y. Choi-Nelson, Principal, Tchoi & Associates

"The parallel permitting program is a significant improvement over the standard plan check process and estimated time saving 20-25%, estimated dollars saving 5-15%."

Christian Kienapfel, Architect, LEED, Dipl.-Ing. Architekt, Germany

"Sense of partnership with the plan checker. Sense of "first class" assistance. It saves a great deal of time over the standard, non-expedited, plan check process. On scale of 1 to 10, my experience with the program has been a 10!"

Restaurant & Hospitality Express Program (RHEP)

Open on Schedule!

AR0067886

CO-0001-028

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

Running a restaurant is difficult but opening a restaurant is worse. Prior to the Restaurant & Hospitality Express Program (RHEP), very few restaurants opened on schedule due to the permitting and construction complexities.

RHEP, comprised of 5 LADBS staff (4 inspectors and 1 engineer), was created to provide an assistance program tailored to streamline the permitting and inspection approval process for food service establishments to ensure TIMELY OPENING.

A multi-agency network led by LADBS (4 LADBS inspectors and 1 with the following agencies works collaboratively with the design/construction teams:

- County Health
- Sanitation
- Fire
- Planning
- Bureau of Engineering

CO-0001-029

AR0067887

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

RHEP has improved the procedure :

- Developed an over-the-counter plan check review.
- Created policies to eliminate inspection inconsistencies.
- Standardized referral procedures among agencies.

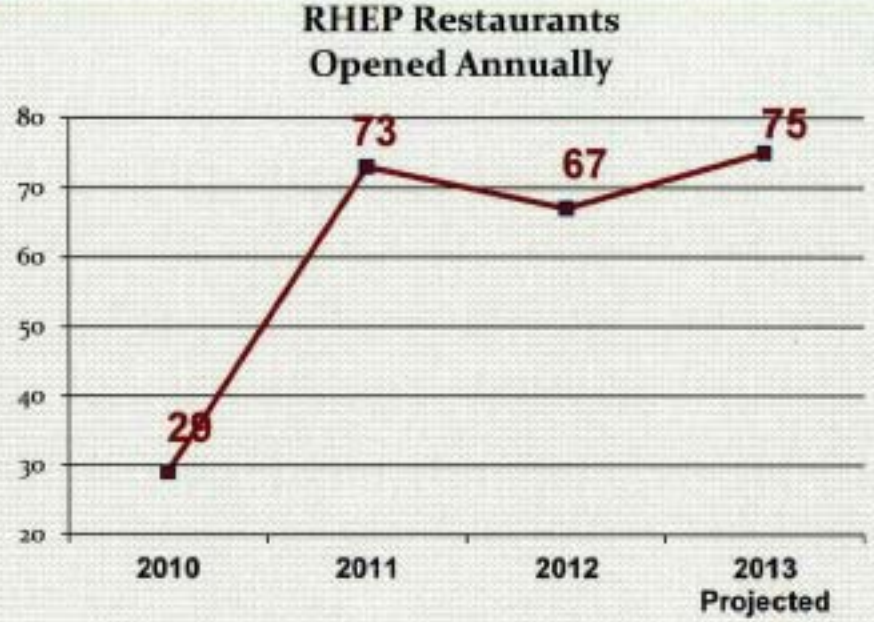
RHEP also assists restaurant projects throughout the entire development process:

- **Design Phase:**
  - Clarify code requirements and solve foreseeable issues
  - Determine permit cost.
- **Permitting Phase:**
  - Assign one plan check staff to perform counter plan check.
  - Assist project to obtain signoffs from other agencies.
- **Construction Phase:**
  - Resolve construction issues and conflicts.
  - Schedule inspection to meet completion timeline.

CO-0001-030

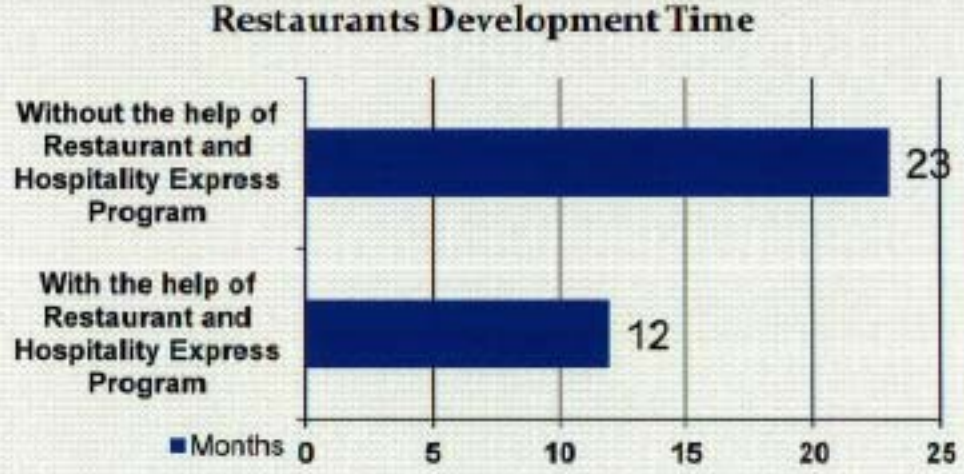
AR0067888

LA DBS
DEPARTMENT OF BUILDING AND SAFETY



206 RHEP restaurants were opened on schedule stimulating the economy and creating new jobs.

These RHEP restaurants saved approximately 6 to 18 months during the Design, Permitting, and Construction phases.



CO-0001-031

AR0067889

Testimonials

Due to its success, RHEP has been featured in many publications including the L.A. Times, L.A. Business Journal, and Contra Costa Times.

Keith Glassman, Starbucks

"I want to Thank you for all the great work and tremendous customer assistance experience you provide all year long... the LADBS Hospitality program has been instrumental in expediting the plans review process and resolving issues..."

Frank Leon, Chef/Owner

"I wanted to express my personal gratitude as your hospitality program has helped small business owners like myself... Your guidance has truly been instrumental in keeping us on par throughout this entire process"

Matt Karatz, Former Deputy Mayor

"Awesome work Restaurant Express. The Mayor uses your group as a model for better customer assistance in many speeches across town."

DSCP will fill those 'boxes' with services to assist all of our customers.

CO-0001-036

AR0067894

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

The proposed Development Services "Concierge" Program will provide consultation, facilitation, and problem solving services to all Major, Midsize, Small and Special projects throughout the Design, Permitting, and Construction phases. DSCP will include:

Three existing programs:

- Development Services Case Management (DSCM)
- Parallel Design-Permitting Process (PDPP)
- Restaurant & Hospitality Express Program (RHEP)

Two EXPANDED existing programs:

- Expanded DSCM (to cover Midsize and Small projects)
- Expanded PDPP (to cover Midsize projects)

Three NEW programs:

- Inspection Case Management (ICM)
- Weekend Inspection for Single Family Dwellings
- High Tech Fast Track (HTFT)

CO-0001-037

AR0067895

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

Expanded Development Services Case Management

Development Services Case Management Services will be expanded to include Midsize Projects, Small Businesses, and Small Single Dwellings.

Case managers will be available to perform project feasibility studies, coordinate pre-development meetings with other departments, conduct preliminary plan reviews to identify potential building site and code issues, resolve issues arising from design considerations and code requirements, and assist applicants with plan check corrections and the citywide clearance processes.

In addition a **Help Center** will be created to provide Ad Hoc assistance to property owners with their home improvements and additions. The Help Center will provide the same service to small business owners.

CO-0001-038

AR0067896

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

Expanded Parallel Design-Permitting Process

PDPP services will be expanded to include Midsize projects.

With this expansion, the construction valuation of all PDPP projects will be approximately 70% of the total valuation of all development projects.

These PDPP projects , the ones that would contribute the most to jump start the economy and create the most jobs, will be built at least 6 to 9 months faster!

Inspection Case Management (ICM)

The Development Service Case Management assists projects at their Design and Permitting phases.

The ICM program carries the case management concept into the Construction Phase for Major, Midsize, and Small Business projects.

ICM creates a partnership with developers and contractors to facilitate project construction and utilizes a series of "all-hands" meetings to collaborate on solutions to issues standing in the way of project completion.

CO-0001-041

AR0067899

LA DBS
DEPARTMENT OF BUILDING AND SAFETY

ICM Pre-construction Meeting

Before construction starts, the construction team meets with LADBS inspection team to discuss issues such as construction timelines, overlapping inspection disciplines, trade specific questions, off-hour inspections, etc.

ICM Construction Facilitation Meeting

During construction, the two teams meet regularly to discuss and resolve issues such as technical details, plan inconsistencies, code interpretations, correction notices, etc.

ICM Certificate of Occupancy (C/O) Meeting

When a project nears completion and either a Temporary C/O or C/O is on a tight timeline, the two teams meet to discuss final inspections scheduling, fire and life safety systems testing and approvals, equipment listings, etc.

CO-0001-042

AR0067900

Construction Coordinator (funded by the development project)

In construction, time is money. While there are many reasons for construction delay, one common cause is not knowing where or who to contact to resolve an on-site problem when it arises. For examples, the approval of the usage of unapproved materials, unexpected change of inspection scheduling, etc.

The ICM includes the assignment of a Construction Coordinator (an LADBS senior inspector) to a project who will provide full time , on-site service to the construction teams.

The ICM Coordinator will be a facilitator, pathfinder, and problem-solver, who serves the project by accessing and coordinating a variety of departmental resources to resolve any construction and inspection related issues within a minimal amount of time.

The Construction Coordinator will be funded by the project.

Weekend Inspection for Single Family Dwellings

Currently, inspections for single-family dwellings are available only during normal business hours from Monday through Friday.

Owners or tenants may have to take time off work or assign someone to wait at home for the inspectors to show up.

With Weekend Inspection, inspection services will be available on weekends for minor construction work:

- building, plumbing, mechanical and electrical repairs
- replacement of fixtures and mechanical equipment

This program will give single family dwelling owners or tenants the flexibility of receiving inspection service during weekends instead of taking time off work.

High Tech Fast Track (HTFT)

With the best weather and a large talent pool educated by the many outstanding universities in the region, L. A. is becoming a hot spot for High Tech companies (clean energy, information, telecommunications).

HTFT can help to attract these High Tech companies through its services (similar to the RHEP's):

- **Design Phase:**
  - Clarify code requirements and solve foreseeable issues
  - Determine permit cost.
- **Permitting Phase:**
  - Assign 1 plan check staff to perform counter plan check.
  - Assist project to obtain signoffs from other agencies.
- **Construction Phase:**

Table of Public Benefits

DA Section and Page Number	Benefit Component	Timing	First Phase	Initial East Parcel/West Parcel Phase
	Labor/Hiring and Wage Components			
§3.1.3.1 Pg. 11	1. **Project Labor Agreement** – Developer shall enter into a "Project Labor Agreement" that will identify the construction trade union(s) as the primary source of all craft labor employed on the Project.	Developer must enter into agreement prior to issuance of a building permit for each Phase of the Project.		
§3.1.3.2 Pg. 11	2. **Local Hiring** – For each Phase of the Project Developer shall implement an apprenticeship and zip code identification program to prioritize local source hiring for Project construction from the 13th Council District.	A report detailing demographic information on the Project's workers shall be included as a part of the Annual Review.	Program shall be prepared no later than six months before start of construction of First Phase.	
§3.1.3.3 Pg. 12	3. **Construction Trades Prevailing Wage** - Construction workers employed in the construction of each Phase of the Project shall be paid no less than the prevailing wage as determined by the provisions of Sections 1770 et seq. of the California Labor Code	Proof of compliance shall be submitted prior to the issuance of any certificate of occupancy for the Project.		
	Transportation Improvements			
§3.1.3.5(a) Pg. 12	4. **Circulation Shuttle** Developer shall operate a shuttle service, providing "on call" service between the Project and residential areas within a two mile radius. Developer shall not be obligated to spend more than $50,000 per year for the operation of service.	The Developer shall demonstrate how it has implemented the program in the Annual Review.	Prior to issuance of final certificate of completion for the first Phase, Developer shall procure the shuttle service. Service shall operate during the Term of the Development Agreement (the "DA")

AR0067908

DA Section and Page Number	Benefit Component	Timing	First Phase	Initial East Parcel/West Parcel Phase
§3.1.3.5(b) Pg. 13	5. **Bicycle Amenities Plan** Developer shall maintain a kiosk or tenant space of at least 200 square feet for bicycle repair services. This space is in addition to bicycle parking facilities required by the Development Regulations.	Developer shall demonstrate to the Planning Director how it has implemented the program in the Annual Review.	Provision of bicycle amenities shall commence upon issuance of a final certificate of occupancy for First Phase and thereafter for the Term of the DA	The East and West Portion Phase shall include dedicated bicycle ways and wayfinding signage between public streets and the facilities.
§3.1.3.5(c) Pg. 13	E. **Linkages to future public transit services** – Developer shall: a. Install directional signage showing pedestrian routes to all public transportation access points within a four block radius of the Project. b. Provide $20,000 to the Department of Transportation for the installation of directional signage at the DASH access point nearest the Project, and c. Provide $25,000 to Metro for directional signage for pedestrian routes between public transportation access points and the Project.		Proof of payment of the Transit Linkage Payments shall be submitted to the Planning Director prior to the issuance of a final certificate of occupancy for the First Phase of the Project.

I. **Additional Benefits Proposed to be Included in the Conditions of Approval**

Benefit Component	Requested by:
1. **Pedestrian Improvements Contribution** – Developer shall provide funding in the amount of $50,000 to the Bureau of Street Services, or as otherwise directed by the City, for renovation and upkeep of the Walk of Fame stars and terrazzo, sidewalks and other public streetscape improvements.	*Planning, CD 13 Council Office*
2. **Skate Park** – Developer contribute lesser of estimated cost or $50,000 toward improvement of a community skate park, subject to City's acquisition of a site.	*CHNC*
3. **Central Hollywood Design Overlay** – If requested by City, Developer will contribute $125,000 toward completion of Central Hollywood Design Overlay pursuant to Hollywood Community Plan Policy LU 2.5.1 or other Planning undertaking	*CHNC*

Benefit Component	Requested by:
4. **Hollywood Sign Protection Fund –** Following installation of 410+ foot building, Developer shall make contributions to the Hollywood Sign Trust, a California non-profit corporation, in the amount of $500 per residential dwelling unit in such Phase and subsequent Phases, which contribution shall be payable with respect to each unit within thirty (30) days after the earlier of the initial sale or lease thereof.	*CHNC, CD 4 Council Office, CD 13 Council Office, Planning*
5. **Music and Arts Programming –** For a fifteen (15) year term starting upon issuance of the certificate of occupancy for the final phase of construction for the Project, Developer shall work with the 13th Council District to develop a plan for publicly accessible music and arts programming within the Project which may include such elements as art installations, whether temporary or permanent, changeable exhibition cabinets, or other artistic and musical performances at the Project Site. Programming will be developed in consultation with the City's Cultural Affairs Department, the Hollywood Arts Council, and the Hollywood Business Improvement District. Developer will pay for all costs associated with such programming.	*CD 13 Council Office, Planning*

Benefit Component	Requested by:
1. **Project Information** - Upon issuance of building permits but no less than sixty (60) days prior to the commencement of construction of new improvements. Developer will notify the 13th Council District of the development activity for which permits have been issued including proposed uses for such improvements and anticipated duration of construction. To the extent requested by the 13th Council District, Developer shall hold a public meeting for interested members of the public regarding the construction schedule for and ultimate uses of such improvements for which permits have been issued.	***CD 13 Council Office***

DEVELOPMENT AGREEMENT

This DEVELOPMENT AGREEMENT ("**Agreement**") is executed this _____day of _____, _____, 2013, by and among the CITY OF LOS ANGELES, a municipal corporation (the "**City**"), 1720 NORTH VINE, LLC, a Delaware limited liability company ("**1720 Owner**"), 1749 NORTH VINE STREET LLC, a Delaware limited liability company ("**1749 Owner**"), 1750 NORTH VINE LLC, a Delaware limited liability company ("**Capitol Records Building Owner**"), 1733 NORTH ARGYLE LLC, a Delaware limited liability company ("**Argyle Owner**"; and collectively with the 1720 Owner, the 1749 Owner, and the Capitol Records Building Owner, the "**Property Owners**"), and MILLENNIUM HOLLYWOOD LLC, a Delaware liability company (collectively with the Property Owners, "**Developer**"), pursuant to California Government Code Section 65864 et seq., and the implementing procedures of the City, with respect to the following:

RECITALS

WHEREAS, the City and Developer recognize that the further development of the Property will create significant opportunities for economic growth in the City of Los Angeles, the Southern California region and California generally;

WHEREAS, Developer wishes to obtain reasonable assurances that the Project, as defined below, may be developed in accordance with the Project Approvals, as defined below, and the terms of this Agreement;

WHEREAS, Developer will implement public benefits above and beyond the necessary mitigation for the Project, including benefits and other consideration as noted in Section 2.3.1,

WHEREAS, this Agreement is necessary to assure Developer that the Project will not be reduced in density, height, or use, or be subjected to new rules, regulations, ordinances, or policies unless otherwise allowed by this Agreement;

WHEREAS, by entering into this Agreement, the City is encouraging the development of the Project as set forth in this Agreement in accordance with the goals and objectives of the City, while reserving to the City the legislative powers necessary to remain responsible and accountable to its residents; and

WHEREAS, Developer intends to redevelop the 4.46-acre site (the "**Property**"), as set forth in **Exhibits A-1** and **A-2** attached hereto, located at 1720, 1722, 1724, 1730, 1740, 1745, 1749, 1750, 1751, 1753, 1760, 1762, 1764, 1766, 1768, and 1770 N. Vine Street; 6236, 6270, and 6334 W. Yucca Street; 1733 and 1741 N. Argyle Avenue; and 1746, 1748, 1754, 1760, and 1764 N. Ivar Avenue, Los Angeles, California 90028;

WHEREAS, Developer anticipates that the Project will be completely built-out and operational by the year 2020, but is requesting a longer term in this Agreement to allow sufficient time for development in the unlikely event of delays caused by unforeseen economic conditions and other unforeseen factors such as, but not limited to, unanticipated site conditions and the unavailability of materials or labor shortages;

WHEREAS, for the foregoing reasons, the Parties desire to enter into a development agreement for the Project pursuant to the Development Agreement Act, as defined below, and the City's charter powers upon the terms and conditions set forth herein.

AGREEMENT

NOW, THEREFORE, pursuant to the authority contained in the Development Agreement Act, as it applies to the City, and in consideration of the premises and mutual promises and covenants herein contained and other valuable consideration the receipt and adequacy of which the Parties hereby acknowledge, the Parties agree as follows:

1. DEFINITIONS.

For all purposes of this Agreement, except as otherwise expressly provided or unless the context requires:

1.1 "**Agreement**" means this Development Agreement, including all exhibits attached hereto and all amendments and modifications hereto.

1.2 "**Applicable Rules**" means all of the rules, regulations, ordinances and officially adopted policies of the City in force as of the Effective Date, including, but not limited to, the Municipal Code, this Agreement (including the Development Regulations and all other attachments hereto) and Project Approvals. Additionally, notwithstanding the language of this Section or any other language in this Agreement, all specifications, standards and policies regarding the design and construction of public works facilities, if any, shall be those that are in effect at the time the applicable Project plans are being processed for approval and/or under construction but only to the extent not inconsistent with the Development Regulations or this Agreement.

1.3 "**Argyle Owner**" means 1733 North Argyle LLC, a Delaware limited liability company.

1.4 "**Assignment Agreement**" means a written agreement between Developer (or any of them) and a Transferee of Developer (or any of them), consistent with the terms of this Agreement, in which the parties agree to specific obligations of this Agreement being transferred from such Developer to such Transferee. An Assignment Agreement may, but shall not be required to, allocate to the Transferee for its portion of the Property a defined portion of the Maximum Floor Area.

1.5 "**Capitol Records Building Owner**" means 1750 North Vine LLC, a Delaware limited liability company.

1.6 "**CEQA**" means the California Environmental Quality Act (Cal. Public Resources Code Sections 21000 et seq.) and the State CEQA Guidelines (Cal. Code of Regs., Title 14, Sections 15000 et seq.).

1.7 "**City**" means the City of Los Angeles, a charter City and municipal corporation.

AR0067924

1.8 "**City Agency**" means each and every agency, department, board, commission, authority, employee, and/or official acting under the authority of the City, including without limitation, the City Council and the Planning Commission.

1.9 "**City Council**" means the City Council of the City and the legislative body of the City pursuant to Section 65867 of the California Government Code.

1.10 "**Conditions of Approval**" means the conditions of approval issued in connection with the Project Approvals.

1.11 "**Development Parameters**" means, collectively, the Development Regulations and the Equivalency Program.

1.12 "**Development Regulations**" means the Millennium Hollywood, Development Regulations: Design Guidelines and Standards attached as **Exhibit B**.

1.13 "**Developer**" means, collectively or individually, as applicable, 1720 Owner, 1749 Owner, Capitol Records Building Owner, and Millennium Hollywood LLC, a Delaware liability company, and all of their respective Transferees.

1.14 "**Development Agreement Act**" means Article 2.5 of Chapter 4 of Division 1 of Title 7 (Sections 65864 et seq.) of the California Government Code.

1.15 "**Discretionary Action**" means an action which requires the exercise of judgment, deliberation, or a decision on the part of the City and/or any City Agency, including any board, commission, or department or any officer or employee thereof, in the process of approving or disapproving a particular activity, as distinguished from an activity which merely requires the City and/or any City Agency, including any board, commission or department or any officer or employee thereof, to determine whether there has been compliance with statutes, ordinances, or regulations.

1.16 "**EIR**" means the Environmental Impact Report for the Project, State Clearinghouse No. ENV-2012-____-EIR-__, certified by the City in accordance with the requirements of CEQA.

1.17 "**Effective Date**" is the date on which this Agreement is attested by the City Clerk of the City of Los Angeles after execution by Developer and the Mayor of the City of Los Angeles.

1.18 "**Equivalency Program**" means the land use equivalency program, as more fully described in Section 3.2.5 of this Agreement and the Project Approvals, which allows land uses to be developed on the Property to be exchanged among the permitted land uses so long as the limitations of such equivalency program are satisfied and do not exceed the analyzed upper levels of environmental impacts that are identified in the EIR or exceed the Maximum Floor Area. All permitted land use increases can be exchanged for corresponding decreases of other permitted land uses on the Property under the Equivalency Program once the maximum FAR is reached.

1.19 "**Existing Improvements**" means the existing buildings, structures and improvements located within the Property, consisting only of the Capitol Records Building, the Gogerty Building, and parking facilities as of the Effective Date or replaced pursuant to this Agreement.

1.20 "**Fees**" means Impact Fees, Processing Fees and Charges and any other fees or charges imposed or collected by the City.

1.21 "**Floor Area**" means the floor area of the improvements, as measured by the City pursuant to Section 12.03 of the Los Angeles Municipal Code.

1.22 "**General Plan**" means the General Plan of the City.

1.23 "**Impact Fees**" means impact fees, linkage fees, exactions, assessments or fair share charges or other similar impact fees or charges imposed on and in connection with new development by the City pursuant to rules, regulations, ordinances and policies of the City set forth in the Applicable Rules. Impact Fees do not include (i) Processing Fees and Charges or (ii) other City-wide fees or charges of general applicability, provided that such City-wide fees or charges are not imposed on impacts of new development.

1.24 "**include**","**including**", "**includes**" in each instance will be deemed to be followed by the phrase "without limitation".

1.25 "**Litigation**" means any lawsuit (including any cross-action) filed against the City and/or Developer to the extent such lawsuit challenges the validity, implementation or enforcement of or seeks any other remedy directly relating to, all or any part of this Agreement, the EIR and/or the Project Approvals.

1.26 "**Ministerial Permits and Approvals**" means the permits, approvals, plans, inspections, certificates, documents, licenses, and all other actions required to be taken by the City in order for Developer to implement and construct the Project. Ministerial Permits and Approvals shall not include any Discretionary Actions.

1.27 "**Mitigation Measures**" means the mitigation measures set forth in the EIR for each potential environmental impact of the Project and set forth in the mitigation monitoring program adopted as a condition of approval of the EIR and/or Project Approvals.

1.28 "**Mortgage**" means any mortgage, deed of trust, pledge, encumbrance, sale leaseback, or other security interest granted to a person, made in good faith and for fair value, encumbering all or any part of the Developer Property or Developer's interest in this Agreement, given by Developer for the purpose of obtaining Financing for the acquisition of land within the Property or any portion thereof, the construction of any improvements thereon, or any other purpose.

1.29 "**Mortgagee**" means any (i) the holder of any Mortgage (including, as applicable, any administrative agent), (ii) beneficiary under any Mortgage, and/or (iii) with respect to any parcel in the Project which is the subject of a sale-leaseback transaction, the person acquiring fee title under a Mortgage who has delivered a Mortgagee Notice to the City as provided in Section

AR0067926

6.1.4 of this Agreement, including the successors and assigns of any such holder, beneficiary or lessor.

1.30 "**Mortgagee Successor**" is defined in Section 6.1.4 of this Agreement.

1.31 "**Municipal Code**" means, as applicable, the Los Angeles Municipal Code as the same may exist from time to time during the term of this Agreement, or, when used in the context and within the meaning of the Applicable Rules, the Los Angeles Municipal Code as of the Effective Date of this Agreement.

1.32 "**Parties**" means collectively Developer and the City.

1.33 "**Party**" means any one of Developer or the City.

1.34 "**Phase**" shall have the meaning described in Section 3.2.1 of this Agreement.

1.35 "**Planning Commission**" means the City Planning Commission and the planning agency of the City pursuant to Section 65867 of the California Government Code (Development Agreement Act).

1.36 "**Planning Director**" means the Director of Planning for the City or his or her designee.

1.37 "**Proceeding**" is defined in Section 7.9.1.

1.38 "**Processing Fees and Charges**" means all processing fees and charges required by the City or any City Agency including, but not limited to, fees for land use applications, project permits, building application, building permits, grading permits, encroachment permits, tract or parcel maps, lot line adjustments, air right lots, street vacations and certificates of occupancy which are necessary to accomplish the intent and purpose of this Agreement. Expressly exempted from Processing Fees and Charges are all Impact Fees which may be imposed by the City on development projects pursuant to laws enacted after the Effective Date, except as specifically provided for in this Agreement. Processing Fees and Charges include those linkage fees, impact fees, and exactions which are in effect as of the Effective Date, the amounts of which are subject to ongoing annual increases which shall be calculated at time of payment. The amount of the Processing Fees and Charges to be applied in connection with the development of the Project shall be the amount which is in effect on a City-wide basis at the time an application for the City action is made unless an alternative amount is established by the City in a subsequent agreement.

1.39 "**Project**" means a mixed-use development described in greater detail in the Project Approvals and the Development Regulations.

1.40 "**Project Approvals**" those Discretionary Actions authorizing the Project which have been requested by Developer and approved by the City and which are comprised of (1) Vesting Zone Change and Height District removal of the "D" Limitation from C4-2D-SN to C2-2-SN per Municipal Code Section 12.32 F and 12.32Q and Ordinance 165,659-SA 180; (2) Vesting Conditional Use Permit to allow a hotel use within five hundred feet of a R Zone per

Municipal Code Section 12.24.W.24 and 12.24.T; (3) Conditional Use Permit for floor area ratio averaging in a unified development per Municipal Code Section 12.24.W.19; (4) the Conditional Use Permit for beverage with full alcohol, live entertainment and dancing per Municipal Code Sections 12.24.W.1 and 12.24.W.18.a; (5) Variance from Municipal Code Section 12.14.A.1(a)(10) for restaurants with outdoor eating areas above the ground floor per Municipal Code § 12.27; (6) Variance from Municipal Code Section 12.21.A.4(c)(2) to reduce parking required for sports club facility per Municipal Code § 12.27; (7) Authority for Reduced On-Site Parking with Remote Off-site Parking or Transportation Alternatives; (8) Site Plan Review for a project that creates a maximum of 1,116,000 square feet of development on a 4.4 acre site; and (9) the subdivision of the Property pursuant to the Vesting Tentative Tract Map dividing the Property into 2 grounds lots and 39 "air space" lots, and providing for further subdivision of up to 4 such air space lots into a maximum 897 condominium units.

1.41 "**Property**" shall have the meaning in the sixth Recital, is depicted on the Development Site Map attached hereto as **Exhibit** A-1, and is legally described in **Exhibit A-2** attached hereto. Notwithstanding the foregoing, prior to acquisition of the Third Party Property by Developer, the Property shall not include the Third Party Property.

1.42 "**Reserved Powers**" means the rights and authority excepted from this Agreement's restrictions on the City's police powers and which are instead reserved to the City. The Reserved Powers include the powers to enact regulations or take future Discretionary Actions after the Effective Date of this Agreement that may be in conflict with the Applicable Rules and Project Approvals, but: (1) are necessary to protect the public health and safety, and are generally applicable on a City-wide basis (except in the event of natural disasters as found by the City Council such as floods, earthquakes and similar acts of God); (2) are amendments to Chapter IX of the Los Angeles Municipal Code Section 91.0101 et seq. (Building Code) or Chapter V of the Los Angeles Municipal Code Section 57.01.01 et(Fire Code) regarding the construction, engineering and design standards for private and public improvements and which are (a) necessary to the health and safety of the residents of the City, and (b) are generally applicable on a Citywide basis (except in the event of natural disasters as found by the Mayor or The City Council such as floods, earthquakes, and similar acts of God); (3) are necessary to comply with state or federal laws and regulations (whether enacted previous or subsequent to the Effective Date of this Agreement) as provided in Section 3.2.3.3 or; (4) constitute Processing Fees and Charges imposed or required by the City to cover its actual costs in processing applications, permit requests and approvals of the Project or in monitoring compliance with permits issued or approvals granted for the performance of any conditions imposed on the Project, unless otherwise waived by the City.

1.43 "**Term**" means the period of time for which this Agreement shall be effective in accordance with Section 7.2 hereof.

1.44 "**Third Party Property**" means the portion of the Property that is not owned by Developer as of the Effective Date, which property is depicted on the Development Site Map attached hereto as **Exhibit A-1** and is legally described on **Exhibit A-3** attached hereto.

1.45 "**Transferee**" means individually or collectively, Developer's successors in interest, assignees, or transferees of all or any portion of the Property, which may include Mortgagees and/or Mortgagee Successors.

1.46 "**Vesting Tentative Tract Map**" means Vesting Tentative Tract Map No. 17834 approved by the City on _____, ____, _____, ___, 2053, dividing the Property into 2 grounds lots and 39 "air space" lots, and providing for further subdivision of up to 4 such air space lots into a maximum 897 condominium units.

1.47 "**1720 Owner**" means 1720 North Vine LLC, a Delaware limited liability company.

1.48 "**1749 Owner**" means 1749 North Vine LLC, a Delaware limited liability company.

2. RECITALS OF PREMISES, PURPOSE, AND INTENT.

2.1 State Enabling Statute. To strengthen the public planning process, encourage private participation in comprehensive planning and reduce the economic risk of development, the Legislature of the State of California adopted the Development Agreement Act which authorizes any the City to enter into binding development agreements establishing certain development rights in real property with persons having legal or equitable interests in this property. Section 65864 of the Development Agreement Act expressly provides as follows:

> "The Legislature finds and declares that:
>
> "(a) The lack of certainty in the approval of development projects can result in a waste of resources, escalate the cost of housing and other development to the consumer, and discourage investment in and a commitment to comprehensive planning which would make maximum efficient utilization of resources at the least economic cost to the public.
>
> (a) (b) Assurance to the applicant for a development project that upon approval of the project, the applicant may proceed with the project in accordance with existing policies, rules and regulations, and subject to conditions of approval will strengthen the public planning process, encourage private participation in comprehensive planning, and reduce the economic cost of development.
>
> (b) (c) The lack of public facilities, including, but not limited to, streets, sewerage, transportation, drinking water, school, and utility facilities, is a serious impediment to the development of new housing. Whenever possible, applicants and local governments may include provisions in agreements whereby applicants are reimbursed overtime for financing of public facilities."

Notwithstanding the foregoing, to ensure that the City remains responsive and accountable to its residents while pursuing the benefits of development agreements contemplated by the

Legislature, the City: (1) accepts restraints on its police powers contained in development agreements only to the extent and for the duration required to achieve the mutual objectives of the Parties; and (2) to offset these restraints, seeks public benefits which go beyond those obtained by traditional City controls and conditions imposed on development project applications.

2.2 **City Procedures and Actions.The City Planning Commission Action**. The City Planning Commission held a duly noticed public hearing, and recommended approval of this Agreement on _____ , 2013.

2.2.2 The City Council Action. The City Council on _____, 2013, after conducting a duly-noticed public hearing, adopted Ordinance No. _____, to become effective on the thirty-first day after publication, or on the forty-first day after posting, approving this Agreement, found that its provisions are consistent with the City's General Plan, the Hollywood Community Plan, and the Municipal Code, and authorized the execution of this Agreement.

2.3 Purpose of This Agreement.

2.3.1 Public Benefits. This Agreement provides assurances that the public benefits identified below, which are additional consideration for this Agreement, will be achieved and developed in accordance with the Applicable Rules and Project Approvals and with the terms of this Agreement and subject to the City's Reserved Powers. The Project will provide local and regional public benefits to the City, including without limitation (i) promote Hollywood and its commercial corridor; (ii) increased sales tax, property tax, and future transient occupancy tax revenues; (iii) promote tourism and business expansion and relocation in Hollywood, the City and the region; (iii) provide temporary and permanent jobs to improve the local and regional economy; (iv) provide the density necessary to support a new mix of uses in close proximity to mass transit; and other benefits as contained in Section 3.1.4. The Project will contribute positively to the City by providing a vibrant project with a variety of land uses, which will serve to increase the level of activity necessary to sustain Hollywood as a regional center and create new jobs and increase City tax revenues.

2.3.2 Developer Objectives. In accordance with the legislative findings set forth in the Development Agreement Act, and with full recognition of the City's policy of judicious restraints on its police powers, Developer wishes to obtain reasonable assurances that the Project may be developed in accordance with the Applicable Rules and Project Approvals and with the terms of this Agreement and subject to the City's Reserved Powers. In the absence of this Agreement, Developer would have no assurance that it can complete the Project for the uses and to the density and intensity of development set forth in this Agreement and the Project Approvals. This Agreement, therefore, is necessary to assure Developer that the Project will not be (1) reduced or otherwise modified in density, intensity or use from what is set forth in the Project Approvals, (2) subjected to new rules, regulations, ordinances, or official policies or plans which are not adopted or approved pursuant to the City's Reserved Powers, or (3) subjected to delays for reasons other than Citywide health and safety enactments related to critical situations such as, but not limited to, the lack of water availability or sewer or landfill capacity.

2.3.3 **Mutual Objectives.** Development of the Project in accordance with this Development Agreement will provide for the orderly development of the Property in accordance with the objectives set forth in the General Plan. Moreover, a development agreement for the Project will eliminate uncertainty in planning for and securing orderly development of the Property, assure installation of necessary improvements, assure attainment of maximum efficient resource utilization within the City at the least economic cost to its citizens and otherwise achieve the goals and purposes for which the Development Agreement Act was enacted. The Parties believe that such orderly development of the Project will provide public benefits, as described in Section 2.3.1, to the City through the imposition of development standards and requirements under the provisions and conditions of this Agreement, including without limitation: increased tax revenues, installation of on-site and off-site improvements, redevelopment of an underutilized site, preservation of the historic Capitol Records building, a grade level pedestrian plaza, a mix of land uses including some or all of the following uses: residential, commercial and office within an existing activity center offering direct proximity to existing public transit and transportation infrastructure, the addition of retail and restaurant uses, approximately 2,900 construction-related jobs, and creation and retention of 1,257 to 3,635 direct and indirect jobs for the City of Los Angeles. Additionally, although development of the Project in accordance with this Agreement will restrain the City's land use or other relevant police powers, this Agreement provides the City with sufficient Reserved Powers during the term hereof to remain responsible and accountable to its citizens. In exchange for these and other benefits to the City, Developer will receive assurance that the Project may be developed during the term of this Agreement in accordance with the Applicable Rules, Project Approvals and Reserved Powers, subject to the terms and conditions of this Agreement.

2.4 **Applicability of the Agreement.** This Agreement does not: (1) grant height, density, or intensity in excess of that otherwise established in the Applicable Rules and Project Approvals; (2) eliminate future Discretionary Actions relating to the Project if applications requiring such Discretionary Action are initiated and submitted by the owner of the Property after the Effective Date of this Agreement; (3) guarantee that Developer will receive any profits from the Project; (4) prohibit the Project's participation (with the consent of Developer, to the extent required under Applicable Rules) in any benefit assessment district that is generally applicable to surrounding properties; or (5) amend the City's General Plan. This Agreement has a fixed Term. Furthermore, in any subsequent Discretionary Actions applicable to the Property or any portion thereof, the City may apply the new rules, regulations and official policies as are contained in its Reserved Powers.

3. AGREEMENT AND ASSURANCES.

3.1 **Agreement and Assurance on the Part of Developer.** In consideration for the City entering into this Agreement, and as an inducement for the City to obligate itself to carry out the covenants and conditions set forth in this Agreement, and in order to effectuate the premises, purposes, and intentions set forth in Section 2.3 of this Agreement, Developer hereby agrees as follows:

3.1.1 **Project Development.** Developer agrees that it will use its commercially reasonable efforts, in accordance with its own business judgment and taking into account market conditions and economic considerations, to undertake development of the Project in accordance

with the terms and conditions of this Agreement, including the Applicable Rules and the Project Approvals. Nothing in this Agreement shall be construed to require Developer to proceed with the construction of or any other implementation of the Project or any portion thereof. In addition, Developer agrees to the following:

(1) Dedication of Land for Public Street Purposes. Provisions for the dedication of land for public purposes are set forth in the conditions of approval of the Project Approvals.

(2) Description of Transportation Improvements. The transportation improvements to be included within the scope of the Project are set forth in the Project Approvals.

(3) Maximum Height of the Project. The maximum height of the Project shall not exceed 585 feet and the Project shall comply with and be limited as set forth in the Project Approvals.

(4) Maximum Floor Area of the Project. The maximum Floor Area ("**Maximum Floor Area**") of the Project shall not exceed 1,166,970 net square feet (inclusive of Existing Improvements that are retained) and the Project shall comply with and be limited as set forth in the Project Approvals.

3.1.2 Timing of Development. Developer may construct the Project in any number of phases (each a "**Phase**") as Developer determines on the Property, consistent with the Applicable Rules and the Project Approvals. The parties acknowledge that Developer cannot at this time predict when or at what rate the Property would be developed. These decisions depend upon numerous factors that are not all within the control of Developer, such as market orientation and demand, availability of financing, and competition. Because the California Supreme Court held in Pardee Construction Co. v. The City of Camarillo, 37 Cal. 3d 465 (1984), that the failure of the parties therein to provide for the timing of development permitted a later adopted initiative restricting the timing of development and controlling the Parties' agreement, Developer and the City do hereby acknowledge and provide for the right of Developer to develop the Project in an order and at a rate and times as Developer deems appropriate within the exercise of its sole and subjective business judgment, subject to any restrictions that may exist in the Project Approvals. The City acknowledges that this right is consistent with the intent, purpose, and understanding of the Parties to this Agreement.

3.1.3 Additional Obligations of Developer as Consideration for this Agreement. In addition to the obligations identified in Sections 2.3.1 and 3.1.1 of this Agreement, in consideration for the City entering into this Agreement, and as an inducement for the City to obligate itself to carry out the covenants and conditions set forth in this Agreement, and in order to effectuate the premises, purposes and intentions set forth in Section 2 of this Agreement, Developer hereby agrees as follows:

3.1.3.1 Project Labor Agreement. Developer shall, or shall cause its Contractor to, enter into a "**Project Labor Agreement**" (herein so called) with the Building and Construction Trades Council for each Phase of the Project prior to the issuance of a building

permit for such Phase. The purpose of each Project Labor Agreement will be to promote efficiency of construction operation during the construction of such Phase and provide for the orderly settlement of labor disputes and grievances without strikes or lockouts, thereby assuring timely and economical completion of such Phase and the balance of the Phase. Additionally, the Project Labor Agreement will reflect a commitment by all parties to diversity in the workforce hiring that reflects levels of minority, women and other worker utilization at levels which are representative of the relevant workforce of these groups in the Greater Los Angeles Area. The Project Labor Agreement will serve to identify the construction trade union(s) as the primary source of all craft labor employed on the Phase of the Project. The union(s) will use their best efforts to recruit and identify individuals, particularly residents of the City of Los Angeles, for entrance into joining labor/management apprenticeship programs and to assist individuals in qualifying and becoming eligible for such programs.

3.1.3.2 Local Hiring. Developer shall work with the local construction trades and implement an apprenticeship and zip code identification program to prioritize local source hiring for Project construction from the 13th Council District of the City of Los Angeles, with priority given to construction workers from such area. This program shall be prepared in consultation with the Planning Department, no later than six months prior to the commencement of construction of the first Phase of the Project. Thereafter, on an annual basis as part of the required Annual Review for any year during which construction activity occurred, a report detailing the demographic and geographic information of the Project's construction workers shall be included.

3.1.3.3 Construction Trades Prevailing Wage. Construction workers employed in connection with the construction of the Project including core and shell construction shall be paid no less than the prevailing rate of wages as determined pursuant to the provisions of Sections 1770 et seq. of the California Labor Code. Developer shall submit proof of compliance with this obligation prior to the issuance of any certificate of occupancy for the Project.

3.1.3.4 Community Organization Space. Developer shall provide up to 1,200 square feet of meeting space at the Project for use by Hollywood and community non-profit groups including, but not limited to, the local Neighborhood Council and other civic organizations, during reasonable business hours, as available. Subject to availability, meeting space shall be provided to accommodate small gatherings, such as regularly scheduled community meetings, for a maximum of 50 occurrences per year. Subject to availability, groups shall be provided with access to such space if they schedule at least 30 days in advance, pay a refundable $500 deposit to hold the space, and provide a nominal flat clean up fee of $300. Developer shall establish and operate a reservation system whereby community groups can reserve the meeting space as available. This requirement shall include only the use of space and shall not include Developer's provision of security, food, beverage, equipment or other materials. The meeting space will be included in one of the Project buildings and, subject to availability, may also be used by residents, tenants, or others in the Project. The foregoing requirement is not intended to create a property right for any group or the City with respect to any particular space within the Project, and the location of any meeting space in the Project may be changed at Developer's discretion from time to time.

3.1.3.5 Transportation Improvements. Developer shall provide the following transportation related benefits:

(a) Circulator Payment. Developer shall provide funding in the amount of One Hundred Thousand Dollars ($100,000) (the "**Circulator Payment**") to the City or its designee toward development of local small bus shuttle service to promote multi-modal transportation alternatives and facilitate pedestrian traffic among the Project and designated areas within the Hollywood area including publicly accessible parking lots and structures in Hollywood and the hillside community north of the Project Site. Proof of payment of the Circulator Payment shall be submitted to the Planning Director prior to issuance of a final certificate of occupancy for the first Phase of the Project.

(b) Bicycle Amenities Plan. Commencing upon issuance of a final certificate of occupancy for the second Phase of the Project, thereafter during the Term of this Agreement, Developer shall provide or cause to be provided bicycle amenities within the second Phase of Project, including short term bicycle storage racks, long term bicycle storage, a kiosk or tenant space of not less than 100 square feet for the provision by a tenant of bicycle repair services, dedicated bicycle ways between the public streets and such facilities, and wayfinding signage directing bicycle users to such facilities. The final location of such bicycle facilities shall be mutually agreeable to Developer and the Director of Planning, in their reasonable discretion.

(c) Linkages to Future Public Transit Services. Developer shall provide funding in the amount of Fifty Thousand Dollars ($50,000) (the "**Transit Linkage Payment**") to the City or its designee toward development of connection mechanisms from the Project to public transit services constructed or implemented after the Effective Date, including wayfinding signage, within 1,000 yards of the Property. Such payment will be a condition to the next Phase of the Project constructed by Developer following the earlier to occur of (i) commencement of construction by City, Metro or otherwise of any such connection mechanisms that are improvements or (ii) commencement of service City, Metro or otherwise of any such connection mechanisms that are services, such as bus routes. Proof of payment of the Transit Linkage Payment shall be submitted to the Planning Director prior to issuance of a final certificate of occupancy for such Phase of the Project.

(d) Parking Tracking Services. Developer shall provide a fixed-fee contribution to supplement the City Department of Transportation's Express Park program that will provide new parking meter technology, vehicle sensors, a central management system, and real-time parking guidance for motorists in the vicinity of the Project. The contribution shall be in the amount of Fifty Thousand Dollars ($50,000) to be paid to the City Department of Transportation and made prior to issuance of the final certificate of occupancy for the second Phase of the Project.

(e) Vine Street and Metro Connections. Developer shall engage an urban planning and architectural firm reasonably acceptable to the Director of Planning and the 13th Council District Councilmember to prepare a study of the design, efficacy, potential cost, feasibility and impact on vehicular and pedestrian circulation of a portal north of Hollywood Boulevard into the Hollywood Boulevard/Vine Street Metro Station. Such study shall be completed and delivered to the Department of Planning not later than, and as a condition to, the issuance of the first building permit for the first Phase of the Project.

(f) Metro Passes. Commencing upon issuance of a final certificate of occupancy for the first Phase of the Project, thereafter during the Term of this Agreement, Developer shall provide within the Project, either by machine or through its management office, for the sale of Los Angeles County Metropolitan Transportation Authority ("**Metro**") passes to Project residents, tenants and their employees. Developer will use its commercially reasonable efforts to obtain a discount from Metro for such passes.

(g) Monthly Parking Leases for Metro Commuters. Commencing upon issuance of a final certificate of occupancy for the first Phase of the Project, thereafter during the Term of this Agreement, Developer shall provide, within each publicly accessible parking area in the Project, not less than ten (10) "Park and Ride" spaces for monthly lease to persons who are not tenants or occupants of the Project who use the spaces and then transfer to Metro commuter train or bus for transportation to their place of employment. Developer shall establish and maintain a monitoring and reporting program to reasonably assure that such parking continue to meet such condition.

3.1.3.6 Protection of Capitol Records Building, Recording Studios and Echo Chambers. As a condition to issuance of a building permit for the first Phase of the Project on the East Parcel (which area is depicted on Exhibit A-1 attached hereto), Developer shall prepare and submit to the Department of Building and Safety for its approval a written adjacent structure monitoring plan to ensure that construction will not damage the Capitol Records Building, including the recording studios and underground echo chambers therein. Approval of such plan may be issued by the Director of Building and Safety, in his or her reasonable discretion. The Director shall not withhold its approval of the proposed plan if an officer of EMI Music Ltd. dba Capitol Records, or the then tenant of the portions of the Capitol Records Building containing such recording studios and echo chambers ("**Capitol Records**") submits written confirmation that Capitol Records has approved such plan. Following its approval, such plan shall be implemented during construction of all improvements on the East Parcel.

3.1.3.7 Public Performances, Music and Arts Programming. After issuance of a final certificate of completion for the Phase of the Project which includes the open public space to be constructed adjacent to the existing Jazz Mural (the "**Art Plaza**"), for a period equal to the lesser of ten (10) years or the remaining term of this Agreement, Developer shall conduct within the Art Plaza at least four (4) public events per year, which may include musical, dramatic, comedic and/or dance performances, and art exhibitions. Developer will pay for all

costs associated with such public events, including planning, promotion, security, cleanup and insurance. Developer will obtain all permits required pursuant to applicable law, including assembly permits as may be required by the Municipal Code, in connection with each such public event. Developer will reasonably consider, but will not be bound to conduct, public events suggested by City and/or City Agencies. An annual schedule of such public events will be provided by Developer to the City Agency designated by the City to oversee such events. The foregoing will all be conducted at Developer's sole cost and expense.

3.1.3.8 Parking Access Management System. Developer shall provide a parking access management system containing, among other things, overhead illuminated signs for each exit/entry driveway from public streets into non-residential parking areas of the Project. The final size and design of such parking access management system shall be mutually agreeable to Developer and the Director of Planning, in their reasonable discretion.

3.1.3.9 Pedestrian Improvements Contribution. Developer shall provide funding in the amount of Fifty Thousand Dollars ($50,000) to the Hollywood Chamber of Commerce Walk of Fame Committee or otherwise as directed by the City (the "**Pedestrian Payment**") toward the renovation and upkeep of the Walk of Fame stars and terrazzo, sidewalks and other public streetscape improvements along Vine Street between the Project and Hollywood Boulevard. Such renovation and upkeep is intended to enhance the pedestrian experience for people in the vicinity of the Property. Proof of payment of the Pedestrian Payment shall be submitted to the Planning Director prior to issuance of a final certificate of occupancy for the first Phase of the Project.

3.1.3.10 Music Appreciation Exhibit. Developer shall install publicly accessible artwork and/or changeable exhibition cabinets and/or platforms within the first Phase of the Project (collectively, the "**Music Appreciation Exhibit**"). The Music Appreciation Exhibit shall be designed, decorated and programmed in a manner so as to celebrate music and entertainment. The Music Appreciation Exhibit plans shall be reviewed by the Director of Planning, in consultation with the Council Office, and approved by the Director of Planning, in his or her reasonable discretion. Developer's shall be entitled to credit to the Art Developments Fee otherwise payable by Developer under the Applicable Rules in connection with the Project for Developer's cost of installing such Music Appreciation Exhibit. The Music Appreciation Exhibit shall be maintained by Developer, at its sole cost, to a standard at least as high as the balance of the Project.

3.1.3.11 Hollywood Central Park. Commencing upon the April 15 following the later of (a) issuance of a final certificate of occupancy for the first Phase of the Project or (b) the completion and commencement of operation of the proposed Hollywood Central Park, and thereafter on April 1 of each year during the remaining Term of this Agreement, Developer shall make an annual contribution, in the amount of $50,000 to the City Department of Recreation and Parks or otherwise as directed by the City for the operation and maintenance of the Hollywood Central Park.

3.1.3.12 Retail/Restaurant Discount Program. During the Term of this Agreement, Developer will use its commercially reasonable efforts to establish, with

tenants of the Project, a discount program offered by retail and/or restaurant tenants for the benefit of employees and residents of the Project.

3.1.3.13 Electrical Car Recharging Station. Developer shall construct, maintain and operate within the parking facilities of the Project, ten (10) 208/240 V 40 amp, grounded AC outlets, in addition to the outlets required by applicable provisions of the Municipal Code.

3.1.3.14 Affordable Housing. Prior to the issuance of any final certificate of occupancy for any residential dwelling units in any Phase of the Project, Developer shall provide evidence to the Director of Planning that it has either:

(a) **Affordable Housing Payment**. Contributed a fixed-fee payment to the City Housing Authority to support affordable housing (each and collectively, the "**Affordable Housing Payment**") in an amount equal to Seventy Five Thousand Dollars ($75,000) multiplied by fifteen percent (15%) of the total number of market rate residential dwelling units in such Phase as shown on the final approved building plans for such Phase, or

(b) **Affordable Project Contribution** Contributed an amount equal to the Affordable Housing Payment for such Phase to a developer of a Transit Affordable Housing Project. As used herein, the term "**Transit Affordable Housing Project**" means a multifamily development project located within 1,000 yards of a commuter rail station or bus route containing "Affordable Units" (as defined below) in the amount of no less than fifteen percent (15%) of the total number of market rate residential dwelling units in such Project Phase. As used herein, the term "**Affordable Units**" means multifamily units subject to a regulatory agreement with the City and/or other governmental agency limiting rental thereto to low and/or very low income families, as defined in Section 8 of the United States Housing Act of 1937, as amended from time to time.

3.2 Agreement and Assurances on the Part of the City. In consideration for Developer entering into this Agreement, and as an inducement for Developer to obligate itself to carry out the covenants and conditions set forth in this Agreement and in order to effectuate the premises, purpose, and intentions set forth in Section 2.3 of this Agreement, the City hereby agrees as follows:

3.2.1 Entitlement to Develop. Developer has the vested right to develop the Project containing up to Maximum Floor Area in, on, under and/or above the Property as contemplated by the EIR subject to the terms and conditions of this Agreement, the Applicable Rules, Project Approvals, the Equivalency Program and the Reserved Powers. The 114,303 square feet of existing Floor Area in the Existing Improvements shall be included as part of such maximum permitted density of the Project. The density of certain portions of the Property may exceed the pro-rata or average per acre density for the Property as a whole provided that (a) such density shall be subject to maximum height limitations applicable to each portion of the Property as set forth in the Project Approvals and Development Regulations, and (b) the total density for the Property shall not exceed Maximum Floor Area. Developer's vested rights under this

Agreement shall include, without limitation, the right to remodel, renovate, rehabilitate, rebuild, or replace the Project or any portion thereof throughout the applicable Term for any reason, including, without limitation, in the event of damage, destruction, or obsolescence of the Project or any portion thereof, subject to the Applicable Rules, Project Approvals, and Reserved Powers. Any and/or all Existing Improvements which comply with the Applicable Rules on the Property as of the Effective Date which are damaged or destroyed during the Term may be remodeled, renovated, rehabilitated, repaired, rebuilt or replaced subject to the Applicable Rules (other than the Project Description set forth on **Exhibit B**) and the Reserved Powers. To the extent that all or any portion of the Project is remodeled, renovated, rehabilitated, rebuilt, or replaced, Developer may locate that portion of the Project at any other location of the Property, subject to the requirements of the Project Approvals, the Applicable Rules, and the Reserved Powers.

3.2.2 Consistency in Applicable Rules. Based upon all information made available to the City up to or concurrently with the execution of this Agreement, the City finds and certifies that no Applicable Rules prohibit or prevent or encumber the full completion and occupancy of the Project in accordance with the uses, densities, designs, heights, signage regulations, permitted demolition, and other development entitlements incorporated and agreed to herein and in the Project Approvals

3.2.3 Changes in Applicable Rules.

3.2.3.1 Non-Application of Changes in Applicable Rules. Any change in, or addition to, the Applicable Rules, including, without limitation, any change in any applicable General Plan, zoning or building regulation, adopted, or becoming effective after the Effective Date of this Agreement, including, without limitation, any such change by means of ordinance including but not limited to adoption of a specific plan or overlay zone, The City Charter amendment, initiative, referendum, resolution, motion, policy, order or moratorium, initiated, or instituted for any reason whatsoever and adopted by the City, the Mayor, City Council, Planning Commission or any other Board, Commission, Department or Agency of the City, or any officer or employee thereof, or by the electorate, as the case may be, which would, absent this Agreement, otherwise be applicable to the Project and which would conflict in any way with the Applicable Rules, Project Approvals, or this Agreement, shall not be applied to the Project unless these changes represent an exercise of the City's Reserved Powers, or are otherwise agreed to in this Agreement. Notwithstanding the foregoing, Developer may, in its sole discretion, give the City written notice of its election to have any subsequent change in the Applicable Rules applied to some portion or all of the Property as it may own, in which case such subsequent change in the Applicable Rules shall be deemed to be contained within the Applicable Rules insofar as that portion of the Property is concerned. In the event of any conflict or inconsistency between this Agreement and the Applicable Rules, the provisions of this Agreement shall control.

3.2.3.2 Changes in Building and Fire Codes. Notwithstanding any provision of this Agreement to the contrary, development of the Project shall be subject to changes occurring from time to time in the California Building Code and other uniform construction codes. In addition, development of the Project shall be subject to changes occurring from time to time in Chapters V and IX of the Municipal Code regarding the construction, engineering, and design standards for both public and private improvements provided that these

changes are (1) necessary to the health and safety of the residents of the City, and (2) are generally applicable on a Citywide basis (except in the event of natural disasters as found by the Mayor or City Council, such as floods, earthquakes and similar disasters).

3.2.3.3 Changes Mandated by Federal or State Law. This Agreement shall not preclude the application to the Project of changes in, or additions to, the Applicable Rules, including rules, regulations, ordinances, and official policies, to the extent that these changes or additions are mandated to be applied to developments such as this Project by state or federal regulations, pursuant to the Reserved Powers. In the event state or federal laws or regulations prevent or preclude compliance with one or more provisions of this Agreement, these provisions shall be modified or suspended as may be necessary to comply with state or federal laws or regulations.

3.2.4 Subsequent Development Review. The City shall not require Developer to obtain any approvals or permits for the development of the Project in accordance with this Agreement other than those permits or approvals that are required by the Applicable Rules, the Reserved Powers, and/or the Project Approvals. Except as permitted by the Equivalency Program and by those changes and modifications as described in Section 3.2.5, any subsequent Discretionary Action initiated by Developer that is not permitted by the Project Approvals or Applicable Rules, which changes the uses, intensity, density, building height, or timing of the Project, or decreases the lot area, setbacks, yards, parking, or which increases entitlements allowed under the Project Approvals, shall be subject to rules, regulations, ordinances, and official policies of the City then in effect. The Parties agree that this Agreement does not modify, alter or change the City's obligations pursuant to CEQA and acknowledge that future Discretionary Actions may require additional environmental review pursuant to CEQA. In the event that additional environmental review is required by CEQA, the City agrees to utilize tiered environmental documents to the fullest extent permitted by law, as determined by the City, and as provided in California Public Resources Code Sections 21093 and 21094.

3.2.5 Development Parameters.

3.2.5.1 Development Flexibility. The City acknowledges that the Development Parameters provide flexibility regarding modifications to Project's final development layout so that the Project can be built with a mix of uses and layout that responds to market demand and changing needs of the Southern California economy while maintaining design quality and consistency. Developer shall have the right to modify the Project within the limits set forth in the Development Parameters. Implementation of the Development Parameters will not require any new or additional Discretionary Approvals from the City.

3.2.5.2 Development Regulations. The Development Regulations permit design flexibility within a set of site-wide guidelines and standards that ensure the integrity of an overall master plan concept for the Site and protect the visual and environmental quality of the Project as a whole. The Development Regulations establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting and sustainability.

3.2.5.3 Equivalency Program. The Equivalency Program is intended to provide flexibility in land uses for the Project while ensuring that a change in land uses would

not result in new significant environmental impacts or a substantial increase in the severity of significant environmental impacts identified in the EIR.

3.2.5.4 EIR Analysis. Implementation of the Development Parameters will not result in any new significant environmental impacts or a substantial increase in the severity of previously identified significant environmental impacts as analyzed in the EIR. The Project including the development flexibility set forth in the Development Parameters were fully analyzed in the EIR.

3.2.6 Special Taxes and Assessments. Developer shall have the right, to the extent permitted by law, to protest, oppose, and vote against any and all special taxes, assessments, levies, charges, and/or fees imposed with respect to any assessment districts, infrastructure financing, Mello-Roos or community facilities districts, community taxing districts, maintenance districts, or other similar districts. If Developer requests the formation of any such districts in connection with the Project, the City agrees to cooperate fully in their formation.

3.2.7 Effective Development Standards. The City agrees that it is bound to permit the uses, intensity of use and density on this Property which are permitted by this Agreement and the Project Approvals, insofar as this Agreement and the Project Approvals so provide or as otherwise set forth in the Applicable Rules or the Reserved Powers. The City hereby agrees that it will not unreasonably withhold or unreasonably condition any Discretionary Action which must be issued by the City in order for the Project to proceed, provided that Developer reasonably and satisfactorily complies with all City-wide standard procedures, actions, payments of Processing Fees and Charges, and criteria generally required of developers by the City for processing Requests for development consistent with this Agreement.

3.2.8 Interim Use. The City agrees that Developer may use the Property during the Term of this Agreement for any use which is otherwise permitted by the applicable zoning regulations and the General Plan in effect at the time of the interim use, except as expressly provided in this Development Agreement, or pursuant to any approvals, permits, other agreements between the City and Developer, or other entitlements previously granted and in effect as of the Effective Date.

3.2.9 Moratoria or Interim Control Ordinances. In the event an ordinance, resolution, policy, or other measure is enacted, whether by action of the City, by initiative, or otherwise, which relates directly or indirectly to the Project or to the rate, amount, timing, sequencing, or phasing of the development or construction of the Project on all or any part of the Property, the City agrees that such ordinance, resolution, or other measure shall not apply to the Property or this Agreement, unless such changes: (1) are found by the City to be necessary to the public health and safety of the residents of the City, and (2) are generally applicable on a Citywide basis (except in the event of natural disasters as found by the Mayor or the City Council, such as floods, earthquakes and similar disasters).

3.2.10 Time Period of Tentative Tract Map and Project Approvals. The City acknowledges that the construction of the Project may be subject to unavoidable delays due to factors outside Developer's control. Pursuant to California Government Code Section

AR0067940

66452.6(a), the City agrees that the duration of the Vesting Tentative Tract Map and any new tract or parcel map which are consistent with the Project Approvals, shall automatically be extended for the Term of this Agreement. The City further agrees that the duration of all of the Project Approvals shall automatically be extended for the Term of this Agreement.

3.2.11 Processing Fees and Charges. Developer shall pay all Processing Fees and Charges for Ministerial Permits and Approvals.

3.2.12 Timeframes and Staffing for Processing and Review. The City agrees that expeditious processing of Ministerial Permits and Approvals and Discretionary Actions, if any, and any other approvals or actions required for the Project are critical to the implementation of the Project. In recognition of the importance of timely processing and review of Ministerial Permits and Approvals, the City agrees to work with Developer to establish time frames for processing and reviewing such Ministerial Permits and Approvals and to comply with timeframes established in the Project Approvals. The City agrees to expedite all Ministerial Permits and Approvals and Discretionary Actions requested by Developer, if any.

3.2.13 Other Governmental Approvals. Developer may apply for such other permits and approvals as may be required for development of the Project in accordance with the provisions of this Agreement from other governmental or quasi-governmental agencies having jurisdiction over the Property. The City shall cooperate with Developer in its endeavors to obtain such permits and approvals. Each Party shall take all actions and do all things, and execute, with acknowledgment or affidavit, if required, any and all documents and writings that may be necessary or proper to achieve the purposes and objectives of this Agreement.

3.2.14 Administrative Changes and Modifications. The Parties may determine as the development of the Project proceeds that refinements and changes are appropriate with respect to certain details of the Project and the performance of the Parties under this Agreement. The Parties desire to retain a certain degree of flexibility with respect to the details of the Project development and with respect to those items covered in general terms under this Agreement and under the Project Approvals. If and when the Parties find that "Substantially Conforming Changes," as herein defined, are necessary or appropriate, they shall, unless otherwise required by law, effectuate such changes or adjustments through administrative modifications approved by the Parties. As used herein, "**Substantially Conforming Changes**" are changes, modifications or adjustments that are substantially consistent with the Project Approvals, and that do not materially alter the overall nature, scope or design of the Project including, without limitation, minor changes to the Vesting Tentative Tract Map, minor changes in building footprint configurations, locations, size or heights of buildings, architectural features or other Development Parameters (subject in all cases to the maximum intensity and height restriction set forth in the Applicable Rules), signage or configuration and size of parcels or lots (including lot line adjustments). Such Substantially Conforming Changes would not be considered Discretionary Actions, and would therefore not require a public hearing.

3.3 **Third Party Property.** The Third Party Property, which may be acquired by Developer after the Effective Date, shall be subject to this Agreement upon acquisition thereof by Developer (or any of them or any entity controlled by, controlling or under common control with any of them), including without limitation the Development Parameters. Developer shall

provide to the City (a) notice pursuant to Section 6.2 and Section 7.12 of this Agreement of the acquisition of the Third Party Property by Developer, and (ii) evidence of Developer's ownership or leasehold interest in the Third Party Property. Developer is in no way obligated to acquire or attempt to acquire the Third Party Property, and in the event that Developer does not acquire the Third Party Property, neither Developer nor the owner of the Third Party Property shall have any rights or obligations under the terms of this Agreement with respect to the Third Party Property.

4. ANNUAL REVIEW.

4.1 Annual Review. During the Term of this Agreement, the City shall review annually Developer's compliance with this Agreement by Developer, and/or any Transferee. This periodic review shall be limited in scope to good faith compliance with the provisions of this Agreement as provided in the Development Agreement Act and Developer, and/or any Transferee, shall have the burden of demonstrating such good faith compliance relating solely to such parties' portion of the Property and any development located thereon. The Annual Review shall be in the form of an Annual Report prepared and submitted by the Planning Director. The Report shall include, the number, type and square footage of and the status of Project; any transfers of floor area; the total number of parking spaces developed; provisions for open space; any equivalency transfers; status of activities relating to streetscape improvements; summary of performance of Developer's obligations.

4.2 Pre-Determination Procedure Submission by Developer, and/or Transferee, of evidence of compliance with this Agreement with respect to each such Party's portion of the Property, in a form which the Planning Director may reasonably establish, shall be made in writing and transmitted to the Planning Director not later than sixty (60) days prior to the yearly anniversary of the Effective Date. The public shall be afforded an opportunity to submit written comments regarding compliance to the Planning Director at least sixty (60) days prior to the yearly anniversary of the Effective Date. All such public comments and final staff reports shall, upon receipt by the City, be made available as soon as possible to Developer, and/or any Transferees.

4.2.1 Special Review. The City may order a special review of compliance with this Agreement, at any time.

4.3 Planning Director's Determination. On or before the yearly anniversary of the Effective Date of the Agreement, the Planning Director shall make a determination regarding whether or not Developer, and/or any Transferee, has complied in good faith with the provisions and conditions of this Agreement. This determination shall be made in writing with reasonable specificity, and a copy of the determination shall be provided to Developer, and/or any Transferee, in the manner prescribed in Section 7.12(i).

4.4 Appeal by Developer. In the event the Planning Director makes a finding and determination of non compliance, Developer, and/or any Transferee as the case may be, shall be entitled to appeal that determination to the Planning Commission. After a public hearing on the appeal, the Planning Commission shall make written findings and determinations, on the basis of substantial evidence, whether or not Developer, and/or any Transferee as the case may be, has complied in good faith with the provisions and conditions of this Agreement. Nothing in this

Section or this Agreement shall be construed as modifying or abrogating Los Angeles City Charter Section 245 (City Council review of Commission and Board actions).

4.5 Period to Cure Non-Compliance. If, as a result of this Annual Review procedure, it is found and determined by the Planning Director or the Planning Commission or The City Council, on appeal, that Developer, and/or any Transferee, as the case may be, has not complied in good faith with the provisions and conditions of this Agreement, the City, after denial of any appeal or, where no appeal is taken, after the expiration of the appeal period described in Section 7.3, shall submit to Developer, and/or any Transferee, as the case may be, by registered or certified mail, return receipt requested, a written notice of default in the manner prescribed in Section 7.8 L, stating with specificity those obligations of Developer and/or any Transferee, as the case may be, which have not been performed. Upon receipt of the notice of non-compliance, Developer, and/or any Transferee, as the case may be, shall promptly commence to cure the identified default(s) at the earliest reasonable time after receipt of the notice of default and shall complete the cure of the default(s) not later than sixty (60) days after receipt of the notice of default, or any longer period as is reasonably necessary to remedy such items of the default(s), by mutual consent of the City and Developer provided that Developer shall continuously and diligently pursue the remedy at all times until the item of default(s) is cured.

4.6 Failure to Cure Non-Compliance Procedure. If the Planning Director finds and determines that Developer (or any one of them) or a Transferee (or any one of them) has not cured a default pursuant to this Section, and that the City intends to terminate or modify this Agreement or those transferred or assigned rights and obligations, as the case may be, the Planning Director shall make a report to the Planning Commission. The Planning Director shall then set a date for a public hearing before the Planning Commission in accordance with the notice and hearing requirements of Government Code Sections 65867 and 65868. If after the public hearing, the Planning Commission finds and determines, on the basis of substantial evidence, that (i) such Developer, or such Transferee has not cured a default pursuant to this Section, and (ii) subject to Sections 5.1.1 and 5.1.4, the City may terminate or modify this Agreement, or those transferred or assigned rights and obligations, as the case may be, the finding and determination shall be appealable to the City Council in accordance with Section 7.3 hereof. In the event of a finding and determination of compliance, there shall be no appeal by any person or entity. Nothing in this Section or this Agreement shall be construed as modifying or abrogating Los Angeles City Charter Section 245 (City Council's review of Commission and Council actions).

4.7 Termination or Modification of Agreement. Subject to Sections 5.1.1 and 5.1.4, the City may terminate or modify this Agreement, or those transferred or assigned rights and obligations, as the case may be, after the final determination of noncompliance by the City Council or, where no appeal is taken, after the expiration of the appeal periods described in Section 7.3. There shall be no modifications of this Agreement unless the City Council acts pursuant to Government Code Sections 65867.5 and 65868, irrespective of whether an appeal is taken as provided in Section 7.3.

4.8 Reimbursement of Costs. Developer shall reimburse the City for its actual costs, reasonably and necessarily incurred, to accomplish the required annual review.

4.9 Evidence of Compliance Applicable to a Particular Portion of the Property. Notwithstanding anything to the contrary in this Section 4 or any other provision of this Agreement, a Transferee of all or any portion of the Property shall only be responsible for submitting evidence of compliance with this Agreement as it relates solely to that portion of the Property transferred, assigned, or conveyed to such Transferee in an Assignment Agreement authorized by Section 6.2 of this Agreement.

4.10 The City's Rights and Remedies Against a Developer. The City's rights in Section 4 of this Agreement relating to compliance with this Agreement by Developer shall be limited to only those rights and obligations assumed by Developer under this Agreement and as expressly set forth in the applicable Assignment Agreement authorized by Section 6.2 of this Agreement.

4.11 Developer Written Request for Confirmation. From time to time, Developer of any portion of the Property may, separate from the annual review process, submit a written request for confirmation from the Planning Director that certain obligations of this Agreement have been satisfied. Subject to the time limits and process requirements of Section 4.3, the Planning Director shall issue a written confirmation stating either that such obligations have been satisfied or setting forth the reasons why subject obligation have not been satisfied.

5. DEFAULT PROVISIONS.

5.1 Default by Developer.

5.1.1 Default. In the event Developer (or any one of them) or a Transferee of any portion of the Property fails to perform its obligations under this Agreement applicable to its portion of the Property as specified in the applicable Assignment Agreement, in a timely manner and in compliance pursuant to Section 4 of this Agreement, the City shall have all rights and remedies provided for in this Agreement, including, without limitation, modifying or terminating this Agreement, provided that (a) such modification or termination shall relate solely and exclusively to the property of the defaulting Developer or Transferee, and (b) the City has first complied with all applicable notice and opportunity to cure provisions in Sections 5.1.2 and 6.1.5 and given notice as provided in Sections 4.3, 4.6, 6.1.4 and/or 7.11 hereof, and (c) Developer may appeal such declaration in the manner provided in, and subject to all terms and provisions of, Sections 4.4 and 4.5. In no event shall a default by a Developer or a Transferee of any portion of the Property constitute a default by any non defaulting Developer or Transferee with respect to such non-defaulting parties' obligations hereunder nor affect such non-defaulting parties' rights hereunder, or respective portion of the Property.

5.1.2 Notice of Default. The City through the Planning Director shall submit to Developer (or any one of them) or a Transferee, as applicable, by registered or certified mail, return receipt requested, a written notice of default in the manner prescribed in Section 7.11, identifying with specificity those obligations of such Developer or Transferee, as applicable, which have not been performed. Upon receipt of the notice of default, Developer or Transferee, shall promptly commence to cure the identified default(s) at the earliest reasonable time after receipt of the notice of default and shall complete the cure of the default(s) not later than sixty (60) days after receipt of the notice of default, or a longer period as is reasonably necessary to

remedy the default(s), provided that Developer or Transferee, as applicable, shall continuously and diligently pursue the remedy at all times until the default(s) is cured.

5.1.3 Failure to Cure Default Procedures. If after the cure period has elapsed (Section 4.6), the Planning Director finds and determines that Developer (or any of them), or a Transferee, as the case may be, remains in default and that the City intends, subject to Section 5.1.1 and 5.1.4 of this Agreement, to terminate or modify this Agreement, or those transferred or assigned rights and obligations, as the case may be, the Planning Director shall make a report to the Planning Commission and then set a public hearing before the Commission in accordance with the notice and hearing requirements of Government Code Sections 65867 and 65868. If after public hearing, the Planning Commission finds and determines, on the basis of substantial evidence, that such Developer or Transferee, as applicable, remain(s) in default and that the City intends to terminate or modify this Agreement, or those transferred or assigned rights and obligations, as the case may be, such Developer and such Transferee shall be entitled to appeal that finding and determination to the City Council in accordance with Section 7.3. In the event of a finding and determination that all defaults are cured, there shall be no appeal by any person or entity. Nothing in this Section or this Agreement shall be construed as modifying or abrogating Los Angeles City Charter Section 245 (City Council review of Commission and Board actions).

5.1.4 Termination or Modification of Agreement. Upon default by Developer (or any of them) or a Transferee and the delivery of notice and expiration of all applicable cure periods, the City may terminate or modify this Agreement, or those transferred or assigned rights and obligations hereunder, as the case may be, relating solely to the defaulting Developer or Transferee and such defaulting party's portion of the Property, after such final determination of the City Council or, where no appeal is taken, after the expiration of the appeal periods described in Section 7.3 relating to the defaulting parties rights and obligations. There shall be no termination or modification of this Agreement unless the City Council acts pursuant to Section 7.3.

5.2 Default by the City.

5.2.1 Default. In the event the City does not accept, process, or render a decision on necessary development permits, entitlements, or other land use or building approvals for use as provided in this Agreement upon compliance with the requirements thereof, or as otherwise agreed to by the Parties, or the City otherwise defaults under the provisions of this Agreement, Developer, and any Transferee, shall have all rights and remedies provided herein or by applicable law, which shall include compelling the specific performance of the City's obligations under this Agreement; provided that Developer or Transferee, as the case may be, has first complied with the procedures in Section 5.2.2. No part of this Agreement shall be deemed to abrogate or limit any immunities or defenses the City may otherwise have with respect to claims for monetary damages.

5.2.2 Notice of Default. Developer or Transferee, as the case may be, shall first submit to the City a written notice of default stating with specificity those obligations that have not been performed. Upon receipt of the notice of default, the City shall promptly commence to cure the identified default(s) at the earliest reasonable time after receipt of the notice of default

and shall complete the cure of the default(s) not later than one hundred and twenty (120) days after receipt of the notice of default, or a longer period as is reasonably necessary to remedy such default(s), provided that the City shall continuously and diligently pursue the remedy at all times until the default(s) is cured. In the case of a dispute as to whether the City has cured the default, the Parties shall submit the matter to arbitration pursuant to Section 7.5 of this Agreement.

5.3 **No Monetary Damages.** It is acknowledged by the Parties that the City would not have entered into this Agreement if it were liable in monetary damages under or with respect to this Agreement or the application thereof. The Parties agree and recognize that, as a practical matter, it may not be possible to determine an amount of monetary damages which would adequately compensate Developer for its investment of time and financial resources in planning to arrive at the kind, location, intensity of use, and improvements for the Project, nor to calculate the consideration the City would require to enter into this Agreement to justify the exposure. Therefore, the Parties agree that each of the Parties may pursue any remedy at law or equity available for any breach of any provision of this Agreement, except that the Parties shall not be liable in monetary damages and the Parties covenant not to sue for or claim any monetary damages for the breach of any provision of this Agreement.

6. MORTGAGEE RIGHTS.

6.1.1 Encumbrances on the Property The Parties hereto agree that this Agreement shall not prevent or limit Developer (or any of them), or any Transferee, from encumbering the Property or any estate or interest therein, portion thereof, or any improvement thereon, together with the rights of Developer hereunder, in any manner whatsoever by one or more Mortgages with respect to the construction, development, use or operation of the Project and parts thereof. The City acknowledges that the Mortgagees may require certain Agreement interpretations and modifications and agrees, upon request, from time to time, to meet with Developer and representatives of such lender(s) to negotiate in good faith any such request for interpretation or modification. The City will not unreasonably withhold its consent to any such requested interpretation or modification, provided such interpretation or modification is consistent with the intent and purposes of this Agreement.

6.1.2 Mortgagee Protection. To the extent legally permissible, this Agreement shall be superior and senior to any lien placed upon the Property, or any portion thereof, including the lien of any Mortgage. Notwithstanding the foregoing, no breach of this Agreement shall defeat, render invalid, diminish, or impair the lien of any Mortgage made in good faith and for value. Any acquisition or acceptance of title or any right or interest in or with respect to the Property or any portion thereof by a Mortgagee, pursuant to foreclosure, trustee's sale, deed in lieu of foreclosure, lease or sublease termination or otherwise, shall be subject to all of the terms and conditions of this Agreement applicable to the Property or such portion, as applicable, except that any such Mortgagee, including its affiliate, or any other entity (a "**Mortgagee Successor**") which acquires the Property or any portion thereof a result of the foreclosure of such Mortgage, by power of sale granted thereunder, by acceptance of a deed in lieu of foreclosure, pursuant to a bankruptcy proceeding or other such similar proceedings or otherwise as a result of the exercise of remedies under any Mortgage, shall be entitled to the benefits arising under this Agreement provided Mortgagee complies with Section 6.1.3 below.

6.1.3 Mortgagee Not Obligated. Notwithstanding the provisions of this Section 6, Mortgagee will not have any obligation or duty pursuant to the terms set forth in this Agreement to perform the obligations of Developer or other affirmative covenants of Developer hereunder, or to guarantee such performance, except that the Mortgagee or its Mortgagee Successor shall have no vested right to develop the Project without fully complying with the terms of this Agreement and executing and delivering to the City, in a form and with terms reasonably acceptable to the City, an assumption agreement of Developer's obligations hereunder relating to the portion of the Property acquired by such Mortgagee or Mortgagee Successor.

6.1.4 Request for Notice to Mortgage. The Mortgagee of any Mortgage or deed of trust encumbering the Property, or any part or interest thereof, who has submitted a request in writing to the City in the manner specified herein for giving notices shall be entitled to receive written notification from the City of any notice of non-compliance by Developer in the performance of Developer's obligations under this Agreement. As of the date hereof, HSBC Bank USA, National Association, as administrative agent for itself and certain other lenders ("**Existing Mortgagagee**") is the Mortgagee of the entire Property and there are no other Mortgagees. The City acknowledges that Existing Mortgagee has requested notices pursuant to this Section 6.1.4 and that Existing Mortgagee's addresses for notices are as follows:

HSBC Bank USA, National Association
545 Washington Boulevard, 10th Floor
Jersey City, New Jersey 07310
Attention: Commercial Mortgage Servicing Department

with a copy to:

HSBC Bank USA, National Association
601 Montgomery Street, 10th Floor
San Francisco, California 94111
Attention: Ms. Mee Mee Kiong

6.1.5 Mortgagee's Time to Cure. If the City timely receives a request from a Mortgagee requesting a copy of any notice of non-compliance given to Developer under the terms of this Agreement, the City shall provide a copy of that notice to the Mortgagee within ten (10) days of sending the notice of non-compliance to Developer. The Mortgagee shall have the right, but not the obligation, to cure the non-compliance for a period of one hundred twenty (120) days after the Mortgagee receives written notice, or a longer period as is reasonably necessary to acquire possession of the Property or portion thereof (to the extent necessary to cure the default) and remedy the default(s), provided that Mortgagee shall continuously and diligently pursue the remedy at all times until the default(s) is cured..

6.1.6 Disaffirmation. If this Agreement is terminated as to any portion of the Property by reason of (i) any default or (ii) as a result of a bankruptcy proceeding, or if this

Agreement is disaffirmed by a receiver, liquidator, or trustee for Developer or its property, the City, if requested by any Mortgagee, shall negotiate in good faith with such Mortgagee (or if more than one Mortgage encumbers such portion of the Property, the Mortgagee holding the highest, or most senior priority Mortgage) for a new development agreement in substantially the same form as this Agreement for the Project or such portion of the Property acquired by such Mortgagee or its Successor Mortgagee. This Agreement does not require any Mortgagee to enter into a new development agreement pursuant to this Section.

6.2 Assignment. The Property, as well as the rights and obligations of Developer under this Agreement, may be transferred or assigned in whole or in part by Developer to a Transferee without the consent of the City, subject to the conditions set forth below in Sections 6.2.1 and 6.2.2.

6.2.1 Conditions of Assignment. No such assignment shall be valid until and unless the following occur:

(a) Written Notice of Assignment Required. Developer, or any successor transferor, gives prior written notice to the City of its intention to assign or transfer any of its interests, rights or obligations under this Agreement; and a complete disclosure of the identity of the assignee or Transferee, including copies of the Articles of Incorporation in the case of corporations, the trust declaration in the case of non-public trusts, the names of individual members in the case of a limited liability company, and the names of individual partners in the case of partnerships. Any failure by Developer or any successor transferor to provide the notice shall be curable in accordance with the provisions in Section 5.1.

(b) Automatic Assumption of Obligations. Unless otherwise stated elsewhere in this Agreement to the contrary, a Transferee of Property or any portion thereof expressly and unconditionally assumes all of the rights and obligations of this Agreement (including an allocation of the Transferee's share of the Maximum Floor Area) transferred or assigned by Developer and which are expressly set forth in the applicable Assignment Agreement.

6.2.2 Liability Upon Assignment. Each Developer of any portion of the Property shall be solely and only liable for performance of such Developer's obligations applicable to its portion of the Property under this Agreement as specified in the applicable Assignment Agreement. Upon the assignment or transfer of any portion of the Property together with any obligations assignable under this Agreement, the Transferee shall become solely and only liable for the performance of those assigned or transferred obligations so assumed and shall have the rights of a "Developer" under this Agreement; which such rights and obligations shall be set forth specifically in the Assignment Agreement, executed by the transferring Developer, and the Transferee, as of the date of such transfer, assignment or conveyance of the applicable portion of the Property. The failure of a Developer of any portion of the Property to perform such Developer's obligation set forth in the applicable Assignment Agreement may result, at the City's option, in a declaration that this Agreement has been breached and the City may, but shall not be obligated to, exercise its rights and remedies under this Agreement solely as it relates to the defaulting Developer's portion of the Property as provided for in Section 5.1 hereof, subject

to such defaulting Developer's right to notice and opportunity to cure the default in accordance with provisions of Section 5.1 hereof.

6.2.3 Release of Developer. With respect to a transfer and assignment of all or a portion of a Developer's interest in the Property and the related rights and obligations hereunder, upon the effective date of any such transfer and assignment, as evidenced by the execution of an Assignment Agreement pursuant to this Section 6.2 between such Developer and the Transferee and delivery of such Assignment Agreement to the City, such Developer shall automatically be released from any further obligations to the City under this Agreement with respect to the portion of the Property so transferred.

6.2.4 Release of Property Transferee. A Transferee shall not be liable for any obligations to the City under this Agreement relating to any portion of the Property other than that portion transferred to such Transferee, and no default by a Developer under this Agreement with respect to such other portions of the Property shall be deemed a default by such Transferee with respect to the portion of the Property transferred to such Transferee.

7. GENERAL PROVISIONS.

7.1 Effective Date. The Effective Date of this Agreement shall be the date on which this Agreement is attested by the City Clerk of the City of Los Angeles after execution by Developer and Mayor of the City of Los Angeles.

7.2 Term. The Term of this Agreement shall commence on the Effective Date and shall extend to December 31, 2035, unless said Term is otherwise terminated or modified by circumstances set forth in this Agreement or by mutual consent of the Parties hereto. Following the expiration of this Term, this Agreement shall terminate and be of no further force and effect, provided, however, that this termination shall not affect any right or duty arising from entitlements or approvals, including the Project Approvals on the Property, approved concurrently with, or subsequent to, the Effective Date of this Agreement. The Term of this Agreement shall automatically be extended for the period of time of any actual delay resulting from any enactments pursuant to the Reserved Powers or moratoria, or from legal actions or appeals which enjoin performance under this Agreement or act to stay performance under this Agreement (other than bankruptcy or similar proceedings), or from any actions taken pursuant to Section 7.5 (Dispute Resolution), or from any litigation related to the Project Approvals, this Agreement or the Property.

7.3 Appeals to City Council. Where an appeal by Developer, or its Transferees, as the case may be, to the City Council from a finding and/or determination of the Planning Commission is created by this Agreement, such appeal shall be taken, if at all, within twenty (20) days after the mailing of such finding and/or determination to Developer, or its successors, Transferees, and/or assignees, as the case may be. The City Council shall act upon the finding and/or determination of the Planning Commission within eighty (80) days after such mailing, or within such additional period as may be agreed upon by Developer, or its Transferees, as the case may be, and the City Council. The failure of the City Council to act shall not be deemed to be a denial or approval of the appeal, which shall remain pending until final the City Council action.

AR0067949

7.4 **Enforced Delay; Extension of Time of Performance**. In addition to specific provisions of this Agreement, whenever a period of time, including a reasonable period of time, is designated within which either Party hereto is required to do or complete any act, matter or thing, the time for the doing or completion thereof shall be extended by a period of time equal to the number of days during which such Party is actually prevented from, or is unreasonably interfered with, the doing or completion of such act, matter or thing because of causes beyond the reasonable control of the Party to be excused, including: war; insurrection; riots; floods; earthquakes; fires; casualties; acts of God; litigation and administrative proceedings against the Project (not including any administrative proceedings contemplated by this Agreement in the normal course of affairs (such as the Annual Review)); any approval required by the City (not including any period of time normally expected for the processing of such approvals in the ordinary course of affairs); restrictions imposed or mandated by other governmental entities; enactment of conflicting state or federal laws or regulations; judicial decisions; the exercise of the City's Reserved Powers; or similar bases for excused performance which are not within the reasonable control of the Party to be excused (financial inability excepted). This Section shall not be applicable to any proceedings with respect to bankruptcy or receivership initiated by or on behalf of Developer or, if not dismissed within ninety (90) days, by any third parties against Developer. If written notice of such delay is given to either Party within thirty (30) days of the commencement of such delay, an extension of time for such cause will be granted in writing for the period of the enforced delay, or longer as may be mutually agreed upon.

7.5 **Dispute Resolution**.

7.5.1 **Dispute Resolution Proceedings**. The Parties may agree to dispute resolution proceedings to fairly and expeditiously resolve disputes or questions of interpretation under this Agreement. These dispute resolution proceedings may include: (a) procedures developed by the City for expeditious interpretation of questions arising under development agreements; or (b) any other manner of dispute resolution which is mutually agreed upon by the Parties.

7.5.2 **Arbitration**. Any dispute between the Parties that is to be resolved by arbitration shall be settled and decided by arbitration conducted by an arbitrator who must be a former judge of the Los Angeles County Superior Court or Appellate Justice of the Second District Court of Appeals or the California Supreme Court. This arbitrator shall be selected by mutual agreement of the parties.

7.5.2.1 **Arbitration Procedures**. Upon appointment of the arbitrator, the matter shall be set for arbitration at a time not less than thirty (30) nor more than ninety (90) days from the effective date of the appointment of the arbitrator. The arbitration shall be conducted under the procedures set forth in Code of Civil Procedure Section 638, et seq., or under such other procedures as are agreeable to both Parties, except that provisions of the California Code of Civil Procedure pertaining to discovery and the provisions of the California Evidence Code shall be applicable to such proceeding.

7.5.3 **Extension of Term**. The Term of this Agreement as set forth in Section 7.2 shall automatically be extended for the period of time in which the Parties are engaged in dispute resolution to the degree that such extension of the Term is reasonably

required because activities which would have been completed prior to the expiration of the Term are delayed beyond the scheduled expiration of the Term as the result of such dispute resolution.

7.5.4 **Legal Action**. Either Party may, in addition to any other rights or remedies, institute legal action to cure, correct, or remedy any default, enforce any covenant or agreement herein, enjoin any threatened or attempted violation, or enforce by specific performance the obligations and rights of the Parties hereto. Notwithstanding the above, the City's right to seek specific performance shall be specifically limited to compelling Developer to complete, demolish or make safe any particular improvement(s) on public lands which is required as a Mitigation Measure or Condition of Approval. Developer shall have no liability (other than the potential termination of this Agreement) if the contemplated development fails to occur.

7.5.5 **Applicable Law**. This Agreement shall be construed and enforced in accordance with the laws of the State of California, and the venue for any legal actions brought by any Party with respect to this Agreement shall be the County of Los Angeles, State of California for state actions and the Central District of California for any federal actions.

7.6 **Amendments**. This Agreement may be amended from time to time by mutual consent in writing of the Parties to this Agreement and each Mortgagee in accordance with Government Code Section 65868, and any Transferee of the Property or any portion thereof, in the event such amendment affects the rights and obligations of the Transferee under this Agreement in connection with the development, use and occupancy of its portion of the Property and/or any improvements located thereon. Any amendment to this Agreement which relates to the Term, permitted uses, substantial density or intensity of use, height, or size of buildings provisions (not otherwise permitted by the Development Parameters or changes and modifications pursuant to Section 3.2.5 or otherwise permitted by the Agreement) obligations for reservation and dedication of land, conditions, restrictions, and requirements relating to subsequent Discretionary Action or any conditions or covenants relating to the use of the Property, which are not provided for under the Applicable Rules or Project Approvals, shall require notice and public hearing before the Parties may execute an amendment thereto. Developer, or a Transferee as applicable, shall reimburse the City for its actual costs, reasonably and necessarily incurred, to review any amendments requested by Developer or a Transferee, including the cost of any public hearings.

7.7 **Covenants**. The provisions of this Agreement shall constitute covenants which shall run with the land comprising the Property for the benefit thereof, subject to the provisions of any Assignment Agreement (if applicable), and the burdens and benefits hereof shall bind and inure to the benefit of the Parties hereto and all successors and assigns of the Parties, including any Transferee of Developer.

7.8 **Cooperation and Implementation.Cooperation in the Event of Legal Challenge**. In the event of any legal action instituted by a third party or other governmental entity or official challenging the validity of any provision of this Agreement, the Parties hereby agree to affirmatively cooperate in defending said action. Developer and the City agree to cooperate in any legal action seeking specific performance, declaratory relief or injunctive relief,

to set court dates at the earliest practicable date(s) and not cause delay in the prosecution/defense of the action, provided such cooperation shall not require any Party to waive any rights.

7.8.2 Relationship of the Parties. It is understood and agreed by the Parties hereto that the contractual relationship created between the Parties hereunder is that Developer is an independent contractor and not an agent of the City. Further, the City and Developer hereby renounce the existence of any form of joint venture or partnership between them and agree that nothing herein or in any document executed in connection herewith shall be construed as making the City and Developer joint-venturers or partners.

7.9 Indemnification.

7.9.1 Obligation to Defend, Indemnify and Hold Harmless: Developer hereby agrees to defend, indemnify, and hold harmless the City and its agents, officers, and employees, from any claim, action, or proceeding ("**Proceeding**") against the City or its agents, officers, or employees (i) to set aside, void, or annul, all or any part of any Project Approval, or (ii) for any damages, personal injury or death which may arise, directly or indirectly, from such Developer or such Developer's contractors, subcontractors', agents', or employees' operations in connection with the construction of the Project, whether operations be by such Developer or any of such Developer's contractors, subcontractors, by anyone or more persons directly or indirectly employed by, or acting as agent for such Developer or any of such Developer's contractors or subcontractors. In the event that the City, upon being served with a lawsuit or other legal process to set aside, void or annul all or part of any Project Approval, fails to promptly notify Developer of the Proceeding, or fails to cooperate fully in the defense of the Proceeding, Developer shall thereafter be relieved of the obligations imposed in this Section 7.9. However, if Developer has actual notice of the Proceeding, it shall not be relieved of the obligations imposed hereunder, notwithstanding the failure of the City to provide prompt notice of the Proceeding. The City shall be considered to have failed to give prompt notification of a Proceeding if the City, after being served with a lawsuit or other legal process challenging the Approvals, unreasonably delays in providing notice thereof to the Applicant. As used herein, "unreasonably delays" shall mean any delay that materially adversely impacts Applicant's ability to defend the Proceeding. The obligations imposed in this Section 7.9 shall apply notwithstanding any allegation or determination in the Proceedings that the City acted contrary to applicable laws. Nothing in this Section shall be construed to mean that Developer shall hold the City harmless and/or defend it from any claims arising from, or alleged to arise from, intentional misconduct or gross negligence in the performance of this Agreement.

7.9.2 Defending the Project Approvals. Developer shall have the obligation to timely retain legal counsel to defend against any Proceeding to set aside, void, or annul, all or any part of any Project Approval. The City shall have the right if it so chooses, to defend the Proceeding utilizing in-house legal staff, in which case Developer shall be liable for all legal costs and fees reasonably incurred by the City, including charges for staff time charged. In the event of a conflict of interest which prevents Developer's legal counsel from representing the City, and in the event the City does not have the in-house legal resources to defend against the Proceeding, the City shall also have the right to retain outside legal counsel, in which case Developer shall be liable for all legal costs and fees reasonably incurred by the City. Provided that Developer is not in breach of the terms of this Section 7.9, the City shall not enter into any

settlement of the Proceeding which involves modification to any Project Approval or otherwise results in Developer incurring liabilities or other obligations, without the consent of Developer.

7.9.3 Breach of Obligations. Actions constituting a breach of the obligations imposed in this Section 7.9 shall include, but not be limited to: (i) the failure to timely retain qualified legal counsel to defend against the Proceedings; (ii) the failure to promptly pay the City for any attorneys' fees or other legal costs for which the City is liable pursuant to a judgment or settlement agreement in the Proceeding seeking to set aside, void or annul all or part of any Project Approval; or (iii) the breach of any other obligation imposed in this Section 7.9, in each case after written notice from the City and a reasonable period of time in which to cure the breach, not to exceed thirty-days. For purposes of this Section 7.9, Developer shall be considered to have failed to timely retain qualified legal counsel if such counsel is not retained within fourteen (14) days following the City's provision of the notice of Proceedings to Developer required hereunder. As used herein, qualified legal counsel shall mean competent counsel retained by Developer that does not have a conflict of interest with the City as a result of representing Developer in the Proceeding. In the event that Developer breaches the obligations imposed in this Section 7.9, the City shall have no obligation to defend against the Proceedings, and by not defending against the Proceedings, the City shall not be considered to have waived any rights in this Section 7.9.

7.9.4 Cooperation: The City shall cooperate with Developer in the defense of the Proceeding; provided however, that such obligation of the City to cooperate in its defense shall not require the City to (i) assert a position in its defense of the Proceeding which it has determined, in its sole discretion, has no substantial merit; (ii) advocate in its defense of the Proceeding legal theories which it has determined, in its sole discretion, lack substantial merit; or (iii) advocate in its defense of the Proceeding legal theories which it has determined, in its sole discretion, are contrary to its best interests, or to public policy. Nothing contained in this section shall require Developer to refrain from asserting in its defense of the Proceeding positions or legal theories that do not satisfy the foregoing requirements.

7.9.5 Contractual Obligation: Developer acknowledges and agrees that the obligations imposed in this Section 7.9 are contractual in nature, and that the breach of any such obligation may subject Developer to a breach of contract claim by the City.

7.9.6 Waiver of Right to Challenge: Developer hereby waives the right to challenge the validity of the obligations imposed in this Section 7.9.

7.9.7 Survival: The obligations imposed in this Section 7.9 shall survive any judicial decision invalidating the Project Approvals.

7.9.8 Preparation of Administrative Record: Developer and the City acknowledge that upon the commencement of legal Proceedings, the administrative record of proceedings relating to the Project Approvals must be prepared. Those documents must also be certified as complete and accurate by the City. Developer, as part of its defense obligation imposed in this Section 7.9, shall prepare at its sole cost and expense the record of proceedings in a manner which complies with all applicable laws; in accordance with reasonable procedures established by the City; and subject to the City's obligation to certify the administrative record of

proceedings and the City's right to oversee the preparation of such administrative record. Developer agrees that its failure to prepare the administrative record as set forth herein, and in compliance with all time deadlines imposed by law, shall constitute a breach of its obligation to defend the City. In the event that Developer fails to prepare the administrative record, the City may do so, in which event the City shall be entitled to be reimbursed by Developer for all reasonable costs associated with preparation of the administrative record, including reasonable charges for staff time.

7.9.9 **Termination**. Developer shall have the right, without City's prior approval but only with the prior written consent of all Mortgagees, in the event of and during the continuation of any Litigation, to terminate this Agreement or renounce the Project Approvals, provided, however, that the provisions of this Section 7.9 shall survive any such termination.

7.10 **Deposit** Following the filing of a lawsuit, or other legal process seeking to set aside, void or annul all or part of any Project Approval, Developer shall be required, following written demand by the City, to place funds on deposit with the City, which funds shall be used to reimburse the City for expenses incurred in connection with defending the Project Approvals. For Project Approvals which included the certification of an environmental impact report by the City, the amount of said deposit shall be ten thousand ($10,000) dollars. For all other Project Approvals, the amount of the deposit shall be five thousand ($5,000) dollars. The City, at its sole discretion, may require a larger deposit upon a detailed showing to Developer of the basis for its determination that the above stated amounts are insufficient. Any unused portions of the deposit shall be refunded to Developer within thirty (30) days following the resolution of the challenge to the Project Approvals. All Deposits must be paid to the City within thirty (30) days of Developer's receipt of the City's written demand for the Deposit.

7.11 **Notices** Any notice or communication required hereunder between the City or Developer must be in writing, and shall be given either personally or by registered or certified mail, return receipt requested. If given by registered or certified mail, the same shall be deemed to have been given and received on the first to occur of (i) actual receipt by any of the addressees designated below as the Party to whom notices are to be sent, or (ii) five (5) days after a registered or certified letter containing such notice, properly addressed, with postage prepaid, is deposited in the United States mail. If personally delivered, a notice shall be deemed to have been given when delivered to the Party to whom it is addressed. Any Party hereto may at any time, by giving ten (10) days' written notice to the other Party hereto, designate any other address in substitution of the address, or any additional address, to which such notice or communication shall be given. Such notices or communications shall be given to the Parties at their addresses set forth below:

If to the City:

Director of City Planning
The City of Los Angeles
200 N. Spring Street, 5th Floor
Los Angeles, CA 90012

with copies to

City Attorney
City of Los Angeles
Real Property/ Environment Division
700 The City Hall East, 200 N. Main Street
Los Angeles, CA 90012

If to Developer:

1720 North Vine LLC
1749 North Vine LLC
1750 North Vine LLC
1733 North Argyle LLC
Millennium Hollywood LLC
Suite 1000
1680 North Vine Street
Los Angeles, CA 90028
Attn: Mario Palumbo

with copies to

Millennium Partners
1195 Broadway, 3rd Floor
New York, NY 10023
Attn: Chief Financial Officer

And with copies to

Sheppard Mullin Richter & Hampton LLP
333 South Flower Street
43rd Floor
Los Angeles, CA 90071
Attn: Alfred Fraijo, Jr., Esq.

And with copies to

Paul Hastings Janofsky & Walker LLP
Real Property/ Environment Division
75 East 55th Street
New York, NY 10022
Attn: Eric R. Landau, Esq.

7.12 **Recordation**. As provided in Government Code Section 65868.5, this Agreement shall be recorded with the Registrar-Recorder of the County of Los Angeles within ten (10) days following its execution by all Parties. Developer shall provide the City Clerk with the fees for such recording prior to or at the time of such recording, should the City Clerk effectuate the recordation.

7.13 **Constructive Notice and Acceptance**. Every person who now or hereafter owns or acquires any right, title, interest in or to any portion of the Property, is and shall be conclusively deemed to have consented and agreed to every provision contained herein, whether or not any reference to this Agreement is contained in the instrument by which such person acquired an interest in the Property.

7.14 **Successors and Assignees.** The provisions of this Agreement shall be binding upon and shall inure to the benefit of the Parties any subsequent owner of all or any portion of the Property and their respective Transferees, successors, and assignees, subject to applicable Assignment Agreements.

7.15 **Severability**. If any provisions, conditions, or covenants of this Agreement, or the application thereof to any circumstances of either Party, shall be held invalid or unenforceable, the remainder of this Agreement or the application of such provision, condition, or covenant to persons or circumstances other than those as to whom or which it is held invalid

or unenforceable shall not be affected thereby and shall be valid and enforceable to the fullest extent permitted by law.

7.16 **Time of the Essence**. Time is of the essence for each provision of this Agreement of which time is an element.

7.17 **Waiver**. No waiver of any provision of this Agreement shall be effective unless in writing and signed by a duly authorized representative of the Party against whom enforcement of a waiver is sought and refers expressly to this Section. No waiver of any right or remedy with respect to any occurrence or event shall be deemed a waiver of any right or remedy with respect to any other occurrence or event.

7.18 **No Third Party Beneficiaries**. The only Parties to this Agreement are the City and Developer and their successors-in-interest. There are no third party beneficiaries (other than Mortgagees) and this Agreement is not intended, and shall not be construed to benefit or be enforceable by any other person whatsoever.

7.19 **Entire Agreement**. This Agreement sets forth and contains the entire understanding and agreement of the Parties and there are no oral or written representations, understandings or ancillary covenants, undertakings or agreements which are not contained or expressly referred to herein and no testimony or evidence of any such representations, understandings, or covenants shall be admissible in any proceedings of any kind or nature to interpret or determine the provisions or conditions of this Agreement.

7.20 **Legal Advice; Neutral Interpretation; Headings, Table of Contents**. Each Party acknowledges that it has received independent legal advice from its attorneys with respect to the advisability of executing this Agreement and the meaning of the provisions hereof. The provisions of this Agreement shall be construed as to their fair meaning, and not for or against any Party based upon any attribution to such Party as the source of the language in question. The headings and table of contents used in this Agreement are for the convenience of reference only and shall not be used in construing this Agreement.

7.21 **Estoppel Certificate**. At any time, and from time to time, Developer may deliver written notice to the City and the City may deliver written notice to Developer requesting that such Party certify in writing that, to the knowledge of the certifying Party (i) this Agreement is in full force and effect and a binding obligation of the Parties, (ii) this Agreement has not been amended, or if amended, the identity of each amendment, and (iii) the requesting Party is not in breach of this Agreement, or if in breach, a description of each such breach (an "**Estoppel Certificate**"). The Planning Director shall be authorized to execute, on behalf of the City, any Estoppel Certificate requested by Developer which complies with this Section 7.21. The City acknowledges that an Estoppel Certificate may be relied upon by Transferees or successors in interest to Developer who requested the certificate and by Mortgagees holding an interest in the portion of the Property in which that Developer has a legal interest.

7.22 **Counterparts**. This Agreement is executed in duplicate originals, each of which is deemed to be an original. This Agreement, not counting the Cover Page and Table of

Contents, consists of pages and 6 Attachments which constitute the entire understanding and agreement of the Parties.

[SIGNATURES ON FOLLOWING PAGES]

IN WITNESS WHEREOF, the Parties hereto have executed this Agreement as of the date first written above.

DEVELOPMENT REGULATIONS
[*Attached*]

I. **Community Benefits Approved by City Planning Commission**

Included in entitlement approvals by the City Planning Commission and modified by the City Council PLUM Committee.

Benefit Component	Requested by:
1. **Observation Deck** – Developer to construct an open space observation area. (Required per the Development Regulations)	*CD 4 Council Office*
2. **Circulation Shuttle** – For 15 years, Developer shall operate a shuttle service, providing "on call" service between the Project and residential areas within a two mile radius. Developer shall not be obligated to spend more than $250,000 per year for the operation of service.	*City Planning*
3. **Bicycle Amenities Plan** – For 15 years, Developer shall maintain a kiosk or tenant space of at least 200 square feet for bicycle repair services. This space is in addition to bicycle parking facilities required by the Development Regulations.	*CHNC; City Planning*
4. **Parking Tracking Services** – Developer shall contribute $50,000 to the Department of Transportation's Express Park program for new parking meter technology, vehicle sensors, a central management system and real-time parking guidance for motorists in the vicinity of the Project.	*City Planning*
5. **Metro Passes** – Developer shall provide a fund of $500,000 over ten (10) years ($50,000 per year for ten (10) years) and work with Metro to create a program whereby the developer funds shall supplement 50% of the cost of 400 Metro passes per year over the ten (10) year period.	*City*

Benefit Component	Requested by:
6. **Monthly Parking Leases for Metro Commuters** – Developer shall provide fifty (50) "park and ride" spaces for monthly lease to persons who are not tenants or occupants of the Project and establish a monitoring program of the park and ride spaces. Monthly fees will not exceed $50 in first year (thereafter subject to increase by 3% per year)	*City, CHNC* ***Although an agreement with the Hollywood Dell Civic Association was not reached, these measures were included with input from the Dell Civic Association***
7. **Daily Discount Parking for Metro Commuters** – Developer will provide 10% parking rate discount to holders of Metro pass	*HSDNC, CHNC*
8. **Shared Vehicle Parking** Developer shall maintain 10 parking spaces within non-residential parking areas of the Project for shared vehicle services and lease same to Zipcar or other operator.	*City*
9. **Medians on Vine** – Developer will fund a study of the feasibility of installing landscaped medians on Vine Street between Franklin Avenue and Hollywood Boulevard	*CHNC*
10. **No Off-Site Signage** – Project shall not include any off-site revenue generating signage. (Required per the Development Regulations)	***Various stakeholder groups, CD 13 Council Office***

II. **Additional Benefits Proposed to be Included in the Development Agreement**

Additional community benefits to be [illegible] opment Agreement. Negotiations on additional benefi[illegible] completed prior to the Commission hearing.

Benefit Component	
Incorporated as Third Party Agreemen	
1. **Project Labor Agreement** – Developer shall enter into a "Project Labor Agreement" that will identify the construction trade union(s) as the primary source of all craft labor employed on the Project.	***Labor groups, CD 13 Council Office*** ***Completed through separate private agreement. Would be enforceable pursuant to the DA.***
2. **Local Hiring** – For each Phase of the Project Developer shall implement an apprenticeship and zip code identification program to prioritize local source hiring for Project construction from the 13th Council District. Thereafter, Developer shall implement an apprenticeship and zip code identification program to prioritize local source hiring for Project operation by Developer's employees.	***City, CHNC***
3. **Operation – Hotel Labor Agreement.** Developer shall enter into a labor agreement for the operation and maintance of the hotel.	***Labor groups, CD 13 Council Office*** ***Completed through separate private agreement. Would be enforceable pursuant to the DA.***
4. **Construction Trades Prevailing Wage** – Construction workers employed in the construction of each Phase of the Project shall be paid no less than the prevailing wage as determined by the provisions of Sections 1770 et seq. of the California Labor Code.	***City; Labor groups***

Benefit Component	Requested by:
Additional Benefits	
5. **Community Organization Meeting Space** – Developer shall provide not less than 1,200 square feet of meeting space at the Project for use by Hollywood and community non-profit groups.	*CHNC; HUNC; City Planning*
6. **Discount Parking for Local Area Residents** – Developer will provide 10% parking rate discount to car with occupant holding a driver's license showing address in Hollywood Central or Hollywood Hills zip code]	*CHNC*
7. **Public Performances, Music, and Arts Programming –** Developer shall conduct *at least 12 days of public events per year* in the Art Plaza and pay costs associated with events. *until 15th anniversary of Entitlement Date.*	*CD 13 Council Office, Planning*
8. **Parking Access Management System** – Developer shall provide a parking access management system.	*DOT, CD 13 Council Office, Planning*
9. **Pedestrian Improvements Contribution** – Developer shall provide funding in the amount of $50,000 to the Hollywood Chamber of Commerce Walk of Fame Committee, or as otherwise directed by the City, for renovation and upkeep of the Walk of Fame stars and terrazzo, sidewalks and other public streetscape improvements.	*Planning, CD 13 Council Office*

what is the Ask DOT

Benefit Component	Requested by:
10. **Music Appreciation Exhibit** – For 15 years. Developer shall install publicly accessible artwork and/or changeable exhibition cabinets and/or platforms. The Music Appreciation Exhibit shall be maintained at Developers sole cost.	***CD 13 Council Office***
11. **Hollywood Central Park** –shall make contribution to the Friends of Hollywood Central Park in the amount of $50,000. Thereafter, for 15 years, Developer Developer shall make an annual contribution in the amount of $50,000 for the operation and maintenance of the Hollywood Central Park.	***Planning, CHNC, CD 13 Council Office***
Additional Community Benefits	
12. **Dog Park** – Developer contribute lesser of estimated cost or $25,000 toward improvement of a community dog park, subject to City's acquisition of a site.	***CHNC***
13. **Franklin/Ivar Park –** Developer contribute lesser of estimated cost or $25,000 toward improvement of Franklin/Ivar Park.	***CHNC***
14. **Central Hollywood Design Overlay –** If requested by City, Developer will contribute $250,000 toward completion of Central Hollywood Design Overlay pursuant to Hollywood Community Plan Policy LU 2.5.1 or other Planning undertaking	***CHNC***

Benefit Component	Requested by:
15. **LAPD Hollywood Division Building** – Developer will (esser of estimated cost or $50,000 for the following improvements to 6501 Fountain Avenue: replacement of windows, refinishing façade facing Fountain Avenue, fabrication and installation of signage, and installation of a Wi-Fi system useable throughout the public portions of such building.	***CHNC***
16. **Grocer** – *Developer will use its commercially reasonable efforts to procure a grocery store tenant in any available, suitable retail area within the Project, subject to market conditions and demand, rent levels and competitive grocery facilities in the area.*	***CHNC***
17. **Hollywood Sign Protection Fund** – Following installation of 400+ foot building, Developer shall make contributions to the Hollywood Sign Trust, a California non-profit corporation, in the amount of $2,000 per residential dwelling unit in in such Phase and subsequent Phases, which contribution shall be payable with respect to each unit within thirty (30) days after the earlier of the initial sale or lease thereof.	***CHNC, CD 4 Council Office, CD 13 Council Office, Planning***
18. **Affordable Housing Payment** – Developer shall pay $4,800,000 for the development of 100 new affordable housing units. The affordable housing Projects are (a) the Westlake Theater Project, and (b) the Coronel Project (the "HCHC Projects"). If funds cannot be used or are not needed for HCHC Projects, LAHD can use for other affordable housing projects.	***To be completed by separate agreement. City/LAHD, CD 13 Council Office, Affordable housing advocates*** $2.4 mil HCHC $2.4 mil AHTF

III. **Mitigation Measures in Millennium Hollywood Project Environmental Impact Report (EIR) to Address Traffic and Circulation**

Benefit Component	Requested by:
Section IV.K.1 of the EIR:	
Transportation – Traffic	
K.1-1 To mitigate potential temporary traffic impacts of any necessary lane and/or sidewalk closures during the construction period, the Project Applicant shall, prior to construction, develop a Construction Management Plan/Worksite Traffic Control Plan (WTCP) to be approved by LADOT. The WTCP shall be designed to minimize the effects of construction on vehicular and pedestrian circulation and assist in the orderly flow of vehicular and pedestrian circulation on the public streets in the area of the Project. The WTCP shall include temporary roadway striping and signage for traffic flow as necessary, elements compliant with conditions xv through xvii in Measure K.1-3, and the identification and signage of alternative pedestrian routes in the immediate vicinity of the Project. The Plan shall show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. Any construction related hauling traffic shall be restricted to off-peak hours.	***Planning, DOT***
K.1-2 In order to minimize peak period construction trips, construction related traffic shall be restricted to off-peak hours. The following language is to be incorporated into the WTCP: i On weekdays, work shifts shall not begin between 7:01 AM and 9:29 AM. ii Work shifts shall not end between 3:31 PM and prior to 6:29 PM. The WTCP shall also include Mitigation Measure K.1-3, Condition i, time restrictions for hauling.	***Planning, DOT***

Benefit Component	Requested by:
K.1-3 Prior to the issuance of a grading permit, the Project Applicant shall record and execute a Covenant and Agreement (Planning Department General Form CP-6770), binding the Project Applicant to the following haul route conditions: i All Project construction haul truck traffic shall be restricted to truck routes approved by the City of Los Angeles Department of Building and Safety, which shall avoid residential areas and other sensitive receptors to the extent feasible. ii Except under a permitted exception, all hauling (both delivery and export) shall be during the hours of 9:00 AM to 4:00 PM or 6:30 PM to 9:00 PM. Any exceptions to the above time limits shall be permitted by the Department of Building and Safety in consultation with the Department of Transportation. Exceptions to the haul activity time limits are to be permitted only when necessary, such as for the continuation of concrete pours that can not reasonably be completed otherwise. iii Permitted Days of the week shall be Monday through Saturday. No hauling activities are permitted on Sundays or Holidays. iv Project haul trucks shall be restricted to 18-wheel trucks or smaller. v The Traffic Bureau of the Los Angeles Police Department shall be notified prior to the start of hauling (213.485.3106). vi Streets shall be cleaned of spilled materials at the termination of each work day. vii The final approved haul routes and all the conditions of approval shall be available on the job site at all times. viii The Contractor shall keep the construction area sufficiently dampened to control dust caused by grading and hauling, and at all times provide reasonable control	***Planning, DOT***

Benefit Component	Requested by:
of dust caused by wind. ix Hauling and grading equipment shall be kept in good operating condition and muffled as required by law. x All loads shall be secured by trimming, watering or other appropriate means to prevent spillage and dust. xi All trucks are to be watered only when necessary at the job site to prevent excessive blowing dirt. xii All trucks are to be cleaned of loose earth at the job site to prevent spilling. Any material spilled on the public street shall be removed by the contractor. xiii The Project Applicant shall be in conformance with the State of California, Department of Transportation policy regarding movements of reducible loads. xiv All regulations set forth in the State of California Department of Motor Vehicles pertaining to the hauling of earth shall be complied with xv "Truck Crossing" warning signs shall be placed 300 feet in advance of the exit in each direction. xvi One flag person(s) shall be required at the job site to assist the trucks in and out of the Project area. Flag person(s) and warning signs shall be in compliance with Part II of the 1985 Edition of "Work Area Traffic Control Handbook." xvii The City of Los Angeles, Department of Transportation, telephone 213.485.2298, shall be notified 72 hours prior to beginning operations in order to have temporary "No Parking" signs posted along the route. xviii Any desire to change the prescribed routes shall be approved by the concerned governmental agencies by contacting the Street Use Inspection Division at 213.485.3711 before the change takes place. xix The permittee shall notify the Street Use	

Benefit Component	Requested by:
Inspection Division, 213.485.3711, at least 72 hours prior to the beginning of hauling operations and shall also notify the Division immediately upon completion of hauling operations. xx A surety bond by Contractor shall be posted in an amount satisfactory to the City Engineer for maintenance of haul route streets. The forms for the bond shall be issued by the Central District Engineering Office, 201 N. Figueroa Street, Room 770, Los Angeles, CA 90012. Further information regarding the bond may be obtained by calling 213.977.6039	
K.1-4 The Project Applicant shall contact the Metro Bus Operations Control Special Events Coordinator at 213-922-4632 regarding construction activities that may impact Metro bus lines.	***Planning, DOT, Metro***
K.1-5 Transportation Demand Management (TDM) – The Project is a mixed-use development, located within a quarter mile radius of the Hollywood/Vine Metro Red Line Transit Station and allows immediate access to the Metro Red Line rail system. Additionally, a number of Metro and LADOT bus routes are less than one-quarter mile (considered to be within reasonable walking distance) from the Project Site, providing access for Project employees, visitors, residents and guests. The Project Site is surrounded by numerous supporting and complementary uses, such as additional housing for employees and additional shopping for residents within walking distance. The Project shall take advantage of these opportunities through a pedestrian/bicycle friendly design and implementation of a TDM program. A preliminary TDM program shall be prepared and provided for LADOT review prior to the issuance of the first building permit for the Project and a final TDM program approved by LADOT is required prior to the issuance of the first certificate of occupancy for the Project. The TDM Program applies to the new land uses to be developed as part of the final development program for the Project. To the extent a TDM Program element is specific to a use, such element shall be implemented at such time that	***Planning, CD 13 Council Office, DOT, Metro, Caltrans, CHNC, and other stakeholder groups*** ***Although an agreement with the Hollywood Dell Civic Association was not reached, these measures were included with input from the Dell Civic Association***

Benefit Component	Requested by:
new land use is constructed. Both the pedestrian/bicycle friendly design and TDM program shall be acceptable to the Departments of Planning and Transportation. The TDM program shall include, but not be limited to, the following strategies: • Provide an internal Transportation Management Coordination Program with an on-site transportation coordinator; • A bicycle, transit, and pedestrian friendly environment; • Administrative support for the formation of carpools/vanpools; • Inclusion of business services to facilitate work-at-home arrangements for the proposed residential uses, if constructed; • Flexible/alternative work schedules and telecommuting programs; • Provide car share amenities (including a minimum of 5 parking spaces for shared car program); • Parking provided as an option only for all leases and sales; • A provision requiring compliance with the State Parking Cash-out Law in all leases; • Provision of a self-service bicycle repair area and shared tools for residents and employees; • Distribution of information to all residents and employees of the onsite pedestrian, bicycle and transit rider services, including shared car and shared bicycle services; • Coordinate with LADOT to provide space for a future Integrated Mobility Hub;	

Benefit Component	Requested by:
• Guaranteed ride home program potentially via the shared car program; • Transit routing and schedule information; • Transit pass sales; • Rideshare matching services; • Bike and walk to work promotions; • Visibility of the alternative commute options through a location on the central court of the Project Site; • Preferential rideshare loading/unloading or parking location; • Financial contribution to the City's Bicycle Plan Trust Fund that is currently being established (CF 10-2385-S5). In addition to these TDM measures, LADOT also recommends that the Project Applicant explore the implementation of an on-demand van, shuttle or tram service that connects the Project to off-site transit stops based on the transportation needs of the Project's employees, residents and visitors. Such a service shall be included as an additional measure in the TDM program if it is deemed feasible and effective by the Project Applicant.	
K.1-6 Hollywood Community Transportation Management Organization (TMO) – The Project shall join or help create a TMO serving the Hollywood Area by providing a meeting area and initial staffing for one year (free of charge). The Project owner shall participate in the TMO as a member. The TMO shall offer services to member organizations, which include: • Matching services for multi-employer carpools. • Multi-employer vanpools (to serve areas that are	***CD 13 Council Office, DOT, CHNC***

Benefit Component	Requested by:
identified as under served by transit, but contain the residences of the Hollywood area employees). • Help coordinating the Bicycle Share and Car Share programs. • Promotion and implementation of pedestrian, bicycle and transit stop enhancements (such as transit/bicycle lanes), and • Other efforts to encourage and increase the use of alternative transportation modes in the Hollywood area.	
K.1-7 Integrated Mobility Hubs – To support the goals of the Project's TDM plan and to expand the City's program, the Project Applicant shall coordinate with LADOT to provide space for a Mobility Hub in a convenient location within or near the Project Site. The Project Applicant has offered to provide on-site parking spaces for shared cars that could be a project-specific amenity or be linked with the larger Mobility Hubs program. The Project Applicant shall also provide space that shall accommodate bicycle parking, bicycle lockers, and shared bicycles. LADOT is currently working on an operating plan and assessment study for the Mobility Hubs project that shall include specific sites, designs, and blueprints for Mobility Hub stations. The results of this study shall assist in determining the appropriate location and space needed to accommodate a Mobility Hub at the Project Site.	***CD 13 Council Office, DOT, Metro, CHNC***
K.1-8 Transit Enhancements – The Project shall provide a pedestrian friendly environment through sidewalk pavement reconstruction/improvements, and improved amenities such as landscaping and shading particularly along the sidewalks on Ivar Avenue and Argyle Avenue linking the project to the Hollywood/Vine Metro Red Line Station. Enhancements shall include reconstructing damaged or missing pavement in the sidewalks along Ivar Avenue and Argyle Avenue between the Project Site and the Hollywood/Vine Metro Red Line Transit Station.	***CD 13 Council Office, DOT, CHNC***

Benefit Component	Requested by:
and installing up to four transit shelters with benches at stops within a block of the Project Site, as deemed appropriate by LADOT. The LADOT designation of locations shall be made in consultation with Los Angeles County Metropolitan Transportation Authority (Metro).	
K.1-9 Bike Plan Trust Fund – The Project Applicant shall contribute a one-time fixed-fee of $250,000 to be deposited into the City's Bicycle Plan Trust Fund that is currently being established (CF 10-2385-S5). These funds shall be used by LADOT, in coordination with the Department of City Planning and Council District 13, to implement bicycle improvements within the Hollywood area. However, improvements within Hollywood that are consistent with the City's complete streets and smart growth policies shall also be eligible expenses utilizing these funds. Any measures implemented by using the fund shall be consistent with the General Plan Transportation Element. Items beyond signing and striping, such as curb realignment and signal system modifications, may be included in the funded projects, to the degree necessary for safe and efficient operation. Should shuttle riders on the DASH system warrant an increase in capacity, the Project funding may instead be used for the purchase of a shuttle vehicle for the DASH system.	***CD 13 Council Office, DOT, CHNC***
K.1-10 Traffic Signal System Upgrades – The Project Applicant shall be required to implement the traffic signal upgrades identified in Attachment 3 to the LADOT's Correspondence to the Department of City Planning, dated August 16, 2012 (See Appendix K.2 to this Draft EIR). Should the project be approved, then a final determination on how to implement these traffic signal upgrades shall be made by LADOT prior to the issuance of the first building permit. These signal upgrades shall be implemented either by the Project Applicant through the B-permit process of the Bureau of Engineering (BOE), or through payment of a one-time fixed fee to LADOT to fund the cost of the upgrades. If LADOT selects the payment option, then the Project Applicant shall be required to pay LADOT the estimated cost to implement	***CD 13 Council Office, DOT***

Benefit Component	Requested by:
the upgrades, and LADOT shall design and construct the upgrades. If the upgrades are implemented by the Project Applicant through the B-Permit process, then these traffic signal improvements shall be guaranteed prior to the issuance of any building permit and completed prior to the issuance of any certificate of occupancy.	
K.1-11 Intersection Specific Improvements – Argyle Avenue/Franklin Avenue – US 101 Freeway Northbound On-Ramp – To mitigate the significant traffic impact at this intersection under both existing (2011) and future (2020) conditions, the Project Applicant shall restripe this intersection to provide a left-turn lane, two through lanes, and a right-turn lane for the southbound approach and two left-turn lanes and a shared through/right lane for the northbound approach. The final design of this improvement shall require the joint approval of Caltrans and LADOT.	***CD 13 Council Office, Planning, DOT***
K.1-12 Highway Dedication and Street Widening Requirements – The City Council recently adopted the updated Hollywood Community Plan. The new plan includes revised street standards that provide an enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Vine Street has been designated as a Modified Major Highway Class II requiring a 35-foot half width roadway within a 50-foot half-width right-of-way. Yucca Street between Ivar Avenue and Vine Street is classified as a Secondary Highway, which requires a 35-foot half-width roadway within a 45-foot half-width right-of-way. Yucca Street between Vine Street and Argyle Avenue is classified as a Local Street. Ivar Avenue and Argyle Avenue are also classified as Local Streets. A Local Street requires a 20-foot half width roadway within a 30-foot half-width right-of way. The Project Applicant shall check with BOE's Land Development Group to determine if there are any highway dedication, street widening and/or sidewalk requirements for this project.	***Planning, DOT***

Benefit Component	Requested by:
K.1-13 Implementation of Improvements and Mitigation Measures. The Project Applicant shall be responsible for the cost and implementation of any necessary traffic signal equipment modifications and bus stop relocations associated with the proposed transportation improvements described above. Unless otherwise noted, all transportation improvements and associated traffic signal work within the City of Los Angeles shall be guaranteed through the B-Permit process of the Bureau of Engineering, prior to the issuance of any building permits and completed prior to the issuance of any certificates of occupancy. Temporary certificates of occupancy may be granted in the event of any delay through no fault of the Project Applicant, provided that, in each case, the Project Applicant has demonstrated reasonable efforts and due diligence to the satisfaction of LADOT. Prior to setting the bond amount, BOE shall require that the developer's engineer or contractor contact LADOT's B-Permit Coordinator, at (213) 928-9663, to arrange a pre-design meeting to finalize the proposed design needed for the project.	
K.1-14 East Site Residential Unit and Reserved Residential Parking Cap. On the East Site, residential development shall be limited to 450 residential units and 675 reserved residential parking spaces.	what is the rationale?
Section IV.K.2 of the EIR: **Transportation – Parking**	
K.2-1 No sidewalk in the pedestrian route along a public right-of-way shall be closed for construction unless an alternative pedestrian route is provided that is no more than 500 feet greater in length than the closed route.	***CD 13 Council Office, Planning, DOT***
K.2-2 Construction Related Parking. Off-street parking shall be provided for all construction-related employees generated by the Project. No employees or subcontractors shall be allowed to park on surrounding residential streets for the duration of all construction	***CD 13 Council Office, Planning, DOT***

Benefit Component	Requested by:
activities. There shall be no staging or parking of heavy construction vehicles on the surrounding street for the duration of all construction activities. There shall be no staging or parking of construction vehicles, including vehicles that transport workers, on any residential street in the immediate area. All construction vehicles shall be stored onsite unless returned to the base of operations.

13. DEFINITIONS 58

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and ensure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project Site.

e. Ensure compliance with the Development Objectives.

f. Ensure preservation of the Capitol Records Building and the Gogerty Building according to the *Secretary of the Interior's Standards for Rehabilitation*.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve the Capitol Records Building and the Gogerty Building according to established preservation guidelines (the *Secretary of the Interior's Standards for Rehabilitation* and guidance provided by Office of Historic Resources).

b. Preserve public views from certain key vantage points to the Capitol Records Tower by creating grade level open space / civic plazas on the East Site adjacent to the Jazz Mural and Capitol Records Building and West Site across from the Capitol Records.

c. Preserve existing view corridors from certain key vantage points to the Hollywood Hills.

fig. 1.2.2.b-c: Capitol Records View Corridors

d. Create civic plazas that are activated by retail, landscaped, and enhance the Hollywood Walk of Fame by providing it as an urban node. Reinforce the urban and historical

importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Encourage street life by the creation of a new pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces that permit open and green spaces for both the on-site and off-site population.

fig 1.2.2.d: View North Along Vine Street

g. Create a 24 hr. community by the creation of a Thriving Mixed-Use Development.

h. Eliminate the visual impact of current on-site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in proximity to the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street, and existing bus routes.

j. Establish standards to address architectural excellence.

k. Provide designs that address, respect and complement the existing context, including standards for ground-level open space, podium heights and massing setbacks that minimize impacts to the historic setting.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood from the Hollywood Freeway.

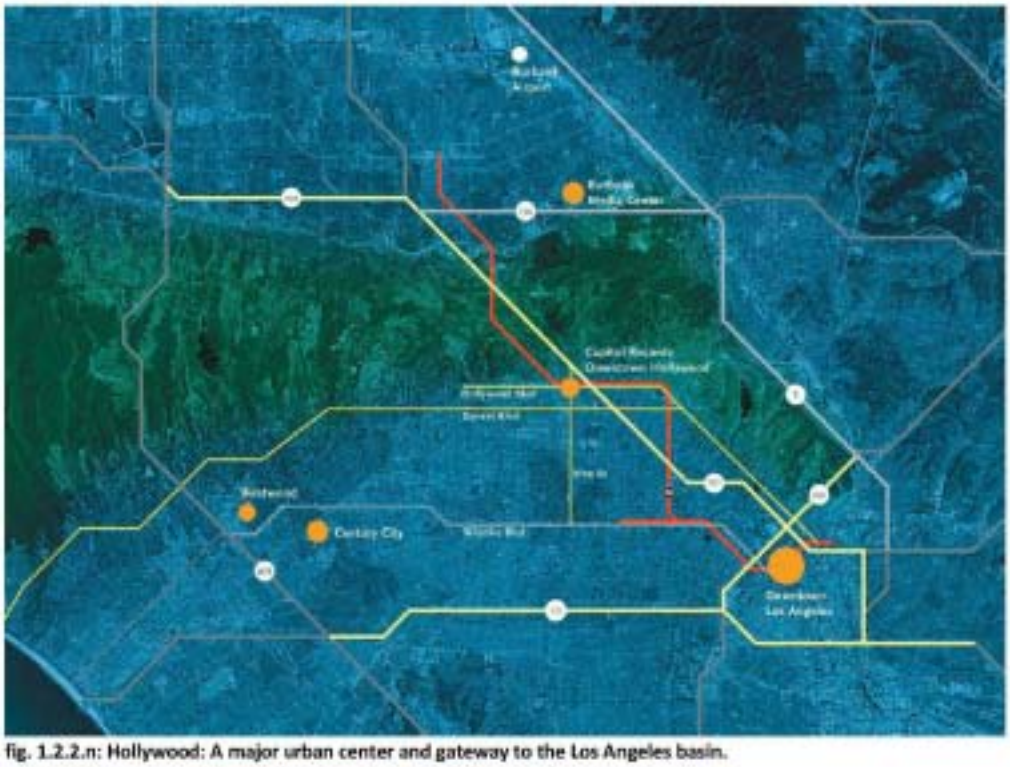

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict requirements for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and _____ ("Millennium Development Agreement") on _____.

1.4.2 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street.

The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 21 feet (NE to SW) from Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Vine Street. The existing sidewalk elevations will not be altered as part the Project.

fig. 2.1. Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 The Project Site is zoned Commercial (C2). The City General Plan land use designation is Regional Center commercial.

2.2.2 The Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Notwithstanding any provision in these Regulations, residential floor area is not permitted within 500 feet of any freeway.

2.2.4 Floor Area Ratio: 6:1

2.2.5 Height District: No. 2

3. HISTORIC RESOURCES AND SETTING

3.1 Overview

The Project Site is located in a historically rich area of Hollywood that contains a number of recognized historic resources. This Project is a preservation project in that its ambition is to respect, respond to, and preserve the Capitol Records Building and to continue the urban character of Vine Street on the Project Site. The Project is designed to be observant of historic settings and buildings. Two buildings located on the Project Site, the Capitol Records Tower and the Gogerty Building, are historically significant. Other historic buildings, located on adjacent parcels, are the Pantages Theater, the Equitable Building, the Hollywood Palace, and the Art Deco commercial building at 6316-6324 Yucca Street. Several of these historic resources are located within the Hollywood Boulevard Commercial and Entertainment District, a National Register listed historic district located just south of the Project Site.

Composed of commercial properties from the first half of the 20th Century, contributing properties to the Hollywood Boulevard Commercial and Entertainment District include a wide variety of property types including single-story storefronts, two-story commercial blocks, department stores, theaters, high-rise office buildings and hotels.

The Capitol Records Building is a unique building whose cylindrical form has always been visible from portions of Hollywood and Vine from the south and the freeway from the north. The Capitol Records Tower and the iconic buildings in the Hollywood Boulevard Commercial and Entertainment District (the Hollywood Palace, Pantages Theater, Equitable Building) will maintain their prominence after implementation of the Project.
Portions of the Hollywood Walk of Fame (L.A. Historic Cultural Monument #194) are located along Vine Street between Yucca Street and Sunset Boulevard and will be protected.

The protection of Hollywood's historic resources and unique character is an important objective of the Project. The guidelines and standards contained in this document were created in part to ensure the protection of historic resources within the Project Site and minimize potential adverse effects to historic resources from new development. Key Project objectives regarding historic resources include:

1) Preservation, maintenance, and rehabilitation of the Capitol Records Building and the Gogerty Building in accordance with the Secretary of the Interior's Standards. See sections 1.2.2a and 1.2.2b of this document.

2) Protection and preservation of the portions of the Hollywood Walk of Fame (LA Historic Cultural Monument #194) will need to be temporarily removed during construction and replaced after construction is completed. A preservation plan, outlined in the Hollywood Walk of Fame Terrazzo Pavement and Repair Guidelines (March, 2011) will be prepared for this aspect of the Project.

3) Incorporation of ground-floor open space and building setback requirements to moderate the overall massing of new development in a manner that preserves important views to and from the Capitol Records Building, the Hollywood Boulevard Commercial and Entertainment District, and important view corridors to the Hollywood Hills. See sections 1.2.2 c, 6.1, 6.9, 7.1, 7.5, 8.1 and 8.2 of this document.

4) Incorporation of ground-floor open space and building setback requirements to reduce massing at the street level and limit the visual crowding of adjacent historic resources. See sections 1.2.2c, 6.1, 7.1, 7.5,

8.1 and 8.2 of this document.

5) Requirement that design of new buildings be in a manner that is differentiated from but compatible with adjacent historic resources. See sections 6.6, 6.8, 7.1.5, and 7.4 of this document.

One means of creating compatible new buildings in an urbanized setting is to incorporate qualities of vertical and horizontal visual complexity in world class design. The general characteristics, proportions, and details of older buildings may serve as a reference for the Project. The Project's intent is to allow old and new to mix, recognizing that Hollywood sustains its image through both the rehabilitation of existing historic structures and the design of creative and contemporary architecture.

4. DENSITY

4.1 Floor Area Ratio Averaging and Density Transfer

The Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the sum of the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

4.2 Land Use Equivalency Program

The Land Use Equivalency Program is intended to provide flexibility in land uses for the Project while ensuring that a change in land uses would not result in new significant environmental impacts or a substantial increase in the severity of significant environmental impacts identified in the EIR, ENV-2011-0675-EIR (SCH No. 2011041094). With respect to any proposed Phase of the Project (an "Exchange Phase") that would result in a build out of the Project that is not consistent with at least one of the Project scenarios studied under the EIR, under the Land Use Equivalency Program, the developer may request a transfer or exchange of land uses, as well as modifications to the siting, massing or other development standard in so far as they are consistent with the provisions herein, for such Exchange Phase by a delivering written request therefore to the Planning Department of the City, which request shall be accompanied by (a) detailed information identifying the land use transfer/exchange that is being proposed for such Exchange Phase; (b) information documenting how the proposed land uses and densities in the Exchange Phase, together with the existing improvements and the other phases previously developed, are consistent with the overall AM and PM peak hour trip cap identified in Table II-3, Project Trip Cap from the EIR; and (c) supporting documentation to demonstrate that the Project including the proposed Exchange Phase would not exceed the maximum environmental impacts identified in the EIR (collectively, an "Equivalency Program Exchange Submission"). The Planning Director shall approve such request if the Equivalency Program Exchange Submission reasonably demonstrates that the Project including the proposed Exchange Phase is consistent with the overall AM and PM peak hour trip cap identified in such Table II-3, Project Trip Cap, does not conflict with the impacts analysis for the maxim Commercial and Residential Scenarios, and would not otherwise exceed the maximum environmental impacts identified in the EIR.

5. HEIGHT

5.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capital Records Tower.

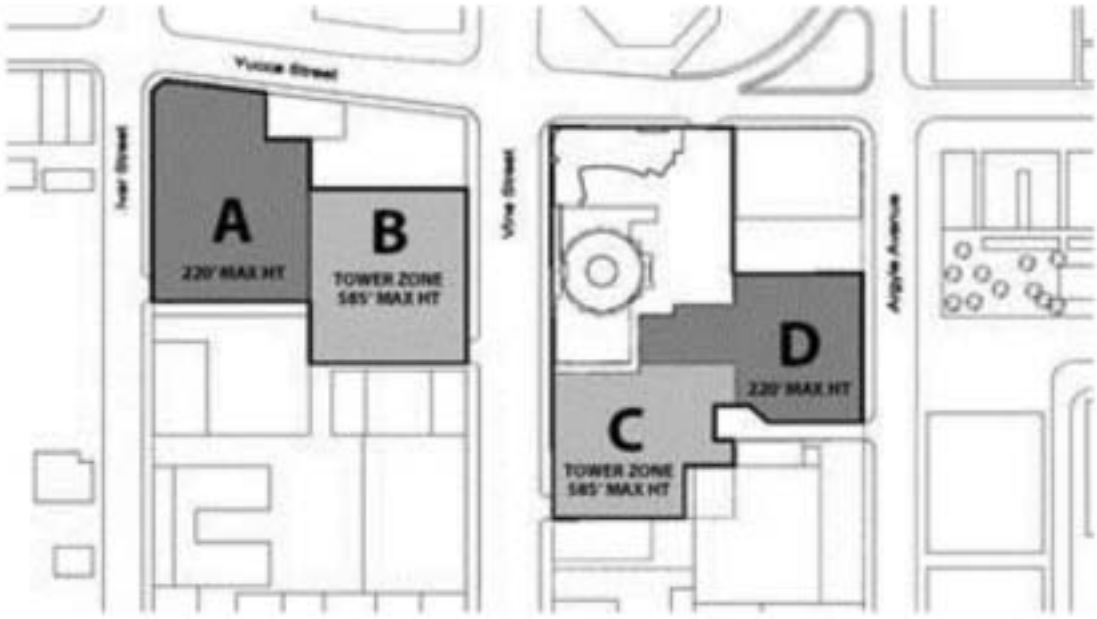

Fig. 5.1 Height Zones

6. BUILDING AND STREET EXPERIENCE

6.1 Tower Massing Standards

6.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 6.1.1.

Tower Height (feet)	Maximum Tower Lot Coverage (%)	Minimum Floor Area Below 220 Feet (%)	Maximum Tower Floor Plate (sq. ft.)	Minimum Tower Setback (feet)	Minimum Public Open Space (%)	Figures
151 – 585	11.5	50	13,325 East Site 9,042 West Site	10 15[1]	12	6.1.2.d.1 6.1.2.d.2
151 – 550	15	50	17,380 East Site 11,794 West Site	10 15[1]	10	6.1.2.c.1 6.1.2.c.2
151 – 400	28	50	22,745 East Site 22,016 West Site	10 15[1]	8	6.1.2.b.1 6.1.2.b.2
150 – 220	48	n/a	55,616 East Site 37,742 West Site	10 15[1]	5	6.1.2.a.1 6.1.2.a.2

Table 6.1.1

Note 1: 15' tower setback required for any tower fronting Vine Street on West parcel. See Figure 6.3.2.

6.1.2 For the purpose of calculating the maximum lot coverage the total lot area is equal to the total lot area for each of the sites, the West Site and the East Site. If there is more than one tower on a site, the maximum lot coverage requirement in Table 6.1.1 is calculated based on the combined area of all towers on each site. The total lot coverage applies to the aggregate floor plate(s) of the tower or towers on each site.

6.1.3 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 6.1.2.a.1 – 2.)

6.1.4 At least 50% of total floor area must be located below 220 feet.

6.1.5 Tower wall articulation:

a. Minimum 10% of tower aggregate area shall be articulated.

6.1.6 Types of permitted articulations for tower walls:

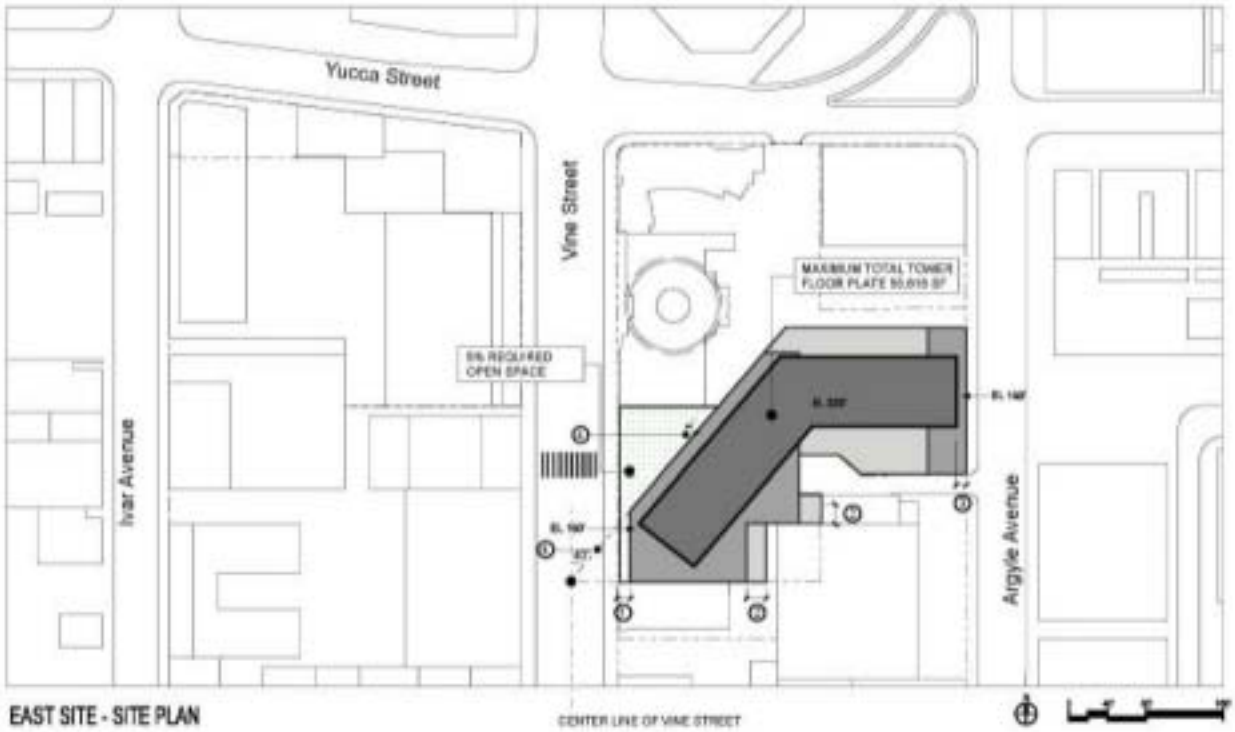
a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

The following developments are for illustrative purposes only.
Maximum Lot Coverage and Tower Floor Plate – Figs. 6.1.2.a – d.



EAST SITE - SITE PLAN

① MINIMUM 10' SETBACK ALONG VINE STREET
② MINIMUM 20' SETBACK ABOVE 150'
③ MINIMUM 10' SETBACK ABOVE 150'
④ 10' SETBACK FROM CAPITOL RECORDS TOWER

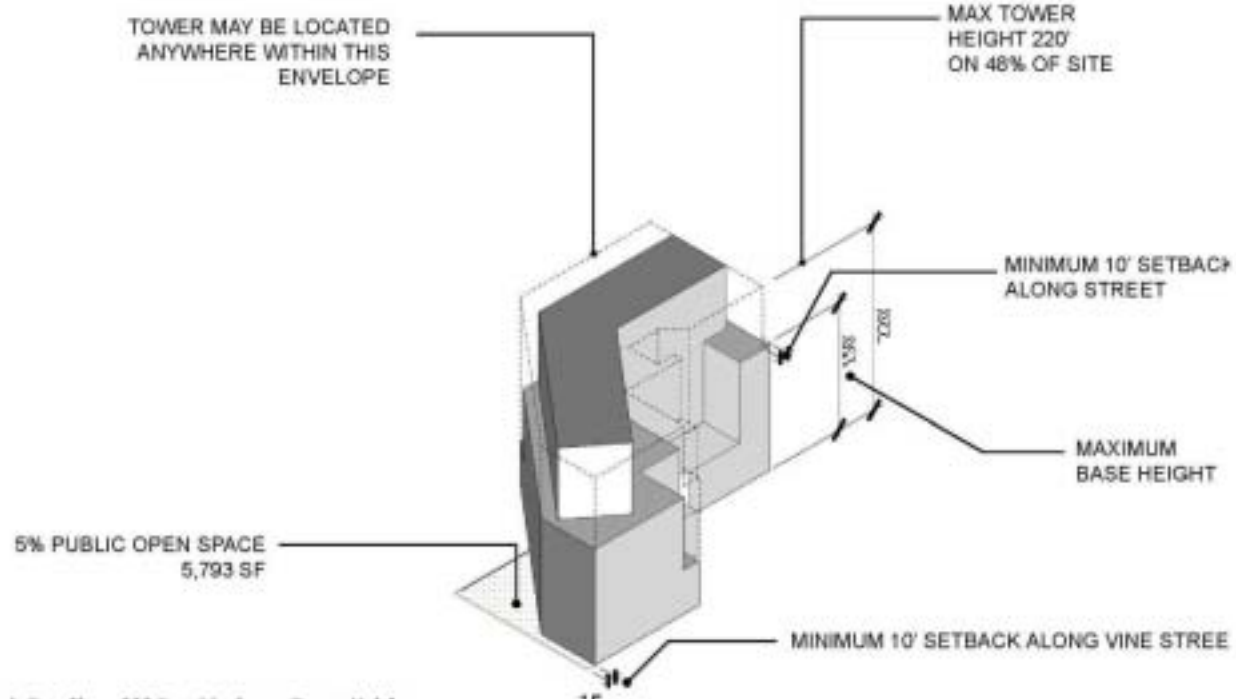


fig. 6.1.2.a.1: East Site – 220 Feet Maximum Tower Height

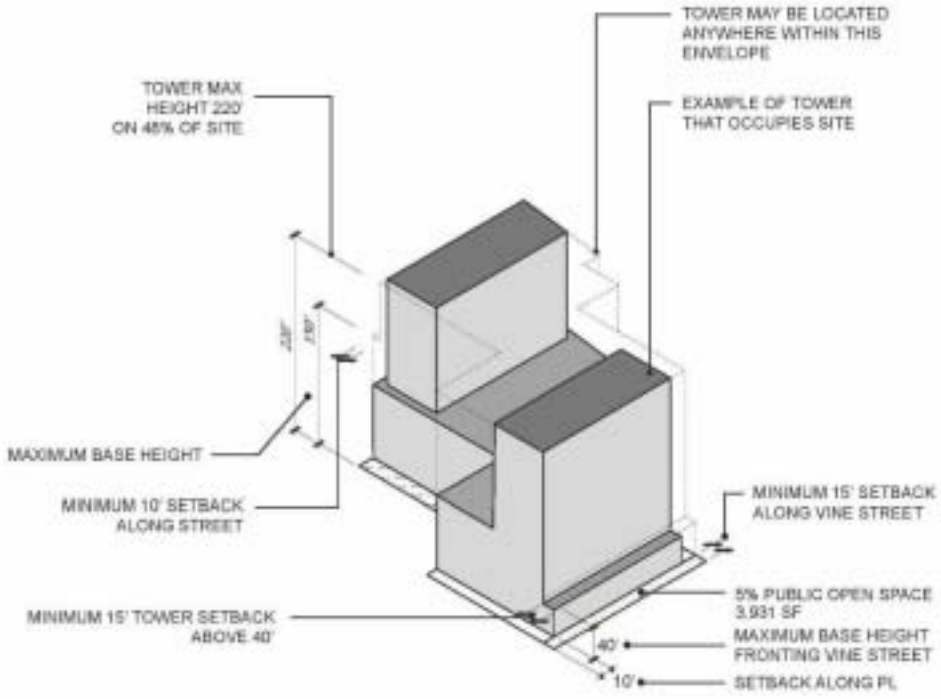

fig. 6.1.2.a.2: West Site - 220 Feet Maximum Tower Height.

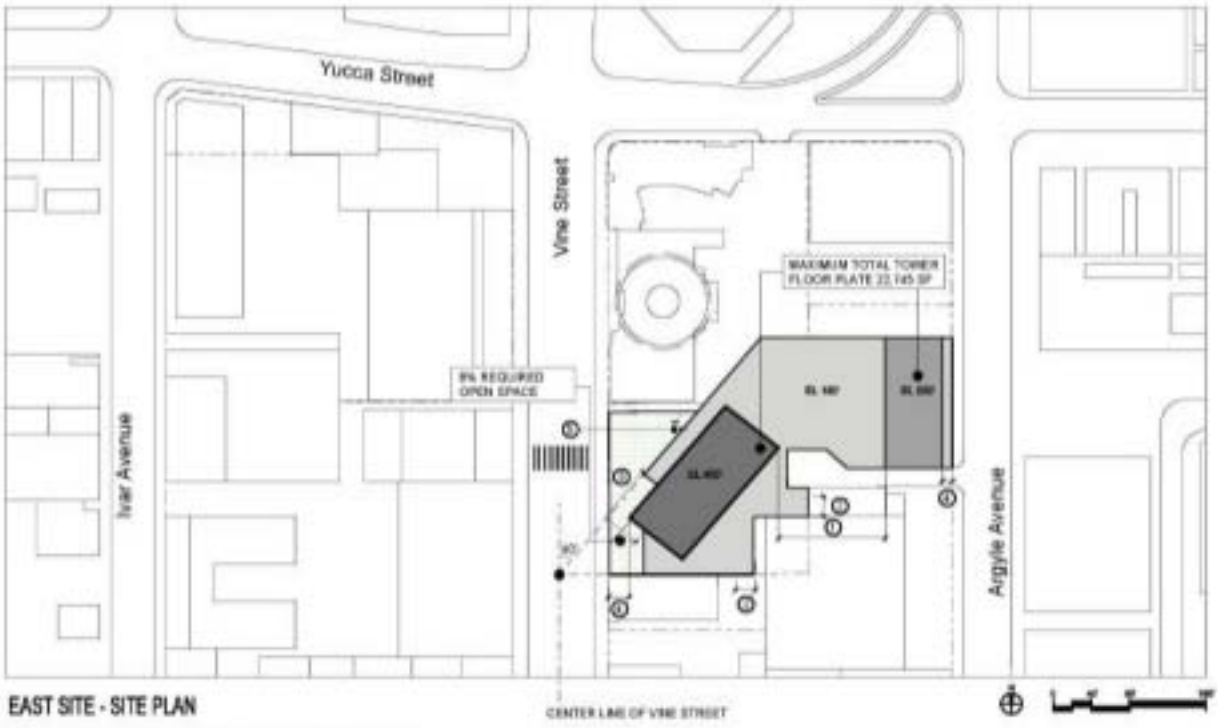

EAST SITE - SITE PLAN

① MINIMUM 60' SEPARATION BETWEEN 'TOWERS' ON SAME SITE
② MINIMUM 20' SETBACK ABOVE 156'
③ MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
④ MINIMUM 10' SETBACK ABOVE 156'
⑤ 10' SETBACK FROM CAPITOL RECORDS TOWER

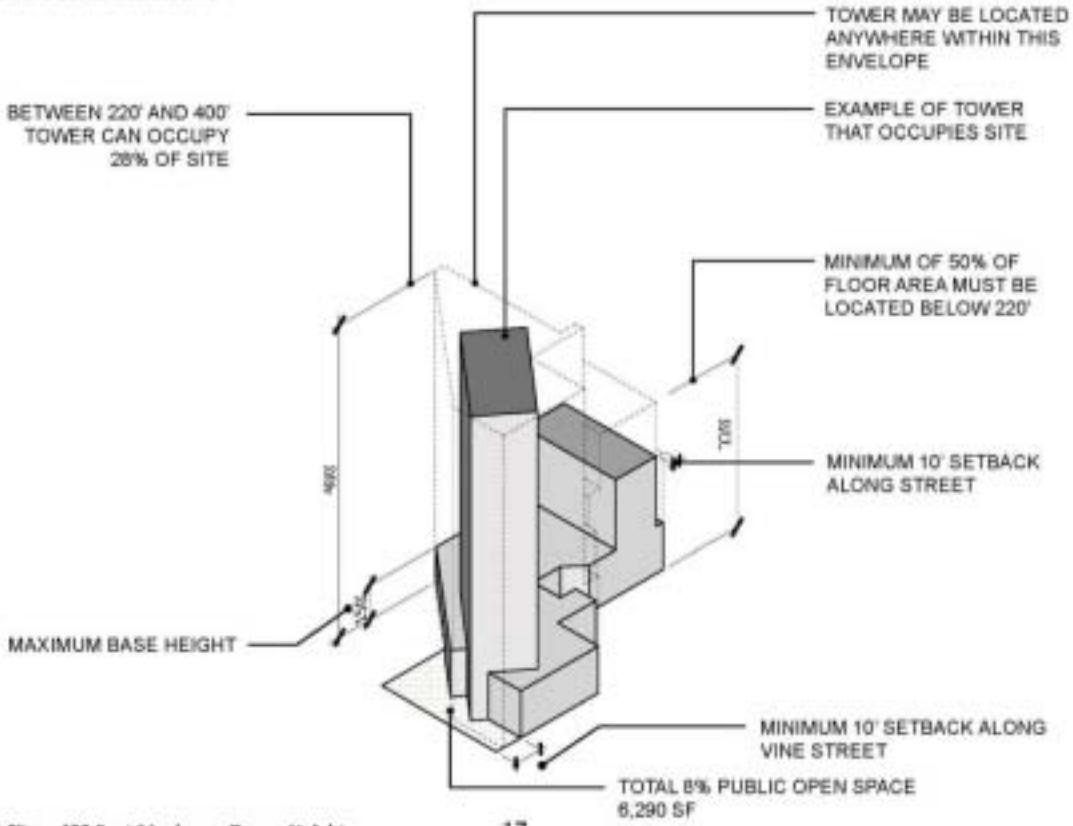

fig. 6.1.2.b.1: East Site – 400 Feet Maximum Tower Height

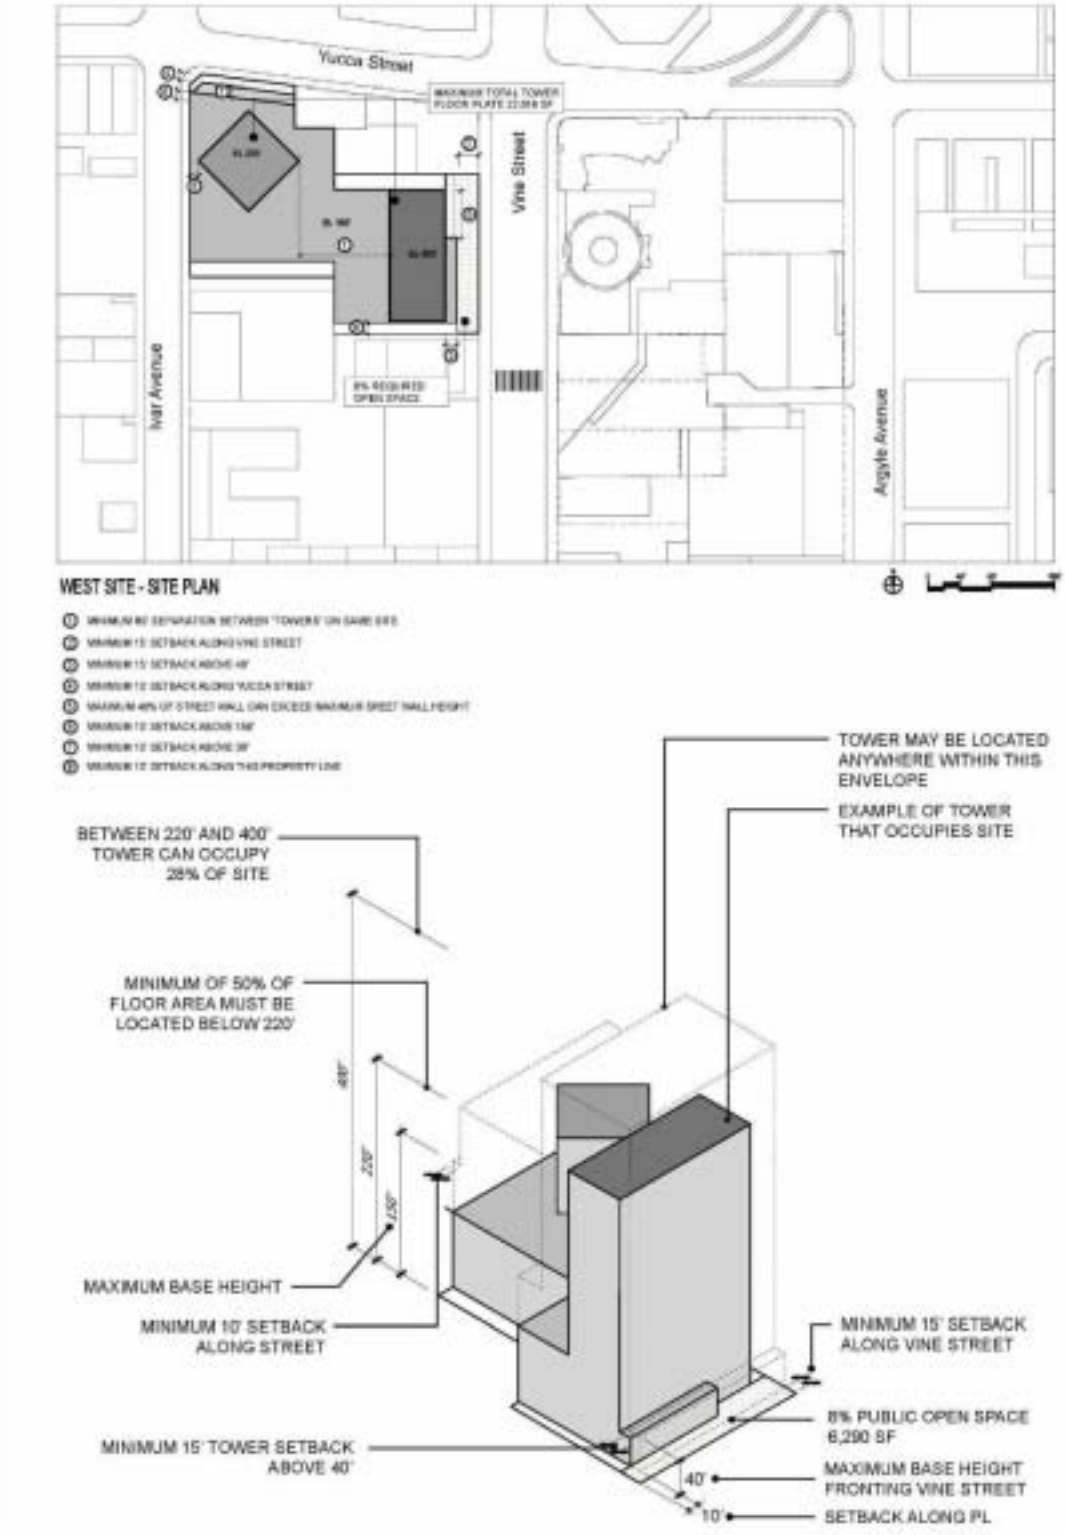

fig. 6.1.2.b.2: West Site – 400 Feet Maximum Tower Height

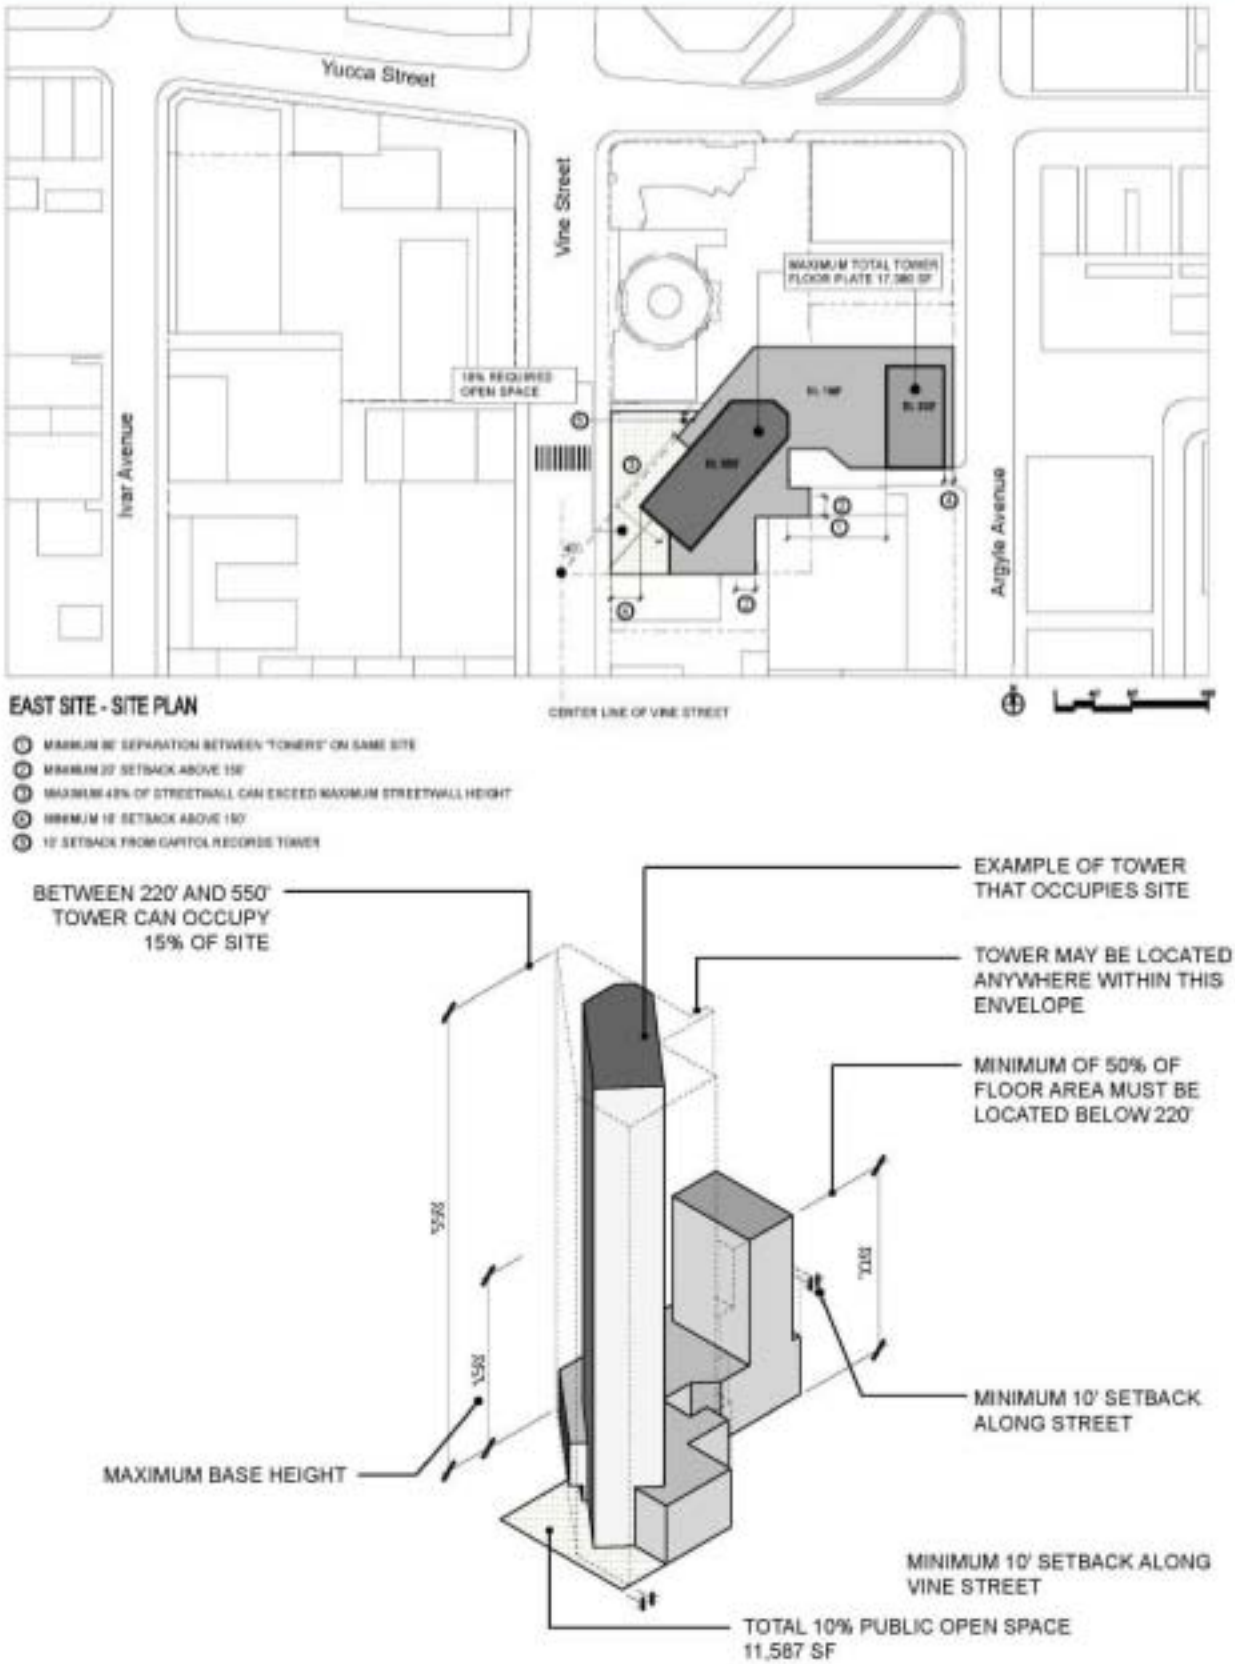

fig. 6.1.2.c.1: East Site – 550 Feet Maximum Tower Height

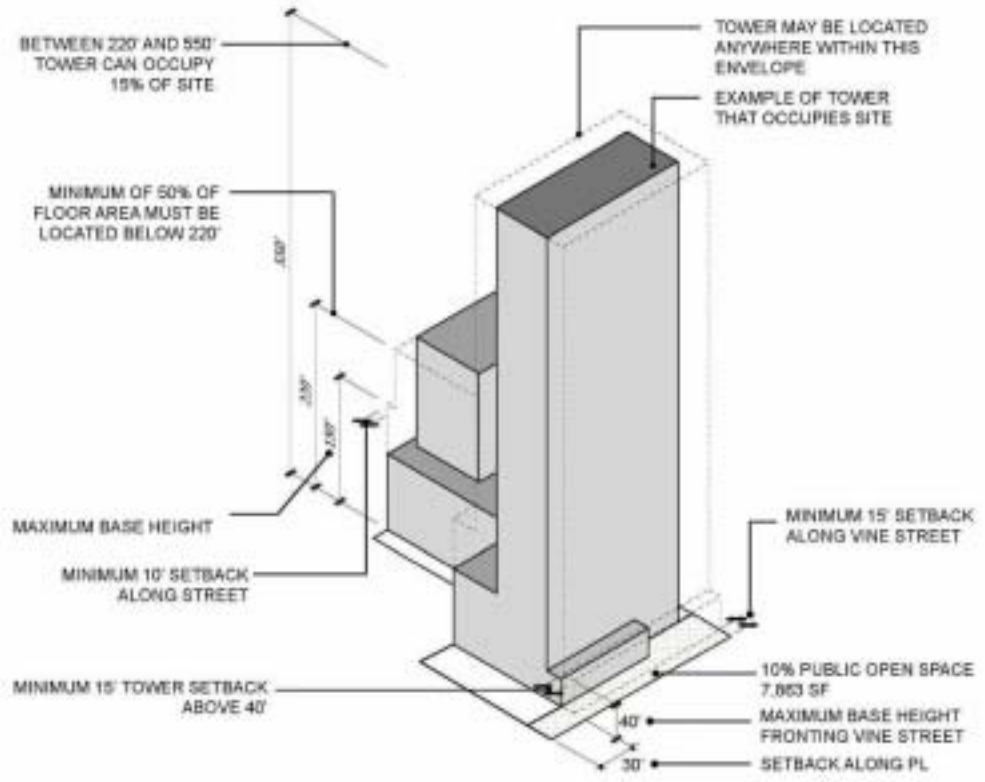

fig. 6.1.2.c.2: West Site – 550 Feet Maximum Tower Height

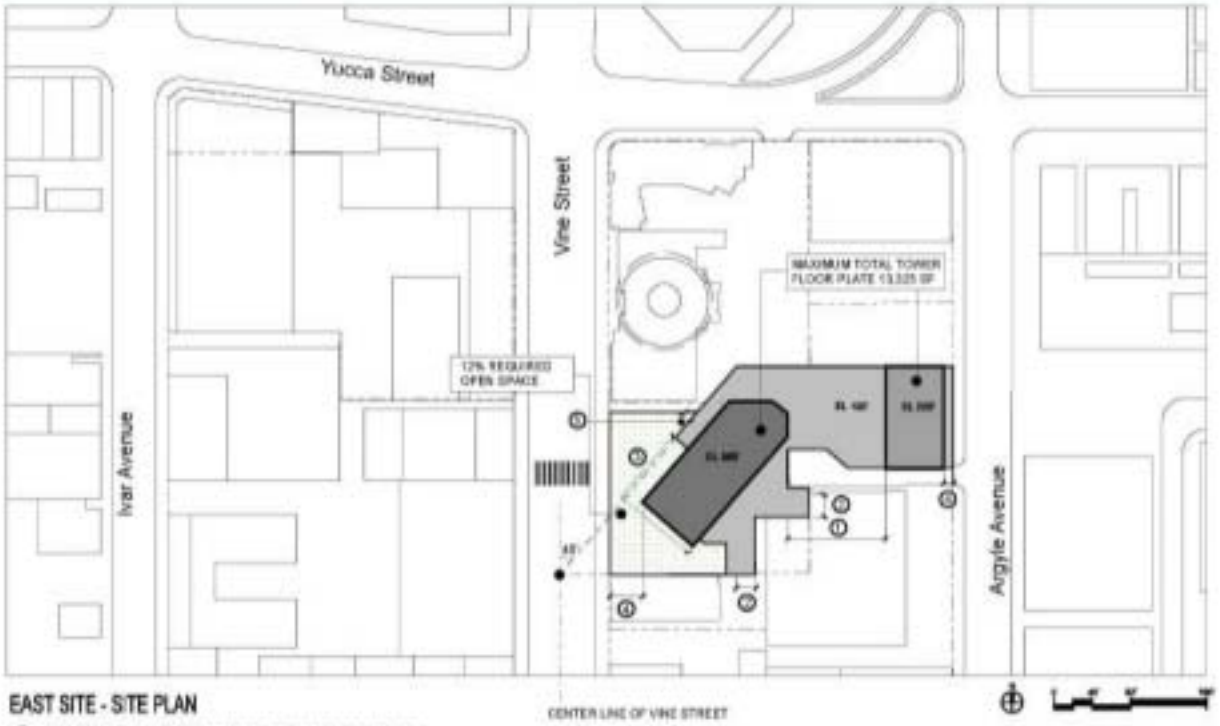

EAST SITE - SITE PLAN

1. MINIMUM 80' SEPARATION BETWEEN "TOWERS" ON SAME SITE
2. MINIMUM 20' SETBACK ABOVE 150'
3. MAXIMUM 40% OF STREETWALL CAN EXCEED MAXIMUM STREETWALL HEIGHT
4. MINIMUM 15' SETBACK ABOVE 150'
5. 10' SETBACK FROM CAPITOL RECORDS TOWER

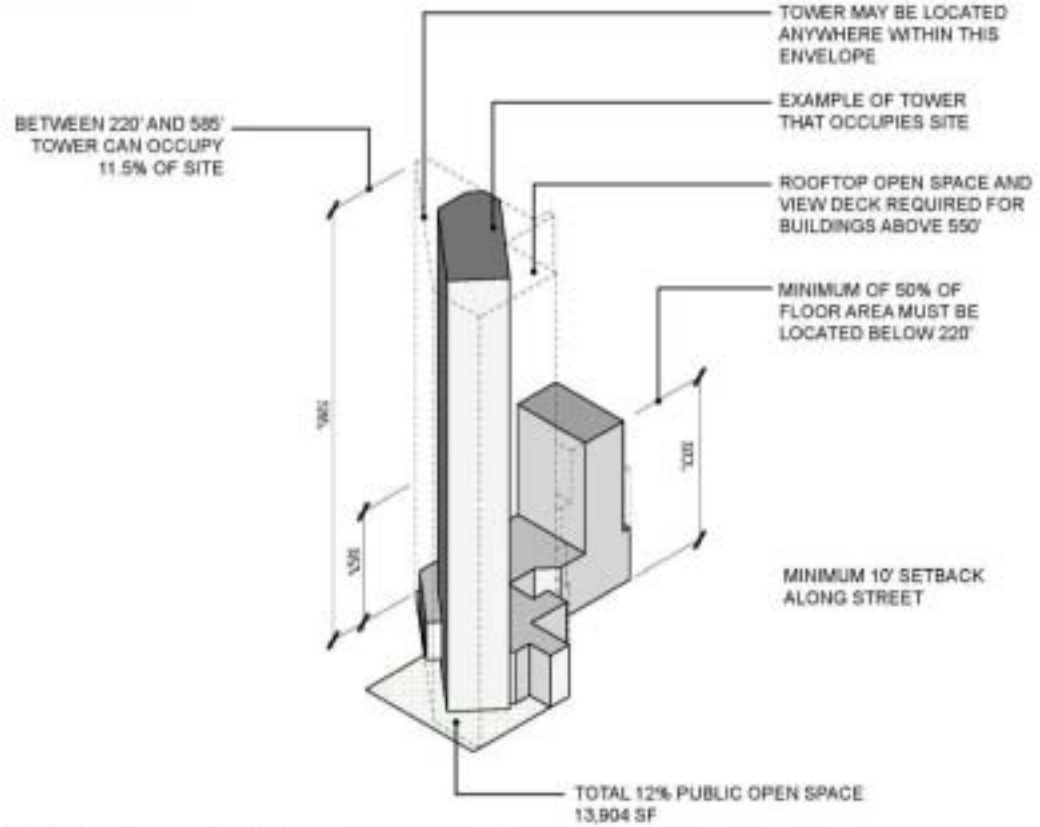

fig. 6.1.2.d.1: East Site – 585 Feet Maximum Tower Height

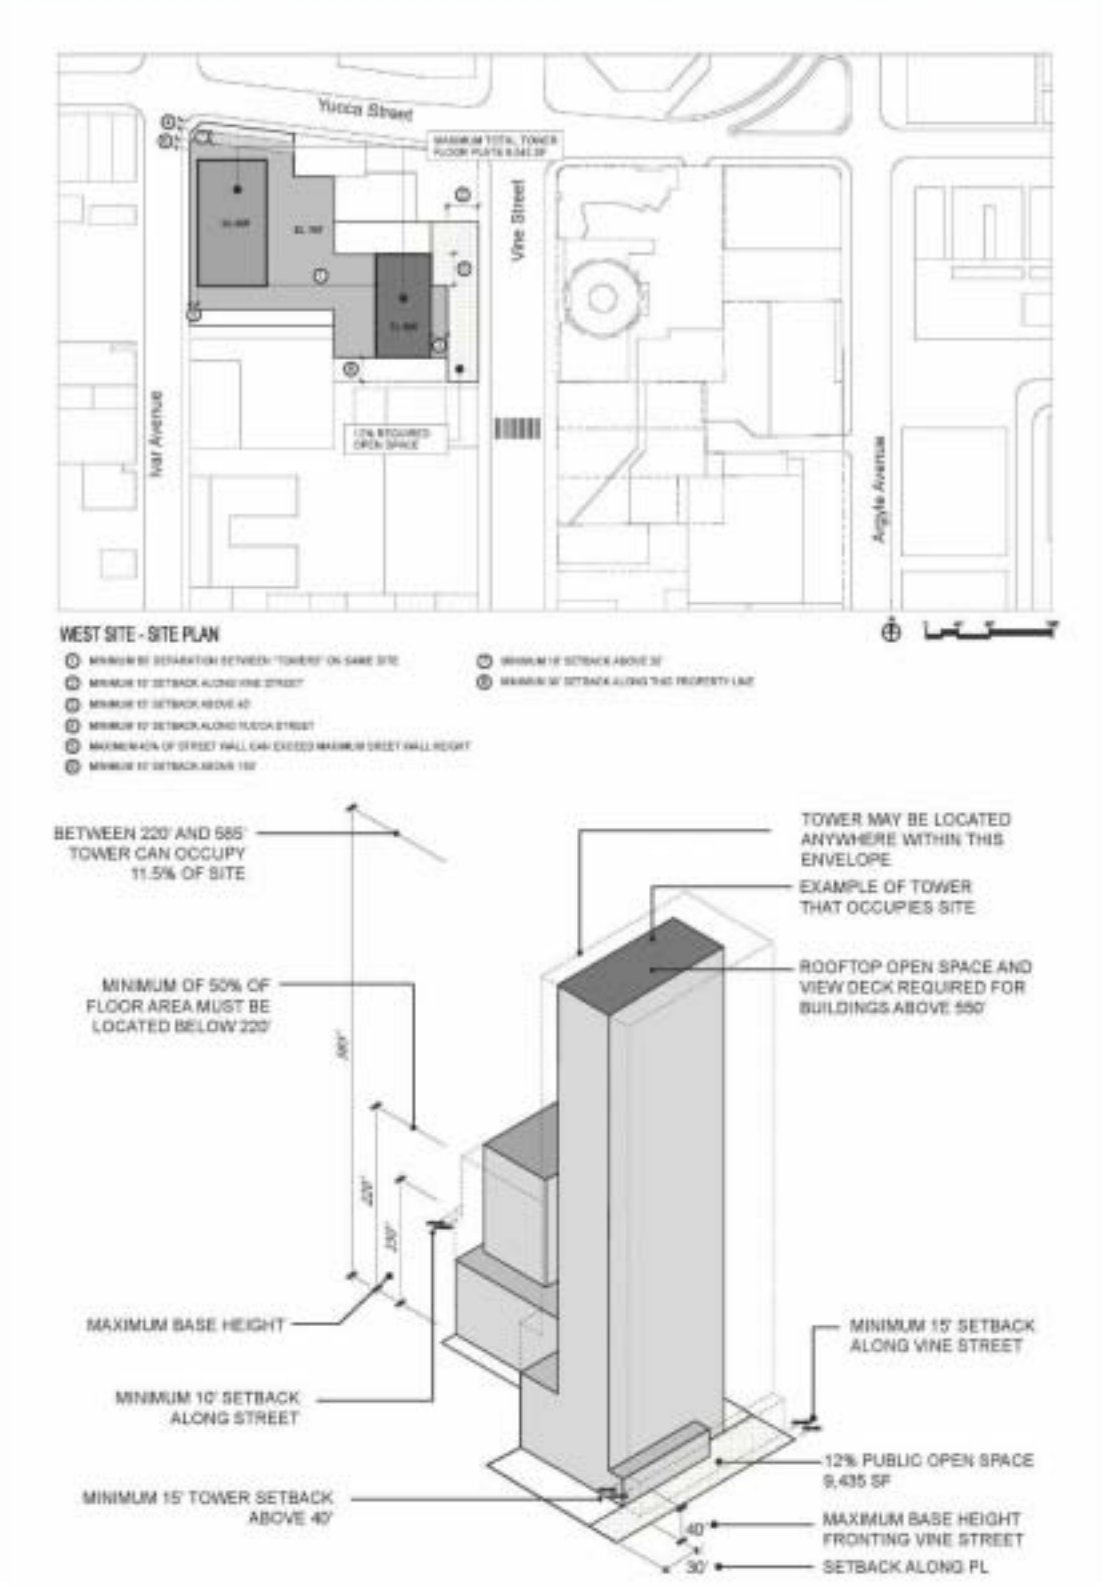

fig. 6.1.2.d.2: West Site – 585 Feet Maximum Tower Height

6.2 Street Walls

6.2.1 A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation. The street wall shall have proportions and architectural building details which emphasize and reflect the presence and importance of the pedestrian environment. Massing offsets, fenestration, varied textures, openings, recesses, and design accents are strongly encouraged to ensure there are no un-articulated walls and monolithic roof forms, and architectural elements such as balconies, verandas, and porches that add architectural character are encouraged.

6.3 Street Wall Standards

6.3.1 Location of a required street wall:

a. Parcels with a grade level open space: the required street wall shall be located a minimum 10 feet from the property line along Vine Street on the East Site and 15 feet along Vine Street on the West Site.

b. A grade level open space is required for any building fronting Yucca Street with a minimum 10 feet setback from the property line.

c. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

6.3.2 Height of required street wall:

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b), (c) and (d) below.

b. Street walls fronting Vine Street on the West Site shall be built to a maximum height of 40 feet above curb level except as noted in item (d) below.

c. Street walls fronting Yucca Street shall be built to a maximum height of 30 feet. Building can extend to a maximum height of 150 feet with a 10 foot setback above 30 feet except as noted in item (d) below.

d. 40% of the aggregate width of the required street wall frontage on each street can exceed the maximum street wall height up to the maximum tower height.

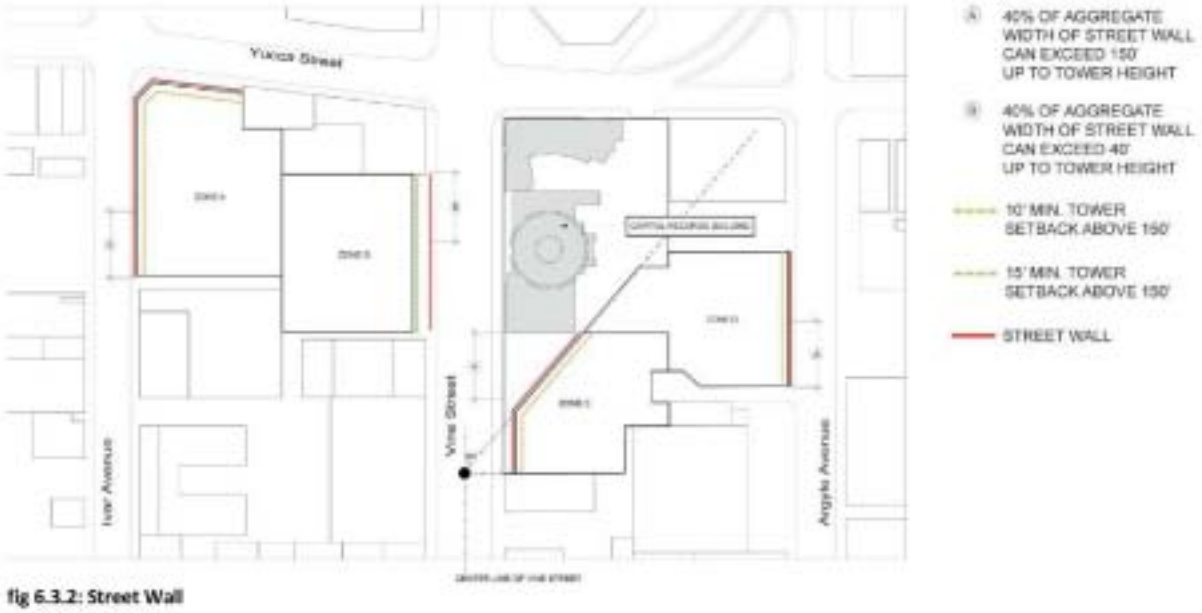

fig 6.3.2: Street Wall

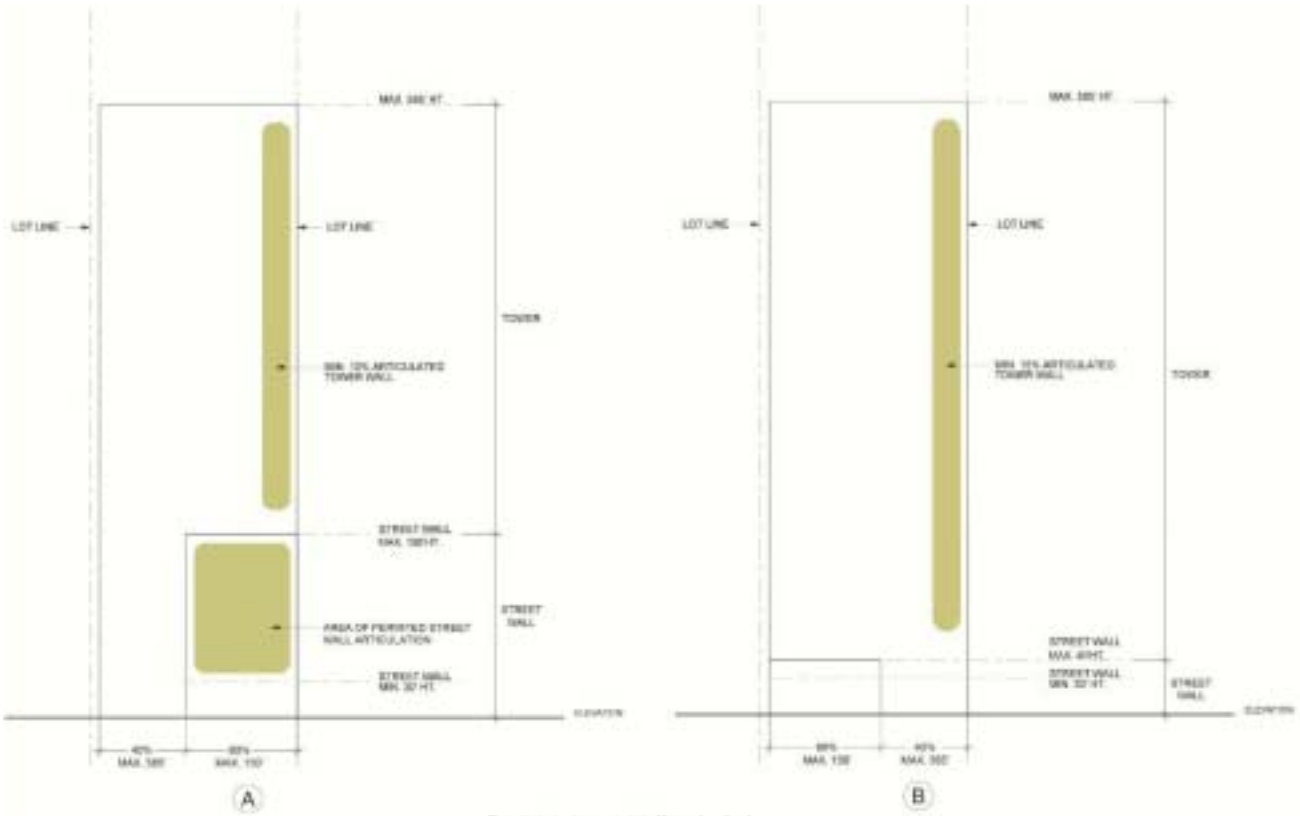

fig. 6.3.3: Street Wall Articulation

6.3.3 Types of permitted articulation of a required street wall:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

6.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Commercial marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0'. The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

6.4 Street Wall Guidelines

6.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

6.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop-offs and loading entries and exits and vehicular access driveways are also permitted within the street wall area on the Project Site.

6.5 Yard Standards

6.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

6.5.2 Commercial Use: no front, side or rear yard setbacks are required.

6.5.3 Residential Use:

a. Front Yard: none.

b. Side Yard: Minimum 5 feet; for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet; for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

6.6 Building Materials and Color Guidelines

6.6.1 The goal of the building materials and colors is to reinforce the character of the Hollywood area and provide a design that is compatible yet avoids any appearance that the building is being historicized. These guidelines will address the façade treatment for both residential and commercial portions of buildings.

a. Buildings shall feature long-lived and sustainable materials. The material palette shall provide variety, reinforce massing and changes in the horizontal or vertical plane.

b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

c. Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents.

d. The architecture of the building shall clearly delineate an architectural style, and shall not appear as a simplified version thereof, with appropriate fenestration patterns, architectural features, proportions and materials.

e. The building's skin, especially for towers, shall be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

f. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style. There will be clear contrast between the building's surface material and the building's glazed areas.

g. In general, the overall massing, roof forms, materials, and architectural style of new structures shall provide a variety of forms, depth and texture, and encourage a cohesive character. Building massing shall include a variation in wall planes and height as well as roof forms to promote architectural excellence, a pedestrian friendly environment and take into account the context.

h. To provide visual variety and depth, the building skin shall be layered and designed with a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin shall reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

i. Rooftop mechanical equipment screening shall be designed to be integral with the building architecture and the visual impact shall be minimized by using materials that are complimentary or consistent with the building.

j. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

Fig. 6.6.1

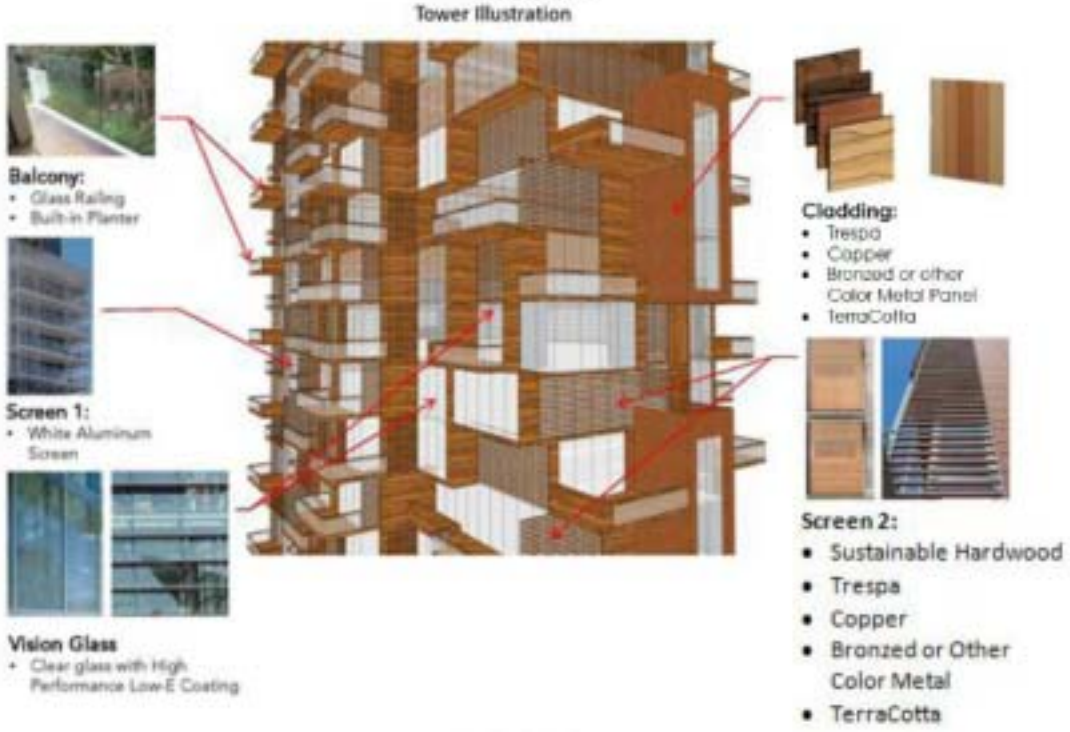

Fig. 6.6.2

k. Examples of acceptable materials are illustrated in Figures 6.6.1 – 2

6.7 Grade Level Standards

6.7.1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground floor street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and shall be integral to the architecture of the building.

6.7.2 Ground floor height:

a. Minimum 12'-0" height measured from floor to ceiling.

6.7.3 Building entrances:

a. The primary entrance to a street level tenant space that has frontage along a public street shall be provided from that street. The primary entrance to a tenant space that does not have its frontage along a public street shall be provided from a courtyard, *grade level open space*, or *publicly accessible passageway*. Entries less than 18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries greater than 18 inches from the property line shall be within 30 inches of the adjacent grade level along street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. All retail spaces shall be accessed primarily from a ground floor, single-tenant entry along a street, plaza or passageway. Where reasonably practical given architecture and tenant requirements, access to different tenant spaces shall occur at a maximum interval of 60 feet.

c. Main building entrances shall read differently from retail storefronts, restaurants and commercial entrances which could include but are not limited to material change, architectural elements or elevation change.

d. In addition to the building's required primary entrance(s), there may be ancillary entrances to the building from parking garages.

6.7.4 Ground Floor Glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet above curb level.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing shall constitute a minimum of 30% of the area of a building face and shall not exceed 80% of the area of a building face.

6.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0-foot candles.

6.7.6 Service and Refuse Requirements

Hotel and Commercial / Office / Retail that abuts an alley

a. Every required loading space shall be located and arranged such that delivery vehicles may be driven upon or into said space from an alley. Such loading space shall have a minimum height of 14 feet and be accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet; a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet; and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

Condominiums (Residential)

d. None

Rental (Residential)

e. None

6.7.7 Service and Refuse Guidelines

a. Storage areas shall be provided within the building of a size sufficient for the development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible from a curb cut.

b. Service, utility, and mechanical functions, including retail loading, shall be located in alleys whenever present. When alleys are not present, service functions shall be placed within buildings.

c. Service, utility, and mechanical equipment that is visible from the street shall be screened from view with landscaping or enclosures. Back flow and fire standpipes, along with utility box transformers, shall be screened.

d. All screening devices shall be compatible with the architecture, materials and colors of adjacent buildings.

e. Trash and storage enclosures shall be architecturally compatible with the project design and landscaping shall be provided adjacent to the enclosure(s) to screen them and deter graffiti.

f. Trash enclosures and retail loading areas shall be sited to minimize nuisance to adjacent properties.

g. The location of trash enclosures shall be easily accessible for trash collection and should not impede general site circulation patterns during loading operations.

h. Mechanical equipment shall vent to an alley wherever possible.

i. Roof-vent penetrations and mechanical equipment shall be located at least 10 feet from any exterior Building Face.

j. Gutters and downspouts shall be made of galvanized steel, copper (not copper coated), or aluminum.

6.7.8 Storefronts

a. Storefront (residential, retail, restaurant and commercial) requirements shall include frontage along streets and grade level open spaces.

b. Storefronts shall comprise a minimum of 70% of the building's street level façade along Vine Street and 40% along all other streets and be recessed where necessary.

c. Storefront glazing shall comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets.

d. All retail space shall have a minimum 12 feet finished ceiling clearance.

e. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Storefront openings shall be no shorter than 12 feet above the adjoining grade for 90% of the required storefront frontage.

g. Security grilles will be located behind glass and be at minimum 70% open.

h. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

i. Awnings shall not obscure storefront signage. Vinyl awnings are not permitted.

6.8 Podium Standards

6.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment of the building's base, middle and top

through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

6.8.2 Podiums shall comply as applicable with the minimum setback requirements set forth in Figures 6.1.2a – d.

6.9 Podium Guidelines

6.9.1 Podiums shall have fenestration that establishes a clear pattern on the façade (with special attention paid to facades that are visible from a public street) and that provides depth and additional articulation.

6.9.2 An identifiable break between the building's ground floors and upper floors shall be provided. This break may include a change in material, change in fenestration pattern or similar means.

6.9.3 Podium level windows shall be vertically oriented.

6.9.4 Podium levels shall be predominantly light in color.

6.9.5 An expression band shall be provided at the highest story within the podium.

6.9.6 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade shall be a maximum of four floors high, and shall have variation in its surface plane (using cutouts, insets or pop-outs). It shall employ different scales of elements as viewed when seeing the entire building massing.

6.9.7 Louvers and wall openings shall be designed to integrate with building architecture.

6.9.8 Podiums are encouraged as feasible to be set back from Pantages to preserve sightlines and promote groundfloor open space.

6.10 Street and Sidewalk Standards

6.10.1 The Site is comprised of a variety of public elements that include open spaces, streets and sidewalks. The Hollywood Walk of Fame is an integral element that fronts open spaces on both East and West Sites. Its adjacency to the public plazas requires compatibility and cohesiveness.

6.10.2 The combination of landscaped plazas, publicly accessible passageways and landscaped streets and sidewalks creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

6.11 Screening Standards

6.11.1 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

6.11.2 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

7. TOWERS

7.1 Purpose

7.1.1 Towers shall have their massing designed to reduce overall bulk and to appear slender.

7.1.2 Towers shall be designed to achieve a simple faceted geometry and exhibit big, simple moves. They shall not appear overwrought or to have over-manipulated elements.

7.1.3 Towers that emulate a more streamlined modern style shall provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

7.1.4 If a project has more than one tower, the towers shall be complementary to each other and employ a similar yet varied architectural design approach.

7.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) shall not be historicized. They are contemporary forms in the skyline and shall appear as such.

7.2 Projections

7.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. Roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building;

b. Skylights, towers, steeples, flagpoles, water tanks, silos;

c. Wireless masts; and

d. Solar energy devices and similar structures.

7.2.2 Permitted building elements or equipment in Section 7.2.1 shall be screened as practical and based on building design except if such projections – e.g., flagpoles or steeples – are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

7.2.3 Enclosures for bulkheads shall not count against building height.

7.3 General Standards

7.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

7.3.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

7.3.3 Towers shall be set back from maximum street wall height a minimum of 10 feet except for towers fronting Vine Street on the West site, these towers shall be setback a minimum of 15 feet from the maximum street wall height.

7.3.4 Towers shall be setback on West Site from shared property line with Hollywood Playhouse a minimum of 10 feet above 150 feet.

7.3.5 Adherence to minimum setbacks and other separation standards for towers is required as may be applicable to a specific tower and its location with the Project area. Please refer to standards for towers set forth in Figures 6.1.2.a – d.

7.3.6 Tower orientation and placement that enhances important sightlines is encouraged.

7.3.7 In no instance should the tower fronting Vine Street on the East site development have more than a 15% height differential from the tower on the West ste development .

7.4 Wall Standards

7.4.1 All walls are required to be articulated.

7.4.2 The following types of articulation of a tower wall are permitted:

a. Recess;

b. Standard balconies may be projecting or recessed or a combination of both; and

c. Bay windows.

fig. 7.4.2.a: Balcony/Recess

fig. 7.4.2.b: Bay Window

7.4.3 Balcony: a balcony shall be integral to the façade (see figs. 7.4.3.a and b) and shall not create a relentless horizontal and vertical stacking pattern. Balconies are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations and shall be a minimum 75% *transparent*. Balconies are encouraged on buildings facing major public spaces such as plazas, passageways and open spaces. Long balconies resembling corridors are prohibited.

fig. 7.4.3.a: Recess/Balcony: Integral Balcony

fig. 7.4.3.b: Bay Window: Integral Balcony

7.5 Spacing Standards

7.5.1 If two towers are located on a single site the towers shall be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

7.5.2 Generally, any portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except for the following which will meet Planning Code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 7.5.2.

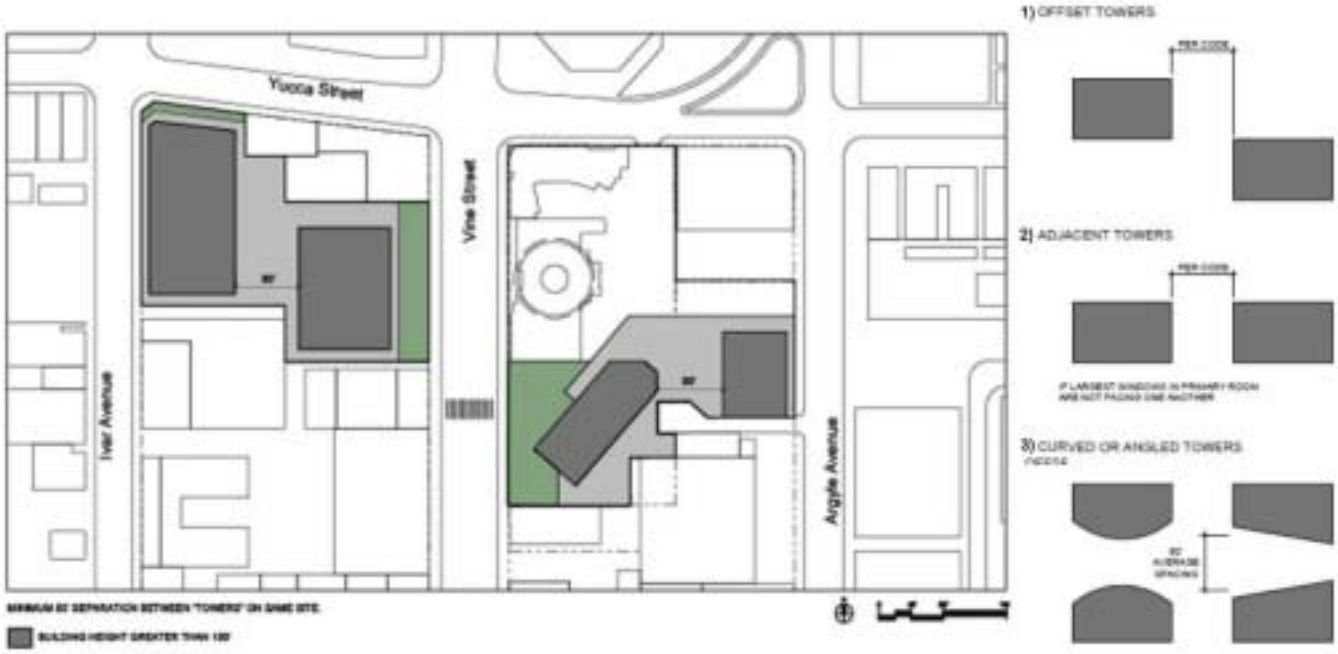

fig. 7.5.2: Tower Spacing

7.5.3 Since a tower is defined as any building above 150 feet, all buildings above 150 feet shall be spaced at least 80 feet from any portion of any adjacent or separate building on the site,

exceeding 150 feet, excluding a project within the height range of 150 to 220 feet, as shown in figures 6.1.2.a.1 and 6.1.2.a.2.

7.5.4 Spires, signage, parapets, and mechanical enclosures are excluded from the tower spacing regulations.

7.6 Rooftops Guidelines

7.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

7.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 8.5.

7.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

7.6.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

7.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

7.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

7.7.2 Materials and design for roof mechanical equipment shall be consistent with the building architecture and shall utilize similar colors and materials as in other portions of the building.

7.7.3 Roof mechanical equipment shall be screened.

8. OPEN SPACE

8.1 Overview

The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Building and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

8.2 Grade Level Open Space Standards

8.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records Building and accentuate the low scale character.

8.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Fig. 6.1.2.a.1 – 2 and 8.1.1)

8.2.3 An additional 3% of open space (total 8%) shall be required for buildings between 221 feet and 400 feet. (See Fig. 6.1.2.b.1 – 2 and 8.1.2)

8.2.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 550 feet (See Fig. 6.1.2.c.1 – 2 and 8.1.3)

8.2.5 An additional 7% (total 12%) of open space shall be required for buildings taller than 550 feet. (See Fig. 6.1.2.d.1 – 2 and 8.1.4)

8.2.6 Location

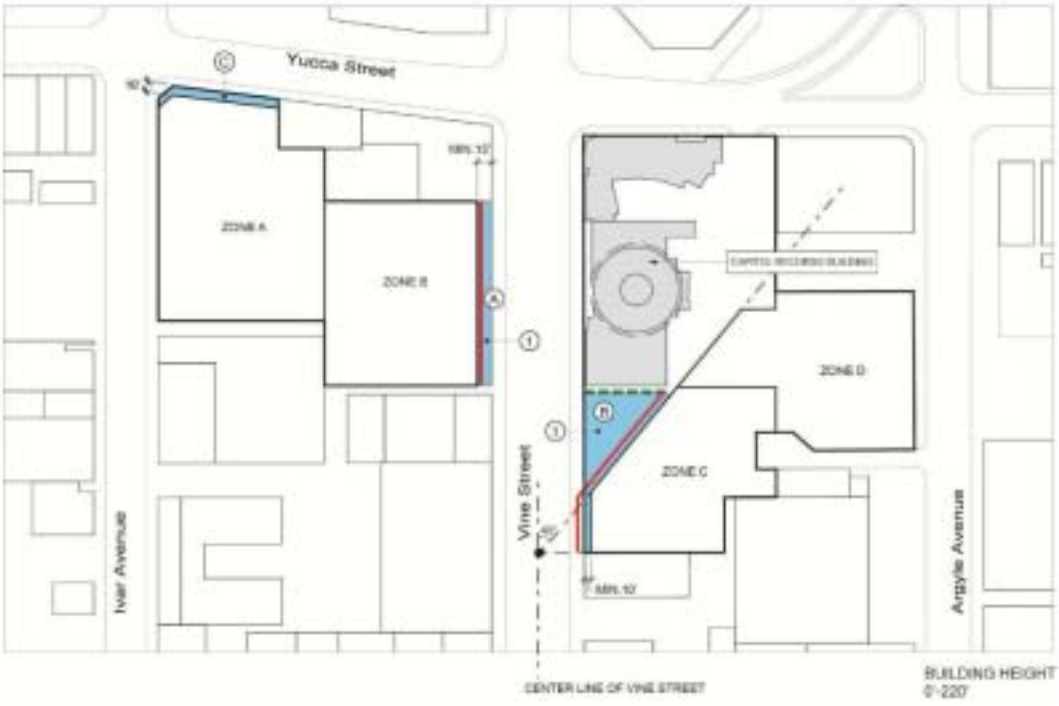
a. East Site: adjacent to the Jazz Mural and Capitol Records Building; West Site: across from the Capitol Records Building along Vine Street and along Yucca Street.

b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular from any point on each of the boundaries of the open space area. Open space on West Site fronting Vine Street shall have a horizontal dimension no less than 15 feet when measured perpendicular from any point.

c. On West Site, open space must occupy the area to the west of a line struck at 40 degrees from center line of Vine Street ROW at alignment with the southern most property line and a minimum 10' setback from the southeast corner of the Capitol Records Building. (See Figs. 8.1.1 – 4)

Figs 8.1.1 – 8.1.4: Grade Level Open Space

figs 8.1.1 Open Space Requirements for Maximum Building Height at 220 Feet



figs 8.1.2 Open Space Requirements for Maximum Building Height at 400 Feet

figs 8.1.3 Open Space Requirements for Maximum Building Height at 550 Feet

figs 8.1.4 Open Space Requirements for Maximum Building Height at 585 Feet

8.3 Passageway Standards

8.3.1 *A publicly accessible passageway* is a continuous through-block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

8.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

8.3.3 Location and Size standards:

a. The major portion of a *publicly accessible passageway* is the largest area of the *passageway* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total passageway area and shall not be less than 20'-0" wide.

b. Minor portions of *publicly accessible passageway* are secondary areas that allow for additional flexibility in the shape and configuration of a passageway. Minor portions shall not occupy more than 25 percent of the total area of the *passageway*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

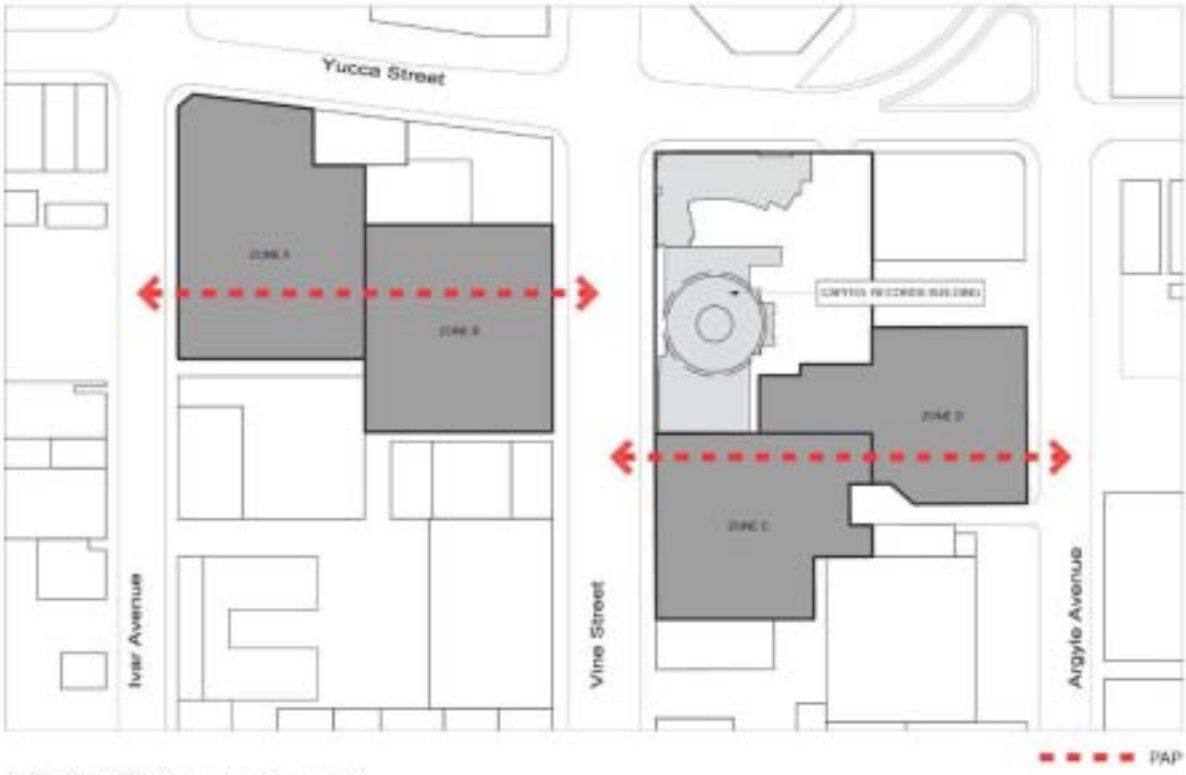


fig. 8.3.3: Publicly Accessible Passageway

8.3.4 Permitted Obstructions:

a. The minimum percentage of *publicly accessible passageway* area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within the major portion of an open air *publicly accessible passageway* are any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open-air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies and bay windows; awnings, canopies and marquees; stairs, ramps

fig. 8.3.4: View from Argyle Avenue Along PAP Towards Capitol Records

and bollards.

8.3.5 Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Building and Safety in conformance with the Building Code. Kiosks, including roofed areas, shall not count as floor area, exceed 3% of the total area of the *publicly accessible passageway*, or occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open-air cafes, flower stands or public service/information booths.

d. All kiosks greater than 250 square feet are permitted but will count as floor area.

8.3.6 Open-Air Café:

a. Where an open-air cafe is provided it shall be an unenclosed restaurant or open-air seating for an enclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open-air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *publicly accessible passageway*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *publicly accessible passageway*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

8.3.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on the *publicly accessible passageway* through open windows.

8.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No building refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *publicly accessible passageway*.

b. No exhaust vents are permitted on any *publicly accessible passageway* or on any building wall of the development fronting upon the passageway except where such vents are more than 10'-6" above the level of the *passageway*.

8.3.9 Frontages:

a. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *publicly accessible passageway* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *publicly accessible passageway* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

8.3.10 Maintenance:

a. The building owner shall be responsible for the maintenance of the *publicly accessible passageway* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the passageway and in the street sidewalk area adjacent to the passageway.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *publicly accessible passageway* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *passageway* in connection with outdoor eating services or other uses permitted on *passageway* which generate litter.

8.4 Roof-top Open Space

8.4.1 The Project shall include roof-top open space.

8.4.2 Roof-top open space shall include an observation area (i.e., viewing deck) accessible to the public.

8.4.3 The hotel, if developed, shall include an observation area (i.e., open space viewing area) accessible to the public.

8.4.4 The hotel observation area (i.e., viewing area), if developed, shall satisfy the requirement in section 8.4.1 above.

8.4.5 Roof-top open space may include a café.

8.5 Residential Common Open Space

8.5.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential common open space requirements.

8.5.2 Common Open Space Standards

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

c. Open space shall be open to the sky and have no structures that project into the common open space area, except as permitted in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the Site.

e. Common open space shall have a minimum area of 400 square feet with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f. Common open space shall constitute at least 50% of the total required usable open space in the built development.

g. Common open space areas shall incorporate recreational amenities including but not limited to swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use may be considered as common open space.

i. Refer to LAMC 12.21.G for additional open space requirements.

8.6 Residential Private Open Space

8.6.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

8.6.2 Residential Open Space Standards:

a. Private open space shall contain a minimum area of 50 square feet, of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

b. Private open space shall have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c. Private open space shall provide a minimum eight-foot vertical clearance under any projection, except as permitted in the Zoning Code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with Zoning Code may qualify as usable open space provided it meets each of the above specified requirements noted in items a-c.

9. LANDSCAPE

9.1 Grade Level Open Space Standards

9.1.1 Planting requirements: a minimum of 10% of grade level open space shall be landscaped with softscape or water features.

9.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material and 30% of all landscaping shall be California Natives or drought tolerant.

9.1.3 The landscaped portion of open space may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.1.4 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

9.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

9.1.7 Open-air *publicly accessible passageways* are not to be included in the grade level open space requirements.

9.2 Common Open Space Standards

9.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

9.2.2 At least one 36-inch box tree for every four dwelling units shall be provided on-site and may include street trees in the parkway, sidewalks adjoining the property, open space, *publicly accessible passageway* and common roof decks.

9.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

9.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

fig. 9.3.a: Movable Seating

fig. 9.3.b: Open Air Café

9.3 Standards For Open Air Portions of Publicly Accessible Passageway

9.3.1 The landscaped portion of open air passageways may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.3.2 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.3.4 Planting requirements:

a. A minimum of 10% of open air *publicly accessible passageway* shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

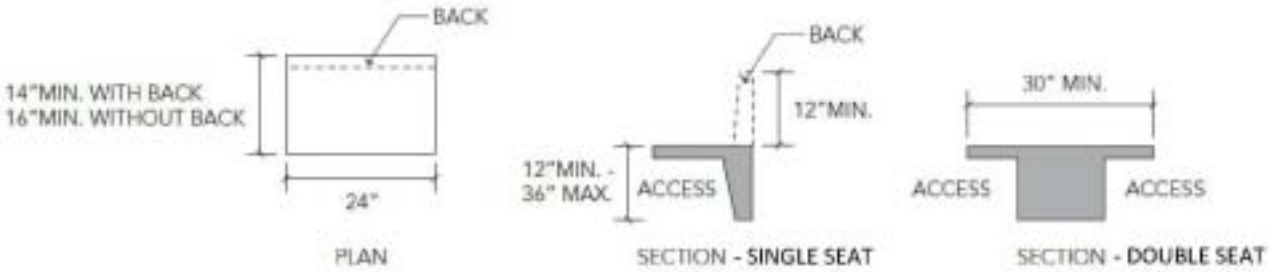

fig. 9.3.5: Seating Standards

9.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *publicly accessible passageway* excluding the area of an open-air cafe.

b. One seat shall equal two linear feet.

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count as double seating provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating of open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open-air cafes do not count toward meeting the seating requirements.

9.4 Tree Planting Guidelines

9.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

9.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

9.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree-planting pattern.

9.5 Lighting Standards

9.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

9.5.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open *publicly accessible passageway*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0-foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

f. All exterior lighting shall be shielded or directed toward the areas to be lit to limit spill-over onto off-site uses.

g. Light quality shall not be harsh, glaring, blinking or shed beyond property boundaries.

9.5.3 Responsibility for maintenance:

a. The Building Owner shall be responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building Owner.

9.5.4 Lighting for areas located inside the lot line and visible from the street, such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

9.5.5 Lighting for above-grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

9.6 Publicly Accessible Passageway Lighting Standards

9.6.1 A *publicly accessible passageway* shall be illuminated throughout with an overall minimum average level of illumination of not less than 1.0 maintained foot candle (lumens per square foot) on the horizontal plane at grade.

9.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

9.7 Continuity of Design

9.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

9.7.2 Where possible, materials, lighting, site elements and landscape shall be similar between different open and enclosed public spaces at the grade level.

10. PARKING

10.1 Automobile Standards

10.1.1 Base Standards

The following standards shall apply for the base level of parking to be provided as the minimum for each use in the project area. The Regulations set forth below incorporate the parking requirements in the LAMC, where applicable, and supersede the LAMC requirements for development in the Development Agreement area.

a. Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulations incorporate applicable parking requirements in the LAMC as set forth below.

b. Sports Club:

Two parking spaces for every one thousand square feet of combined gross floor area.

c. Hotel

One parking space for each individual guest room or suite of rooms for the first 30;

One additional parking space for each two guest rooms or suites of rooms in excess of 30 but not exceeding 60; and

One additional parking space for each three guest rooms or suites of rooms in excess of 60.

d. Condominiums (Residential):

Two parking spaces per dwelling unit.

One-quarter parking space per dwelling unit for guest parking.

e. Rental (Residential):

One parking space for each dwelling unit of less than three habitable rooms; one-and-one-half parking spaces for each dwelling unit of three habitable rooms; and two parking spaces for each dwelling unit of more than three habitable rooms.

f. Combination of Uses:

Where there is a combination of uses on a lot, the base number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking:

a. Shared parking may be applied to the Section 10.1.1 base rates for the Site when the uses have different parking requirements and different demand patterns in a 24-hour cycle or between weekends and weekdays. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses. The calculation of the parking requirements shall be based on a detailed assessment prior to its construction.

b. Calculating Shared Parking:

(i) The individual land use parking requirements for each component of a phase of development shall be calculated from Section 10.1.1. above to establish the "Base Demand."

(ii) For parking spaces that are to be shared between uses, the calculated minimum parking requirement for the Site, including that new phase of construction, is to be adjusted from the Base Demand based on the procedures in *Shared Parking*, Urban Land Institute, 2nd Edition (2005) or another source as determined by the Director of Planning.

10.2 Additional Regulations

10.2.1 The automobile parking spaces required shall be provided either on the same lot as the use for which they are intended to serve or on another lot located within 750 feet of the lot; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

10.2.2 Curb cuts for driveways shall be located no closer than 50 feet to the intersection of two streets unless approved by The Department of Transportation.

10.2.3 Access driveways to parking facilities not at signalized intersections shall not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

10.2.4 Parking and loading access shall be shared where feasible.

10.2.5 Priority placement within parking structures shall be given to bike parking, car-share parking, and other alternative ride vehicles.

10.2.6 Pedestrian entrances to all parking shall be directly from the street, except that underground parking garages may be entered directly from a building.

10.3 Screening

10.3.1 Above grade parking for the first 20 feet shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible and shall be designed to blend in with the form and massing and to look like an integral part of the building, with the use of windows and/or cladding, or by landscaping, or green screens, or a combination thereof. The interior of a parking structure shall be designed to be screened from the view of streets and sidewalks.

10.4 Bicycle Standards

10.4.1 Bicycle parking shall be provided per Ordinance No.182386.

10.5 Transportation Demand Management Plan

10.5.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.5.2 The transportation demand management plan shall set forth best practices that relate to the Project Site and the Project's building design features in order to:

a. Promote bicycle and pedestrian circulation within the Project Site.

b. Promote alternative modes of transportation.

c. Create pedestrian linkages to public and private amenities outside the Project Site.

d. Provide convenient and attractive onsite pedestrian linkages for routes to the Metro Red Line Station at Hollywood Boulevard and Vine Street.

e. Provide adequate parking, but provide incentives to tenants and residents to utilize alternative modes of travel. The incentives shall include bicycle facilities, car sharing, discounted subway passes, and parking spaces as an only optional part of all lease and sale agreements.

11. SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 181340: Hollywood Signage Supplemental Use District (Amended) pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 11.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig. 11.2.

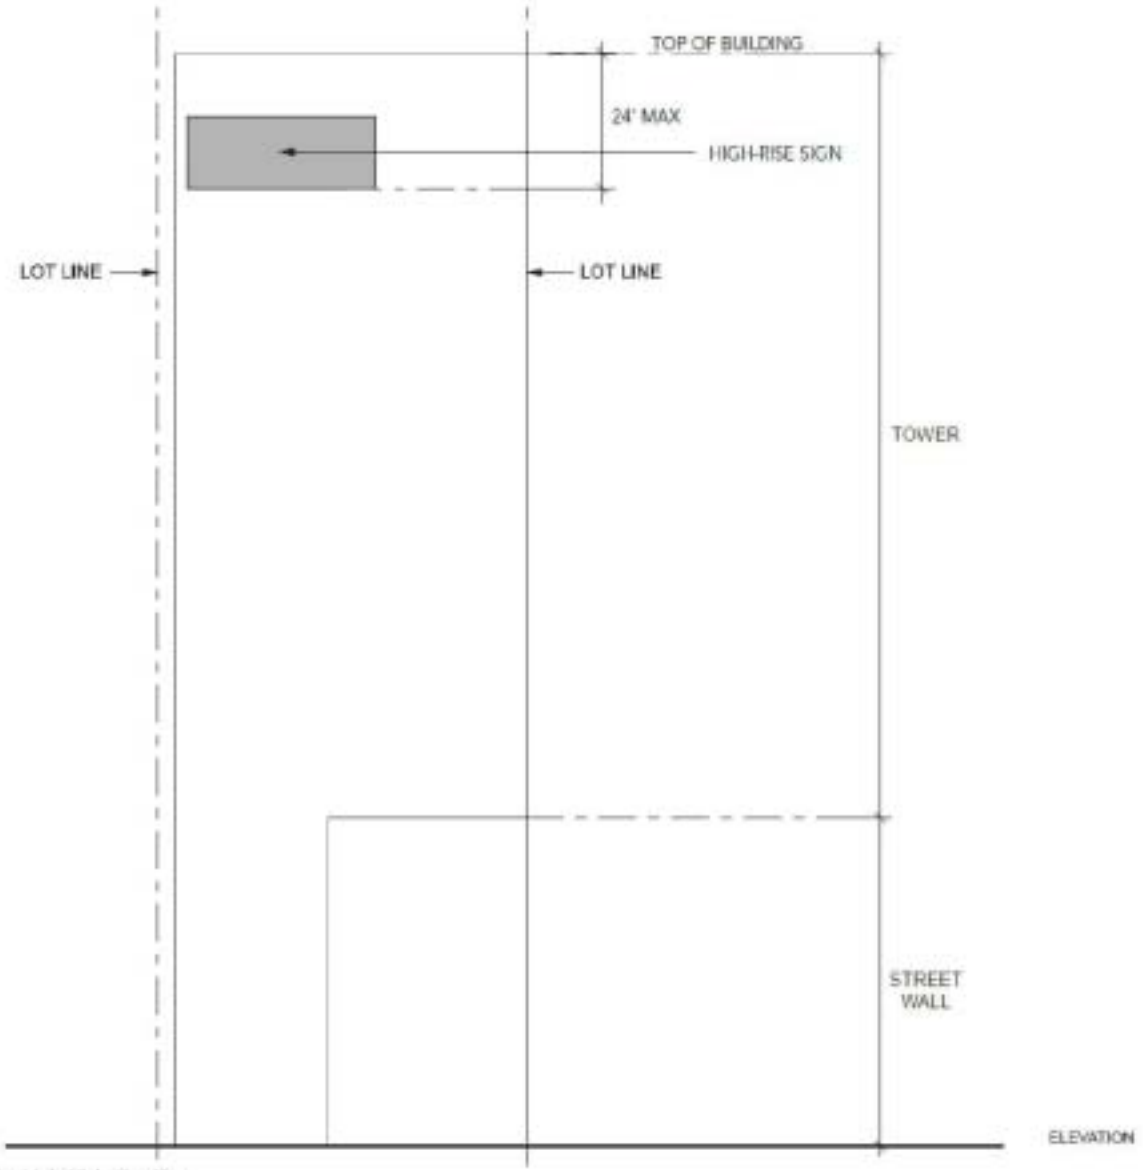

fig. 11.2: High Rise Sign

12. SUSTAINABILITY

12.1 Non-Residential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

12.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13. DEFINITIONS

Awning: glazing or fabric on metal frame structure supported entirely by the building to provide weather protection at doors, windows and/or storefronts; may be retractable.

Base: the lower portion of a building located at or within 150' above curb level

Canopy: glazing, fabric and/or metal structure with vertical supports located on the sidewalk to provide weather protection at a building's primary entrance.

Expression band: a distinctive linear architectural element occurring on the building base façade at the highest floor. The band shall be contrasting in color, texture, material and/or fenestration from the adjacent building base surface. Projections may occur within an expression band.

Grade level open space: a continuous open space fronting the street and open to the sky

Maximum building height: the maximum height permitted, measured from the adjacent street curb level

Maintenance: the ordinary repair, care and upkeep of a property

Open space use: active and passive recreational areas accessible to the general public, except as noted herein. Open spaces can occur in publicly accessible passageways, grade level open space, residential common open space and residential private open space which are defined herein.

Preservation: in conformance with standards and guidelines of the Secretary of the Interior, the act or process of applying measures necessary to sustain the existing form, integrity, and materials of an historic property

Publicly accessible passageway: a continuous through-block public connection between two parallel streets, located on privately owned land and designated for and designed to encourage public pedestrian circulation and other appropriate public uses

Rehabilitation: in conformance with standards and guidelines of the Secretary of the Interior, the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values.

Required street wall: a wall or portion of a wall of a building facing a street or grade level open space which must be built to a maximum height above curb level

Required street wall articulation, aggregate width of: the sum of the maximum widths of all segments of required street wall articulation on a street at the level of any story. The width of a required street wall articulation is measured in plan as the width of the street line from which perpendicular lines may be drawn to such required street wall articulation

Residential common open space: a "rear yard" providing light and air to apartments on the interior of a parcel located at any story above curb level.

Residential private open space: open space that is contiguous to and immediately accessible only from a single dwelling unit.

Setting: the area or environment in which an historic property is found. It may be an urban or suburban neighborhood or a natural landscape in which a building has been constructed. Elements of setting can include the relationship of buildings to each other, setbacks, views, sidewalks, and street trees.

Storefront: the architectural facade, including doorways, of any tenant-leased premise perimeter adjacent to public circulation areas. Storefronts refers to all permitted residential, retail uses including retail, service, restaurants and cultural establishments and commercial uses, including but not limited to hotels and sports clubs.

Tower: the portion of a building located above 150' above curb level.

Transparency: architectural elements that can be seen through or allows light to emit through, including but not limited to glass, trellis and wire mesh.

Millennium Hollywood

Millennium Hollywood Project
Meeting with Planning/Environmental
July 20, 2012
AGENDA

1. Status of Review
2. CEQA Outstanding:
   a. DOT – Determination Letter expected August 25, 2012
   b. Police - Will Serve Letter
3. Design Guidelines
   a. Finalize Revisions
   b. Tower Placement
   c. Code Overrides
4. Schedule (see below)
5. Design Presentation and Draft Development Agreement – Next Meeting(s)
6. Next Steps

	Milestone/Action	Date
1.	Master Land Use Application (MLUA) and Supplemental Submitted to City	**August 18, 2008; October 14, 2009**
2.	Circulation of NOP and IS (30-day public review period**)	**April 28, 2011 – May 31, 2011**
3.	Conduct Public Scoping Meeting (during NOP circulation period)	**May 11, 2011**
4.	Submit First Screencheck Draft EIR (DEIR) to the City	**January 17 – 24, 2012**
5.	File Vesting Tentative Tract Map (VTTM) with City	**February 23, 2012**
6.	City completes review of First Screencheck DEIR	**May 4, 2012**
7.	Submit Second Screencheck DEIR to City	**May 23, 2012**
8.	DOT approves Traffic Study	**July 25, 2012**
9.	City completes review of Second Screencheck DEIR	**Status Pending**
10.	Submit Final Screencheck for Review (Meeting with Srimal)	**Status Pending**
11.	Publish and mail DEIR for public review	**August 2012**
12.	Public review period for Draft EIR (45 days**)	**August – September**

How does the Hollywood Community Plan Improve Hollywood?

dcp Los Angeles Department of City Planning

The Plan directs growth around transit, away from hillsides and low density neighborhoods.

- maintains residential neighborhood zoning, directing future growth into the center of Hollywood adjacent to transportation choices
- maintains all parking requirements per the City code, encourages parking options
- downzones many residential areas with historic resources within the former Redevelopment Plan boundary
- implements stronger subdivision controls in the hills, promoting open space.
- maintains commercial development restrictions in hillside districts, such as Barham Avenue and Franklin Avenue

The Plan reinforces Hollywood's role as a media and entertainment jobs center – preserves industrial media lands.

- reserves M-zoned lands south of Santa Monica Boulevard in the Media District for industrial uses
- promotes tourism, entertainment, and media jobs
- promotes the expansion and modernization of Hollywood's studios

The Plan provides mobility choices, less dependence on automobiles.

- promotes transit-oriented development, design, and mixed-use amenities in the center of Hollywood
- raises standards for new building design, with an emphasis on pedestrian amenities
- implements city's Bike Plan, provides for expanded bike lanes on Fairfax and Fountain Avenues

The Plan establishes new lower height limits around historic districts, and integrates development into existing scale.

- lowers development heights north and south of Hollywood Boulevard along the National Register Historic District
- establishes lower height limits around the Melrose Hill Historic District and Spaulding Square Historic District
- maintains all existing height limits (a total of two parcels are proposed for a higher height limit, 60 feet, to make them consistent with neighborhood properties)

The Plan supports the Hollywood Central Park over the 101 Freeway, and expands park acreage.

- places the creation of such a park into the Community Plan policies, providing support for implementation funding
- rezones recent parkland acquisitions in the Hollywood Hills as permanent open space and expands number of neighborhood parks

The Plan protects hillsides from over development – strengthens development regulations for hillside subdivisions.

- expands the implementation of the "slope density" ordinance in the Community Plan
- applies restrictions to future parcel maps and tract maps in hillside areas
- promotes ridgeline protection and expanding retaining wall controls

Hollywood Community Plan, Continued

The Plan promotes streetscape plans and implements new street standards, wider sidewalks, pedestrian enhancements.

- develops sidewalk, landscaped parking, street tree, and lighting standards for major Hollywood thoroughfares (Santa Monica Boulevard, Melrose Avenue, La Brea Avenue, Western Avenue)
- expands sidewalks along major boulevards, including preservation of the Hollywood Walk of Fame
- preserves existing landscaped parkways and trees on significant thoroughfares, such as Los Feliz Boulevard
- balances pedestrian needs while maintaining roadway capacity

The Plan expands Historic Preservation Districts and preservation tools, including linking all incentives to historic preservation goals.

- expands historic resources in Hollywood
- supports the establishment and expansion of historic districts, including expansion of the Melrose Hill Historic District
- links the use of any incentive to historic preservation, and requires conformance with the Secretary of the Interior's standards

The Plan promotes the regulation of scale and design in the heart of Hollywood through a Hollywood Specific Plan or Community Plan Implementation Overlay.

- adds the development of specific scale, height, massing, and design requirements for the center of Hollywood to the Planning Department's work program

The Plan promotes mixed use along transit boulevards, limits density of mixed use development in Studio District and East Hollywood.

- emphasizes pedestrian friendly mixed-use development along commercial boulevards to maintain existing scale and character in residential neighborhoods
- proposals would limit mixed-use development density along Santa Monica Boulevard and Western Avenue
- maintains existing development limitations on Franklin Avenue, establishes more restrictive height limit on Hillhurst Avenue

The Plan establishes urban design guidelines for new development in Hollywood, reinforcing pedestrian friendly character of commercial districts.

- continues the ban on new supergraphics in Hollywood
- establishes expectations and guidelines for higher quality design, pedestrian orientation, active storefronts, and neighborhood cohesiveness for future development

The Plan funds a nexus study to establish trip fees on new development to finance regional mobility improvements.

- funds a study to establish a fee for new development based on how many car trips each project will generate, in addition to all currently required environmental analysis. Development fees would be used to finance regional transportation improvements in Hollywood

The Plan promotes pedestrian oriented design overlays for Historic Route 66, Hillhurst Avenue, and Melrose Avenues.

- calls for the establishment of pedestrian oriented development standards for Santa Monica Boulevard's Historic Route 66, the Melrose shopping district, and Hillhurst Avenue

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose certain requirements on development. For example, the Regulations establish height requirements along Vine Street. There are other standards, such as those that require open space for the project. Compliance with the standards is mandatory. The guidelines are suggestions that may include a range of choices and require a degree of discretion by the individuals charged with administering and complying with the Regulations. The purpose of these guidelines is to encourage high quality design. The purpose is to provide a range of flexible choices within the framework of the Regulations to allow for creativity in the development process. The Regulations require that ultimate design decisions must be determined by the Director of Planning, who may take different views on the total design proposal. The Regulations require ultimate discretionary review by providing a broad range of choices within the framework of the Regulations.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council and are incorporated into the Development Agreement entered into pursuant to California Government Code Section 65864 et seq. entered into by the City and the Developer.

1.4.2 The following sections of the Regulations deviate from corresponding provisions in the Los Angeles Municipal Code (LAMC): 12.21, 12.21.1, 5.9.3.a, 12.4.a, 5.1.6 and 10.2.

1.4.3 Unless otherwise specifically provided in the Regulations, all words, terms and phrases shall have the meanings set forth in the Zoning Ordinance and Subdivision Ordinance of the Los Angeles Municipal Code (LAMC) that apply to the Project Site. Any capitalized terms shall have the meanings set forth in the Development Agreement, unless otherwise defined in this Document.

2 BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of approximately 4.47 acres of land. The subject property is generally bounded by Ivar Street to the north and bisected by Vine Street.

The area bounded by Ivar Avenue, Yucca Street, and Argyle Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and/or public uses and parking. The topography of the site consists of approximately 25 feet (NE to SW) from the Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Yucca Street. The existing uses will be demolished to allow for the development of the Project.

3.1 [illegible]

C) [illegible] Buildings [illegible] that will be established [illegible] with the adjacent [illegible] (see sections 5.1.1, 5.1.2, and 5.1.3 below).

Given the [illegible] the Project Site, the purpose of these [illegible] is to [illegible] a [illegible] and [illegible] that [illegible] the [illegible] and [illegible] of the Project. The Project [illegible] a [illegible] and [illegible] to [illegible] the [illegible] of the [illegible] and [illegible] the [illegible] of the [illegible] and [illegible] of the [illegible].

4. DENSITY

4.1 **Floor Area Ratio Averaging and Density Transfer**

The Development Parcels set by the Subdivision and Density Plan provide that the Project Site is to be developed with a [illegible] and [illegible] and [illegible] Building Heights in the Regulations, which [illegible] and the entire Project does not exceed the cumulative, allowable density, and [illegible] in the Regulations for the Project.

[illegible] for the [illegible] of the [illegible] on the Project Site and ensure [illegible] and density is within the [illegible] the Project Site, including [illegible] and related development requirements, [illegible] of the Project, as [illegible] with the Project Site.

4.2 **Maximum Gross Floor Area**

A mixed-use [illegible] ("Commercial Program") [illegible] as [illegible] and [illegible] uses [illegible] and [illegible] and across the Site [illegible] and [illegible] in the Environmental Impact Report for the Project. The [illegible] between land uses will be based on a maximum allowable building square footage [illegible] ("GSF") [illegible] applicable to and not exceeding [illegible] in the Environmental Impact Report for the Project. The total density [illegible] Gross Floor Area [illegible] Building [illegible] Gross Floor Area [illegible].

4.3 **Use Combination / Discretionary**

[illegible]

taken from another design guideline

5. HEIGHT

5.1 **Building Height Standards**

The Regulations establish Building Heights for [illegible] in response to the Upper Concept Diagram, providing guidance for the [illegible] and the varying [illegible] of the Capital Records Tower.

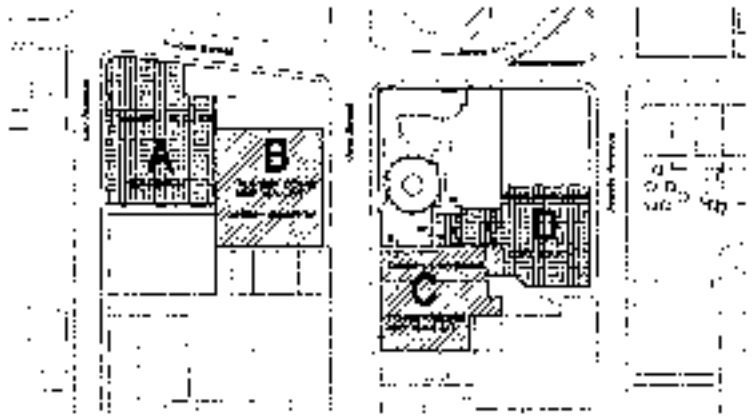

Figure 5.1 – Height Zones

CO-0001-133

AR0068053

5 Building And Street Experience

5.1 Tower Massing Requirements

5.1.1 The Tower Massing Requirements apply to the portion of a building above 150 feet above curb level – see Table 5.1.1

150	90	17,150 East/West 11,500 North/South	10 15	12	5.1.2.a.1 5.1.2.a.2
250	90	17,150 East/West 11,500 North/South	10 15	10	5.1.2.b.1 5.1.2.b.2
400	90	17,150 East/West 11,500 North/South	10 15	8	5.1.2.c.1 5.1.2.c.2
450	90	17,150 East/West 11,500 North/South	10 15	5	5.1.2.d.1 5.1.2.d.2

5.1.2 Maximum gross floor area per floor is the 5% of total gross floor area of the development for the building above 150 feet to 250 feet. See Figure 5.1.2.a – d.1

5.1.3 Maximum floor plate size for portion of building above 250 feet

5.1.4 Tower separation

a. Minimum 80% of tower aggregate area shall be set back

5.1.5 Tower articulation

a. Recessed areas shall be provided for a minimum length of 30 feet

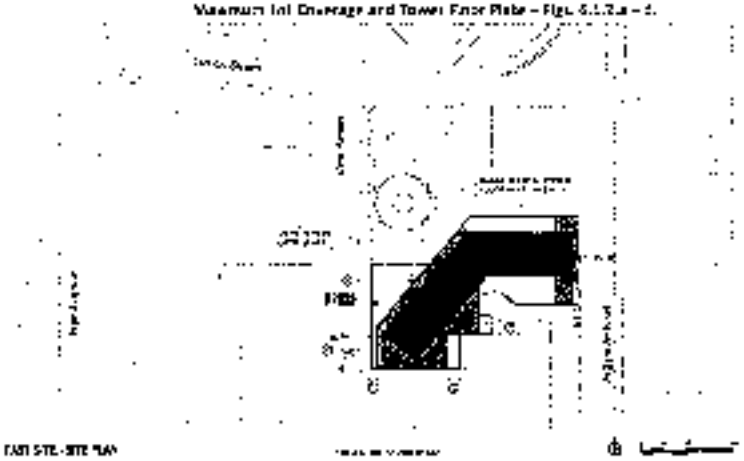
b. Recessed areas may project a maximum of 3 feet from the adjacent tower face and shall be a minimum width of 30 feet

c. Recessed areas shall be provided with a height of at least the adjacent ground floor ceiling height

d. Recessed areas shall be provided for the purpose of providing separate parking, retail, residential and loading areas. The recessed area shall consist of a change in massing, materials or fenestration of the tower face.

The following developments are for illustrative purposes only.

Maximum Tot Coverage and Tower Floor Plate – Figs. 5.1.2.a – d.



EAST SITE - SITE PLAN

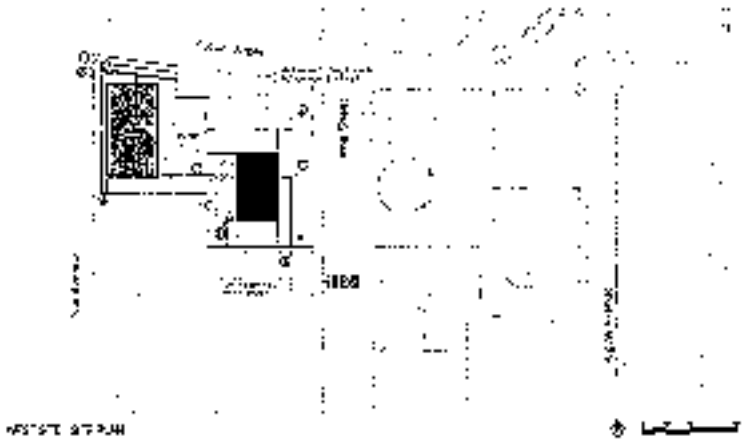
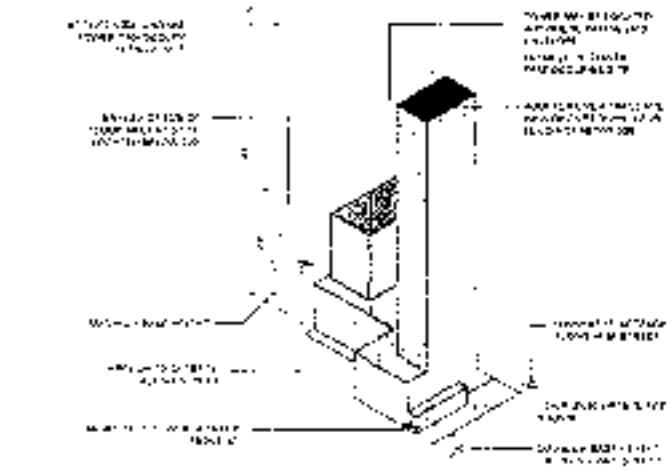
AR0068056

CO-001-136

CO-0001-137

AR0068057





6.3 Street Walls

6.3.1 A street wall is the wall or portion of a wall of a building facing a public street or a public open space. Street wall requirements apply to new development and to the redevelopment or alteration of existing buildings. Street walls are to be designed to create a sense of definition and enclosure, and to contribute to a comfortable pedestrian environment. Building articulation, fenestration, varied materials, and high quality detailing are encouraged. Buildings are encouraged to provide these qualities at grade, podium levels, and the upper floors, and to include active uses at grade (such as retail, restaurants, and amenities) that add architectural character and are encouraged.

6.4 Street and Sidewalk

6.4.1 [illegible]

a Except for the grade level open space, the required street wall is to be located a minimum 10 feet from the property line along the Street on the East Side and 15 feet along the Street on the West Side.

b A grade level open space is required for any building fronting onto the West Side of the Street and is to be located on the property line.

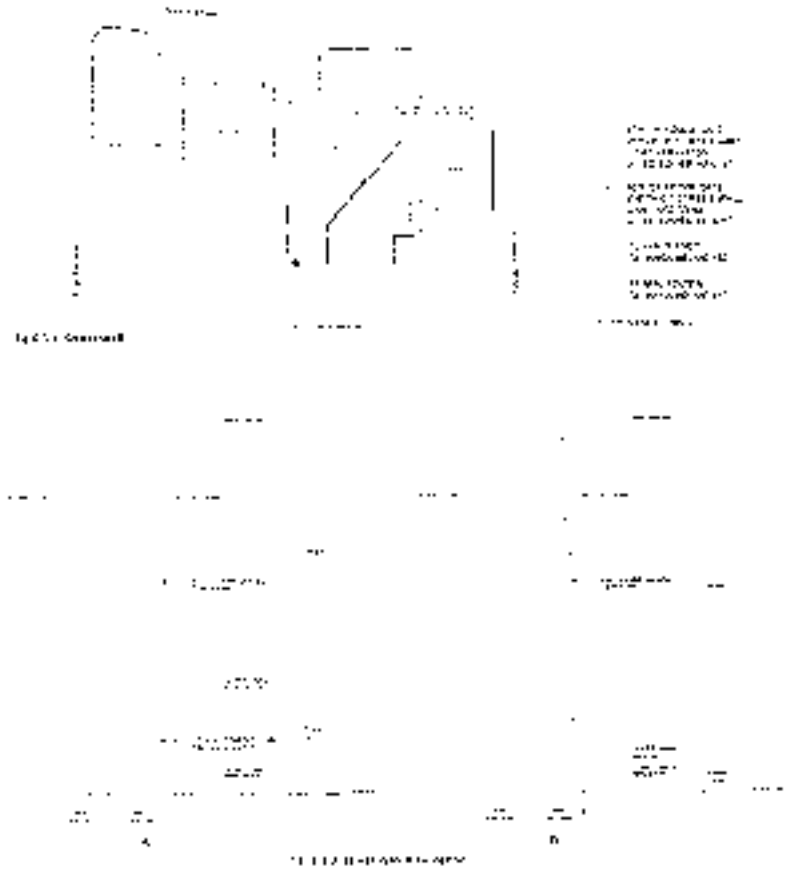
c Portions of the grade level open space may be located between the required street wall and the property line.

6.4.2 Height of required street wall

a Street walls shall be a minimum height of 10 feet above the curb height and a maximum height of 30 feet above curb level except as noted in items (b) and (c) below.

b Street walls fronting onto Street may exceed the 30 feet maximum height of the street wall to a maximum height of 150 feet with a 15 foot setback above 30 feet above curb level as noted in item (a) above.

c 50% of the aggregate width of the required street wall may exceed the maximum street wall height up to the maximum tower height.



5.3.3 Portion of Intermediate Level not required to be built:

a Recess rooftops that are not utilized to a minimum depth of 20'-0"

b Balcony, Bay Window or any projection of 3'-0" from required tower wall over a grade level open space

c Balcony, Bay Window may extend from a required flat roof over a grade level open space

d Permission based on condition that a breezeway be provided between building portion over and open space. This breezeway can not be enclosed and must be open to the sky

5.3.4 Other permitted projections above the height limit for the property for tower and podium wall that comply with the following:

a Architectural façade elements such as cornices or ornamentation, cornice lines, pilasters and downspouts may project from a required street wall over a grade level open space

b Projections may not project more than 6" from the street wall over a grade level open space

c [illegible]

d Tower Projections - may project from a required street wall over a grade level open space up to a maximum depth of 5'-0". The maximum height of these projections for each portion shall not exceed two courses or 28'-0" above curb level, whichever is less.

5.4 Street Wall Setbacks

5.4.1 Recesses or openings through ground floor, podium, balcony, canopy, awning and other projections are permitted subject to the above restrictions

5.4.2 Recessed doors and entrances, arcades, bay windows and landscaping are encouraged and other design elements that add interest along the street wall are encouraged on the Project Site

5.5 Roof Projections

5.5.1 Mechanical equipment, elevator overruns, roof access stairs and screening for such equipment are permitted above the maximum height limit

5.5.2 Communication devices may project above the maximum height limit

5.5.3 Parapet walls:

a Minimum 3'-6"

b Solid parapet walls greater than two courses in height over the roof shall be setback one additional foot for each additional course above the second course, but maximum setback required shall not exceed 10 feet.

c. Setback: Minimum 35 mm, for a building more than three storeys in height, one tier may be set back to the desired setback with the next tier. Additional tiers above the first setback may be set back by a minimum of 20 mm.

6.6 Building Materials and Colour Guidelines

6.6.1 The goal of the building materials and colours is to reinforce the character of the Bukit Ho Swee area and provide a design that complements the surrounding developments. The following guidelines should be addressed in the submission for Qualified Person certification:

a. Buildings should employ a harmonious range of colours. The range of colours should not be overly intrusive, but should complement the character of the residential conventional area.

b. Ground floors should have a minimum 4m2 of glazing on the upper floors and features high-quality durable materials that last long, (brick and stone).

c. Architectural expression of the ground level should be clearly defined and expressed through the choice of materials. Ground floor colours may be used to distinguish building entrances and access.

d. The architecture of the building should demonstrate architectural consistency in the use of materials, colours, and design features on all elevations, including those facing public streets, private streets, and open spaces.

e. The building should be designed to minimize the perception of bulk. The use of setbacks, articulation, and varying heights should be considered. Buildings should not exceed a height of 60 meters without setbacks or other design features to break up the mass.

f. Incorporate sustainable design principles, such as energy-efficient materials, natural ventilation, and renewable energy sources, where feasible. Consider the use of green roofs, solar panels, and rainwater harvesting systems.

g. Integrate the overall massing, roof forms, materials, and architectural style of new developments with the existing context. Respect the scale, rhythm, and character of adjacent buildings. Avoid abrupt changes in height or massing that may disrupt the visual harmony of the area. Consider the use of transitional elements, such as setbacks or stepped facades, to create a smooth transition between different building heights.

h. Incorporate the existing topography, landscaping, and natural features of the site into the design. Minimize excessive grading and earthworks. Use the site's natural contours to inform the building's massing and architectural elements. Consider the impact of the design on the surrounding landscape, including views, shadows, and wind patterns. Incorporate landscaping elements, such as trees, shrubs, and green roofs, to enhance the building's appearance and provide environmental benefits.

i. Design buildings that are easily accessible for people with disabilities, including ramps, elevators, and wide doorways. Provide clear and intuitive wayfinding signage throughout the building and its surroundings.

6.7 Guidelines Standards

6.7.1 The purpose of the guidelines and standards is to provide architects and developers with a clear understanding of the expectations for the development. These guidelines and standards are intended to ensure that the development is consistent with the overall vision for the area, while also allowing for flexibility and innovation in design. The guidelines and standards may be updated from time to time to reflect changing circumstances and best practices in urban development.

6.7.2 Building Height

a. Minimum 10 m or as per requirements by Qualified Person.

6.7.3 Building Articulation

a. The primary entrance to a commercial development shall be clearly visible and accessible from the street. The entrance should be designed to create a welcoming and inviting atmosphere, with features such as canopies, awnings, or overhangs. Consider the use of transparent materials to allow views into the building and create a sense of openness.

b. Buildings should be designed to provide a human scale, using elements such as windows, doors, and architectural details that are appropriate for pedestrians. Avoid large, blank walls and monotonous facades. Consider the use of setbacks, stepbacks, or articulation to break up the mass of the building and create visual interest.

c. Main building entrances shall be clearly defined, well-lit, and easily accessible from the street. Entrances should be designed to be welcoming and inviting, with features such as canopies, awnings, or overhangs. Consider the use of transparent materials to allow views into the building and create a sense of openness.

d. Incorporate public art installations, such as murals, sculptures, or interactive displays, to enhance the visual appeal and cultural significance of the development. Consider the use of local artists and themes that are relevant to the history and culture of the area.

6.7.4 Green Building Standards

a. Buildings should achieve a minimum Green Mark Gold rating or equivalent, with a target of Green Mark Platinum.

b. Incorporate sustainable design principles, such as passive cooling, natural ventilation, and daylighting, to reduce energy consumption.

c. Use energy-efficient lighting, HVAC systems, and appliances.

d. Implement water-saving measures, such as rainwater harvesting and greywater recycling.

e. Use sustainable materials, such as recycled content, low-VOC paints, and responsibly sourced timber.

f. Provide electric vehicle charging stations and encourage the use of electric vehicles.

g. Implement a waste management plan to minimize waste during construction and operation.

h. Consider the use of green roofs, solar panels, and other renewable energy technologies.

i. Aim for a minimum of 20% reduction in energy consumption compared to a baseline building.

CO-0001-140

6.7.5 Articles

a Recreational activities and associated structures shall be set back a minimum of 2.0 feet from the

6.7.6 Setback and Height Requirements

Podium and Tower Setback Requirements

a Every required building setback shall be unobstructed from the ground to the sky except for the following projections: (a) cornices, eaves, sunshading devices, or other ornamental features projecting not more than 2 feet into the required setback; (b) balconies projecting from the building facade

b Every required building setback shall have a minimum area of 400 square feet, of which not less than 40% of it shall be open to the sky, and no dimension shall be less than the minimum required setback frontage for the zone

c Loading spaces shall have a minimum area of 300 square feet, where the gross floor area of the buildings on the site exceeds 50,000 square feet, but not more than 100,000 square feet, a minimum area of 600 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and the full requirement for additional 250 square feet for each additional 200,000 square feet or fraction thereof in excess of 200,000 square feet

Development Height Restrictions

a None

Podium Setback Line

a None

6.7.7 Structure and Setback Guidelines

a Vertical articulation shall be provided at the building facade to break up the massing of the building and to avoid the creation of long flat facades. Articulation shall be provided at intervals not exceeding 75 feet and may consist of a recessed or projected

b Service, storage and maintenance facilities, including related loading and manoeuvring areas, and refuse collection points shall be located within buildings

Service facilities, refuse collection points and loading areas shall be screened from the street and adjacent properties by enclosing them within buildings, or by using screening devices, planting, berms or a combination of these measures

c Architectural elements shall be consistent with the architectural vocabulary and character of the building

h Trash and storage enclosures shall be architecturally compatible with the principal building and shall be provided adjacent to the individual(s) it serves to the extent practicable

i Trash and service and refuse loading areas shall be located to minimize visibility from adjacent properties.

g Site location of trash enclosures shall be subject to review by the Director of Planning and Development to ensure proper functioning of loading operations

h Mechanical equipment and vents shall be screened by architectural elements and

Roof-level open-air recreational space shall be located at least 10 feet from the edge of the building face

i Curtain wall mullions shall be made of aluminum and steel, concealed spandrel panels shall be

6.7.8 Retail Standards

a Storefront glazing shall comprise a minimum of 70% of the length of the ground floor facade and be recessed where necessary

b Window glazing shall constitute a minimum of 30% of the total horizontal area along the street and shall be placed between the heights of

c Retail entrances shall be recessed a minimum of 3 feet to avoid swinging doors

d Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefronts shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

e Storefront openings shall be no more than 12 feet above the adjoining grade or 90% of the required minimum height

f Security grilles shall be located behind glazing and shall be minimum 75% open

g Any gate or roll up door shall be located behind the required minimum 75% open

6.8 City Open Standards

6.8.1 The purpose of the Podium Standards is to establish a model for implementation of the vision for a vibrant and enduring pedestrian environment at the ground level, as well as the upper levels of the podium, by the use of planning principles, regulations, implementing strategies and supporting documents

AR0068061

CO-0001-141

5.0 Podium Locations

5.0.1 Podium(s) shall be provided on the Development Parcel(s) as identified on the Podium Locations Plan and may include a change in material, change in elevation, pavers or similar means.

5.0.2 Pedestrian breezeways between the building podium floors and upper floors shall be provided. This shall may include a change in material, change in elevation, pavers or similar means.

5.0.3 Podium projections shall be permitted, if desired.

5.0.4 Podium projections shall be permitted over public streets.

5.0.5 Podium projections shall be permitted over the highest floor within the podium.

5.0.6 Vehicle access and loading shall be provided, and exceptions may be made for integration of public art or architectural features such as screens or trellises that help to define the façade and add texture and depth to the building elevation. Vehicle access and loading shall be located off of Hall Street, Overton Street, Public Road A, Public Road B, Public Road C, or Public Road D, as applicable, and shall be screened from view from public streets, parks, and open spaces.

5.0.7 Louvers, vents and openings may be designed to integrate with building architecture.

5.1 Streets and Sidewalk Standards

5.1.1 The development shall be designed to provide a network of public streets that is safe, accessible, and well connected to the surrounding neighborhood. The network shall be designed to encourage walking, cycling, and transit use, and shall provide a high level of connectivity for pedestrians, cyclists, and motorists. Public streets shall be designed to accommodate a variety of uses, including vehicular travel, on-street parking, bicycle facilities, and pedestrian sidewalks.

5.1.2 The construction of new public streets shall be designed to provide a safe, comfortable, and attractive environment for pedestrians, cyclists, and motorists. This shall be achieved by providing features such as traffic calming measures, street trees, and landscaping, as well as ensuring that the streets are well-lit and visible. The use of high-quality materials and finishes shall also be encouraged to create a sense of place and enhance the overall aesthetic of the development.

5.1.3 Sidewalks shall be provided on both sides of all public streets, with a minimum width of 6 feet, except where otherwise specified in the Development Regulations. Sidewalks shall be designed to be accessible to all users, including those with disabilities, and shall be free of obstructions such as utility poles, signs, and vegetation that may impede pedestrian movement.

5.1.4 Street trees shall be planted at regular intervals along all public streets, with a minimum spacing of 30 feet on center. Trees shall be selected from a list of approved species that are suitable for the local climate and soil conditions, and shall be planted in accordance with the City's tree planting standards. Trees shall be provided with adequate soil volume, irrigation, and protection from damage, and shall be maintained in a healthy and vigorous condition.

5.1.5 Bicycle facilities, such as bike lanes, shared lanes, or cycle tracks, shall be provided on public streets as required by the Development Regulations. The design of bicycle facilities shall be consistent with the City's bicycle master plan and shall provide a safe and convenient connection to the surrounding bicycle network.

5.1.6 Public streets shall be designed to accommodate emergency vehicles, including fire trucks and ambulances, and shall provide adequate turning radii and clearance for these vehicles. The design of public streets shall also consider the needs of other users, such as pedestrians and cyclists, and shall incorporate features such as curb extensions, raised crosswalks, and speed humps to promote safe and slow traffic speeds.

5.1.7 Public streets shall be designed to be consistent with the City's street naming and numbering system, and shall be named in accordance with the City's street naming policy. The design of public streets shall also consider the integration of public art, such as sculptures, murals, or interactive installations, to enhance the pedestrian experience and create a sense of place.

5.2 Setback Standards

5.2.1 The minimum setback from a public street shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.2 The minimum setback from a property line that is not a public street shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.3 The minimum setback from a property line that is adjacent to a residential use shall be 10 feet, except where otherwise specified in the Development Regulations.

5.2.4 The minimum setback from a property line that is adjacent to a commercial use shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.5 The minimum setback from a property line that is adjacent to an industrial use shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.6 The minimum setback from a property line that is adjacent to a public park or open space shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.7 The minimum setback from a property line that is adjacent to a public street shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.8 The minimum setback from a property line that is adjacent to a private street shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.9 The minimum setback from a property line that is adjacent to a public alley shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.10 The minimum setback from a property line that is adjacent to a railroad right-of-way shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.11 The minimum setback from a property line that is adjacent to a utility easement shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.12 The minimum setback from a property line that is adjacent to a drainage easement shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.13 The minimum setback from a property line that is adjacent to a conservation easement shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.14 The minimum setback from a property line that is adjacent to a historic district shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.15 The minimum setback from a property line that is adjacent to a scenic corridor shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.16 The minimum setback from a property line that is adjacent to a wildlife habitat area shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.17 The minimum setback from a property line that is adjacent to a wetland area shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.18 The minimum setback from a property line that is adjacent to a floodplain shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.19 The minimum setback from a property line that is adjacent to a steep slope shall be 0 feet, except where otherwise specified in the Development Regulations.

5.2.20 The minimum setback from a property line that is adjacent to a cultural resource shall be 0 feet, except where otherwise specified in the Development Regulations.

7. Towers

7.1 Purpose

7.1.1 Towers are a unique architectural element that can help to define the skyline and create a sense of place. They can also be used to provide a sense of scale and proportion to the surrounding buildings and streets.

7.1.2 Towers can be used to create a sense of verticality and emphasize the height of a building, which can help to draw the eye upward and create a sense of grandeur.

7.1.3 Towers can be used to create a sense of enclosure and define the edges of a space, which can help to create a sense of intimacy and human scale.

7.1.4 Towers can be used to create a sense of rhythm and repetition, which can help to create a sense of order and harmony in the urban environment.

7.1.5 Towers can be used to create a sense of contrast and juxtaposition, which can help to create a sense of visual interest and excitement.

7.1.6 Towers can be used to create a sense of landmark and wayfinding, which can help to create a sense of place and identity.

7.1.7 Towers can be used to create a sense of transition and connection, which can help to create a sense of continuity and flow between different parts of the city.

7.1.8 Towers can be used to create a sense of mystery and intrigue, which can help to create a sense of curiosity and exploration.

7.1.9 Towers can be used to create a sense of drama and spectacle, which can help to create a sense of excitement and wonder.

7.1.10 Towers can be used to create a sense of tranquility and serenity, which can help to create a sense of peace and relaxation.

7.1.11 Towers can be used to create a sense of power and authority, which can help to create a sense of respect and admiration.

7.1.12 Towers can be used to create a sense of beauty and aesthetics, which can help to create a sense of pleasure and enjoyment.

7.1.13 Towers can be used to create a sense of history and culture, which can help to create a sense of connection and belonging.

7.1.14 Towers can be used to create a sense of community and social interaction, which can help to create a sense of belonging and identity.

7.1.15 Towers can be used to create a sense of environmental sustainability, which can help to create a sense of responsibility and stewardship.

7.2 Height Bonus

7.2.1 The following building elements are considered exempt from and may exceed the maximum permitted building height:

a. Rooftop structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment, required to operate and maintain the building;

b. Skylights, towers, steeples, flagpoles, water tanks, etc.;

c. Wireless masts; and

d. Solar energy devices and wind turbines.

7.2.2 Permitted building elements or appurtenances listed in Section 7.2.1 shall be limited to practical and necessary functional requirements (e.g., mechanical screening). Requests to exceed the permitted height for these elements shall be reviewed by the Director and may require additional documentation or screening.

7.2.3 No signage or graphics shall be permitted on exempt building elements.

7.3 Tower Standards

7.3.1 A tower 200 feet or greater in height above ground level shall be set back from the edge of the building by a minimum distance of 15 feet on all sides facing public streets.

7.3.2 Rooftop mechanical equipment and lighting fixtures shall not project more than 10 feet above the maximum permitted building height.

7.3.3 Towers shall be designed to minimize their visual impact on the surrounding neighborhood. This may include the use of setbacks, stepbacks, or other architectural features to reduce the perceived mass of the tower.

AR0068062

CO-0001-142

7.1.A Towers that are attached to multi-family residential projects are to be limited to a maximum of 10 residential stories.

7.A Wall Standards

7.A.1 All walls shall be designed to be articulated.

7.A.2 The following guidelines shall be used to design all towers and all projects:

a. Reserved.

b. Standard solutions may be proposed, but must be supported by a comprehensive analysis of site, and

c. Each project.

Fig. 7.A.1a Bunker Hill Towers

Fig. 7.A.1b Los Feliz Towers

7.A.3 Balconies, balcony rails and railings at the facade (see figs. 7.A.3a and b) shall be designed to create a rich, three-dimensional, and vertical shading pattern. Balconies are encouraged to create a complex and varying pattern using multiple projections (minimum 6 projections) per facade (minimum 2 projections) and shall be a minimum 25% transparent. Balconies are encouraged to be designed to face public streets, open spaces, and common courtyards. Long continuous, monotonous, solid walls are discouraged.

B. OPEN SPACE

B.0 Overview

The development of open space is an important objective for the Hollywood Project as an "Open space network" is required to address the open space needs of the community. Open space is an accessible, important feature of the Project and through-site connections for the Project. Grade level open space shall be designed to maximize the City of Beverly Building and Safety and shall include design features that activate the open space and the ground floor frontages.

The open space requirements in the Specific Plan guidelines for the Project are intended to be consistent with the Project's Grade Level Open Space Areas and Common Open Space Areas. Grade level open space shall be designed for the residential uses' Common Open Space and Private Open Space.

B.1 Grade Level Open Space Standards

B.1.1 Grade level open space shall be provided at or within 10 feet above the finished grade of the adjacent sidewalk. The grade level open space shall be designed to be accessible to the residents of the Project and open to the sky. This requirement may be satisfied by providing a portion of the required grade level open space as a roof deck, provided that the roof deck is accessible to the residents of the Project and is designed to be visually and physically integrated with the grade level open space.

B.1.2 Minimum grade level open space. As set forth in Table 6.3.2-1 of the Development Plan, for buildings up to and not exceeding 250 feet. (See Fig. 6.3.2-1 – B)

B.1.3 An additional 5% of open space shall be required for buildings above 250 feet and 400 feet. (See Fig. 6.3.2-1 – C)

B.1.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 500 feet. (See Fig. 6.3.2-1 – D)

B.1.5 An additional 5% (total 15%) of open space shall be required for buildings greater than 500 feet. (See Fig. 6.3.2-1 – E)

B.1.6 Applicability.

a. Each use adjacent to the Las Palmas and Hollywood Boulevard Setback Area shall be setback from the Property Boundary along Vine Street and Yucca Street.

b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular to the open space on each of the boundaries of the open space area. Open space shall be fronting on at least two (2) public streets or Private Streets, other than Alleys, and shall be improved pursuant to the Streetscape Plan.

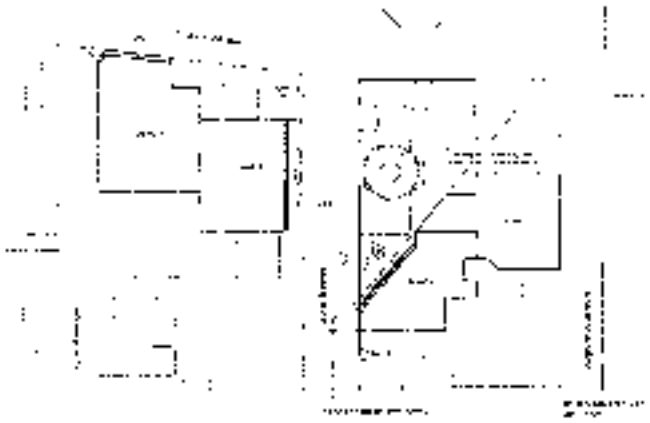
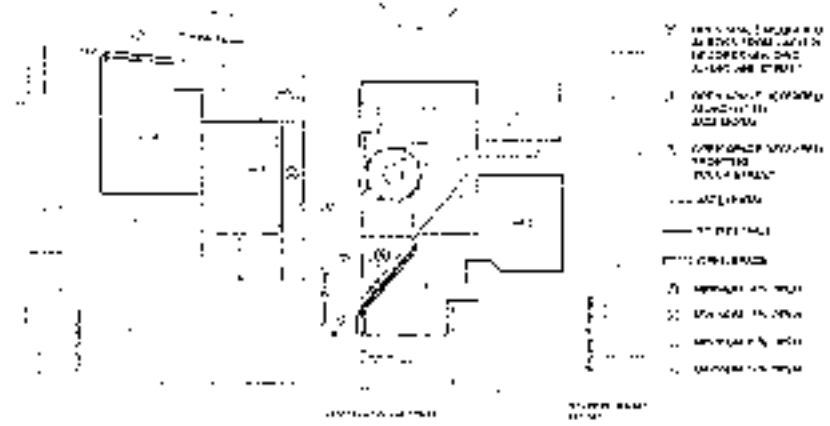
AR0068065





8.3 Passageway Standards

8.3.1 A publicly accessible passageway is a continuous through block public connection between two roads or streets, legible and readily understood. The passageway must be at least XXX metres wide by XXX metres high (or as otherwise specified).

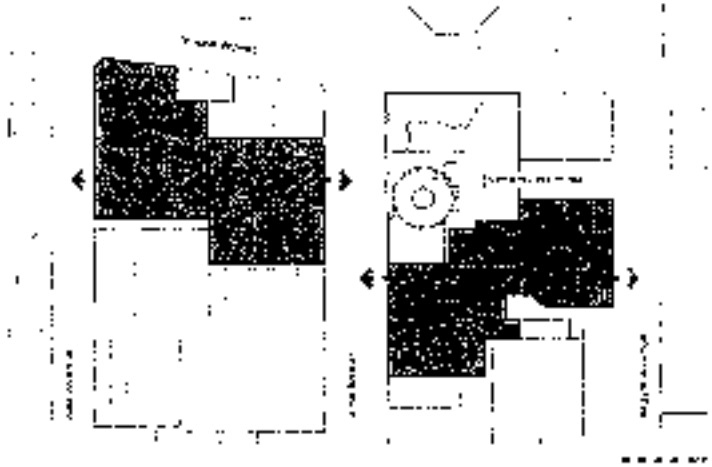
8.3.2 Design Provision to encourage public access and connection between and across appropriate public roads and streets along View Street.

8.3.3 Location and Size Requirements

a The minimum width of a publicly accessible passageway at the lowest level of the passageway and the rear of laneway are. Major publicly accessible parts adjoining buildings are public spaces. Major public spaces occupy no less than 75 percent of the total passageway area and shall not be less than 20 m² wide.

b Where a publicly accessible passageway and laneway does not align to create additional travel lines the shape and composition of a passageway. Where such lines shall not occupy more than 25 percent of the total area of the passageway. The minimum portion shall have a minimum width of 10 feet.

c The passageway shall be clear and open to the sky except as [illegible]



CO-0001-145

AR0068066

5.2.4 Permitted Obstructions.

a. The minimum percentage of publicly accessible passageway area to be open to the sky [illegible] shall be as follows:

(1) Development with maximum building height of [illegible] feet: [illegible]

(2) Development with maximum building height of [illegible] feet: [illegible]

(3) Development with maximum building height of [illegible] feet: [illegible]

(4) Development with maximum building height of [illegible] feet: 40%

5.5.3 Frontages:

a. A minimum of [illegible] of the lot frontage for commercial uses and at least 40% of the lot frontage for [illegible] shall be occupied by buildings that are located close to the property line and [illegible]

b. Such [illegible] requirements shall not apply where the [illegible] provides, in the opinion of the City, that [illegible] from the existing or proposed streetscape [illegible] and [illegible] The remaining frontage may be occupied by other uses, [illegible] and parking facilities.

5.5.4 [illegible]

a. [illegible] that the responsibility for the maintenance of the publicly accessible parking area, including, but not limited to, the performance bond, the [illegible] and replacement of vegetation, and the care and replacement of vegetation within the passageway and on the adjacent sidewalk, boulevard, and adjacent street pavement.

b. [illegible] that all lands associated with the [illegible] shall be conveyed to the City at a rate of [illegible] square feet of public parking area for each [illegible] square feet of [illegible] gross floor area [illegible] and the [illegible] shall be provided for each 2,000 square feet of passageway in connection with the development, or [illegible] as otherwise determined through [illegible]

5.6 Rooftop Open Space

5.6.1 [illegible] square feet [illegible] rooftop [illegible] open space

5.6.2 [illegible] the [illegible] shall be considered private [illegible] accessible to the public

5.6.3 [illegible]

5.7 Neighbourhood Common Open Space

5.7.1 Common open space is [illegible] for the enjoyment, [illegible] and [illegible] of the residents of a parcel, [illegible] or the [illegible] and shall be [illegible] to the City and [illegible] such purposes. Where [illegible] from a commercial, [illegible] and [illegible] shall be [illegible] and the [illegible] common open space.

5.7.2 Common Open Space Standards

a. Provide a minimum of [illegible] open space per dwelling unit, [illegible] for each one bedroom dwelling unit, [illegible] for each two bedroom dwelling unit, and [illegible] for each unit containing three or more bedrooms.

b. Each common open space shall [illegible] and [illegible] to be used for active or passive recreation. Active open space may consist of private and/or semi-private [illegible] uses.

c. Open space may be used to satisfy [illegible] that [illegible] for common open space, except as [illegible] in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the site.

e. Common open space shall not include [illegible] of the site's landscaping, or areas [illegible] that [illegible] and [illegible] of the open space.

f. [illegible] open space shall comprise at least [illegible] of the total required open space on the [illegible].

g. Common open space shall [illegible] [illegible] including, but not limited to, [illegible] seating, [illegible], benches, children's play areas, ball courts, [illegible] areas, [illegible] and [illegible].

h. [illegible] open space shall be [illegible], any [illegible] above [illegible]. The [illegible] portion of a building used for [illegible] parking or [illegible] shall not be considered as common open space.

i. Refer to [illegible] for additional open space requirements.

5.8 Residential Private Open Space

5.8.1 [illegible] open space [illegible] for the [illegible] of residents of [illegible] by [illegible] dwellings.

5.8.2 Residential Open Space Standards

a. Private open space shall contain a minimum area of 10 square feet of which no more than 50 square feet may be [illegible] and shall be [illegible] to the dwelling unit it serves.

b. Private open space shall have a [illegible] of [illegible] that is [illegible] measured perpendicularly from any point on each of the boundaries of the open space area.

c. Private open space shall [illegible] with a minimum [illegible] clearance under any [illegible], except as [illegible] in the Zoning Code.

d. That portion of [illegible] which [illegible] or [illegible] may be [illegible] in connection with the Zoning Code may qualify as open space provided it meets each of the above-described requirements [illegible].

b. For each 500 square feet of landscaped area that is required, one tree shall be planted within the site. [Ord. No. 164,307, Eff. 10-1-89.]

c. Trees required by this section shall be planted within the following distance of the trunk:

Fig. 1 Tree Planting Requirements

3. Screening.

a. There shall be a minimum of one 5-gallon size shrub planting for each 500 square feet of landscaped area. Shrubs shall be planted within the following distance of the trunk of a tree:

b. Trees shall be planted in a manner that will not interfere with the use of fire hydrants.

c. Any more than 50% of the required planting area may be covered with walks, walking areas, or the following combinations:

(1) Walking surfaces constructed of materials with a minimum reflectance of 0.6, for the Society of Illuminating Engineers, a minimum of 50% of the required walking surface area shall be covered with lighting fixtures designed to provide an average maintained illumination level of at least two footcandles, measured at the walking surface.

(2) Walking surfaces constructed of materials with a minimum reflectance of 0.3, for the Society of Illuminating Engineers, a minimum of 100% of the required walking surface area shall be covered with lighting fixtures designed to provide an average maintained illumination level of at least two footcandles, measured at the walking surface.

d. Where walking surfaces, including parking areas, are located on a podium above the ground floor, the podium shall be screened from view by planting, trellis work, or other screening materials not less than 36 inches high.

D. Tree Planting Guidelines

1. Prior to the start of construction, the Project Developer shall submit a tree planting plan to the Director of Planning for review and approval. The tree planting plan shall show the species, location, and size of all trees proposed to be planted on the Project Site. The tree planting plan shall also show all existing trees proposed to be removed or relocated on the Project Site. The Director of Planning shall review the tree planting plan for consistency with the Hollywood Redevelopment Plan and the Hollywood Urban Design Guidelines.

2. Street trees shall be planted in accordance with the Project's approved tree planting plan. Street trees shall be planted in the parkway behind the curb, or in tree wells in the sidewalk, where no parkway exists. Street trees shall be planted at intervals of 20 feet, or as approved by the Director of Planning. Trees shall be planted in accordance with the Urban Forestry Division's standard tree planting procedures. Prior to planting, the Project Developer shall submit a street tree planting plan to the Urban Forestry Division for review and approval. The street tree planting plan shall show the species, location, and size of all trees proposed to be planted within the public right-of-way. Street trees shall be planted in accordance with the Urban Forestry Division's standard tree planting procedures.

3. Specific requirements for the planting of trees in the vicinity of overhead utility lines may be modified by the Urban Forestry Division to ensure adequate clearance for the trees at maturity.

E. Lighting Standards

1. Lighting located on the perimeter of each parcel is required to supplement the street lighting for the purpose of providing adequate illumination of sidewalks, bikeways, and pedestrian walkways. Lighting shall be provided along all publicly accessible areas within the Project Site, including but not limited to, parking areas, recreational areas, and pedestrian walkways. Lighting fixtures shall be energy efficient and shall be designed, located, and directed in such a manner as to prevent glare and excessive illumination on adjacent properties.

2. Decorative and security lighting shall meet the following minimum requirements:

a. Sufficient ornamental street lighting for pedestrians shall be provided along all sides of the project site adjacent to public streets. Such lighting shall be designed in conjunction with the street furniture and coordinated with the architectural theme of the project.

b. Lighting shall be energy efficient.

c. Lighting shall be designed to direct light downward and away from adjacent residential properties, so as not to create a nuisance or hazard to motorists on streets or highways.

d. Security lighting shall be provided in all parking areas, pedestrian walkways, and recreational areas.

e. Lighting poles shall not exceed the maximum height permitted by the Los Angeles Municipal Code.

f. All exterior lighting shall be architecturally integrated with the style, material and color of the buildings.

g. Lighting shall be designed, located, shielded or directed so as to prevent spillover onto adjacent properties.

AR0068070

CO-0001-150

9.5.3 Requirements for Commercial Uses

a. The Building Owner shall be responsible for maintenance and repair of all lighting associated with the property, and shall ensure that all lighting used to meet these requirements does not cause glare or light pollution to adjacent properties or roadways, or impair the safe movement of traffic on adjacent roadways.

b. Additional lighting such as architectural lighting, colored lighting, signage lighting, etc. will be allowed. The operation of said additional lighting will be at the discretion of the Building Owner.

9.5.4 Lighting for commercial uses shall be limited to the minimum needed for security purposes, such as entrances, parking areas, loading areas, and pedestrian walkways. Lighting shall be directed downward and away from adjacent properties and streets. Lighting shall not blink, flash, oscillate, or be of unusually high intensity or brightness.

9.5.5 Lighting for above grade parking garages shall be limited to the minimum lighting necessary and the use of artificial brightness shall not be increased by use of the mixed or new residential lighting scale. This may be accomplished through the installation of motion sensors, security cameras, or limited hours of operation. Parking garages shall be exempt from the above requirements during hours when the building is not open for business.

9.6 Public Accessible Passageway Lighting Standards

9.6.1 A uniform, pedestrian-scale lighting system shall be provided throughout the public accessible passageways. Lighting shall be provided at a minimum average maintained illumination of 1.0 foot-candle (10.8 lumens per square foot) on the ground plane of the passageway.

9.6.2 Lighting shall be designed to minimize glare and to direct light downward and away from adjacent buildings.

9.7 Continuity of Design

9.7.1 Design guidelines for the Architectural Character shall be followed when appropriate to provide a consistent theme throughout the Development Regulations area. Variations to the guidelines may be allowed if the proposed architecture is equal to the guidelines and is approved by the Design Review Committee.

9.7.2 Where possible, similar materials, colors, and textures shall be used throughout the Development Regulations area to provide a consistent and cohesive appearance.

10 PARKING

10.1 Automobile Standards

10.1.1 Minimum Standards

The following standards shall be used to determine the minimum number of parking spaces required for each building. The Regulatory Authority shall have the authority to waive or modify the parking requirements for specific buildings or uses if the applicant can demonstrate that the proposed development is the Development Agreement Area.

a. Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of commercial, office, business, retail, institutional, service, or mixed use space in the Development Agreement Area, unless otherwise specified in the Development Agreement. The Regulatory Authority may waive or modify the parking requirements for specific buildings or uses if the applicant can demonstrate that the proposed development is the Development Agreement Area.

b. Sports Club:

Where a sports club is located in a building with 50,000 gross square feet of contiguous, dedicated space, the general commercial use parking requirements apply and no parking spaces shall be required for any sports club use. Sports club uses in buildings with less than 50,000 square feet of contiguous, dedicated space shall provide parking at a rate of one space per one hundred square feet of floor area for the sports club portion of the building.

c. Condominiums (Residential):

Two parking spaces per dwelling unit.

One space for every guest parking lot and for guest parking.

d. Residential (Apartments):

One parking space for each dwelling unit of less than one habitable room, one and one-half parking spaces for each dwelling unit of two habitable rooms, and two parking spaces for each dwelling unit of more than two habitable rooms.

e. Combinations of Uses:

Where there is a combination of any two or more of the above uses, the total number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking

a. Shared parking may be applied to the Section 10.1.1 base rates for the Site when the uses have different parking requirements and different demand periods, particularly when the uses are complementary or between weekdays and weekends. The intent is to minimize the creation of the total vehicle parking demand with its complementary uses. The calculation of the shared parking shall not be based on a detailed study or survey of actual conditions or

Additional restrictions on parking may be provided at the time of the building permit review process.

i. A minimum of one bicycle parking space shall be provided for each dwelling unit, guest room, or 10,000 square feet of floor area, whichever is greater. Bicycle parking spaces shall be provided in accordance with the requirements of Section 12.21 A.16 of the Los Angeles Municipal Code.

10.3 Transportation Demand Management Plan

10.3.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.3.2 The transportation demand management plan shall set forth best practices that seek to reduce the Project's reliance on single occupancy vehicle trips and may include, but not be limited to, the following:

a. Promote bicycle and pedestrian circulation to and from the Project Site.

b. Promote alternative modes of transportation.

c. Provide preferential parking for high occupancy vehicles and electric vehicles on the Project Site.

d. Encourage carpool and ridesharing activity by designating passenger loading areas in the Project Site adjacent to Hollywood Boulevard and Vine Street.

e. Provide secure bicycle parking, bicycle racks and lockers in convenient locations on the Project Site in accordance with the requirements of Section 12.21 A.16 of the Los Angeles Municipal Code.

11 SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage on the Project Site is governed by Ordinance No. 176,220, the Hollywood Signage Supplemental Use District, pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 5.1, light emitting diode screens shall be permitted on the Project Site, subject to the requirements of the Hollywood Sign District. See Fig. 11.2.

12.2 Other Projects

[illegible]

13. DEFINITIONS

Awning, gating, or louver or other fixed structure projecting from the building to provide weather protection, identity or decoration, and may be illuminated by internal illumination.

Base: the lower portion of a building, defined as the first 150' above curb level.

Canopy: a rigid, fabric and/or metal structure with or without support, located on the sidewalk to provide weather protection for a building's entry and/or retail.

Expression band: a projecting or recessed architectural element occurring on the building base (typically at the height of the base) that runs the length of the building, usually aligning with floor lines, or floor to floor height of adjacent building base facade. Projections may occur in the expression band.

Grade level open space: a continuous open space located at street level and open to the sky.

Maximum: building height, the maximum height permitted, measured from the adjacent street curb level.

Maintenance: the ongoing repair, care and upkeep of a property.

Open space: usable and active recreational areas accessible to the general public except as noted herein. Open space can consist of publicly accessible passageways, grade level open space, terraces, courtyards, roof top open space, and other open space which are defined herein.

Preservation: the act or process of applying measures necessary to sustain the existing form, integrity and materials of an historic property.

Publicly accessible passageway: a covered or uncovered pedestrian connection between two parts of the site, which may be private or public, that is designed for and designated to allow safe, convenient and comfortable use by the general public.

Remediation: the act or process of removing or containing hazardous materials in order to protect the health of occupants of a property or the environment. Remediation activities are commonly associated with the cleanup of soil and groundwater contamination, but may also involve the removal of hazardous materials from buildings, such as asbestos, lead paint, and mold.

Required ground level retail: retail or restaurant space at the ground floor of a building, having a minimum depth and minimum square footage as set forth in the applicable Development Parcel Table.

Residential amenity: indoor or outdoor space within a residential building, including but not limited to fitness facilities, lounges, and recreational facilities, provided for the use of residents of the building and their guests.

Residential private open space: open space that is exclusively for the use of residents of a single residential unit.

13. DEFINITIONS 58

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and ensure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project Site.

e. Ensure compliance with the Development Objectives.

f. Ensure preservation of the Capitol Records Building and the Gogerty Building according to the *Secretary of the Interior's Standards for Rehabilitation*.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve the Capitol Records Building and the Gogerty Building according to established preservation guidelines (the *Secretary of the Interior's Standards for Rehabilitation* and guidance provided by Office of Historic Resources).

b Preserve public views from certain key vantage points to the Capitol Records Tower by creating grade level open space / civic plazas on the East Site adjacent to the Jazz Mural and Capitol Records Building and West Site across from the Capitol Records

c. Preserve existing view corridors from certain key vantage points to the Hollywood Hills.

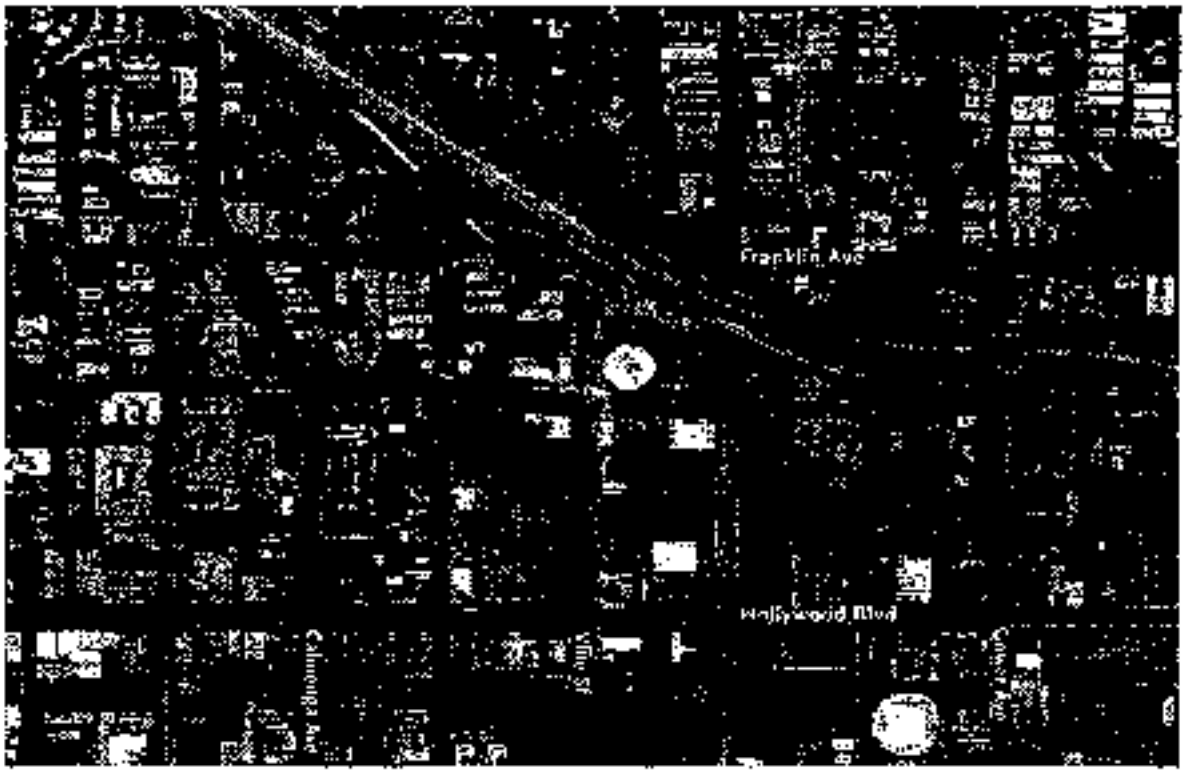

Fig. 1.2.2.b-c. Capitol Records View Corridors

d Create civic plazas that are activated by retail, landscaped, and enhance the Hollywood Walk of Fame by providing it as an urban node. Reinforce the urban and historical

importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

c. Encourage street life by the creation of a new pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

d. Create vibrant urban spaces that permit open and green spaces for both the on-site and off-site population.

fig I.2.2.d: View North Along Vine Street

e. Create a 24 hr community by the creation of a Thriving Mixed-Use Development.

f. Eliminate the visual impact of current on-site parking.

g. Establish where feasible pedestrian linkages to existing public transportation routes in proximity to the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street, and existing bus routes.

h. Establish standards to address architectural excellence.

k. Provide designs that address, respect and complement the existing context, including standards for ground-level open space, podium heights and massing setbacks that minimize impacts to the historic setting.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood from the Hollywood Freeway.

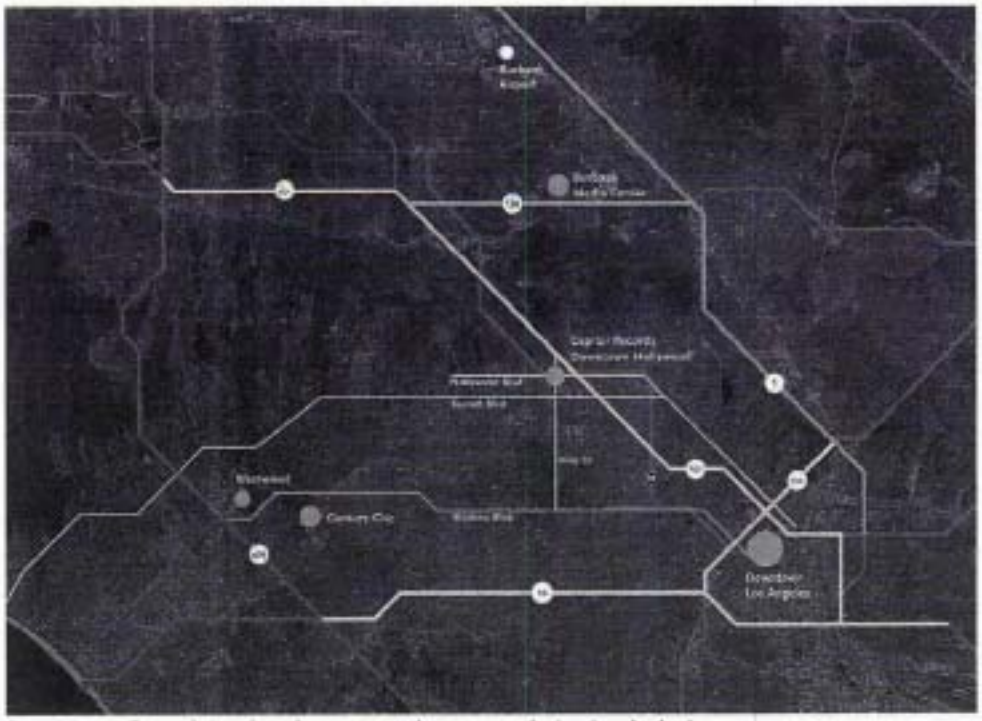

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict requirements for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council ~~and are incorporated~~ in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and _____ ("Millennium Development Agreement") on _____.

1.4.2 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street.

The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 21 feet (NE to SW) from Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Vine Street. The existing sidewalk elevations will not be altered as part the Project.

fig. 2.1. Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 The Project Site is zoned Commercial (C2). The City General Plan land use designation is Regional Center commercial.

2.2.2 The Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Notwithstanding any provision in these Regulations, residential floor area is not permitted within 500 feet of any freeway.

2.2.4 Floor Area Ratio: 6:1

2.2.5 Height District: No. 2

3. HISTORIC RESOURCES AND SETTING

3.1 Overview

The Project Site is located in a historically rich area of Hollywood that contains a number of recognized historic resources. This Project is a preservation project in that its ambition is to respect, respond to, and preserve the Capitol Records Building and to continue the urban character of Vine Street on the Project Site. The Project is designed to be observant of historic settings and buildings. Two buildings located on the Project Site, the Capitol Records Tower and the Gogerty Building, are historically significant. Other historic buildings, located on adjacent parcels, are the Pantages Theater, the Equitable Building, the Hollywood Palace, and the Art Deco commercial building at 6916-6374 Yucca Street. Several of these historic resources are located within the Hollywood Boulevard Commercial and Entertainment District, a National Register listed historic district located just south of the Project Site.

Composed of commercial properties from the first half of the 20th Century, contributing properties to the Hollywood Boulevard Commercial and Entertainment District include a wide variety of property types including single-story storefronts, two-story commercial blocks, department stores, theaters, high-rise office buildings and hotels.

The Capitol Records Building is a unique building whose cylindrical form has always been visible from portions of Hollywood and Vine from the south and the freeway from the north. The Capitol Records Tower and the iconic buildings in the Hollywood Boulevard Commercial and Entertainment District (the Hollywood Palace, Pantages Theater, Equitable Building) will maintain their prominence after implementation of the Project.
Portions of the Hollywood Walk of Fame (L.A. Historic Cultural Monument #194) are located along Vine Street between Yucca Street and Sunset Boulevard and will be protected.

The protection of Hollywood's historic resources and unique character is an important objective of the Project. The guidelines and standards contained in this document were created in part to ensure the protection of historic resources within the Project Site and minimize potential adverse effects to historic resources from new development. Key Project objectives regarding historic resources include:

1) Preservation, maintenance, and rehabilitation of the Capitol Records Building and the Gogerty Building in accordance with the Secretary of the Interior's Standards. See sections 3.2.2a and 3.2.2b of this document.

2) Protection and preservation of the portions of the Hollywood Walk of Fame (LA Historic Cultural Monument #194) will need to be temporarily removed during construction and replaced after construction is completed. A preservation plan, outlined in the Hollywood Walk of Fame Terrazzo Pavement and Repair Guidelines (March, 2011) will be prepared for this aspect of the Project.

3) Incorporation of ground-floor open space and building setback requirements to moderate the overall massing of new development in a manner that preserves important views to and from the Capitol Records Building, the Hollywood Boulevard Commercial and Entertainment District, and important view corridors to the Hollywood Hills. See sections 3.2.2.c, E.1, 6.0, 7.1, 7.5, 8.1 and 8.2 of this document.

4) Incorporation of ground floor open space and building setback requirements to reduce massing at the street level and limit the visual crowding of adjacent historic resources. See sections 3.2.2c, G.1, 7.1, 7.5

8.1 and 8.2 of this document

v) Requirement that design of new buildings be in a manner that is differentiated from but compatible with adjacent historic resources. See Sections 6.6, 6.8, 7.1.5, and 7.4 of this document.

One means of creating compatible new buildings in an urbanized setting is to incorporate qualities of vertical and horizontal visual complexity in world-class design. The general characteristics, proportions, and details of older buildings may serve as a reference for the Project. The Project's intent is to allow old and new to mix, recognizing that Hollywood sustains its image through both the rehabilitation of existing historic structures and the design of creative and contemporary architecture.

4. DENSITY

4.1 Floor Area Ratio Averaging and Density Transfer

The Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the sum of the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

4.2 Land Use Equivalency Program

The Land Use Equivalency Program is intended to provide flexibility in land uses for the Project while ensuring that a change in land uses would not result in new significant environmental impacts or a substantial increase in the severity of significant environmental impacts identified in the EIR. ENV-2011-0675-EIR (SCH No. 2011041094). With respect to any proposed Phase of the Project (an "Exchange Phase") that would result in a build out of the Project that is not consistent with at least one of the Project scenarios studied under the EIR, under the Land Use Equivalency Program, the developer may request a transfer or exchange of land uses, as well as modifications to the siting, massing or other development standards in so far as they are consistent with the provisions herein, for such Exchange Phase by a delivering written request therefore to the Planning Department of the City, which request shall be accompanied by (a) detailed information identifying the land use transfer/exchange that is being proposed for such Exchange Phase, (b) information documenting how the proposed land uses and densities in the Exchange Phase, together with the existing improvements and the other phases previously developed, are consistent with the overall AM and PM peak hour trip cap identified in Table II-3, Project Trip Cap from the EIR; and (c) supporting documentation to demonstrate that the Project including the proposed Exchange Phase would not exceed the maximum environmental impacts identified in the EIR (collectively, an "Equivalency Program Exchange Submission"). The Planning Director shall approve such request if the Equivalency Program Exchange Submission reasonably demonstrates that the Project including the proposed Exchange Phase is consistent with the overall AM and PM peak hour trip cap identified in such Table II-3, Project Trip Cap, does not conflict with the impacts analysis for the maximum Commercial and Residential Scenarios, and would not otherwise exceed the maximum environmental impacts identified in the EIR.

5. HEIGHT

5.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capitol Records Tower

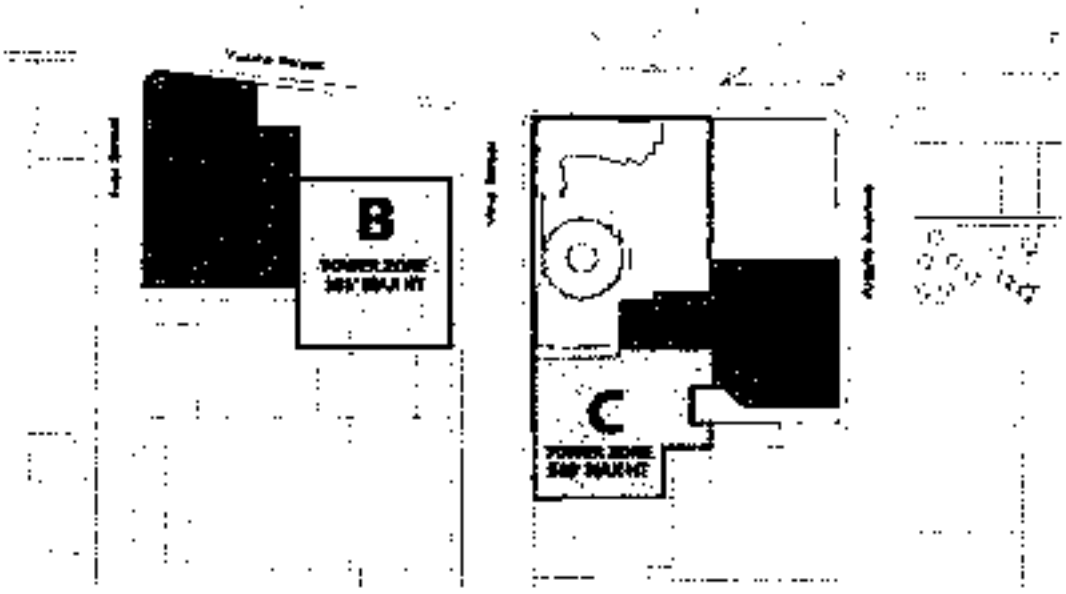

Fig. 5.1 Height Zones

5.1.1 - Number of stories to be counted by unit programmatic floor, excluding mechanical spaces.

5.1.2. Height of the building shall be measured from the curb of the primary street frontage

6. BUILDING AND STREET EXPERIENCE

6.1 Tower Massing Standards

6.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 6.1.1.

Tower Height (feet)	Maximum Tower Lot Coverage (%)	Minimum Floor Area Below 220 Feet (%)	Maximum Tower Floor Plate (sq. ft.)	Minimum Tower Setback (feet)	Minimum Public Open Space (%)	Figures
151 – 585	11.5	50	13,325 East Site 9,042 West Site	10 15[1]	12	6.1.2.d.1 6.1.2.d.2
151 – 550	15	50	17,380 East Site 11,794 West Site	10 15[1]	10	6.1.2.c.1 6.1.2.c.2
151 – 400	28	50	22,745 East Site 22,016 West Site	10 15[1]	8	6.1.2.b.1 6.1.2.b.2
150 – 220	48	n/a	55,616 East Site 37,742 West Site	10 15[1]	5	6.1.2.a.1 6.1.2.a.2

Table 6.1.1

Note 1: 15' tower setback required for any tower fronting Vine Street on West parcel. See Figure 6.3.2.

6.1.2 For the purpose of calculating the maximum lot coverage the total lot area is equal to the total lot area for each of the sites, the West Site and the East Site. If there is more than one tower on a site, the maximum lot coverage requirement in Table 6.1.1 is calculated based on the combined area of all towers on each site. The total lot coverage applies to the aggregate floor plate(s) of the tower or towers on each site.

6.1.3 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 6.1.2.a.1 – 2.)

6.1.4 At least 50% of total floor area must be located below 220 feet.

6.1.5 Tower wall articulation:

a. Minimum 10% of tower aggregate area shall be articulated.

6.1.6 Types of permitted articulations for tower walls:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

The following developments are for illustrative purposes only.
Maximum Lot Coverage and Tower Floor Plate – Figs. 6.1.2.a – d.

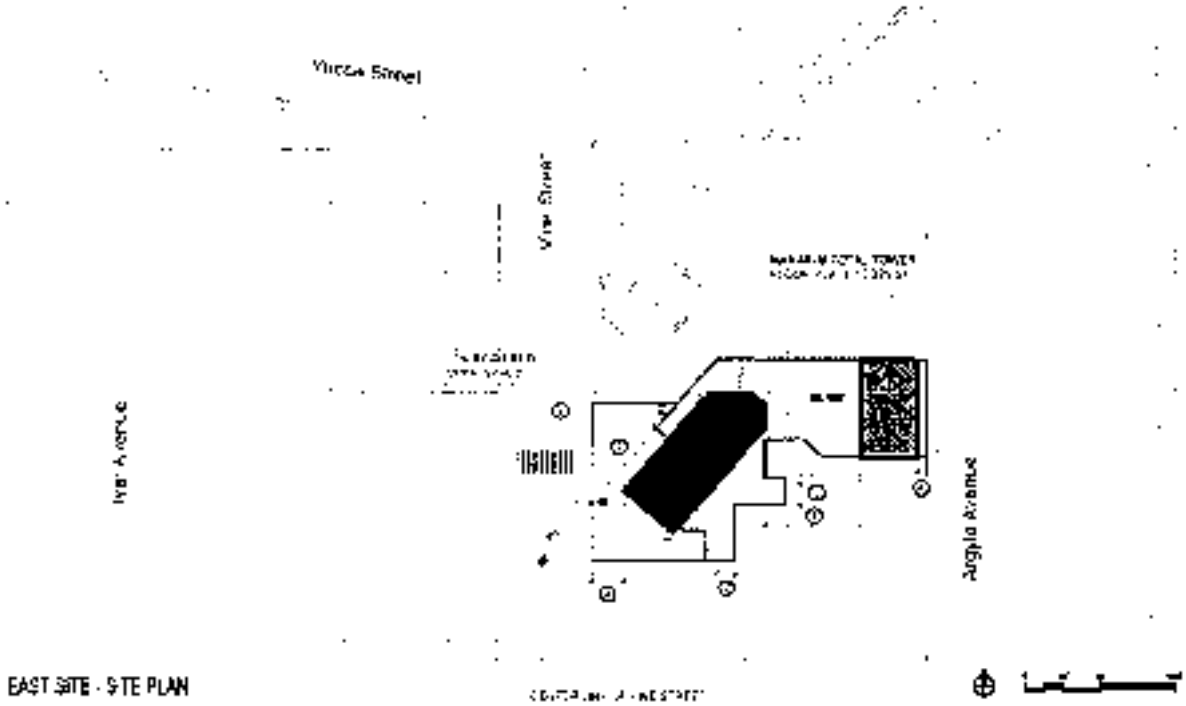

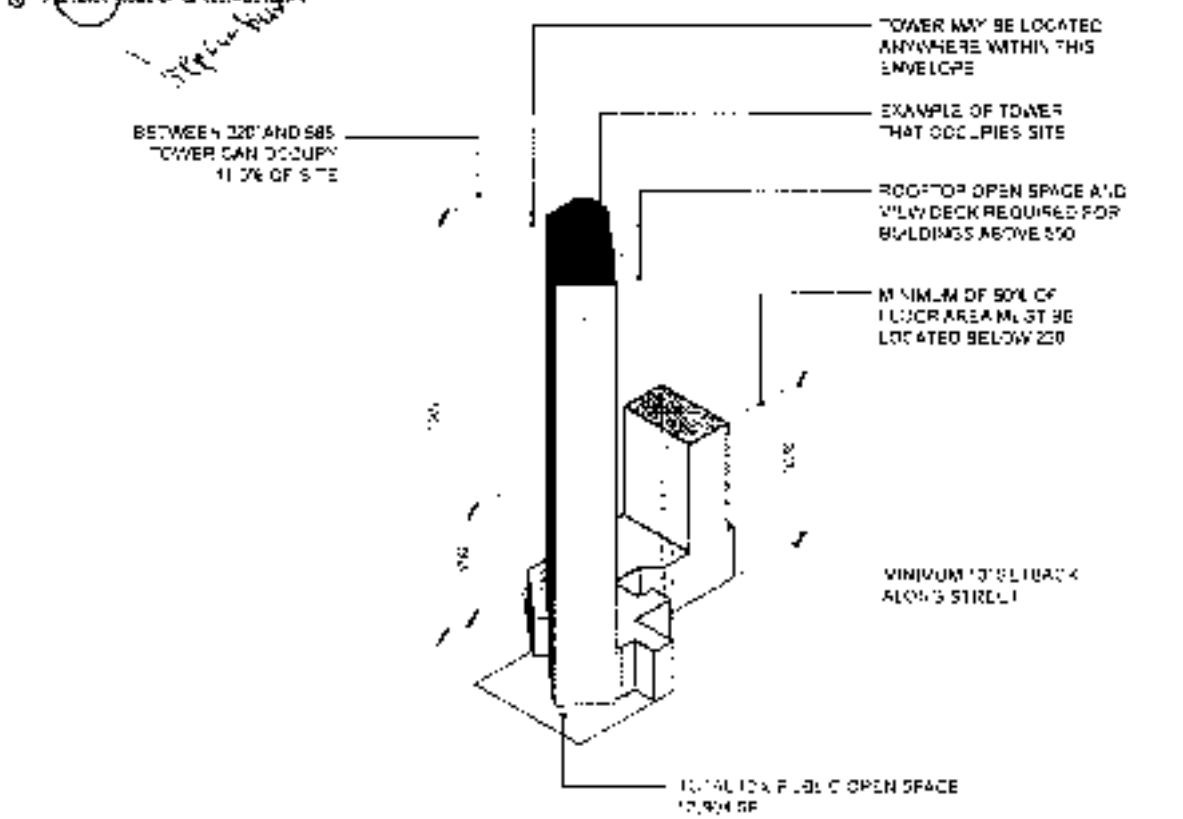

Fig. 4.1.2-1: East Site – 585 Foot Maximum Tower Height

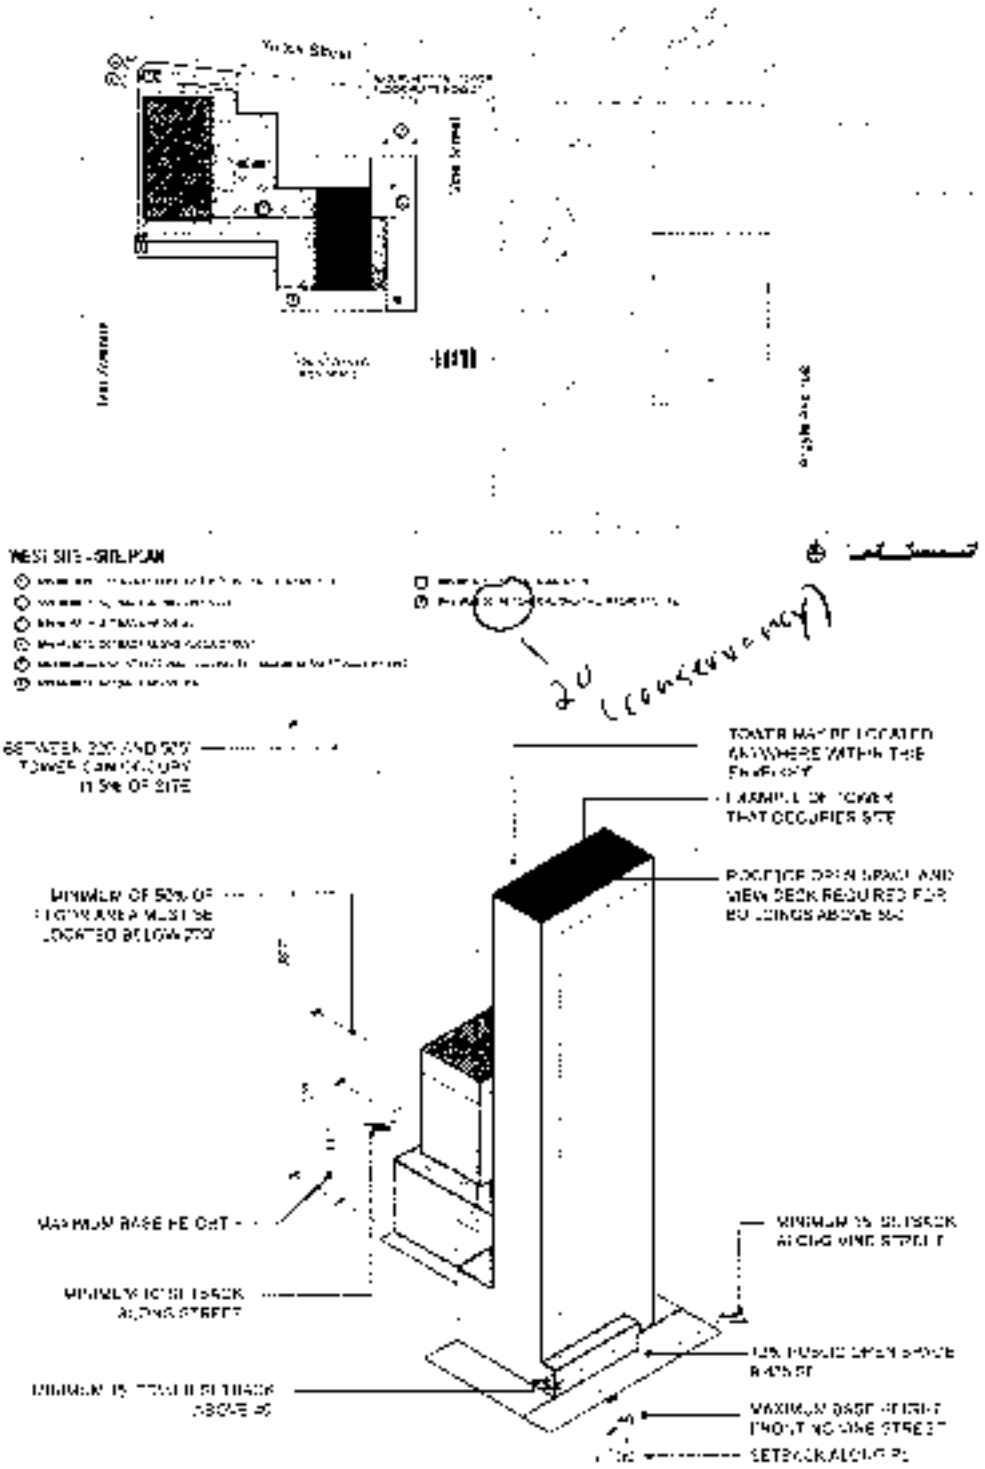

Fig. 6.1.2.d.2 West Side - 585 Feet Maximum Tower Height

6.2 Street Walls

6.2.1 A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation. The street wall shall have proportions and architectural building details which emphasize and reflect the presence and importance of the pedestrian environment. Moving offsets, fenestration, varied textures, openings, recesses, and design accents are strongly encouraged to ensure there are no un-articulated walls and monolithic roof forms, and architectural elements such as balconies, verandas, and porches that add architectural character are encouraged.

6.3 Street Wall Standards

6.3.1 Location of required street wall

Parcels with a grade level open space: the required street wall shall be located a minimum 10 feet from the property line along Vine Street on the East Site and 15 feet along Vine Street on the West Site.

b. A grade level open space is required for any building fronting Yucca Street with a minimum 10 feet setback from the property line.

c. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

6.3.2 Height of required street wall

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b), (c) and (d) below.

b. Street walls fronting Vine Street on the West Site shall be built to a maximum height of 40 feet above curb level except as noted in item (c) below.

c. Street walls fronting Yucca Street shall be built to a maximum height of 30 feet. Building can extend to a maximum height of 150 feet with a 10 foot setback above 40 feet except as noted in item (d) below.

d. 40% of the aggregate width of the required street wall frontage on each street can exceed the maximum street wall height up to the maximum tower height.

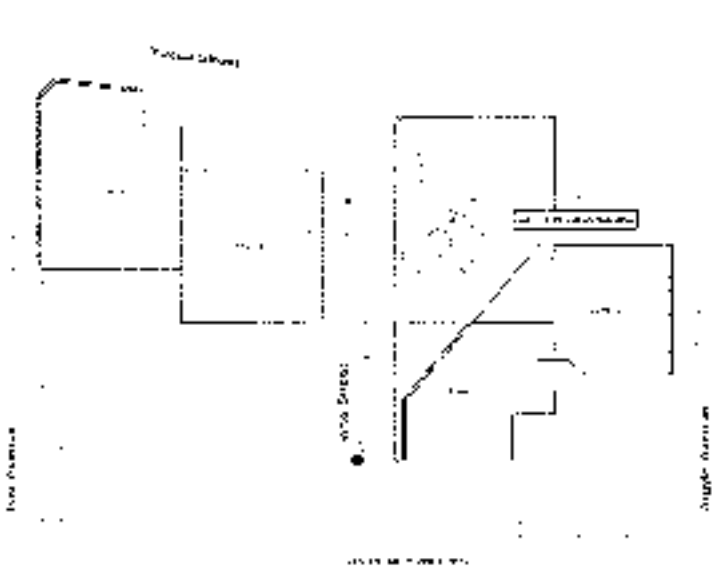

fig 6.3.2: Street Wall

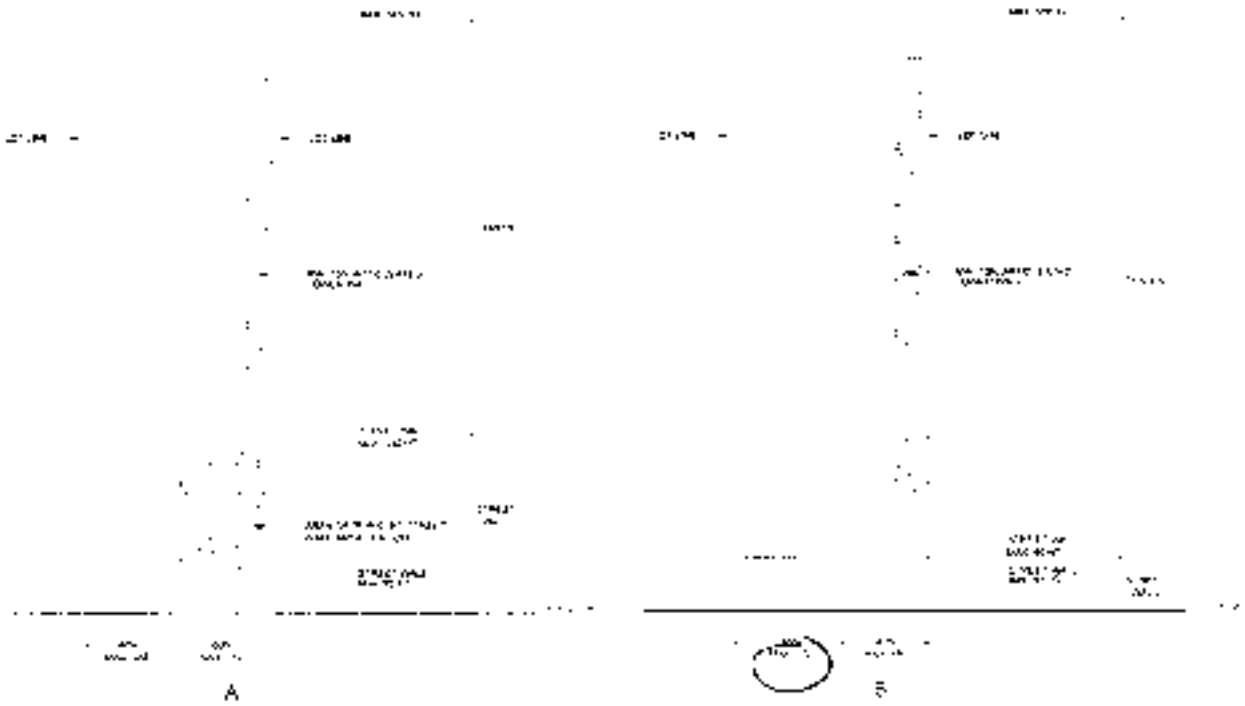

Fig. 6.4.1: Street Wall Articulation

6.3.4 Types of permitted articulation of a required street wall:

a Recess: recesses shall be permitted to a maximum depth of 15'-0".

b Balcony: a balcony may project a maximum of 8'-0" from a required street wall over a grade level open space.

c Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or a similar means.

6.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a Architectural façade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Commercial marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0". The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

6.4 Street Wall Guidelines

6.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

6.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop-offs and loading entries and pedestrian and vehicular access driveways are also permitted within the street wall area on the Project Site.

6.5 Yard Standards

6.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

6.5.2 Commercial Use: no front, side or rear yard setbacks are required.

6.5.3 Residential Use:

a. Front Yard: None.

b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 10 feet in width be required.

c. Rear Yard. Minimum 15 feet, for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

6.5 Building Materials and Color Guidelines

6.6 1 The goal of the building materials and colors is to reinforce the character of the Hollywood area and provide a design that is compatible yet avoids any appearance that the building is being historicized. These guidelines will address the façade treatment for both residential and commercial portions of buildings.

a Buildings shall feature long-lived and sustainable materials. The material palette shall provide variety, reinforce massing and changes in the horizontal or vertical plane.

b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

c. Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents.

d. The architecture of the building shall clearly delineate an architectural style, and shall not appear as a simplified version thereof, with appropriate fenestration patterns, architectural features, proportions and materials.

e. The building's skin, especially for towers, shall be primarily transparent, the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

f In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style. There will be clear contrast between the building's surface material and the building's glazed areas.

g. In general, the overall massing, roof forms, materials, and architectural style of new structures shall provide a variety of forms, depth and texture, and encourage a cohesive character. Building massing shall include a variation in wall planes and height as well as roof forms to promote architectural excellence, a pedestrian friendly environment and take into account the context.

h. To provide visual variety and depth, the building skin shall be layered and designed with a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin shall reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

i Rooftop mechanical equipment screening shall be designed to be integral with the building architecture and the visual impact shall be minimized by using materials that are complimentary or consistent with the building.

j Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

Tower Illustration

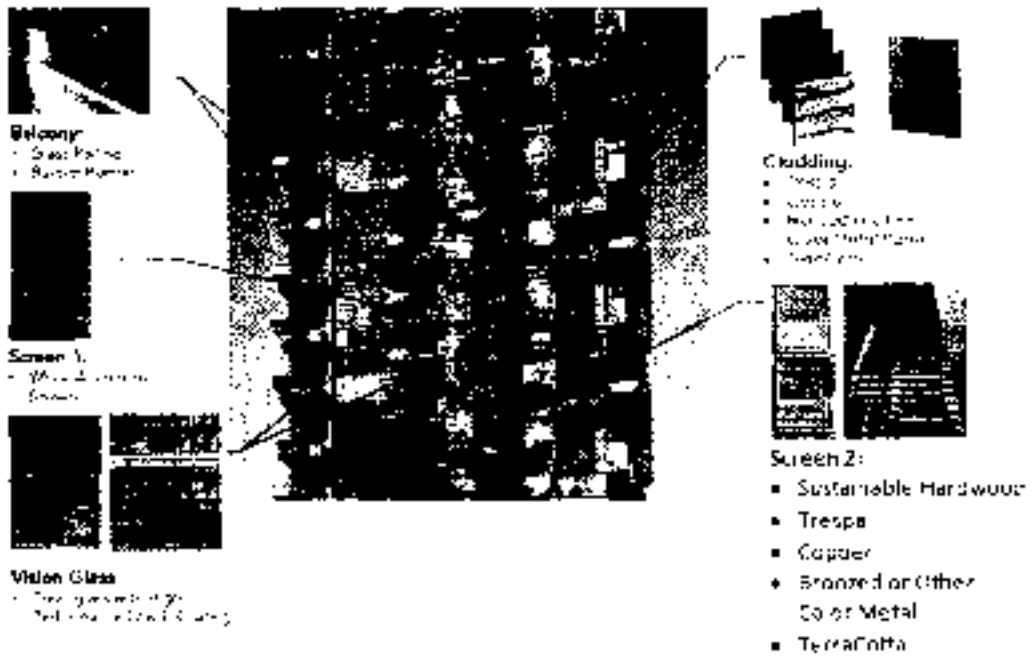

Fig. 6.6.1

Tower Illustration

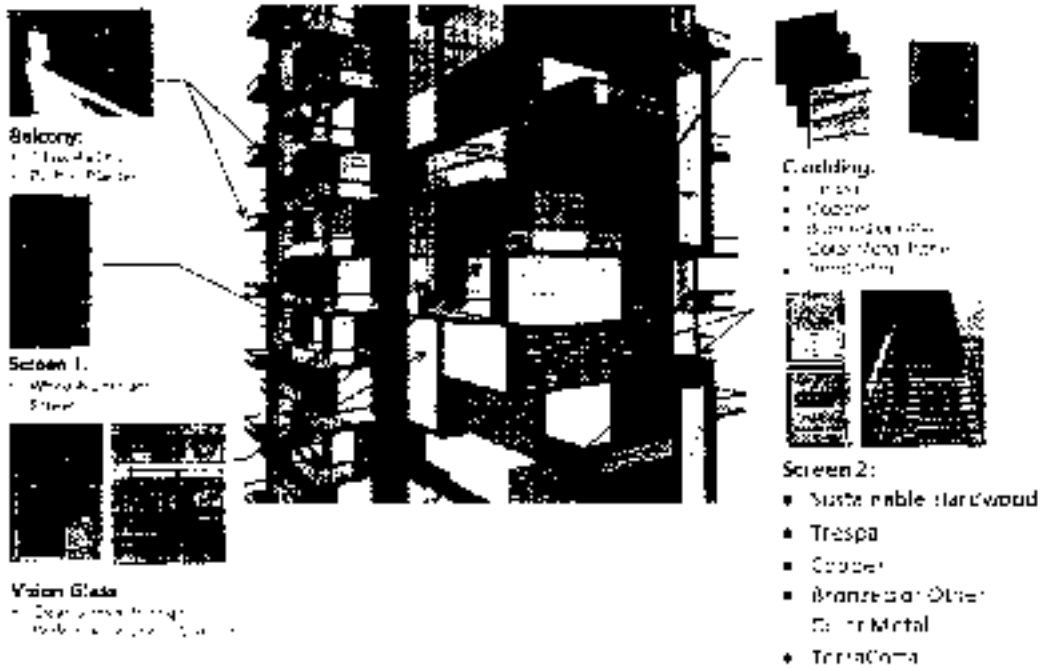

Fig. 6.6.2

c. Examples of acceptable materials are illustrated in Figures 6.6.1 – 2

6.7 Grade Level Standards

6.7.1 The purpose of the grade level standards is to promote pedestrian scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground floor street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and shall be integral to the architecture of the building.

6.7.2 Ground floor height:

a Minimum 20'-0" height measured from floor to ceiling

6.7.3 Building entrances:

a. The primary entrance to a street level tenant space that has frontage along a public street shall be provided from that street. The primary entrance to a tenant space that does not have its frontage along a public street shall be provided from a courtyard, *grade level open space*, or *publicly accessible passageway*. Entries less than 18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries greater than 18 inches from the property line shall be within 30 inches of the adjacent grade level along street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. All retail spaces shall be accessed primarily from a ground floor, single-tenant entry along a street, plaza or passageway. Where reasonably practical given architecture and tenant requirements, access to different tenant spaces shall occur at a maximum interval of 60 feet

c Main building entrances shall read differently from retail storefronts, restaurants and commercial entrances which could include but are not limited to material change, architectural elements or elevation change.

d In addition to the building's required primary entrance(s), there may be ancillary entrances to the building from parking garages.

6.7.4 Ground Floor Glazing

a. Use of clear, colorless and transparent glazing is required within the first 40 feet above curb level.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to-line less than or equal to 18 inches from the property line, glazing shall constitute a minimum of 30% of the area of a building face and shall not exceed 80% of the area of a building face

6.7.5 Arcades

e Arcades in graph will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0-foot candles.

6.7.6 Service and Refuse Requirements

Hotel and Commercial / Office / Retail that abuts an alley

a. Every required loading space shall be located and arranged such that delivery vehicles may be driven upon or into said space from an alley. Such loading space shall have a minimum height of 14 feet and be accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicular to the alley line

c Loading space shall have a minimum area of 800 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet; a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

Condominiums (Residential)

d None

Rental (Residential)

e. None

6.7.7 Service and Refuse Guidelines

a. Storage areas shall be provided within the building or site sufficient for the development to ensure that refuse is stored and loaded off street. Refuse storage areas shall be directly and conveniently accessible from a curb cut.

b. Service, utility, and mechanical functions, including retail loading, shall be located in alleys whenever present. When alleys are not present, service functions shall be planned within buildings.

c Service, utility, and mechanical equipment that is visible from the street shall be screened from view with landscaping or enclosures. Back flow and fire standpipes, along with utility box transformers, shall be screened

d All screening devices shall be compatible with the architecture, materials and colors of adjacent buildings

e. Trash and storage enclosures shall be architecturally compatible with the project design and landscaping shall be provided adjacent to the enclosure(s) to screen them and deter graffiti.

f. Trash enclosures and retail loading areas shall be sited to minimize nuisance to adjacent properties.

g. The location of trash enclosures shall be easily accessible for trash collection and should not impede general site circulation patterns during loading operations.

h. Mechanical equipment shall vent to an alley wherever possible.

i. Roof-vent penetrations and mechanical equipment shall be located at least 10 feet from any exterior Building Face.

j. Gutters and downspouts shall be made of galvanized steel, copper (not copper coated), or aluminum.

G.7.8 Storefronts

a. Storefront (residential, retail, restaurant and commercial) requirements shall include frontage along streets and grade level open spaces.

b. Storefronts shall comprise a minimum of 70% of the building's street level façade along Vine Street and 40% along all other streets and be recessed where necessary.

c. Storefront glazing shall comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets.

d. All retail space shall have a minimum 12 feet finished ceiling clearance.

e. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Storefront openings shall be no shorter than 10 feet above the adjoining grade for 90% of the required storefront frontage.

g. Security grilles will be located behind glass and be at minimum 70% open.

h. At grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

i. Awnings shall not obscure storefront signage. Vinyl awnings are not permitted.

6.8 Podium Standards

G.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment of the building's base, middle and top

through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

6.8.2 Podiums shall comply as applicable with the minimum setback requirements set forth in Figures 6.1.2a – d.

6.9 Podium Guidelines

6.9.1 Podiums shall have fenestration that establishes a clear pattern on the façade (with special attention paid to facades that are visible from a public street) and that provides depth and additional articulation.

6.9.2 An identifiable break between the building's ground floors and upper floors shall be provided. This break may include a change in material, change in fenestration pattern or similar means.

6.9.3 Podium level windows shall be vertically oriented.

6.9.4 Podium levels shall be predominantly light in color.

6.9.5 An expression band shall be provided at the highest story within the podium.

6.9.6 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade that adds scale and interest to an otherwise bland frontage. In these cases, the façade shall be a maximum of four floors high and shall have variation in its surface plane (using cutouts, insets or pop-outs). It shall employ different scales of elements as viewed when seeing the entire building massing.

6.9.7 Louvers and wall openings shall be designed to integrate with building architecture.

6.9.8 Podiums are encouraged as feasible to be set back from frontages to preserve sightlines and promote ground floor open space.

6.10 Street and Sidewalk Standards

6.10.1 The Site is comprised of a variety of public elements that include open spaces, streets and sidewalks. The Hollywood Walk of Fame is an integral element that fronts open spaces on both East and West Sites. Its adjacency to the public realm requires compatibility and cohesiveness.

6.10.2 The combination of landscaped plazas, publicly accessible passageways and landscaped streets and sidewalks creates diversity, and at the same time forms a single unified system. Connections shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

6.11 Screening Standards

6.11.1 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

6.11.2 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

7. TOWERS

7.1 Purpose

7.1.1 Towers shall have their massing designed to reduce overall bulk and to appear slender.

7.1.2 Towers shall be designed to achieve a simple faceted geometry and exhibit big, simple moves. They shall not appear overwrought or to have over manipulated elements.

7.1.3 Towers that emulate a more streamlined modern style shall provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

7.1.4 If a project has more than one tower, the towers shall be complementary to each other and employ a similar yet varied architectural design approach.

7.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) shall not be historicized. They are contemporary forms in the skyline and shall appear as such.

7.2 Projections

7.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. Roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building.

b. Skylights, towers, steeples, flagpoles, water tanks, silos,

c. Wireless masts, and

d. Solar energy devices and similar structures.

7.2.2 Permitted building elements or equipment in Section 7.2.1 shall be screened as architectural and based on building design except if such projections (e.g., flagpoles or steeples) are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

7.2.3 Enclosures for bulkheads shall not count against building height.

7.3 General Standards

7.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

7.3.2 Distinctive tower crowns and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

7.3.3 Towers shall be set back from the maximum street wall height a minimum of 15 feet except for towers fronting Vine Street on the West site, these towers shall be set back a minimum of 15 feet from the maximum street wall height.

7.3.4 Towers shall be setback on West Site from shared property line with Hollywood Playhouse a minimum of 20 feet above 150 feet

7.3.5 Adherence to minimum setbacks and other separation standards for towers is required as may be applicable to a specific tower and its location within the Project area. Please refer to standards for towers set forth in Figures 5.1.2.a – d.

7.3.6 Tower orientation and placement that enhances important sightlines is encouraged.

7.3.7 In no instance should the tower fronting Vine Street on the East site development have more than a 15% height differential from the tower on the West site development.

7.4 Wall Standards

7.4.1 All walls are required to be articulated.

7.4.2 The following types of articulation of a tower wall are permitted:

a. Recess,

b. Standard balconies may be projecting or recessed or a combination of both; and

c. Bay windows.

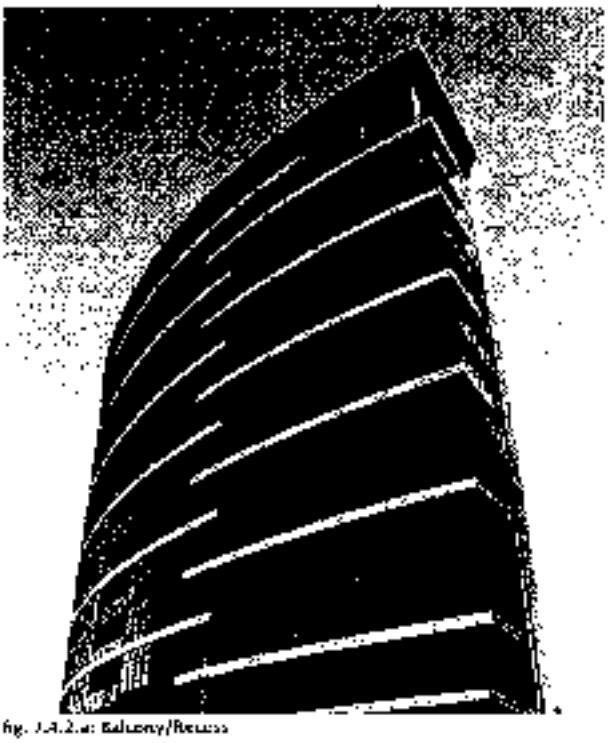

fig. 7.4.2.a: Balcony/Recess

fig. 7.4.2.b: Bay Window

7.4.3 Balcony: a balcony shall be integral to the façade (see Figs. 7.4.3.a and b) and shall not create a relentless horizontal and vertical stacking pattern. Balconies are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations and shall be a minimum 75% transparent. Balconies are encouraged on buildings facing major public spaces such as plazas, passageways and open spaces. Long balconies resembling corridors are prohibited.

Fig. 7.4.3.a: Recess/Balcony: Integral Balcony

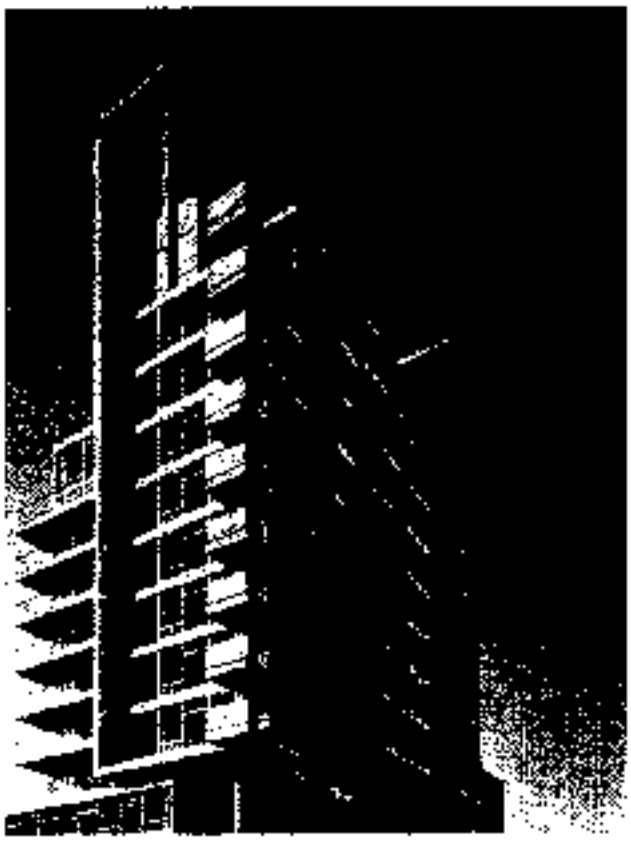

Fig. 7.4.3.b. Bay Window: Integral Balcony

7.5 Spacing Standards

7.5.1 If two towers are located on a single site the towers shall be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

7.5.2 Generally, any portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except for the following which will meet Planning Code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 7.5.2.

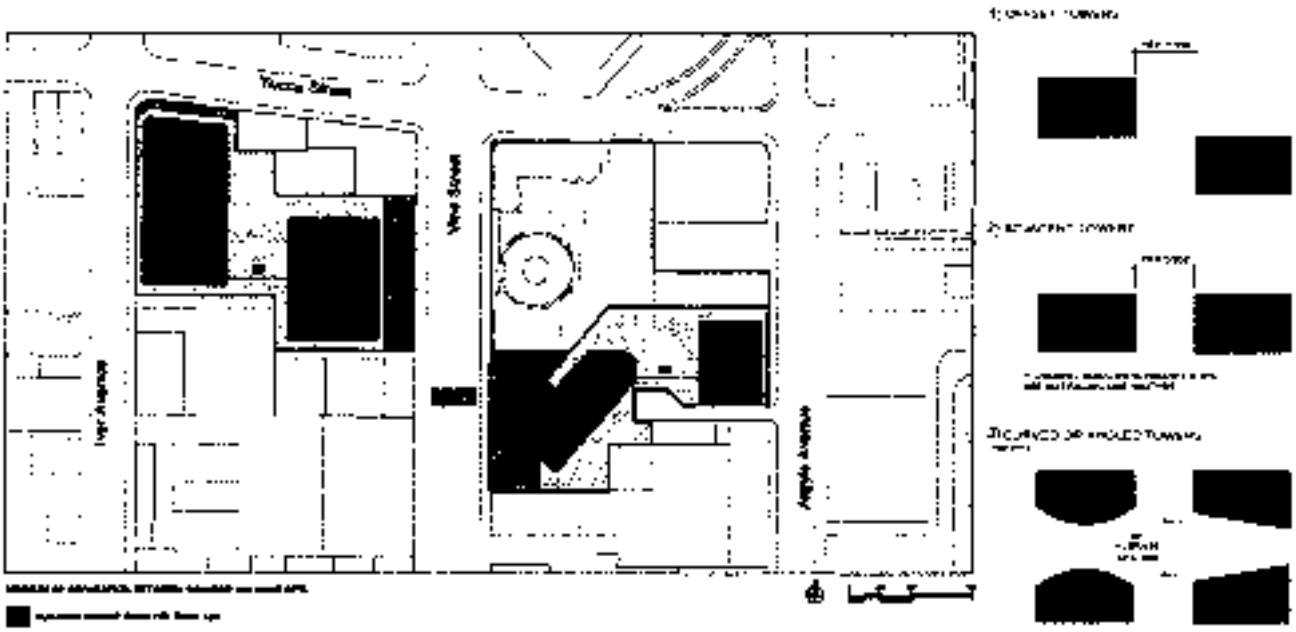

Fig. 7.5.2. Tower Spacing

7.5.3 Since a tower is defined as any building above 150 feet, all buildings above 150 feet shall be spaced at least 80 feet from any portion of any adjacent or separate building on the site.

exceeding 1[illegible] feet, excluding a project within the height range of 150 to 220 feet, as shown in figures 6.1.2.a.1 and 6.1.2.a.2.

7.5.4 Spires, signage, parapets, and mechanical enclosures are excluded from the tower spacing regulations.

7.6 Rooftops Guidelines

7.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

7.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 8.5.

7.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

7.6.4 All obtrusive features such as vents, skylights and cooling units shall be screened from lateral and pedestrian views.

7.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

7.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

7.7.2 Materials and design for roof mechanical equipment shall be consistent with the building architecture and shall utilize similar colors and materials as in other portions of the building.

7.7.3 Roof mechanical equipment shall be screened.

8. OPEN SPACE

8.1 Overview

The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Building and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

8.2 Grade Level Open Space Standards

8.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records Building and accentuate the low scale character.

8.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Fig. 8.1.2.a.1 – 2 and 8.1.1)

8.2.3 An additional 3% of open space (total 8%) shall be required for buildings between 221 feet and 400 feet. (See Fig. 8.1.2.b.1 – 2 and 8.1.2)

8.2.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 550 feet (See Fig. 8.1.2.c.1 – 2 and 8.1.3)

8.2.5 An additional 7% (total 12%) of open space shall be required for buildings taller than 550 feet. (See Fig. 8.1.2.d.1 – 2 and 8.1.4)

8.2.6 Location

a. East Site: adjacent to the Jazz Mural and Capitol Records Building, West Site: across from the Capitol Records Building along Vine Street and along Yucca Street.

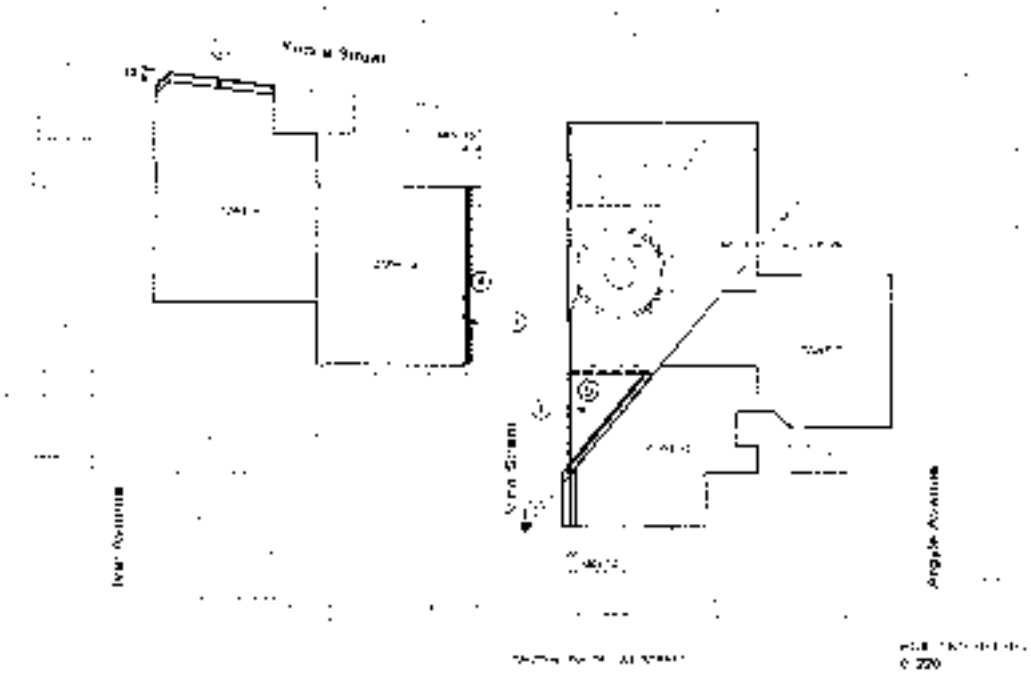
b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular from any point on each of the boundaries of the open space area. Open space on West Site fronting Vine Street shall have a horizontal dimension of no less than 15 feet when measured perpendicular from any point.

c. On West Site, open space must occupy the area to the west of a line struck at 40 degrees from center line of Vine Street ROW at alignment with the southern most property line and a minimum 10' setback from the southeast corner of the Capitol Records Building. (See Figs. 8.1.1 – 4)

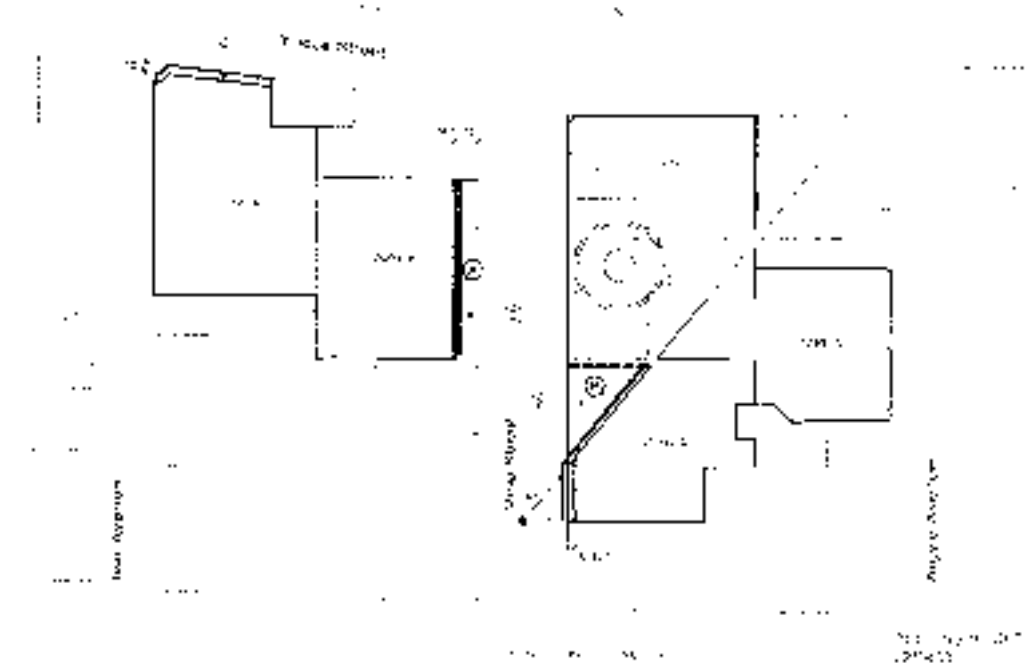
8.2.7 – Section 8.3.4 through 8.3.10 (excepting 8.3.4c) shall apply to grade level open space.

Figs 8.1.1 – 8.1.4: Grade-Level Open Space

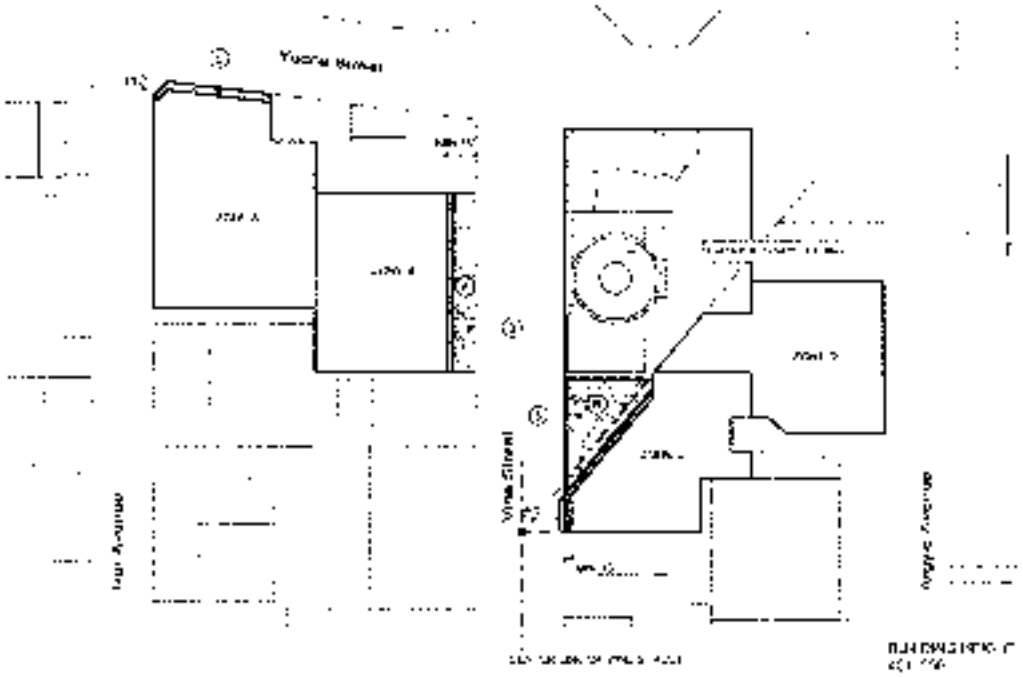
figs 8.1.1 Open Space Requirements for Maximum Building Height at 220 Feet



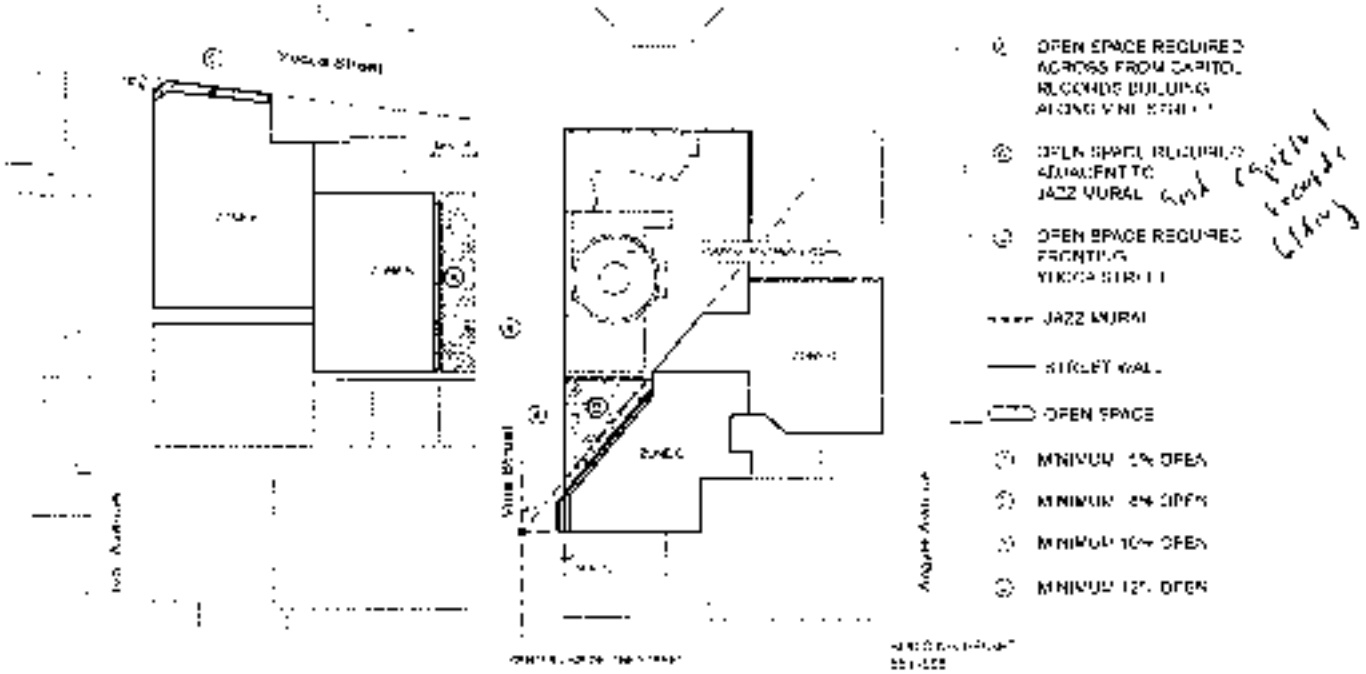
figs 8.1.2 Open Space Requirements for Maximum Building Height at 400 Feet



Figs 8.1.3 Open Space Requirements for Maximum Building Height at 350 Feet



figs 8.1.4 Open Space Requirements for Maximum Building Height at 585 Feet



8.3 Passageway Standards

8.3.1 *A publicly accessible passageway* is a continuous through block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

8.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

8.3.3 Location and Size standards:

a The major portion of *a publicly accessible passageway* is the largest area of the *passageway* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total passageway area and shall not be less than 20'-0" wide.

b Minor portions of *publicly accessible passageway* are secondary areas that allow for additional flexibility in the shape and configuration of a passageway. Minor portions shall not occupy more than 25 percent of the total area of the *passageway*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

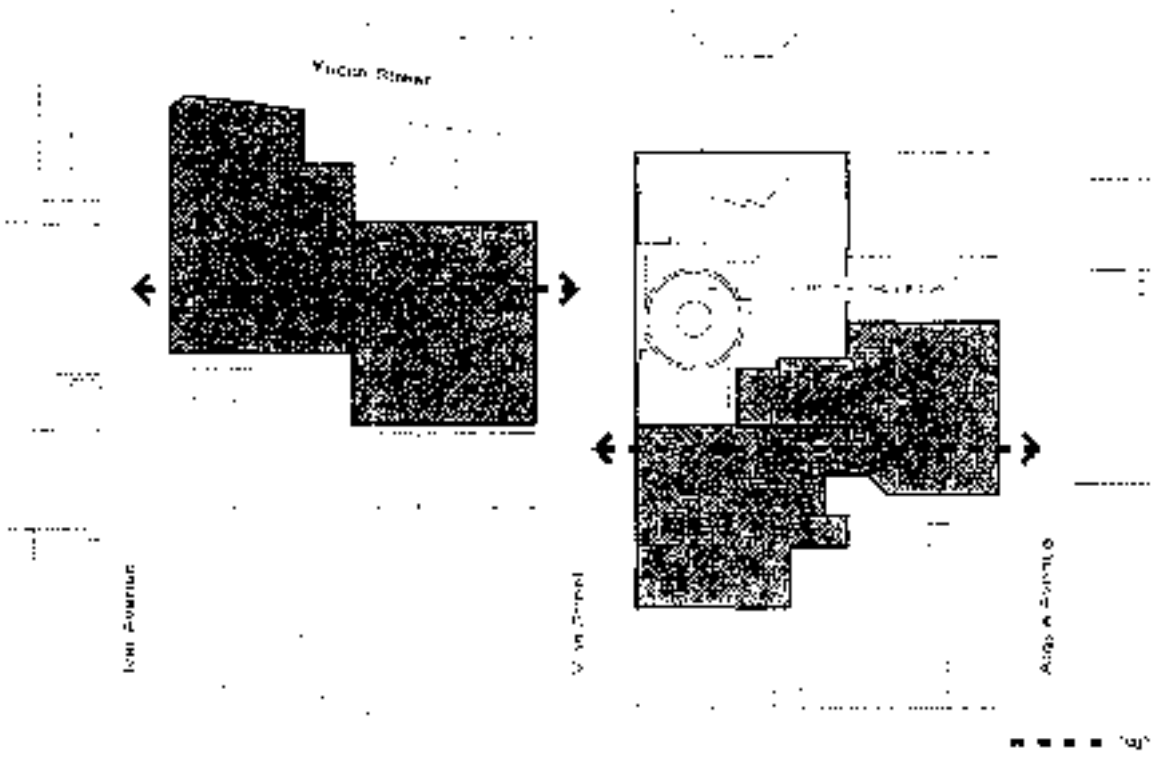


fig. 8.3.1: Publicly Accessible Passageway

8.3.4 Permitted Obstructions:

a. The minimum percentage of *publicly accessible passageway* area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within the major portion of an open air *publicly accessible passageway* are any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open-air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions, balconies and bay windows; awnings, canopies and marquees, stairs, ramps

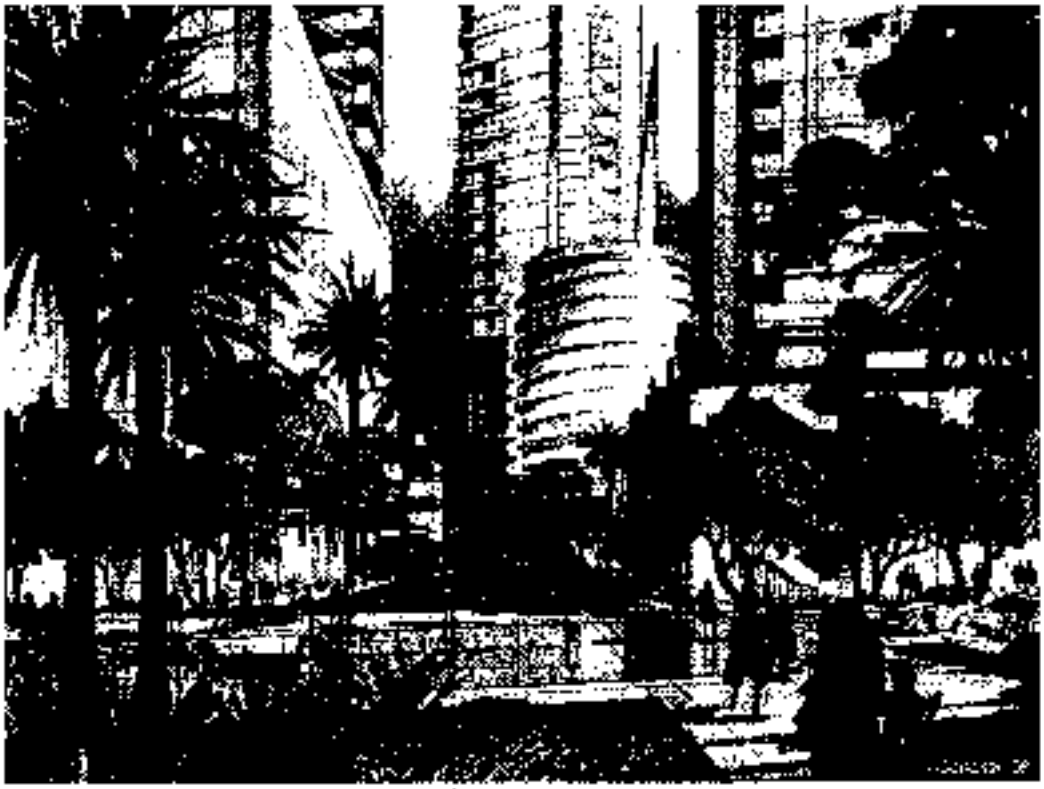

Fig. 8.3.4. View from Argyle Avenue Along PAP Towards Capitol Records

and bollards.

8.3.5 Kiosk.

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Building and Safety in conformance with the Building Code. Kiosks, including roofed areas, shall not count as floor area, exceed 3% of the total area of the *publicly accessible* passageway, or occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open air cafes, flower stands or public service/information booths.

d. All kiosks greater than 250 square feet are permitted but will count as floor area.

8.3.6 Open-Air Café

a. Where an open-air cafe is provided it shall be an unenclosed restaurant or open-air seating for an enclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *publicly accessible passageway*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *publicly accessible passageway*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

8.3.7 Service through windows.

a. Outdoor eating services or uses occupying kiosks may serve customers on the *publicly accessible passageway* through open windows.

8.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas.

a. No building refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *publicly accessible passageway*.

b. No exhaust vents are permitted on any publicly accessible passageway or on any building wall of the development fronting upon the passageway except where such vents are more than 10' 6" above the level of the passageway.

8.3.9 Frontages

a Mandatory allocation of frontages for permitted uses: at least 40% of the total frontage of building walls of the development fronting on a *publicly accessible passageway* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *publicly accessible passageway* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

8.3.10 Maintenance:

a The building owner shall be responsible for the maintenance of the *publicly accessible passageway* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the passageway and in the street sidewalk area adjacent to the passageway.

b. Litter receptacles shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *publicly accessible passageway* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *passageway* in connection with outdoor eating services or other uses permitted on *passageway* which generate litter.

8.4 Roof-top Open Space

8.4.1 The Project shall include roof-top open space.

8.4.2 Roof-top open space shall include an observation area (i.e., viewing deck) accessible to the public.

8.4.3 The hotel, if developed, shall include an observation area (i.e., open space viewing area) accessible to the public.

8.4.4 The hotel observation area (i.e., viewing area), if developed, shall satisfy the requirement in section 8.4.1 above.

8.4.5 Roof-top open space may include a café.

8.5 Residential Common Open Space

8.5.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children, and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential common open space requirements.

8.5.2 Common Open Space Standards.

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms, 125 square feet for each unit having three habitable rooms, and 175 square feet for each unit having more than three habitable rooms.

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common areas as further defined and regulated herein.

c. Open space shall be open to the sky and have no structures that project into the common open space area, except as permitted in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the Site.

e. Common open space shall have a minimum area of 400 square feet with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f. Common open space shall constitute at least 50% of the total required usable open space in the built development.

g. Common open space areas shall incorporate recreational amenities including but not limited to swimming pools, saunas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use may be considered as common open space.

i. Refer to LAMC 12.21 G for additional open space requirements.

8.6 Residential Private Open Space

8.6.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

8.6.2 Residential Open Space Standards.

a. Private open space shall contain a minimum area of 50 square feet, of which no more than 5ft square feet per dwelling unit shall be attributable to the total required usable open space.

b. Private open space shall have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c. Private open space shall provide a minimum eight foot vertical clearance under any projection, except as permitted in the Zoning Code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with Zoning Code may qualify as usable open space provided it meets each of the above specified requirements noted in items a - c.

9. LANDSCAPE

9.1 Grade Level Open Space Standards

9.1.1 Planting requirements. A minimum of 10% of grade level open space shall be landscaped with softscape or water features.

9.1.2 Landscape area(s) shall be planted with seasonally diverse plant material and 30% of all landscaping shall be California Natives or drought tolerant.

9.1.3 The landscaped portion of open space may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.1.4 The minimum soil depths for planting are:

a Trees: 42"

b Shrubs: 30"

c Lawns, ground cover: 18"

9.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.1.6 Permitted obstructions: The following are permitted obstructions which may occur in the *grade level open space*:

a Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

9.1.7 Open-air *publicly accessible* passageways are not to be included in the grade level open space requirements.

9.2 Common Open Space Standards

9.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

9.2.2 At least one 36-inch box tree for every four dwelling units shall be provided on-site and may include street trees in the parkway, sidewalks adjoining the property, open space, *publicly accessible* passageways and common roof decks.

9.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

9.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

Fig. 9.3.a. Movable Seating

Fig. 9.3.b. Open Air Café

9.3 **Standards For Open Air Portions of Publicly Accessible Passageway**

9.3.1 The landscaped portion of open air passageways may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.3.2 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.3.4 Planting requirements.

a. A minimum of 10% of open air publicly accessible passageway shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

fig. 4.6 Seating Standards

9.8.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *publicly accessible passage way* excluding the area of an open-air cafe.

b. One seat shall equal two linear feet.

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count as double seating provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls or ledges but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating at open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open air cafes do not count toward meeting the seating % requirements.

9.4 Tree Planting Guidelines

9.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

9.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

9.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree-planting pattern.

9.5 Lighting Standards

9.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

9.5.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open *publicly accessible passageway*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.

e Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

f All exterior lighting shall be shielded or directed toward the areas to be lit to limit spill over onto off site uses.

g. Light quality shall not be harsh, glaring, blinking or shed beyond property boundaries.

9.5.3 Responsibility for maintenance

a. The Building Owner shall be responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighting element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, covered lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the Building Owner.

9.5.4 Lighting for areas located inside the lot line and/or set back from the street, such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

9.5.5 Lighting for above grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

9.6 Publicly Accessible Passageway Lighting Standards

9.6.1 A *publicly accessible passageway* shall be illuminated throughout with an overall minimum average level of illumination of not less than 1.0 maintained foot candle (lumens per square foot) on the horizontal plane at grade.

9.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

9.7 Continuity of Design

9.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

9.7.2 Where possible, materials, lighting, site elements and landscape shall be similar between different open and enclosed public spaces at the grade level.

10. PARKING

10.1 Automobile Standards

10.1.1 Base Standards

The following standards shall apply for the base level of parking to be provided as the minimum for each use in the project area. The Regulations set forth below incorporate the parking requirements in the LAMC, where applicable, and supersede the LAMC requirements for development in the Development Agreement area.

a Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulations incorporate applicable parking requirements in the LAMC as set forth below.

b. Sports Club:

Two parking spaces for every one thousand square feet of combined gross floor area.

c. Hotel

One parking space for each individual guest room or suite of rooms for the first 30;

One additional parking space for each two guest rooms or suites of rooms in excess of 30 but not exceeding 60; and

One additional parking space for each three guest rooms or suites of rooms in excess of 60.

d. Condominiums (Residential):

Two parking spaces per dwelling unit

One quarter parking space per dwelling unit for guest parking

e. Rental (Residential):

One parking space for each dwelling unit of less than three habitable rooms, one-and-one half parking spaces for each dwelling unit of three habitable rooms; and two parking spaces for each dwelling unit of more than three habitable rooms.

f Combination of Uses

Where there is a combination of uses on a lot, the base number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking

a Shared parking may be applied to the Section 10.2.1 base rates for the Site when the uses have different parking requirements and different demand patterns on a 24 hour cycle or between weekends and weekdays. The intent is to maximize efficient use of the Site by matching parking demand with complimentary uses. The calculation of the parking requirements shall be based on a detailed assessment prior to its construction.

b. Calculating Shared Parking

(i) The individual land use parking requirements for each component of a phase of development shall be calculated from Section 10.2.1 above to establish the "Base Demand."

(ii) For parking spaces that are to be shared between uses, the calculated minimum parking requirement for the Site, including that new phase of construction, is to be adjusted from the Base Demand based on the procedures in *Shared Parking*, Urban Land Institute, 2nd Edition (2005) or another source as determined by the Director of Planning.

10.2 Additional Regulations

10.2.1 The automobile parking spaces required shall be provided either on the same lot as the use for which they are intended to serve or on another lot located within 750 feet of the lot; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

10.2.2 Curb cuts for driveways shall be located no closer than 50 feet to the intersection of two streets unless approved by the Department of Transportation.

10.2.3 Access driveways to parking facilities not at signalized intersections shall not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

10.2.4 Parking and loading access shall be shared where feasible.

10.2.5 Priority placement within parking structures shall be given to bike parking, car-share parking, and other alternative ride vehicles.

10.2.6 Pedestrian entrances to all parking shall be directly from the street, except that underground parking garages may be entered directly from a building.

10.3 Screening

10.3.1 Above grade parking for the first 20 feet shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible and shall be designed to blend in with the form and massing and to look like an integral part of the building, with the use of windows and/or cladding, or by landscaping, or green screens, or a combination thereof. The interior of a parking structure shall be designed to be screened from the view of streets and sidewalks.

10.4 Bicycle Standards

10.4.1 Bicycle parking shall be provided per Ordinance No. 182386

10.5 **Transportation Demand Management Plan**

10.5.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.5.2 The transportation demand management plan shall set forth best practices that relate to the Project Site and the Project's building design features in order to:

a. Promote bicycle and pedestrian circulation within the Project Site.

b. Promote alternative modes of transportation.

c. Create pedestrian linkages to public and private amenities outside the Project Site.

d. Provide convenient and attractive onsite pedestrian linkages for routes to the Metro Red Line Station at Hollywood Boulevard and Vine Street.

e. Provide adequate parking, but provide incentives to tenants and residents to utilize alternative modes of travel. The incentives shall include bicycle facilities, car sharing, discounted subway passes, and parking spaces as an only occasional part of all lease and sale agreements.

11. SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 182340, Hollywood Signage Supplemental Use District (Amended) pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 11.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig. 11.2.

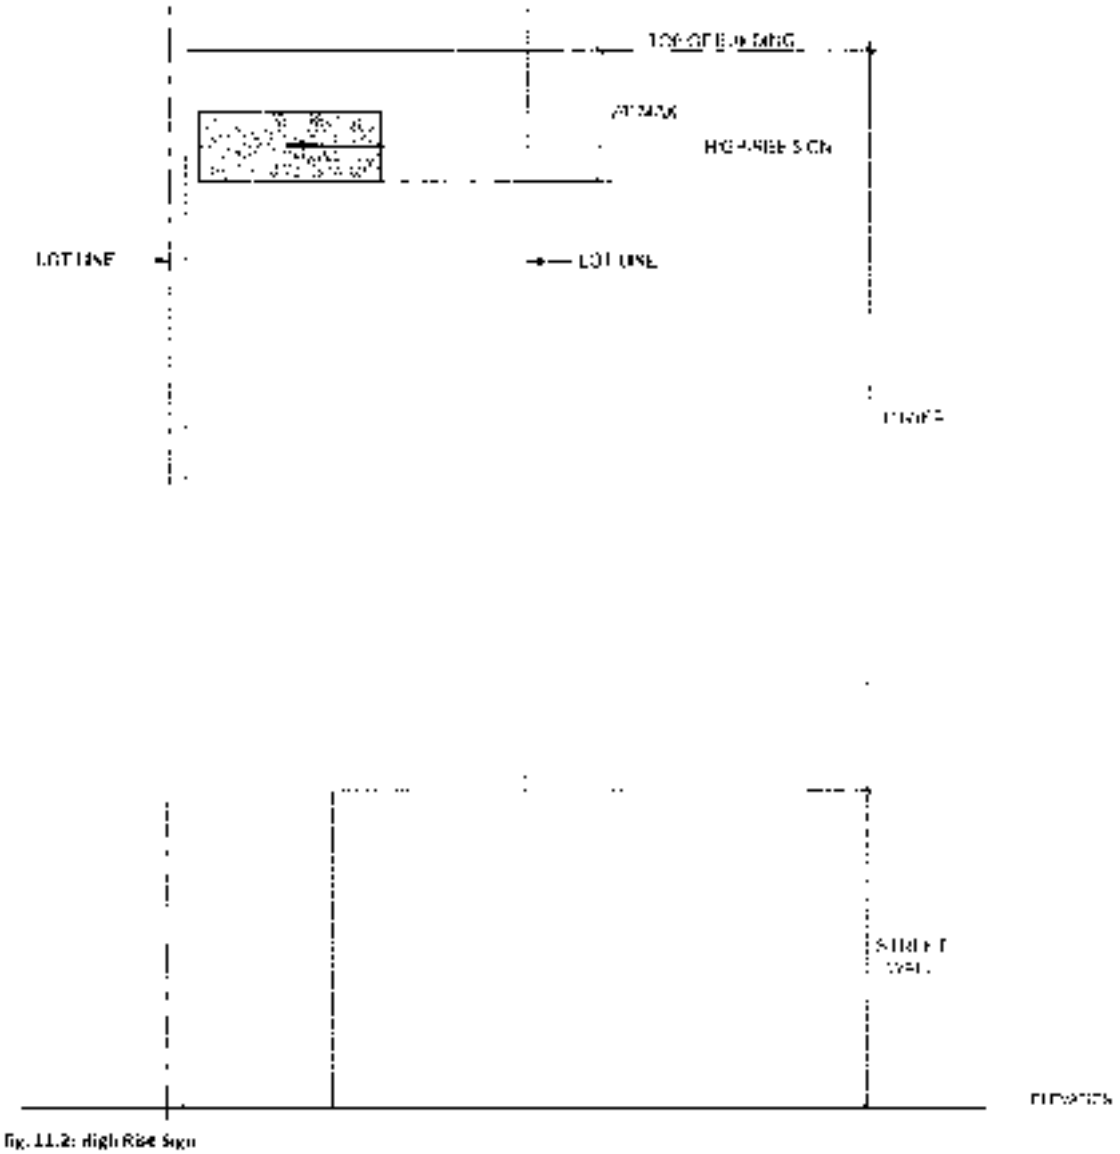

Fig. 11.2: High Rise Sign

12. SUSTAINABILITY

12.1 Non-Residential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds enumerated above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

12.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13. DEFINITIONS

Awning: glazing or fabric on metal frame structure supported entirely by the building to provide weather protection at doors, windows and/or storefronts; may be retractable.

Base: the lower portion of a building located at or within 150' above curb level.

Canopy: glazing, fabric and/or metal structure with vertical supports located on the sidewalk to provide weather protection at a building's primary entrance.

Expression band: a distinctive linear architectural element occurring on the building base facade at the highest floor. The band shall be contrasting in color, texture, material and/or fenestration from the adjacent building base facade. Projections may occur within an expression band.

Grade level open space: a continuous open space fronting the street and open to the sky.

Maximum building height: the maximum height permitted, measured from the adjacent street curb level.

Maintenance: the ongoing repair, care and upkeep of a property.

Open space use: active and passive recreational areas accessible to the general public, except as noted herein. Open spaces can occur in publicly accessible passageways, grade level open space, residential common open space and residential private open space which are defined herein.

Preservation: in conformance with standards and guidelines of the Secretary of the Interior, the act or process of applying measures necessary to sustain the existing form, integrity, and materials of an historic property.

Publicly accessible passageway: a continuous through-block public connection between two parallel streets, located on privately owned land and designated for and designed to encourage public pedestrian circulation and other appropriate public uses.

Rehabilitation: in conformance with standards and guidelines of the Secretary of the Interior, the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values.

Required street wall: a wall or portion of a wall of a building facing a street or grade level open space which must be built to a maximum height above curb level.

Required street wall articulation, aggregate width of: the sum of the maximum widths of all segments of required street wall articulation on a street at the level of any story. The width of a required street wall articulation is measured in plan as the width of the street line from which perpendicular lines may be drawn to such required street wall articulation.

Residential common open space: a "rear yard" providing light and air to apartments or the interior of a parcel located at any story above curb level.

Residential private open space: open space that is contiguous to and immediately accessible only from a single dwelling unit.

Setting: the area or environment in which a historic property is found. It may be an urban or suburban neighborhood or a natural landscape in which a building has been constructed. Elements of setting can include the relationship of buildings to each other, setbacks, views, sidewalks, and street trees.

Storefront: the architectural facade, including doorways, of any tenant-leased premise perimeter adjacent to public circulation areas. Storefronts refers to all permitted residential, retail uses including retail, service, restaurants and cultural establishments and commercial uses, including but not limited to hotels and sports clubs.

Tower: the portion of a building located above 150' above curb level.

Transparency: architectural elements that can be seen through or allows light to emit through, including but not limited to glass, grills and wire mesh.

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and ensure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project Site.

e. Ensure compliance with the Development Objectives.

f. Ensure preservation of the Capitol Records Building and the Gogerty Building according to the *Secretary of the Interior's Standards for Rehabilitation*.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives.

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve the Capitol Records Building and the Gogerty Building according to established preservation guidelines (the *Secretary of the Interior's Standards for Rehabilitation* and guidance provided by Office of Historic Resources).

b. Preserve public views from certain key vantage points to the Capitol Records Tower by creating grade level open space / civic plazas on the East Site adjacent to the Jazz Mural and Capitol Records Building and West Site across from the Capitol Records.

c. Preserve existing view corridors from certain key vantage points to the Hollywood Hills.

fig. 1.2.2.b-c: Capitol Records View Corridors

d. Create civic plazas that are activated by retail, landscaped, and enhance the Hollywood Walk of Fame by providing it as an urban node. Reinforce the urban and historical

importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Encourage street life by the creation of a new pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces that permit open and green spaces for both the on-site and off-site population.

fig 1.2.2.d: View North Along Vine Street

g. Create a 24 hr. community by the creation of a Thriving Mixed-Use Development.

h. Eliminate the visual impact of current on-site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in proximity to the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street, and existing bus routes.

j. Establish standards to address architectural excellence.

k. Provide designs that address, respect and complement the existing context, including standards for ground-level open space, podium heights and massing setbacks that minimize impacts to the historic setting.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood from the Hollywood Freeway.

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict requirements for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 The Development Regulations are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and _____ ("Millennium Development Agreement") on _____.

1.4.2 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council.

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street.

The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Avenue is the East Site.

The East Site and the West Site make up the Project Site.

The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 21 feet (NE to SW) from Vine Street to Argyle Avenue and 21 feet (NW to SE) from Ivar Avenue to Vine Street. The existing sidewalk elevations will not be altered as part the Project.

fig. 2.1. Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 The Project Site is zoned Commercial (C2). The City General Plan land use designation is Regional Center commercial.

2.2.2 The Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Notwithstanding any provision in these Regulations, residential floor area is not permitted within 500 feet of any freeway.

2.2.4 Floor Area Ratio: 6:1

2.2.5 Height District: No. 2

3. HISTORIC RESOURCES AND SETTING

3.1 Overview

The Project Site is located in a historically rich area of Hollywood that contains a number of recognized historic resources. This Project is a preservation project in that its ambition is to respect, respond to, and preserve the Capitol Records Building and to continue the urban character of Vine Street on the Project Site. The Project is designed to be observant of historic settings and buildings. Two buildings located on the Project Site, the Capitol Records Tower and the Gogerty Building, are historically significant. Other historic buildings, located on adjacent parcels, are the Pantages Theater, the Equitable Building, the Hollywood Palace, and the Art Deco commercial building at 6316-6324 Yucca Street. Several of these historic resources are located within the Hollywood Boulevard Commercial and Entertainment District, a National Register listed historic district located just south of the Project Site.

Composed of commercial properties from the first half of the 20th Century, contributing properties to the Hollywood Boulevard Commercial and Entertainment District include a wide variety of property types including single-story storefronts, two-story commercial blocks, department stores, theaters, high-rise office buildings and hotels.

The Capitol Records Building is a unique building whose cylindrical form has always been visible from portions of Hollywood and Vine from the south and the freeway from the north. The Capitol Records Tower and the iconic buildings in the Hollywood Boulevard Commercial and Entertainment District (the Hollywood Palace, Pantages Theater, Equitable Building) will maintain their prominence after implementation of the Project.
Portions of the Hollywood Walk of Fame (L.A. Historic Cultural Monument #194) are located along Vine Street between Yucca Street and Sunset Boulevard and will be protected.

The protection of Hollywood's historic resources and unique character is an important objective of the Project. The guidelines and standards contained in this document were created in part to ensure the protection of historic resources within the Project Site and minimize potential adverse effects to historic resources from new development. Key Project objectives regarding historic resources include:

1) Preservation, maintenance, and rehabilitation of the Capitol Records Building and the Gogerty Building in accordance with the Secretary of the Interior's Standards. See sections 1.2.2a and 1.2.2b of this document.

2) Protection and preservation of the portions of the Hollywood Walk of Fame (LA Historic Cultural Monument #194) will need to be temporarily removed during construction and replaced after construction is completed. A preservation plan, outlined in the Hollywood Walk of Fame Terrazzo Pavement and Repair Guidelines (March, 2011) will be prepared for this aspect of the Project.

3) Incorporation of ground-floor open space and building setback requirements to moderate the overall massing of new development in a manner that preserves important views to and from the Capitol Records Building, the Hollywood Boulevard Commercial and Entertainment District, and important view corridors to the Hollywood Hills. See sections 1.2.2 c, 6.1, 6.9, 7.1, 7.5, 8.1 and 8.2 of this document.

4) Incorporation of ground-floor open space and building setback requirements to reduce massing at the street level and limit the visual crowding of adjacent historic resources. See sections 1.2.2c, 6.1, 7.1, 7.5,

8.1 and 8.2 of this document.

5) Requirement that design of new buildings be in a manner that is differentiated from but compatible with adjacent historic resources. See sections 6.6, 6.8, 7.1.5, and 7.4 of this document.

One means of creating compatible new buildings in an urbanized setting is to incorporate qualities of vertical and horizontal visual complexity in world class design. The general characteristics, proportions, and details of older buildings may serve as a reference for the Project. The Project's intent is to allow old and new to mix, recognizing that Hollywood sustains its image through both the rehabilitation of existing historic structures and the design of creative and contemporary architecture.

4. DENSITY

4.1 Floor Area Ratio Averaging and Density Transfer

The Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the sum of the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

4.2 Land Use Equivalency Program

The Land Use Equivalency Program is intended to provide flexibility in land uses for the Project while ensuring that a change in land uses would not result in new significant environmental impacts or a substantial increase in the severity of significant environmental impacts identified in the EIR, ENV-2011-0675-EIR (SCH No. 2011041094). With respect to any proposed Phase of the Project (an "Exchange Phase") that would result in a build out of the Project that is not consistent with at least one of the Project scenarios studied under the EIR, under the Land Use Equivalency Program, the developer may request a transfer or exchange of land uses, as well as modifications to the siting, massing or other development standard in so far as they are consistent with the provisions herein, for such Exchange Phase by a delivering written request therefore to the Planning Department of the City, which request shall be accompanied by (a) detailed information identifying the land use transfer/exchange that is being proposed for such Exchange Phase; (b) information documenting how the proposed land uses and densities in the Exchange Phase, together with the existing improvements and the other phases previously developed, are consistent with the overall AM and PM peak hour trip cap identified in Table II-3, Project Trip Cap from the EIR; and (c) supporting documentation to demonstrate that the Project including the proposed Exchange Phase would not exceed the maximum environmental impacts identified in the EIR (collectively, an "Equivalency Program Exchange Submission"). The Planning Director shall approve such request if the Equivalency Program Exchange Submission reasonably demonstrates that the Project including the proposed Exchange Phase is consistent with the overall AM and PM peak hour trip cap identified in such Table II-3, Project Trip Cap, and would not otherwise exceed the maximum environmental impacts identified in the EIR.

5. HEIGHT

5.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capital Records Tower.

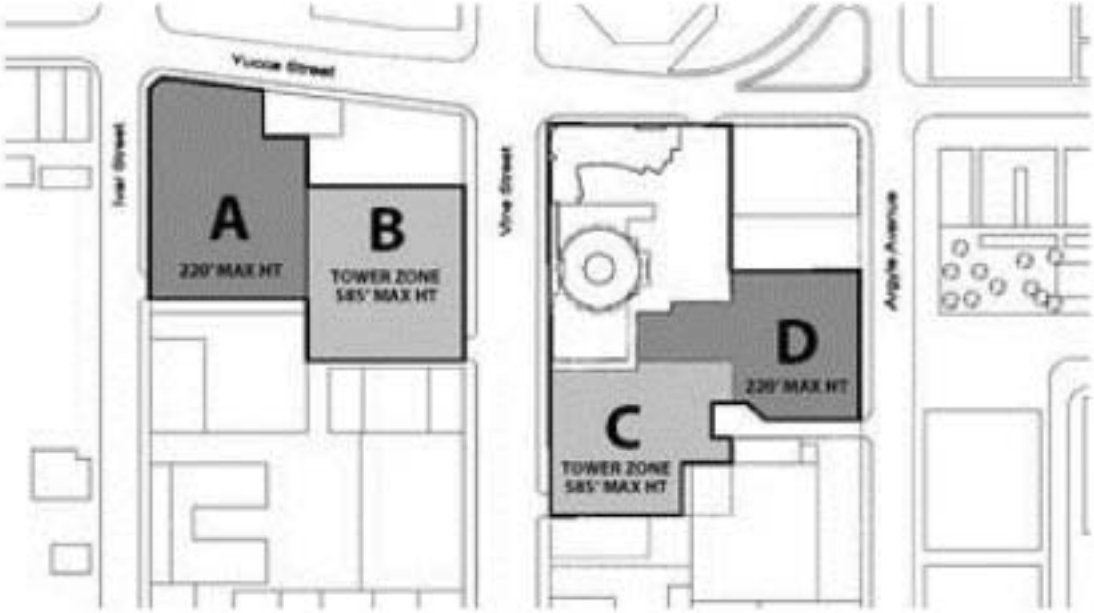

Fig. 5.1 Height Zones

6. BUILDING AND STREET EXPERIENCE

6.1 Tower Massing Standards

6.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 6.1.1.

Tower Height (feet)	Maximum Tower Lot Coverage (%)	Minimum Floor Area Below 220 Feet (%)	Maximum Tower Floor Plate (sq. ft.)	Minimum Tower Setback (feet)	Minimum Public Open Space (%)	Figures
151 – 585	11.5	50	13,325 East Site 9,042 West Site	10 15[1]	12	6.1.2.d.1 6.1.2.d.2
151 – 550	15	50	17,380 East Site 11,794 West Site	10 15[1]	10	6.1.2.c.1 6.1.2.c.2
151 – 400	28	50	22,745 East Site 22,016 West Site	10 15[1]	8	6.1.2.b.1 6.1.2.b.2
150 – 220	48	n/a	55,616 East Site 37,742 West Site	10 15[1]	5	6.1.2.a.1 6.1.2.a.2

Table 6.1.1

Note 1: 15' tower setback required for any tower fronting Vine Street on West parcel. See Figure 6.3.2.

6.1.2 For the purpose of calculating the maximum lot coverage the total lot area is equal to the total lot area for each of the sites, the West Site and the East Site. If there is more than one tower on a site, the maximum lot coverage requirement in Table 6.1.1 is calculated based on the combined area of all towers on each site. The total lot coverage applies to the aggregate floor plate(s) of the tower or towers on each site.

6.1.3 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 6.1.2.a.1 – 2.)

6.1.4 At least 50% of total floor area must be located below 220 feet.

6.1.5 Tower wall articulation:

a. Minimum 10% of tower aggregate area shall be articulated.

6.1.6 Types of permitted articulations for tower walls:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

The following developments are for illustrative purposes only.
Maximum Lot Coverage and Tower Floor Plate – Figs. 6.1.2.a – d.

EAST SITE - SITE PLAN

① MINIMUM 10' SETBACK ALONG VINE STREET
② MINIMUM 20' SETBACK ABOVE 150'
③ MINIMUM 10' SETBACK ABOVE 150'
④ 10' SETBACK FROM CAPITOL RECORDS TOWER

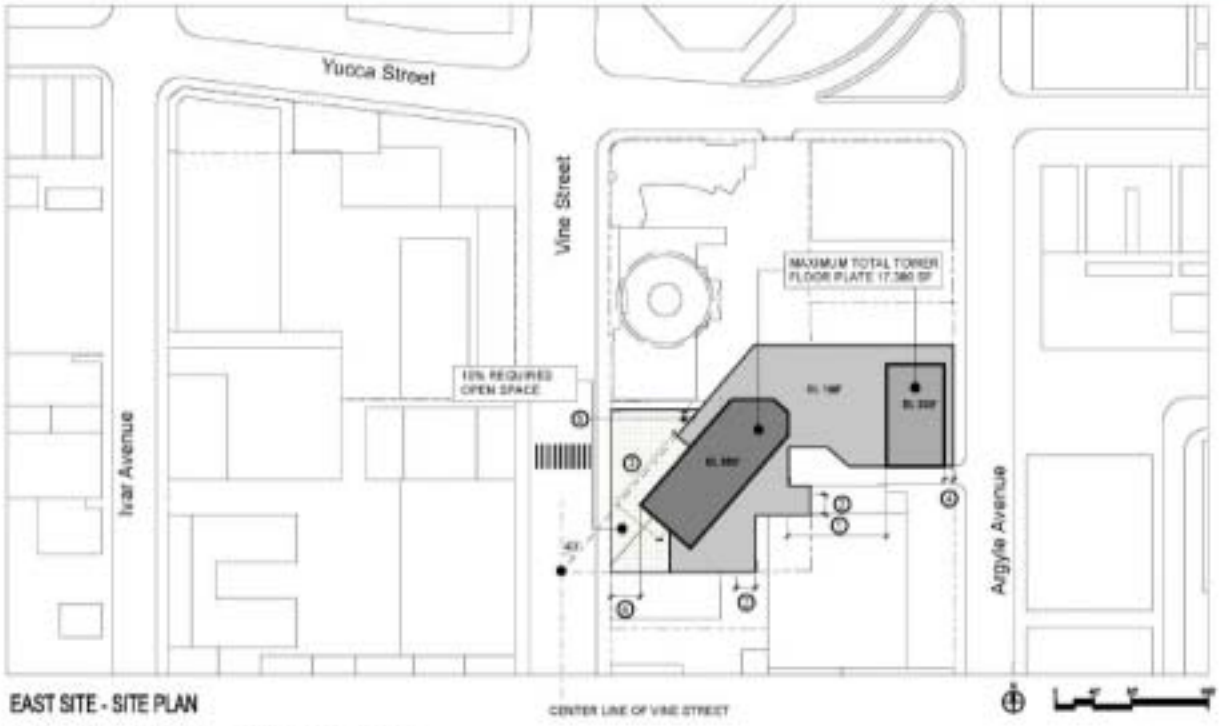

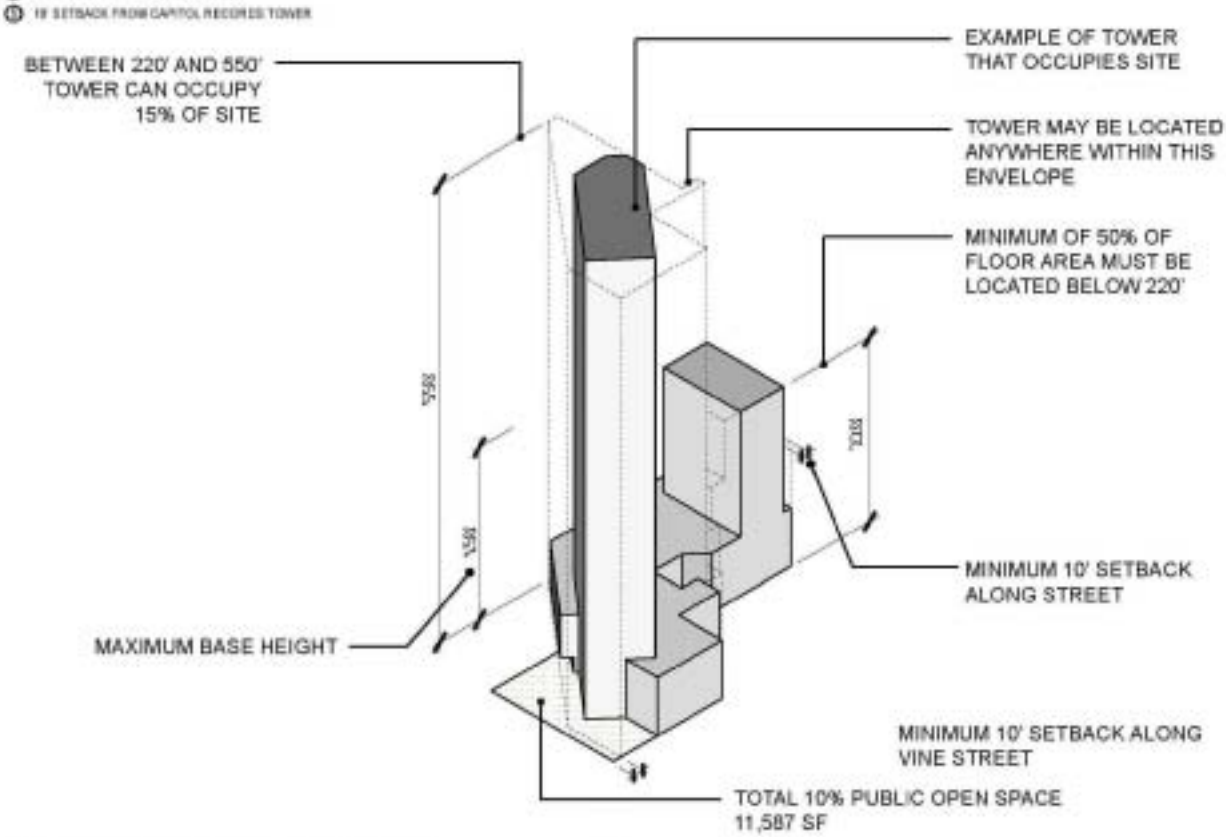

fig. 6.1.2.c.1: East Site – 550 Feet Maximum Tower Height

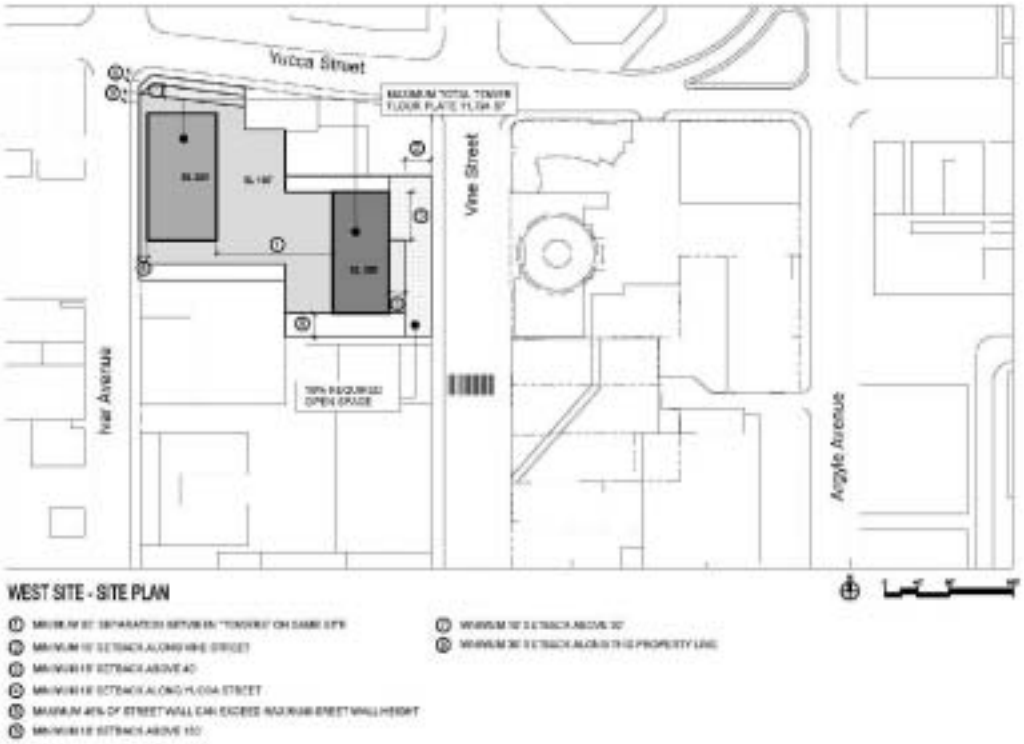

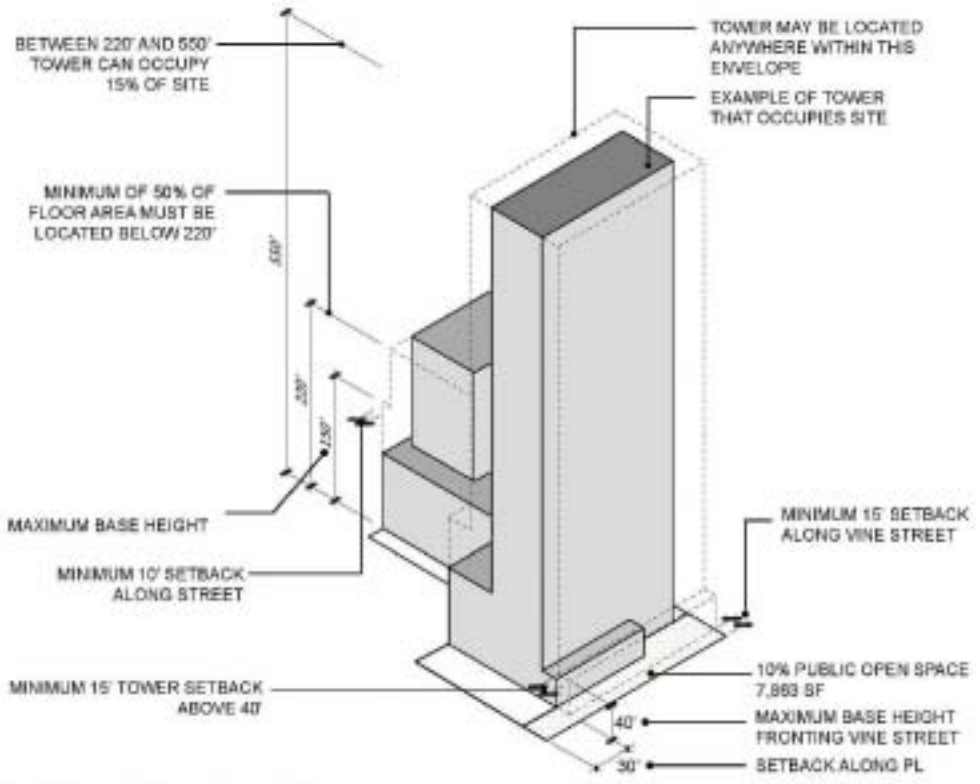

fig. 6.1.2.c.2: West Site – 550 Feet Maximum Tower Height

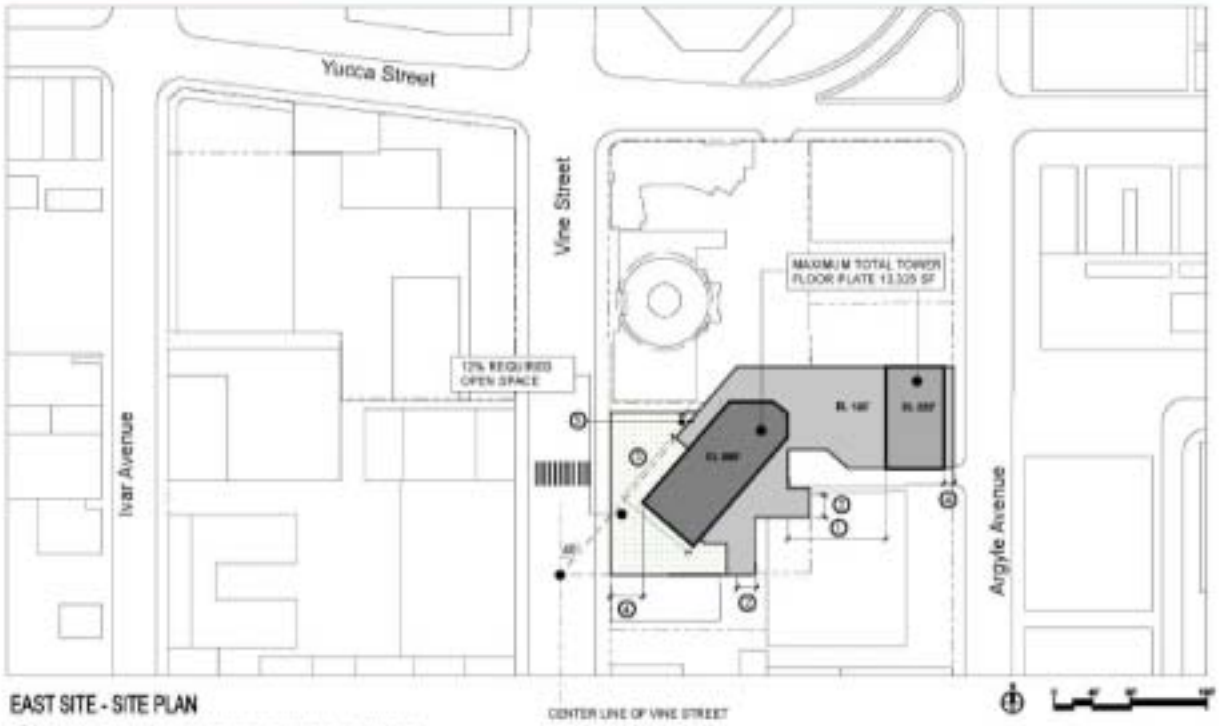

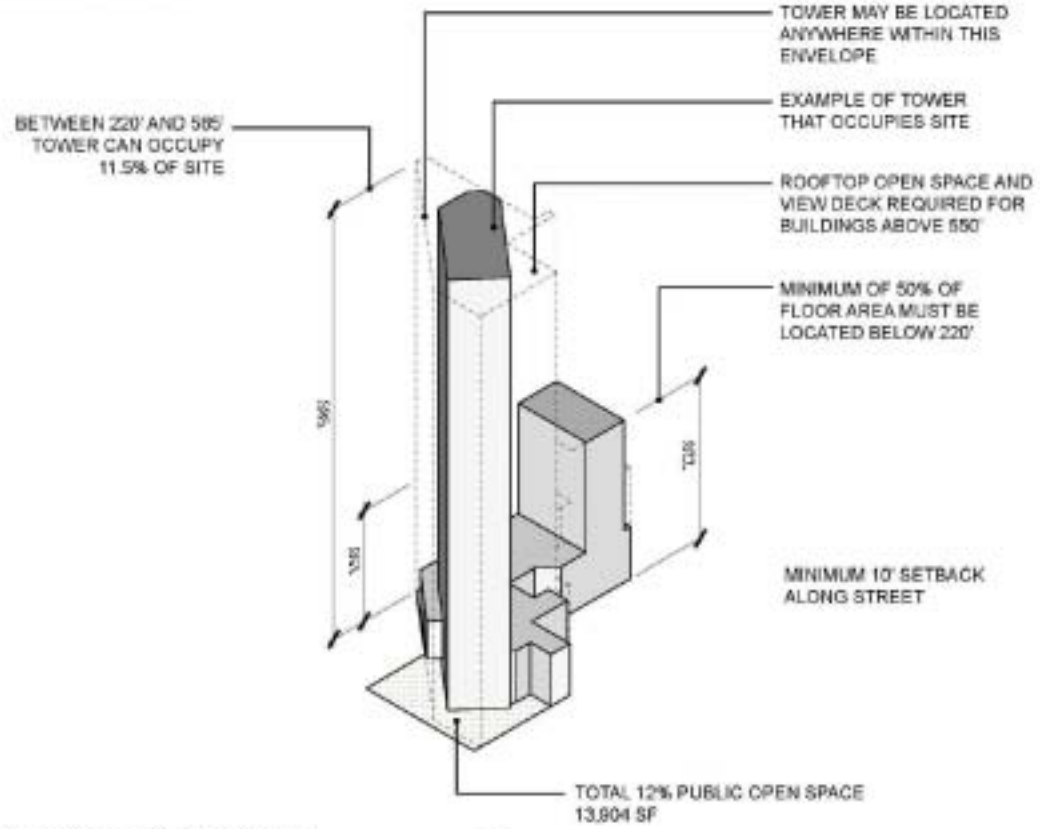

fig. 6.1.2.d.1: East Site – 585 Feet Maximum Tower Height

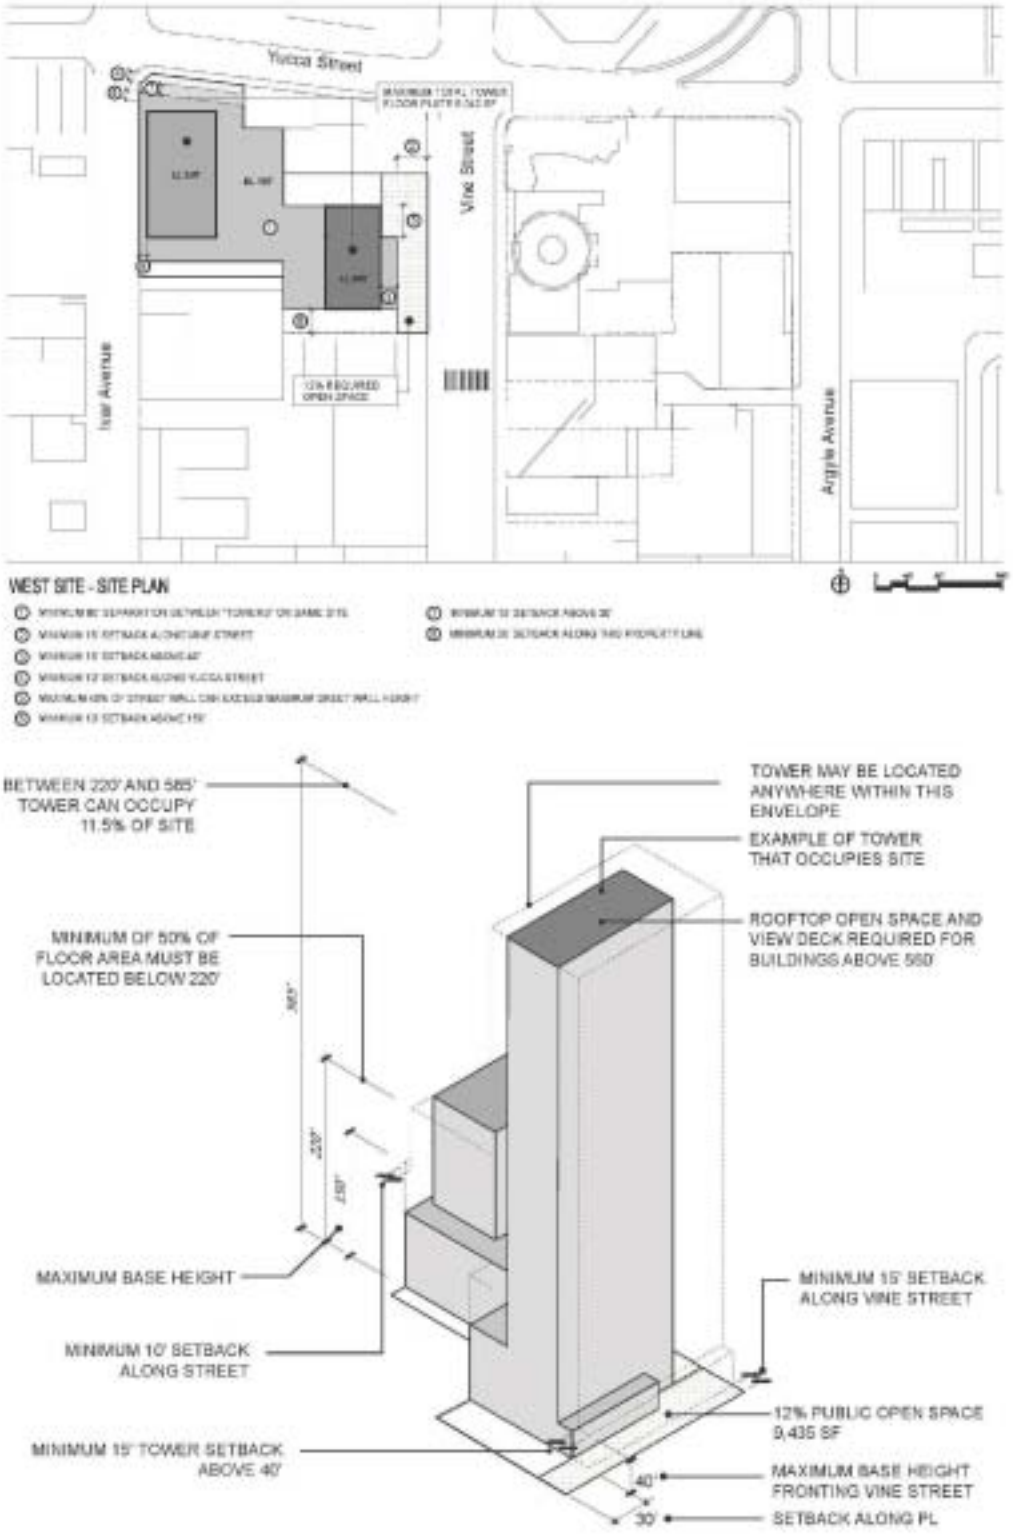

fig. 6.1.2.d.2: West Site – 585 Feet Maximum Tower Height

6.2 Street Walls

6.2.1 A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation. The street wall shall have proportions and architectural building details which emphasize and reflect the presence and importance of the pedestrian environment. Massing offsets, fenestration, varied textures, openings, recesses, and design accents are strongly encouraged to ensure there are no un-articulated walls and monolithic roof forms, and architectural elements such as balconies, verandas, and porches that add architectural character are encouraged.

6.3 Street Wall Standards

6.3.1 Location of a required street wall:

a. Parcels with a grade level open space: the required street wall shall be located a minimum 10 feet from the property line along Vine Street on the East Site and 15 feet along Vine Street on the West Site.

b. A grade level open space is required for any building fronting Yucca Street with a minimum 10 feet setback from the property line.

c. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

6.3.2 Height of required street wall:

a. Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b), (c) and (d) below.

b. Street walls fronting Vine Street on the West Site shall be built to a maximum height of 40 feet above curb level except as noted in item (d) below.

c. Street walls fronting Yucca Street shall be built to a maximum height of 30 feet. Building can extend to a maximum height of 150 feet with a 10 foot setback above 30 feet except as noted in item (d) below.

d. 40% of the aggregate width of the required street wall frontage on each street can exceed the maximum street wall height up to the maximum tower height.

fig 6.3.2: Street Wall

fig. 6.3.3: Street Wall Articulation

6.3.3 Types of permitted articulation of a required street wall:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space.

d. Expression band: an identifiable break shall be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

6.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Commercial marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5'-0'. The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

6.4 Street Wall Guidelines

6.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

6.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop-offs and loading entries and exits and vehicular access driveways are also permitted within the street wall area on the Project Site.

6.5 Yard Standards

6.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

6.5.2 Commercial Use: no front, side or rear yard setbacks are required.

6.5.3 Residential Use:

a. Front Yard: none.

b. Side Yard: Minimum 5 feet; for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet; for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

6.6 Building Materials and Color Guidelines

6.6.1 The goal of the building materials and colors is to reinforce the character of the Hollywood area and provide a design that is compatible yet avoids any appearance that the building is being historicized. These guidelines will address the façade treatment for both residential and commercial portions of buildings.

a. Buildings shall feature long-lived and sustainable materials. The material palette shall provide variety, reinforce massing and changes in the horizontal or vertical plane.

b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

c. Podium levels up to 150 feet will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents.

d. The architecture of the building shall clearly delineate an architectural style, and shall not appear as a simplified version thereof, with appropriate fenestration patterns, architectural features, proportions and materials.

e. The building's skin, especially for towers, shall be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

f. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style. There will be clear contrast between the building's surface material and the building's glazed areas.

g. In general, the overall massing, roof forms, materials, and architectural style of new structures shall provide a variety of forms, depth and texture, and encourage a cohesive character. Building massing shall include a variation in wall planes and height as well as roof forms to promote architectural excellence, a pedestrian friendly environment and take into account the context.

h. To provide visual variety and depth, the building skin shall be layered and designed with a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin shall reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

i. Rooftop mechanical equipment screening shall be designed to be integral with the building architecture and the visual impact shall be minimized by using materials that are complimentary or consistent with the building.

j. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

Fig. 6.6.1

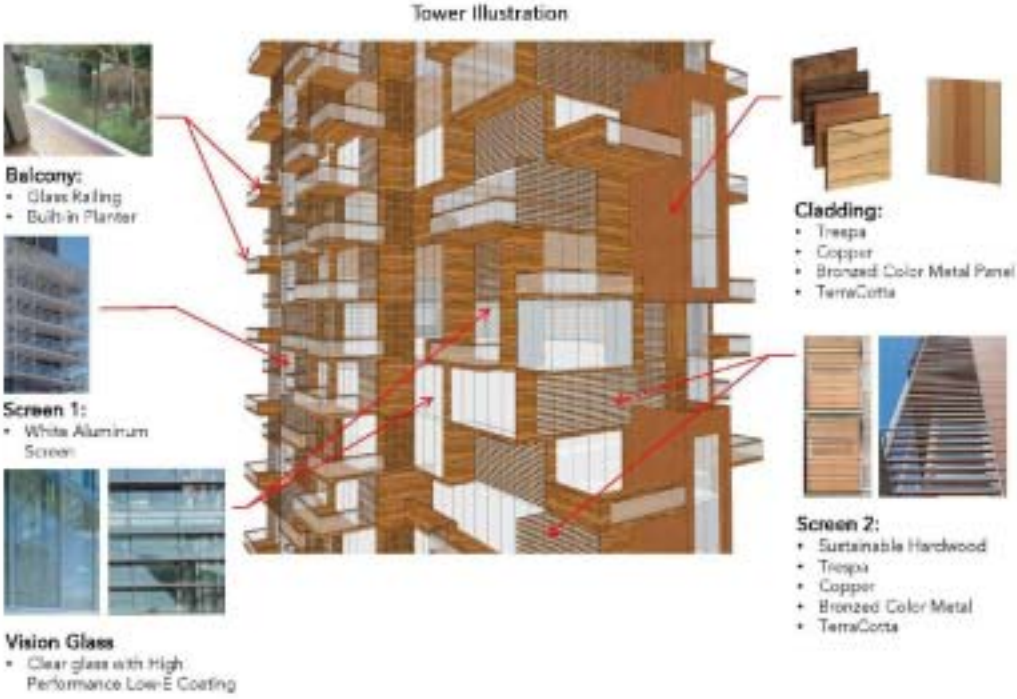

Fig. 6.6.2

k. Examples of acceptable materials are illustrated in Figures 6.6.1 – 2

6.7 Grade Level Standards

6.7.1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground floor street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and shall be integral to the architecture of the building.

6.7.2 Ground floor height:

a. Minimum 12'-0" height measured from floor to ceiling.

6.7.3 Building entrances:

a. The primary entrance to a street level tenant space that has frontage along a public street shall be provided from that street. The primary entrance to a tenant space that does not have its frontage along a public street shall be provided from a courtyard, *grade level open space*, or *publicly accessible passageway*. Entries less than 18 inches from the property line shall not be higher than 12 inches above the elevation of the sidewalk; entries greater than 18 inches from the property line shall be within 30 inches of the adjacent grade level along street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. All retail spaces shall be accessed primarily from a ground floor, single-tenant entry along a street, plaza or passageway. Where reasonably practical given architecture and tenant requirements, access to different tenant spaces shall occur at a maximum interval of 60 feet.

c. Main building entrances shall read differently from retail storefronts, restaurants and commercial entrances which could include but are not limited to material change, architectural elements or elevation change.

d. In addition to the building's required primary entrance(s), there may be ancillary entrances to the building from parking garages.

6.7.4 Ground Floor Glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet above curb level.

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing shall constitute a minimum of 30% of the area of a building face and shall not exceed 80% of the area of a building face.

6.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0-foot candles.

6.7.6 Service and Refuse Requirements

Hotel and Commercial / Office / Retail that abuts an alley

a. Every required loading space shall be located and arranged such that delivery vehicles may be driven upon or into said space from an alley. Such loading space shall have a minimum height of 14 feet and be accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet; a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet; and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

Condominiums (Residential)

d. None

Rental (Residential)

e. None

6.7.7 Service and Refuse Guidelines

a. Storage areas shall be provided within the building of a size sufficient for the development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible from a curb cut.

b. Service, utility, and mechanical functions, including retail loading, shall be located in alleys whenever present. When alleys are not present, service functions shall be placed within buildings.

c. Service, utility, and mechanical equipment that is visible from the street shall be screened from view with landscaping or enclosures. Back flow and fire standpipes, along with utility box transformers, shall be screened.

d. All screening devices shall be compatible with the architecture, materials and colors of adjacent buildings.

e. Trash and storage enclosures shall be architecturally compatible with the project design and landscaping shall be provided adjacent to the enclosure(s) to screen them and deter graffiti.

f. Trash enclosures and retail loading areas shall be sited to minimize nuisance to adjacent properties.

g. The location of trash enclosures shall be easily accessible for trash collection and should not impede general site circulation patterns during loading operations.

h. Mechanical equipment shall vent to an alley wherever possible.

i. Roof-vent penetrations and mechanical equipment shall be located at least 10 feet from any exterior Building Face.

j. Gutters and downspouts shall be made of galvanized steel, copper (not copper coated), or aluminum.

6.7.8 Storefronts

a. Storefront (residential, retail, restaurant and commercial) requirements shall include frontage along streets and grade level open spaces.

b. Storefronts shall comprise a minimum of 70% of the building's street level façade along Vine Street and 40% along all other streets and be recessed where necessary.

c. Storefront glazing shall comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets.

d. All retail space shall have a minimum 12 feet finished ceiling clearance.

e. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Storefront openings shall be no shorter than 12 feet above the adjoining grade for 90% of the required storefront frontage.

g. Security grilles will be located behind glass and be at minimum 70% open.

h. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

i. Awnings shall not obscure storefront signage. Vinyl awnings are not permitted.

6.8 Podium Standards

6.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment of the building's base, middle and top

through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

6.8.2 Podiums shall comply as applicable with the minimum setback requirements set forth in Figures 6.1.2a – d.

6.9 Podium Guidelines

6.9.1 Podiums shall have fenestration that establishes a clear pattern on the façade (with special attention paid to facades that are visible from a public street) and that provides depth and additional articulation.

6.9.2 An identifiable break between the building's ground floors and upper floors shall be provided. This break may include a change in material, change in fenestration pattern or similar means.

6.9.3 Podium level windows shall be vertically oriented.

6.9.4 Podium levels shall be predominantly light in color.

6.9.5 An expression band shall be provided at the highest story within the podium.

6.9.6 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade shall be a maximum of four floors high, and shall have variation in its surface plane (using cutouts, insets or pop-outs). It shall employ different scales of elements as viewed when seeing the entire building massing.

6.9.7 Louvers and wall openings shall be designed to integrate with building architecture.

6.9.8 Podiums are encouraged as feasible to be set back from Pantages to preserve sightlines and promote groundfloor open space.

6.10 Street and Sidewalk Standards

6.10.1 The Site is comprised of a variety of public elements that include open spaces, streets and sidewalks. The Hollywood Walk of Fame is an integral element that fronts open spaces on both East and West Sites. Its adjacency to the public plazas requires compatibility and cohesiveness.

6.10.2 The combination of landscaped plazas, publicly accessible passageways and landscaped streets and sidewalks creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

6.11 Screening Standards

6.11.1 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

6.11.2 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

7. TOWERS

7.1 Purpose

7.1.1 Towers shall have their massing designed to reduce overall bulk and to appear slender.

7.1.2 Towers shall be designed to achieve a simple faceted geometry and exhibit big, simple moves. They shall not appear overwrought or to have over-manipulated elements.

7.1.3 Towers that emulate a more streamlined modern style shall provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

7.1.4 If a project has more than one tower, the towers shall be complementary to each other and employ a similar yet **varied** architectural design approach.

7.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) shall not be historicized. They are contemporary forms in the skyline and shall appear as such.

7.2 Projections

7.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. Roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building;

b. Skylights, towers, steeples, flagpoles, water tanks, silos;

c. Wireless masts; and

d. Solar energy devices and similar structures.

7.2.2 Permitted building elements or equipment in Section 7.2.1 shall be screened as practical and based on building design except if such projections – e.g., flagpoles or steeples – are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

7.2.3 Enclosures for bulkheads shall not count against building height.

7.3 General Standards

7.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

7.3.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

7.3.3 Towers shall be set back from maximum street wall height a minimum of 10 feet except for towers fronting Vine Street on the West site, these towers shall be setback a minimum of 15 feet from the maximum street wall height.

7.3.4 Towers shall be setback on West Site from shared property line with Hollywood Playhouse a minimum of 10 feet above 150 feet.

7.3.5 Adherence to minimum setbacks and other separation standards for towers is required as may be applicable to a specific tower and its location with the Project area. Please refer to standards for towers set forth in Figures 6.1.2.a – d.

7.3.6 Tower orientation and placement that enhances important sightlines is encouraged.

7.3.7 In no instance should the tower fronting Vine Street on the East site development have more than a 15% height differential from the tower on the West ste development .

7.4 Wall Standards

7.4.1 All walls are required to be articulated.

7.4.2 The following types of articulation of a tower wall are permitted:

a. Recess;

b. Standard balconies may be projecting or recessed or a combination of both; and

c. Bay windows.

fig. 7.4.2.a: Balcony/Recess

fig. 7.4.2.b: Bay Window

7.4.3 Balcony: a balcony shall be integral to the façade (see figs. 7.4.3.a and b) and shall not create a relentless horizontal and vertical stacking pattern. Balconies are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations and shall be a minimum 75% *transparent*. Balconies are encouraged on buildings facing major public spaces such as plazas, passageways and open spaces. Long balconies resembling corridors are prohibited.

fig. 7.4.3.a: Recess/Balcony: Integral Balcony

fig. 7.4.3.b: Bay Window: Integral Balcony

7.5 Spacing Standards

7.5.1 If two towers are located on a single site the towers shall be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

7.5.2 Generally, any portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except for the following which will meet Planning Code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 7.5.2.

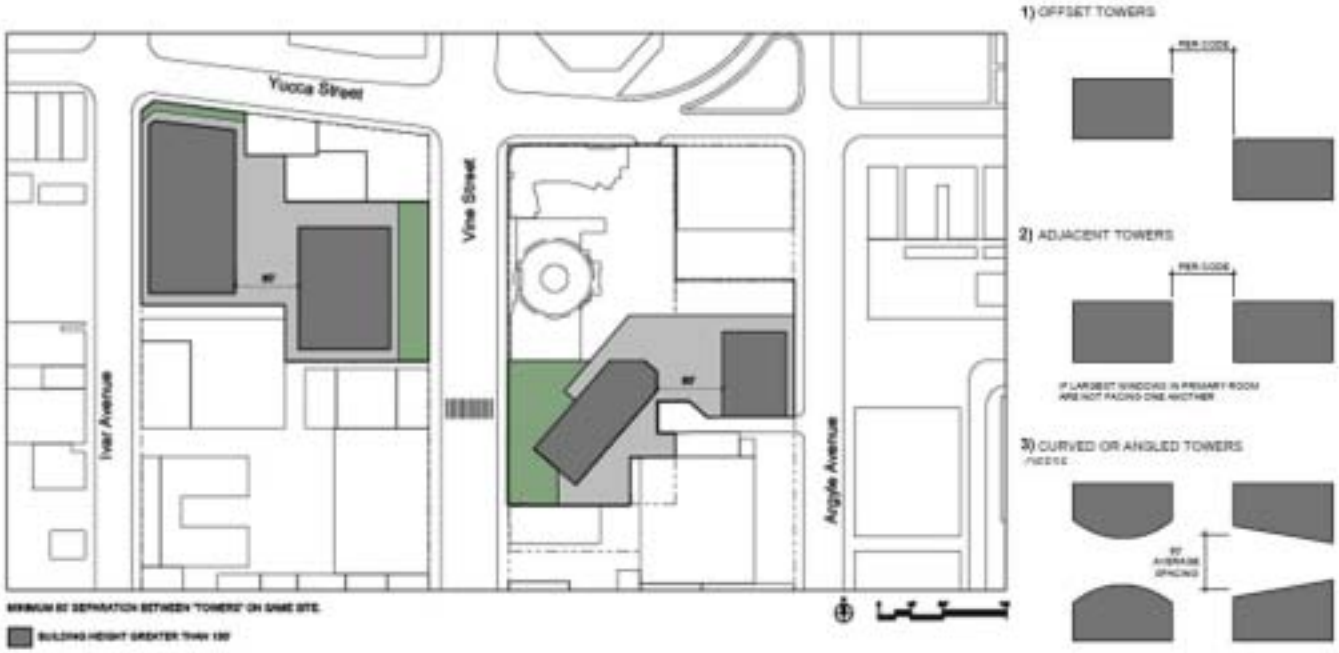

fig. 7.5.2: Tower Spacing

7.5.3 Since a tower is defined as any building above 150 feet, all buildings above 150 feet shall be spaced at least 80 feet from any portion of any adjacent or separate building on the site,

exceeding 150 feet, excluding a project within the height range of 150 to 220 feet, as shown in figures 6.1.2.a.1 and 6.1.2.a.2.

7.5.4 Spires, signage, parapets, and mechanical enclosures are excluded from the tower spacing regulations.

7.6 Rooftops Guidelines

7.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

7.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 8.5.

7.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

7.6.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

7.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

7.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

7.7.2 Materials and design for roof mechanical equipment shall be consistent with the building architecture and shall utilize similar colors and materials as in other portions of the building.

7.7.3 Roof mechanical equipment shall be screened.

8. OPEN SPACE

8.1 Overview

The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Building and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

8.2 Grade Level Open Space Standards

8.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records Building and accentuate the low scale character.

8.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Fig. 6.1.2.a.1 – 2 and 8.1.1)

8.2.3 An additional 3% of open space (total 8%) shall be required for buildings between 221 feet and 400 feet. (See Fig. 6.1.2.b.1 – 2 and 8.1.2)

8.2.4 An additional 5% (total 10%) of open space shall be required for buildings between 401 feet and 550 feet (See Fig. 6.1.2.c.1 – 2 and 8.1.3)

8.2.5 An additional 7% (total 12%) of open space shall be required for buildings taller than 550 feet. (See Fig. 6.1.2.d.1 – 2 and 8.1.4)

8.2.6 Location

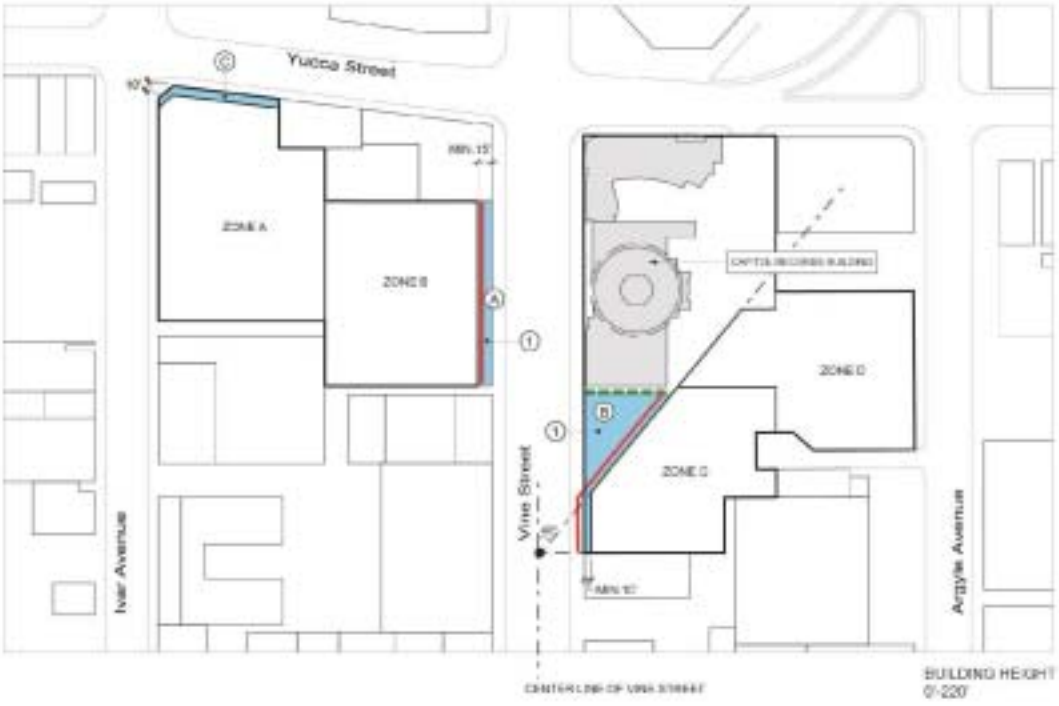
a. East Site: adjacent to the Jazz Mural and Capitol Records Building; West Site: across from the Capitol Records Building along Vine Street and along Yucca Street.

b. Minimum depth: no horizontal dimension less than 10 feet when measured perpendicular from any point on each of the boundaries of the open space area. Open space on West Site fronting Vine Street shall have a horizontal dimension no less than 15 feet when measured perpendicular from any point.

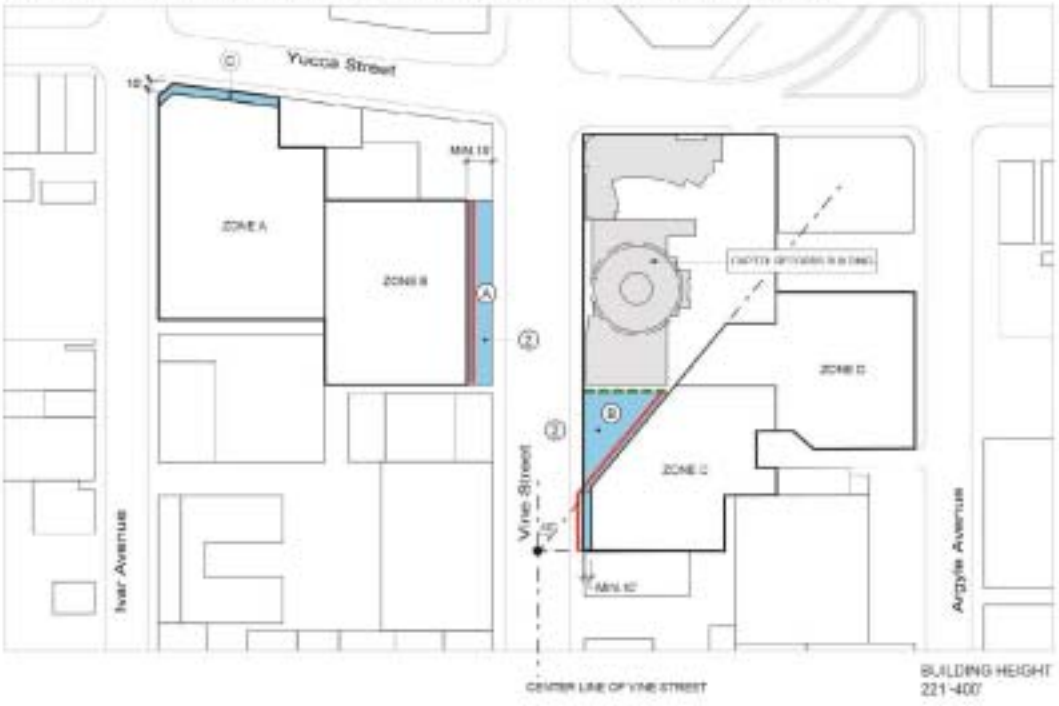
c. On West Site, open space must occupy the area to the west of a line struck at 40 degrees from center line of Vine Street ROW at alignment with the southern most property line and a minimum 10' setback from the southeast corner of the Capitol Records Building. (See Figs. 8.1.1 – 4)

Figs 8.1.1 – 8.1.4: Grade Level Open Space

figs 8.1.1 Open Space Requirements for Maximum Building Height at 220 Feet



figs 8.1.2 Open Space Requirements for Maximum Building Height at 400 Feet



figs 8.1.3 Open Space Requirements for Maximum Building Height at 550 Feet

figs 8.1.4 Open Space Requirements for Maximum Building Height at 585 Feet

8.3 Passageway Standards

8.3.1 *A publicly accessible passageway* is a continuous through-block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

8.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

8.3.3 Location and Size standards:

a. The major portion of a *publicly accessible passageway* is the largest area of the *passageway* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total passageway area and shall not be less than 20'-0" wide.

b. Minor portions of *publicly accessible passageway* are secondary areas that allow for additional flexibility in the shape and configuration of a passageway. Minor portions shall not occupy more than 25 percent of the total area of the *passageway*. The minor portion shall have a minimum width of 10 feet.

c. The minor portion must be directly adjacent to the major portion.

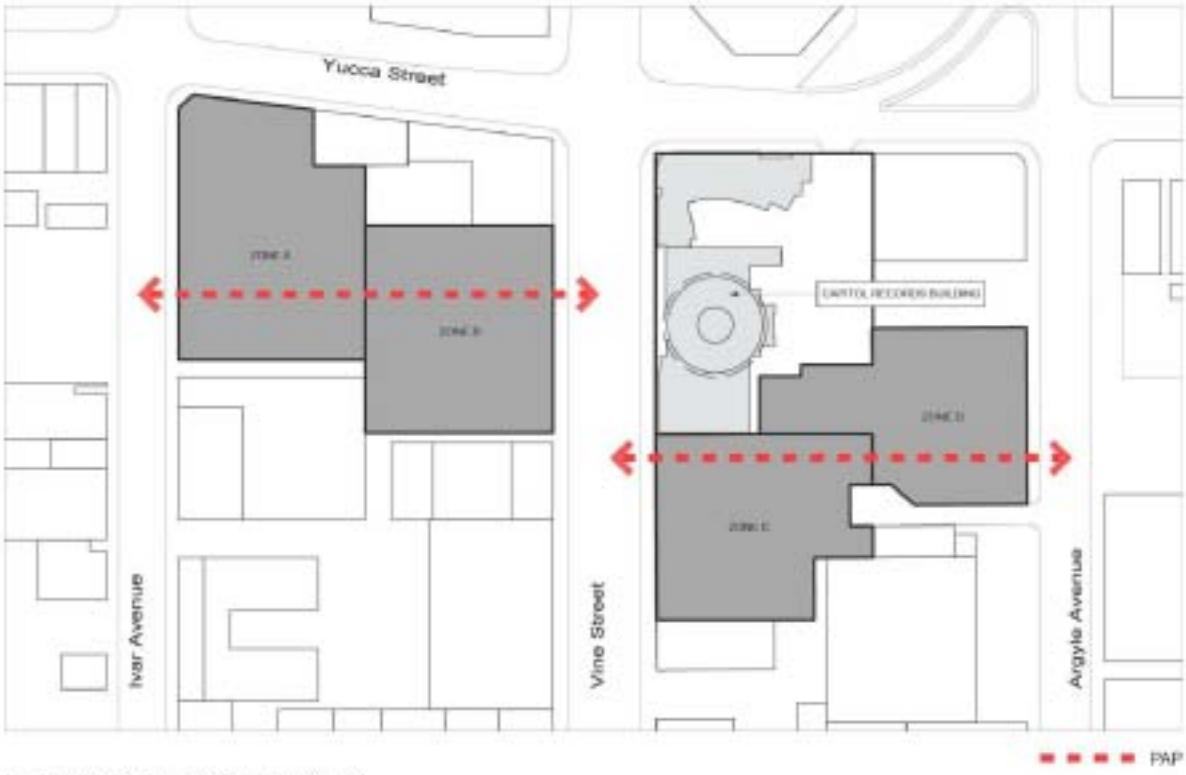


fig. 8.3.3: Publicly Accessible Passageway

8.3.4 Permitted Obstructions:

a. The minimum percentage of *publicly accessible passageway* area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40%

(v) Development with maximum building height of 585 feet: 50%

b. Permitted obstructions within the major portion of an open air *publicly accessible passageway* are any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open-air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies and bay windows; awnings, canopies and marquees; stairs, ramps

fig. 8.3.4: View from Argyle Avenue Along PAP Towards Capitol Records

and bollards.

8.3.5 Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Building and Safety in conformance with the Building Code. Kiosks, including roofed areas, shall not count as floor area, exceed 3% of the total area of the *publicly accessible passageway*, or occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open-air cafes, flower stands or public service/information booths.

d. All kiosks greater than 250 square feet are permitted but will count as floor area.

8.3.6 Open-Air Café:

a. Where an open-air cafe is provided it shall be an unenclosed restaurant or open-air seating for an enclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies.

b. An open-air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *publicly accessible passageway*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *publicly accessible passageway*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

8.3.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on the *publicly accessible passageway* through open windows.

8.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No building refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *publicly accessible passageway*.

b. No exhaust vents are permitted on any *publicly accessible passageway* or on any building wall of the development fronting upon the passageway except where such vents are more than 10'-6" above the level of the *passageway*.

8.3.9 Frontages:

a. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *publicly accessible passageway* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *publicly accessible passageway* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

8.3.10 Maintenance:

a. The building owner shall be responsible for the maintenance of the *publicly accessible passageway* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the passageway and in the street sidewalk area adjacent to the passageway.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *publicly accessible passageway* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *passageway* in connection with outdoor eating services or other uses permitted on *passageway* which generate litter.

8.4 Roof-top Open Space

8.4.1 The Project shall include roof-top open space.

8.4.2 Roof-top open space shall include an observation area (i.e., viewing deck) accessible to the public.

8.4.3 The hotel, if developed, shall include an observation area (i.e., open space viewing area) accessible to the public.

8.4.4 The hotel observation area (i.e., viewing area), if developed, shall satisfy the requirement in section 8.4.1 above.

8.4.5 Roof-top open space may include a café.

8.5 Residential Common Open Space

8.5.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential common open space requirements.

8.5.2 Common Open Space Standards

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

c. Open space shall be open to the sky and have no structures that project into the common open space area, except as permitted in the Zoning Code.

d. Common open space shall be readily accessible to all the residents of the Site.

e. Common open space shall have a minimum area of 400 square feet with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f. Common open space shall constitute at least 50% of the total required usable open space in the built development.

g. Common open space areas shall incorporate recreational amenities including but not limited to swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use may be considered as common open space.

i. Refer to LAMC 12.21.G for additional open space requirements.

8.6 Residential Private Open Space

8.6.1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

8.6.2 Residential Open Space Standards:

a. Private open space shall contain a minimum area of 50 square feet, of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

b. Private open space shall have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c. Private open space shall provide a minimum eight-foot vertical clearance under any projection, except as permitted in the Zoning Code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with Zoning Code may qualify as usable open space provided it meets each of the above specified requirements noted in items a-c.

9. LANDSCAPE

9.1 Grade Level Open Space Standards

9.1.1 Planting requirements: a minimum of 10% of grade level open space shall be landscaped with softscape or water features.

9.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material and 30% of all landscaping shall be California Natives or drought tolerant.

9.1.3 The landscaped portion of open space may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.1.4 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

9.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

9.1.7 Open-air *publicly accessible passageways* are not to be included in the grade level open space requirements.

9.2 Common Open Space Standards

9.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

9.2.2 At least one 36-inch box tree for every four dwelling units shall be provided on-site and may include street trees in the parkway, sidewalks adjoining the property, open space, *publicly accessible passageway* and common roof decks.

9.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

9.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

fig. 9.3.a: Movable Seating

fig. 9.3.b: Open Air Café

9.3 Standards For Open Air Portions of Publicly Accessible Passageway

9.3.1 The landscaped portion of open air passageways may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

9.3.2 The minimum soil depths for planting are:

a. Trees: 42".

b. Shrubs: 30".

c. Lawns, ground cover: 18".

9.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with an automatic irrigation system and waterproof electrical outlets.

9.3.4 Planting requirements:

a. A minimum of 10% of open air *publicly accessible passageway* shall be landscaped.

b. For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

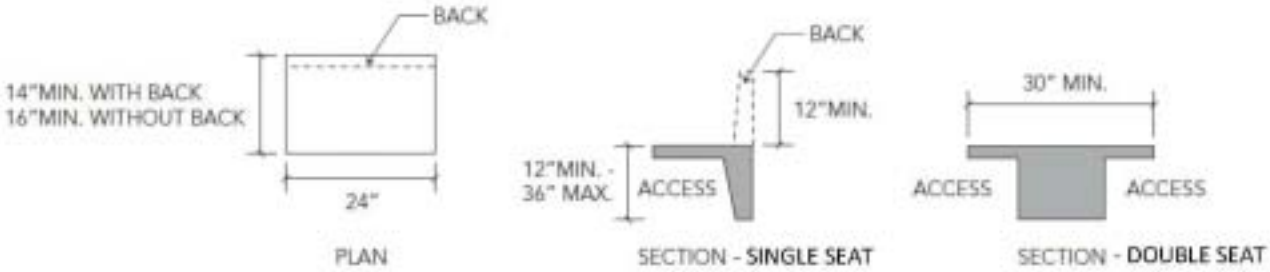

fig. 9.3.5: Seating Standards

9.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *publicly accessible passageway* excluding the area of an open-air cafe.

b. One seat shall equal two linear feet.

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count as double seating provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating of open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open-air cafes do not count toward meeting the seating requirements.

9.4 Tree Planting Guidelines

9.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

9.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

9.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree-planting pattern.

9.5 Lighting Standards

9.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

9.5.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open *publicly accessible passageway*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0-foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

f. All exterior lighting shall be shielded or directed toward the areas to be lit to limit spill-over onto off-site uses.

g. Light quality shall not be harsh, glaring, blinking or shed beyond property boundaries.

9.5.3 Responsibility for maintenance:

a. The Building Owner shall be responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building Owner.

9.5.4 Lighting for areas located inside the lot line and visible from the street, such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

9.5.5 Lighting for above-grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

9.6 Publicly Accessible Passageway Lighting Standards

9.6.1 A *publicly accessible passageway* shall be illuminated throughout with an overall minimum average level of illumination of not less than 1.0 maintained foot candle (lumens per square foot) on the horizontal plane at grade.

9.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

9.7 Continuity of Design

9.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

9.7.2 Where possible, materials, lighting, site elements and landscape shall be similar between different open and enclosed public spaces at the grade level.

10. PARKING

10.1 Automobile Standards

10.1.1 Base Standards

The following standards shall apply for the base level of parking to be provided as the minimum for each use in the project area. The Regulations set forth below incorporate the parking requirements in the LAMC, where applicable, and supersede the LAMC requirements for development in the Development Agreement area.

a. Commercial / Office / Retail:

Two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulations incorporate applicable parking requirements in the LAMC as set forth below.

b. Sports Club:

Two parking spaces for every one thousand square feet of combined gross floor area.

c. Hotel

One parking space for each individual guest room or suite of rooms for the first 30;

One additional parking space for each two guest rooms or suites of rooms in excess of 30 but not exceeding 60; and

One additional parking space for each three guest rooms or suites of rooms in excess of 60.

d. Condominiums (Residential):

Two parking spaces per dwelling unit.

One-quarter parking space per dwelling unit for guest parking.

e. Rental (Residential):

One parking space for each dwelling unit of less than three habitable rooms; one-and-one-half parking spaces for each dwelling unit of three habitable rooms; and two parking spaces for each dwelling unit of more than three habitable rooms.

f. Combination of Uses:

Where there is a combination of uses on a lot, the base number of parking spaces required shall be the sum of the requirements of the various uses.

10.1.2 Shared Parking:

a. Shared parking may be applied to the Section 10.1.1 base rates for the Site when the uses have different parking requirements and different demand patterns in a 24-hour cycle or between weekends and weekdays. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses. The calculation of the parking requirements shall be based on a detailed assessment prior to its construction.

b. Calculating Shared Parking:

(i) The individual land use parking requirements for each component of a phase of development shall be calculated from Section 10.1.1. above to establish the "Base Demand."

(ii) For parking spaces that are to be shared between uses, the calculated minimum parking requirement for the Site, including that new phase of construction, is to be adjusted from the Base Demand based on the procedures in *Shared Parking*, Urban Land Institute, 2nd Edition (2005) or another source as determined by the Director of Planning.

10.2 Additional Regulations

10.2.1 The automobile parking spaces required shall be provided either on the same lot as the use for which they are intended to serve or on another lot located within 750 feet of the lot; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

10.2.2 Curb cuts for driveways shall be located no closer than 50 feet to the intersection of two streets unless approved by The Department of Transportation.

10.2.3 Access driveways to parking facilities not at signalized intersections shall not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

10.2.4 Parking and loading access shall be shared where feasible.

10.2.5 Priority placement within parking structures shall be given to bike parking, car-share parking, and other alternative ride vehicles.

10.2.6 Pedestrian entrances to all parking shall be directly from the street, except that underground parking garages may be entered directly from a building.

10.3 Screening

10.3.1 Above grade parking for the first 20 feet shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible and shall be designed to blend in with the form and massing and to look like an integral part of the building, with the use of windows and/or cladding, or by landscaping, or green screens, or a combination thereof. The interior of a parking structure shall be designed to be screened from the view of streets and sidewalks.

10.4 Bicycle Standards

10.4.1 Bicycle parking shall be provided per Ordinance No.182386.

10.5 Transportation Demand Management Plan

10.5.1 The Project shall incorporate a comprehensive transportation demand management plan.

10.5.2 The transportation demand management plan shall set forth best practices that relate to the Project Site and the Project's building design features in order to:

a. Promote bicycle and pedestrian circulation within the Project Site.

b. Promote alternative modes of transportation.

c. Create pedestrian linkages to public and private amenities outside the Project Site.

d. Provide convenient and attractive onsite pedestrian linkages for routes to the Metro Red Line Station at Hollywood Boulevard and Vine Street.

e. Provide adequate parking, but provide incentives to tenants and residents to utilize alternative modes of travel. The incentives shall include bicycle facilities, car sharing, discounted subway passes, and parking spaces as an only optional part of all lease and sale agreements.

11. SIGNAGE

11.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 181340: Hollywood Signage Supplemental Use District (Amended) pursuant to Section 13.11 of the Los Angeles Municipal Code.

11.2 Modification to Guidelines

Notwithstanding Section 11.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig. 11.2.

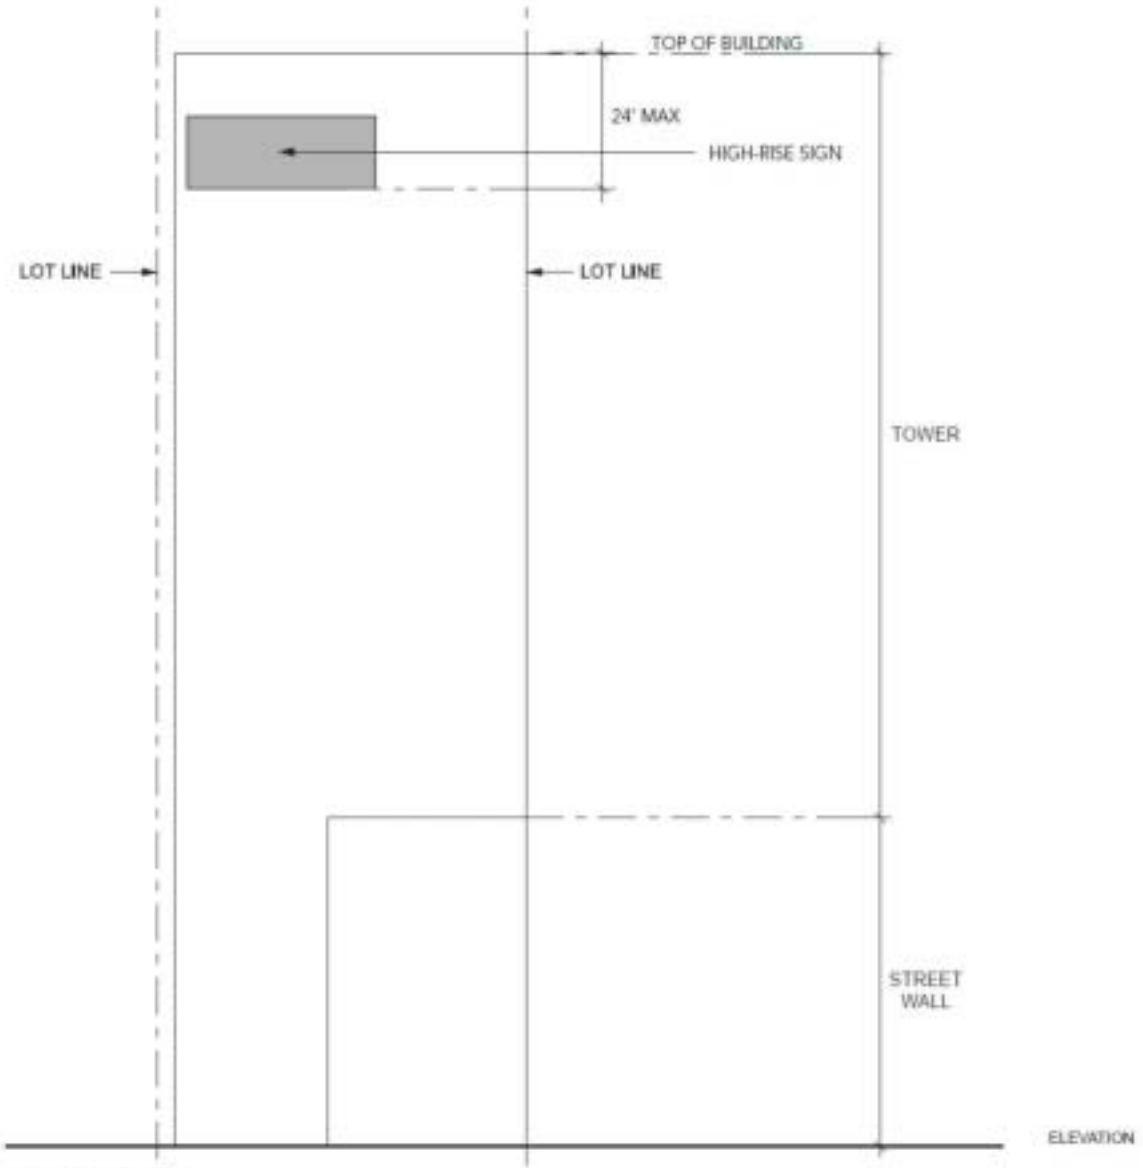

fig. 11.2: High Rise Sign

12. SUSTAINABILITY

12.1 Non-Residential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

12.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13. DEFINITIONS

Awning: glazing or fabric on metal frame structure supported entirely by the building to provide weather protection at doors, windows and/or storefronts, may be retractable.

Base: the lower portion of a building located at or within 150' above curb level.

Canopy: glazing, fabric and/or metal structure with vertical supports located on the sidewalk to provide weather protection at a building's primary entrance.

Expression band: a distinctive linear architectural element occurring on the building base façade at the highest floor. The band shall be contrasting in color, texture, material and/or fenestration from the adjacent building base façade. Projections may occur within an expression band.

Grade level open space: a continuous open space fronting the street and open to the sky.

Maximum building height: the maximum height permitted, measured from the adjacent street curb level.

Maintenance: the ongoing repair, care and upkeep of a property.

Open space use: active and passive recreational uses accessible to the general public, except as noted herein. Open spaces can occur in publicly accessible passageways, grade level open space, residential common open space and residential private open space which are defined herein.

Preservation: in conformance with standards and guidelines of the Secretary of the Interior, the act or process of applying measures necessary to sustain the existing form, integrity, and materials of an historic property.

Publicly accessible passageway: a continuous through-block public connection between two parallel streets, located on privately owned land and designated for and designed to encourage public pedestrian circulation and other appropriate public uses.

Rehabilitation: in conformance with standards and guidelines of the Secretary of the Interior, the process of returning a property to a state of utility, through repair or alteration, which makes possible an efficient contemporary use while preserving those portions and features of the property which are significant to its historic, architectural, and cultural values.

Required street wall: a wall or portion of a wall of a building facing a street or grade level open space which must be built to a minimum height above curb level.

Required street wall articulation, aggregate width of: the sum of the maximum widths of all segments of required street wall articulation on a street at the level of any story. The width of a required street wall articulation is measured in plan as the width of the street line from which perpendicular lines may be drawn to such required street wall articulation.

Residential common open space: a "rear yard" providing light and air to apartments on the interior of a parcel located at any story above curb level.

Residential private open space: open space that is contiguous to and immediately accessible only from a single dwelling unit.

Setting: the area or environment in which a historic property is found. It may be an urban or suburban neighborhood or a natural landscape in which a building has been constructed. Elements of setting can include the relationship of buildings to each other, setbacks, views, sidewalks, and street trees.

Storefront: the architectural facade, including doorways, of any tenant-leased premise perimeter adjacent to public circulation areas. Storefronts refers to all permitted residential, retail uses including retail, service, restaurants and cultural establishments and commercial uses, including but not limited to hotels and sports clubs.

Tower: the portion of a building located above 150' above curb level

Transparency: architectural elements that can be seen through or allows light to emit through, including but not limited to glass, trellis and wire mesh

Blake Lamb - Millennium Hollywood Design Guidelines

From: "Kearns, Rick" <rkearns@handelarchitects.com>
To: "Blake Lamb" <Blake.Lamb@lacity.org>
Date: 7/7/2010 7:23 AM
Subject: Millennium Hollywood Design Guidelines
CC: "Kevin Keller" <Kevin.Keller@lacity.org>, "Handel, Gary" <ghandel@handelarchitects.com>
Attachments: Capital Records_ Millennium Design Guidelines.pdf; Capital Records Design Guidelines Exemplar.pdf

Blake – as promised, attached are the revised guidelines. We revised the text to distinguish the standards and the guidelines per our previous discussions and eliminated, to the extent possible (without compromising clarity), variant terminology. We organized the text under six major headings: density, height, massing (redefined to be community-oriented as "building and street experience"), tower, open space and landscape. We defined landscape to include all environmental aspects of the project to be experienced at eye level not including tower and massing provisions. Thus, rather than include a separate, general section for lighting, we thought that it was better organized under a subheading in landscape.

We have also included examples of how we can use graphics to help better illustrate the rules through renderings and photographs. Images in the examples are used as placeholders only.

We are confirmed for Friday, 9AM at Capitol Records. I will send out an email with room location later today.

See you on Friday

Best,

Rick

Subject: RE: Millennium/Argent Hollywood Meeting
Attachments: 20100615_SK.PDF; 20100615_SK.PDF

Hi Blake, We are confirming the meeting at Capitol - we should have a response by tomorrow.

We overlaid the proposed guidelines on the Entitlement Scheme and the attached documents show what is impacted on both sites. The grade level open space needs to increase on both sites and the pedestrian through block connection (PAP) needs to be added to the west site. We increased the amount of retail/restaurant area along the PAPs to meet the minimum retail frontage requirement. The hand sketch plans show the revised layout. We can discuss further at our meeting on Friday.

Regards,

Rick Kearns

    - % of open space per bldg height
  - subjective things - qualitative based things more likely

how to show quality of design?

quantative - ok harder to define character

different ways to satisfy

→ limit flexibility - create architectural solutions or stick to quantative

could give examples
three diff. types of values

- could be a better palette
agree successful?
illustrative diff
- prescriptive with but leaving open loopcak + reasonable
create mechanism to vary from prescription
normative criteria + give examples
if have better value, there is a mechanism to do internal

did scheme before + ways change
use it as template, also may vary

massing studies

create set of parameters no matter what development
certain things triggered for certain heights, etc.
if go taller, need open space, less lot coverage.

building character is most tough

- Michael Gadamo
- Alfred
- Rick
- Gary

Met with Alfredo Fraijo and Jerry Neuman from Allen Matkins

-Walked through project
-There are 2 sites
East Site (where the existing Capitol Records building will remain) will include a new 46-story (554') residential condo and office
-West Site (across the street) will include a new 38-story (482') residential condo, ground floor retail and restaurant, spa, and 16 story 200 room hotel.
-Still in design phase
-possible subsurface connection through vine street
-planning to make plan amendment in dec 08
-they have questions about balconies/viewdecks and FAR
-one parking variance for health club
some offsite parking already onsite for 40 spaces for a retail shop down the street
enterprise lot (sep ownership for now, but they want to obtain it)
-historic elements are not touched
-haul route hearing required
-kevin keller is the contact from city planning
-charlie (david) is from city planning

Hi Alfred and Eleanor,

I wanted to follow up with you on our meeting yesterday regarding the Capitol Records sites.

1. Regarding the yard designations we can consider all of the frontages on the streets as "Front Yards", and the rest of the lot lines as "Side Yards". However, we would also request that these "yard designations" be called out in your planning entitlement.

2. Regarding the residential and commercial parking combined on an above grade parking level: any floor level containing residential parking will have to observe residential yard setbacks (front yard not required in C zones) even if the residential parking is located in the interior of the floor and away from the lot lines. You will need a yard variance if you are proposing to have the above-grade parking levels containing residential parking all the to the property line.

3. Jamevon suggests that you speak to Greg Shoop at the City Planning Counter (4th Floor of 201 N Figueroa St). There may be creative ways to exceed the 6:1 FAR without the general plan amendment.

Thanks

AR0068220

Subject: Meeting with Project Team to discuss balconies and FAR
Created: 10/7/2008
Modified: 10/8/2008 10:01 AM

Last Modified by: Charmie Huynh

From: Department of Building and Safety

Folder: CMNGS

Spent time reviewing ZA2007-03430 (ZAI) prior to meeting

In attendance: Peggy Pallian (executive arch), Jerry Neuman/Allen Matkins, Alfred Fraijo/Allen Matkins, Gary Handel/design arch, Ed Tacyibana/design arch, and Tom Toynin/developer

Main issues:

-do the leftover spaces that are less than 6' in dimension count as FAR (ZAI 2007-3430 states that one of the conditions to benefit from this interpretation is that the balcony must qualify as Open Space as per 12.21-G,2(b)(2)

how do we measure the 6' measurement that qualifies a balcony as private open space

-will LADBS consider the wood lattice and the glass curtain wall as balcony enclosures?

We discussed the projecting living rooms, the area above the living rooms (open and unenclosed except for guardrails, and the measurements do qualify for private open space) are not FAR (confirmed this also with JL)

We discuss HOTEL Setbacks - hotel is defined as a residential building and must observe required setbacks. They will apply for a variance for the screen wall at the p.l. if it is attached to the building. I did not see a detail of this "screen wall".

Subject: Worked on coordinating the pre-development meeting, reviewed project files, phone conversations with the attorneys/applicants.

>>> "Ord, Eleanor" 10/7/2008 12:08 PM >>>

Hi Charmie,

Because of the City limits on email file size, I'm going to send you the PDM materials for the Capitol Records project in a series of emails. Attached here are (1) our list of issues and questions for the City Departments and (2) a roof plan showing the project setbacks and sidewalk widths.

With regard to PDM attendees, we'd like Kevin Keller to attend from Planning and Tomas Carranza from DOT. We've been working with Kevin and Tomas and both are familiar with the project. It's not necessary to invite anyone from CRA to the PDM. We've been working with Kip Rudd and will schedule a separate CRA meeting with him.

Finally, we'd like to confirm October 22nd at 1:00 pm for the PDM. Thanks for being flexible with the time - 1:00 pm works well for everyone on our team.

Thanks,

Eleanor

Subject: My follow up email to project team and JL RE balconies and FAR — Created: 10/9/2008 11:18 AM, Modified: 10/9/2008 11:18 AM

Last Modified by: Charmie Huynh

From: Department of Building and Safety

Folder: CMYGS

Hello All,

Here's a summary of my discussion with our director Jameson Lee regarding the questions you posed during our meeting last Thursday, Oct 2:

1. Leftover areas that are less than 5' in dimension, but are a part of the balconies that do qualify as private open space as per 12.21G2(b)(2); Are these counted as Zoning Code Floor Area as per ZA2007-3430(ZAI)?

No, we will not count these as Zoning Code Floor Area as long as these areas are a part of the balconies that do qualify as private open space per 12.21G2(b)(2).

2. Interpretation of the measurement of the 6' dimension:

You will need to measure the 6' dimension perpendicular to the boundaries of the open space area. However, you may still have the configuration of your balconies the way you have designed them so far if you have at least 50sf of qualified private open space (i.e., 6' measurement perpendicular, etc.) anywhere on the balcony. If so, then you can have the entire balcony benefit from ZA2007-3430(ZAI). This follows with our interpretation from #1 above.

3. Fixed Wood Lattice with Metal Frame that provide Sun Shade - Does this count as an enclosure for the balconies?

Yes, we will consider this an enclosure for the balconies. You may request to the Department of City Planning that they make the determination to not consider these screened balconies (be specific with the description of the screens) as "enclosed balconies" and thus not counting towards the FAR. You would need to have this request as part of your entitlement package.

4. Glass Curtain Wall as another "sun shade screen" for balcony areas

See #3 above.

5. REGARDING the wood lattice with metal frame (This issue was not discussed during our meeting):

I would like to mention that for Building Code purposes, Type I construction typically does not allow combustible material. Please look into this issue.

6. Another issue that was not discussed at our meeting:

Please contact Greg Shoop from City Planning regarding possible alternative ways to increase the allowable FAR w/o having to do a GPA. Greg can be reached at 213-482-7074. If there is another way around this max FAR issue, then most of your balcony issues would be solved.

Please let me know if you have any questions.

Thank you

Folder: Pre Development

Hello,

You are invited to a case management pre-development meeting for the proposed Millennium Hollywood High Rise projects at 1750 N Vine St (East Site) and 1751 N Vine St (West Site). The Project Narrative is attached to this email.

Date: Wednesday, October 22, 2008
Time: 1:00pm - 3:00pm
Location: 221 N Figueroa St., Suite 160, Los Angeles, CA 90012

Applicant: Alfredo Fraija, Attorney at Law, Allen Matkins, 213-955-5607

Questions and Issues for the City Departments:

1.) Planning/Building & Safety:

Confirmation of required entitlements with respect to the proposed project (are any other entitlements required?)
Confirmation of setbacks provided
Are there minimum distance requirements between the two towers?
Are there minimum distance requirements regarding light and air for windows facing windows, alleys or lot lines?
Confirm loading spaces required for the project and their required dimensions
Discuss balcony enclosure and screening issues (ZA 2007-3430(ZAI) Memo)

2.) Public Works:

Are any offsite improvements required, such as street widening, other than what a traffic study might suggest?

Confirm sidewalk and street dedication requirements
Sewer facility charge and credit
Adequacy of storm drain system near project
Confirmation of sewer capacity availability
Are there any requirements for on-site storm water retention, treatment, discharge during construction and/or operation?
What are the required public improvements regarding street trees etc?
What are the required public improvements regarding street lights?
How will the Walk of Fame be handled during construction?
Task force to determine viability of underground tunnel and obtaining a franchise

3.) LAFD & Fire Hydrants and Access:

What are the type and location of desired Fire Dept. turnarounds?
Where should on-site hydrants be located?
What fire lane access is required to the buildings?
How do hydrant and fire equipment access requirements impact the layout of units?
General review of and input related to the proposed site plan regarding Fire Department requirements.
Observation deck fire access issues, including capacity, fire escape and elevator.

4.) DWP:

Will we be required to provide public or private utilities?
Requirements for undergrounding utilities, if any.
How will project be metered relative to the air lot subdivision?
Potential relocation of traffic island and right-hand turn lane at corner of Yucca and Argyle to create a park
General review and input regarding the proposed site plan and DWP requirements, including water and power service availability, water and power connections and clear distance from existing or future power lines.
Your attendance is greatly appreciated. If you cannot attend, please reply to me via email with your comments and any information you can pass along to the Applicant to address their concerns/issues.

Attached are some of the project files. I will be sending an additional 4 other emails containing the project files.

Thank you

Frank Comfort, Captain - Fire Department, Hydrants and Access Unit
Kevin Keller - City Planning
Richard Ferguson or his designated staff - City Planning, Enforcements Division
Hector Benuelos - Bureau of Street Trees, Public Works,
Rene Baluyot - DWP
Charmie Huynh - LADBS
(Tentative) Ken Bernstein - City Planning, Office of Historic Resources (Lambert will not be able to attend)

Basically, the agenda is as follows:

Self Introductions
Brief Project Overview by your group
Then, we will go around by each department to address the questions you have prepared for them.

Thanks

Hi Charmie,

I'm just checking in to make sure you have all the information you need from us for the PDM next week. Also, can you provide us with a list of confirmed City attendees and with any agendas or other similar materials?

Thanks!

Eleanor

Subject Sent Early Zoning Plan Review Service email to Alfred

Created: 10/10/2008 2:55 PM
Modified: 10/10/2008 3:05 PM

Last Modified by: Charmie Huynh

From: Department of Building and Safety

Folder: CMNGS

Dear Alfred,

As your LADBS Case Manager, I would like to introduce you to our new "Early Zoning Plan Review" program exclusively developed for high rise projects. Your project may benefit from this program.

The normal building plan check submittal will usually take place after the end of 9-12 months of the planning entitlement process and the completion of all the construction drawings. If any violation of a zoning related issue is revealed after regular plan check, major cost in time and money will be required to resolve the issues by re design and/or applications for additional planning entitlements approval.

The "Early Zoning Plan Review" service will allow an earlier confirmation of project compliance with the zoning requirements which includes, but not limited to; building setbacks, sidewalk height, maximum floor area ratio, open space, passageway, density, number of parking spaces required, parking layout...etc.

Due to the familiarity of your project, I will conduct the early zoning review for your project. Simply provide sufficient architectural design and draft of entitlement action approved by the Planning Department.

When this early zoning plan review is completed, typically after 2-3 weeks after submittal, you will receive a complete correction sheet identifying any zoning related violations. I will be responsible to verify zoning compliance after you make all necessary corrections. In addition, you will also receive a "Clearance Summary Sheet" listing all required sign-offs from other agencies enabling you to proceed with required clearances ahead of time.

The "Early Zoning Plan Review" fee is based on 30% of the project's total permit valuation. For your project, please contact me for the estimated zoning plan checking fee. This amount will be deducted from the plan check fee when you submit for the full building plan check.

For more information, please contact me at 213-482-6875

Thank you

Charmie Huynh, P.E.

WC,

Would it be possible for you or your staff to attend this predevelopment meeting this Wednesday from 1PM to 3PM. Our group has a scheduled meeting with Councilmember Alarcon at the same time and I won't be able to attend the predev meeting. Please let me or Charmie know.

Charmie, I will forward the water info as soon as I get it from the water engineer.

Thanks!

Rene

When: Wednesday, October 22, 2008 1:00 PM-3:00 PM (GMT-08:00) Pacific Time (US & Canada).
Where: 221 N Figueroa St., Suite 180, LA, CA 90012

Hello,

You are invited to a case management pre-development meeting, for the proposed Millennium Hollywood High Rise projects at 1750 N Vine St (East Site) and 1751 N Vine St (West Site). The Project Narrative is attached to this email.

Date: Wednesday, October 22, 2008

Time: 1:00pm - 3.00pm

Location: 221 N Figueroa St., Suite 180, Los Angeles, CA 90012

Applicant: Alfredo Fraijo, Attorney at Law, Allen Matkins, 213-955-5607

Questions and Issues for the City Departments:

1.) Planning/Building & Safety: Confirmation of required entitlements with respect to the proposed project (are any other entitlements required?) Confirmation of setbacks provided Are there minimum distance requirements between the two towers? Are there minimum distance requirements regarding light and air for windows facing windows, alleys or lot lines? Confirm loading spaces required for the project and their required dimensions Discuss balcony enclosure and screening issues (ZA 2007-3450(ZAI) Memo)

2.) Public Works: Are any offsite improvements required, such as street widening, other than what a traffic study might suggest? Confirm sidewalk and street dedication requirements Sewer facility charge and credit Adequacy of storm drain system near project Confirmation of sewer capacity availability Are there any requirements for onsite storm water retention, treatment, discharge during construction and/or operation? What are the required public improvements regarding street trees etc? What are the required public improvements regarding street lights? How will the Walk of Fame be handled during construction? Task force to determine viability of underground tunnel and obtaining a franchise

3.) LAFD & Fire Hydrants and Access: What are the type and location of desired Fire Dept. turnarounds? Where should on-site hydrants be located? What fire lane access is required to the buildings? How do hydrant and fire equipment access requirements impact the layout of units? General review of and input related to the proposed site plan regarding Fire Department requirements. Observation deck fire access issues, including capacity, fire escape and elevator

4.) DWP:W: I we be required to provide public or private infiltr os? Requirements for under grounding utilities, if any. How will project be metered relative to the air lot subdivision? Potential relocation of traffic island and right-hand turn lane at corner of Yucca and Argyle to create a park General review and input regarding the proposed site plan and DWP requirements, including water and power service availability, water and power connections and clear distance from existing or future power lines.

Your attendance is greatly appreciated. If you cannot attend, p ease reply to me via email with your comments and any information you can pass along to the Apol cant to address their concerns/issues.

Attached are some of the project files. I will be sending an additional 4 other emails containing the project files.

Thank you

Charmie Huynh, P.E.

-BOSS - Hector Bandelon mentioned that they govern less off-site. Onsite trees by City Planning
-BOS-WPD - Ammar Eltawil discussed the feasibility of the bio-swale option; possibilities for combination design. Gave requirements to Gary/arch. AE said they will need grading approval for OK to have onsite infiltration. During construction, they will need to prepare a SWPPP.
-BOE - Carl Mills said 2' Hwy Dedication req'd on Vine St, both sides. There are widening requirements that they could appeal during planning entitlements. Alley off of argyle, not sure if fully improved. They may have to dedicate some in the alley. Need to do SFC study now. Need formal council directive for the tunnel. Gregg Vandergriff is a contact for the Walk of Fame.
-DWP - Power - Rodolfo Monroy gave vault size reqts. Vaults need to be on private property.
Planning/LADBS - I confirmed that all street frontages are front yards, the rest are side yards, but they need to get this confirmed from Planning. Richard Ferguson said this can be done in the VBT, that they will designate the yards then. Kevin Keller advised them to get CM involved in the design of their signs. entitlements include FAR and hotel near R zones. Alfredo Perez said initially, they do not see a problem with the wood lattice and glass screens. However, they would like to have a discussion with Alan Bell on this. I asked that they include me in that mtg with Alan Bell.
-Fire Department Hydrants and Access - afterwards, we went to the FD counter (Hyd and Acc) to talk to Insp Lynn McClain. He gave them general requirements and a follow up detailed meeting will be needed at a later date.

Hi Alfred,

You're welcome. I'm glad the meeting was productive for you el.

I will proceed with scheduling the fire safety meeting, but I need an agenda first before I set that one up. That meeting will be with LADBS (me) and the Fire Department Building Standards Group. Please provide me with an agenda as soon as possible.

You will need to schedule your meeting with Inspector Lynn McClain of Hydrants and Access separately.

I also will follow up with Richard Ferguson regarding the balconies once he speaks to Alan Bell.

Thanks

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on an existing ZA's interpretation.

Please let me know if you have any questions.

Thanks

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "unenclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a bounding wall that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition; the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide sight screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view

AR0068243

from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2006 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

****
time spent discussing with JL.

****Issue of the area above the cantilevered living rooms. Back on Oct, JL made the call that the area above the living rooms was not FAR and we can consider these as balconies. However, during my review with him today on this issue sent by Alfred re the wood screens and glass wind breaks, we revisited this area above the cantilvered living room.

Per JL, if Chief ZA is willing to make the interpretation on these louver screens, then we would accept the area above the cantilevered living rooms as balconies and not FAR. See attached file, sections 6 and 7. Section 6 shows louvered wood screen. Only difference with Section 7 is that the louvered screens are replaced with a glass wall. JL said if the ZA is going to let the louver screen go, then we would accept the situation in Section 7 because they are almost identical.

Hi Alan,

I sent this email out yesterday regarding the Milenium Hollywood high rise project and the issue of FAR and Balconies. The topic at hand is rejecting the wood louvers and glass wind breaks. I understand from a voicemail message from Alfredo that you feel that LADBS should make the call on this one. I've already spoken with Jameson and we've made the decision to consider these "screens" as enclosures for the balconies and thus creating FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The lawyers want LADBS to consider their interpretation on the ZAI (ZA2007-3430), however, LADBS cannot make an interpretation on a ZA's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back in on Monday. I'd love to get your feedback on this. Jameson and Alfredo are cc'd to this email as well.

Thanks and have a Happy Thanksgiving!

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on an existing ZA's interpretation.

Please let me know if you have any questions.

Thanks

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guard rails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balcon es to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below,

The intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

To/Cc: CMNGS

Hi Chermie - I've reviewed the material you sent me concerning the Millenium Hollywood Development. The Department of Building & Safety's interpretation and application of ZA 2007-3430 (ZAI) concerning FAR and private open space is correct. As the ZAI clearly states, balconies and decks shall not be considered "floor area" for purposes of calculating FAR, only so long as three conditions are met, including condition #2, which is that the balcony or deck remains "unenclosed except for the guard rails required by the Building Code."

The proposed additional screening above the guard rail encloses space that would otherwise be open. The proposed screens, which are parallel to the building wall, do not serve the same purpose as the perpendicular wing walls and privacy screens discussed on p. 4 of the ZAI, which are intended to divide large balconies or decks shared by two or more residential dwelling units.

If you have any questions, please let me know.

possibly tomorrow or next week - really busy today dealing with signs. I can provide you with my opinion, but I still think that technically it has to be DBS's "call" as to how to apply the ZAI to a specific project, since DBS is responsible for interpreting and enforcing the city's zoning ordinances under 12.26. that said, we should talk, and of course I'd be happy to give you my 2 cents.

Hi Channie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind breaks cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to

AR0068249

buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Subject: I forwarded Alan Bell's email to Alfred Fraijo/attorney - Also, discussed issue of cantilevering living rooms
Created: 12/1/2008 4:41 PM
Modified: 12/1/2008 4:41 PM
Last Modified by: Charmie Huynh
From: Department of Building and Safety
Holder: CMNGS

I discussed with alfred that LADBS will count these enclosed balconies (with wood screens and glass screens) as FAR. They need variance from Planning for this increased FAR. He will also explore option proposed by Greg Shoup that says it may be possible to go over the 6:1 w/o variance.

I also discussed that per my last conversation with JL, we now considers the area beneath the projection living rooms as FAR b/c the exterior wall to the living room defines the exterior wall for the building, and it is not longer considered a projection. These areas beneath the "alternating" living rooms (areas are open decks) shall be counted as FAR.

Subject: My email to Alfred regarding exterior wall interpretation (this relates to the cantilevered living rooms)

Hi Alfred,

You're welcome. I'm glad the meeting was productive for you all.

I will proceed with scheduling the fire safety meeting, but I need an agenda first before I set that one up. That meeting will be with LADBS (me) and the Fire Department Building Standards Group. Please provide me with an agenda as soon as possible.

You will need to schedule your meeting with Inspector Lynn McClain of Hydrants and Access separately.

I also will follow up with Richard Ferguson regarding the balconies once he speaks to Alan Bell.

Thanks

Hi Charmie,

I hope you are well.

The project is not on hold. We are taking additional time to review our design and planning approach with our consultant team but we are still moving forward. We anticipate being able to visit with you and consider a submittal with LADBS in the new two months or so. I will keep you posted. Thank you for your follow-up.

Best regards (and happy Cinco de Mayo!),
Alfred Frajo Jr.

Hi Alfred,

Hope you're doing well. It's been a while.

Just wanted to check in with you on the status of this project. Is it moving forward? And if so, do you know if they have an approximate plan check submittal date to LADBS?

Thanks.

Hi Ray,

I spoke to Dana Prevost regarding the Millenium project at 1750 N Vine St. He mentioned that he met with the project team to discuss the Hollywood Fault line that could potentially be crossing the property. Here are some bullet points on what we discussed:

Currently, the Hollywood Fault line is not mapped and may be addressed by the State Geologist in the next 4-5 years min mum.
Per code section 1803.5.11, a geotechnical report shall be conducted for the site to address (among other things) surface displacement due to faulting or lateral spreading. Dana advised the project team that they need to do their own investigation to locate the fault per this code section
Per the Alquist Priolo Earthquake Fault Zoning Act, no structure for human occupancy shall be permitted to be placed on or across an active fault trace. I've attached a copy of our info bulletin and highlighted this condition (#2). It also describes a min 50' no build zone. However, Dana discussed with the project team that he has granted one modification in the past on another project that allowed them to build right adjacent to the fault line.
Please let me know if you have any questions.

Hi Ray,

Thank you for taking our call yesterday. The property address is 1750 North Vine Street.

We are looking for information on the building code regulations that apply to development within a fault zone or prohibitions on development related to fault areas. We were informed by Mr. Dana Prevost that a limited fault investigation would be required in the portion of the subject site. There is a Hollywood Fault trace mapped by the California Geological Survey that prompted the discussion with Mr. Prevost.

The property extends on two adjacent sites along Vine Street and is generally bounded by Yucca Street, Argyle Avenue and Ivar. Below is a general map of the site.

Thank you in advance for your assistance.

The Millennium Hollywood project, which recently won the approval of the Los Angeles City Planning Commission but still needs the backing of the City Council, would be splayed across 4.47 acres of Hollywood, bordering two sides of Vine Street, weaving around the historic Capitol Records building (Shimanaya Illustration / April 3, 2013)

By The Times editorial board
April 4, 2013
For far too long, development in Los Angeles has been approved based not on community plans and zoning codes but on a somewhat chaotic form of negotiation in which developers cajole, strong-arm or, um, financially incentivize city politicians into making concessions and giving breaks. It's time for that to stop. There is a reason why carefully thought out and democratically adopted zoning codes and strategic growth plans should be adhered to — especially in a city destined for its mish-mash of buildings.

Last summer, after a bitter but long overdue debate, the city approved a new and detailed Hollywood Community Plan. That plan went through years of public hearings and community comment, and was ultimately approved by the City Council, 13 to 0. Designed to guide Hollywood growth through 2030, it encouraged greater density around transit hubs. Among other things, it was

CO-0001-1012

well understood that it would lead to taller buildings in the neighborhood.

Now, just nine months later, an enormous and highly controversial project is wending its way through the process. The Millennium Hollywood project, which recently won the approval of the Los Angeles City Planning Commission but still needs the backing of the City Council, would be splayed across 4.47 acres of Hollywood, bordering two sides of Vine Street, weaving around the historic Capitol Records building. The complex would replace a scruffy tract of parking lots and nondescript buildings with two slender towers that at their highest (they will be deliberately asymmetrical) could rise four times the height of the iconic music building. The footprint of the project flanks portions of Vine Street but stretches all the way to Ivar Avenue on the western edge and from Vine to Argyle Avenue on the east.

Including the towers, the other new lower buildings and the existing space in the Capitol Records buildings, the developers say they will have more than a million square feet of residential, office, retail, hotel, dining and fitness center space. (And there will be about 2,000 underground parking spaces.)

Opponents, including numerous neighborhood groups, have extensive objections to the project, which they say would be out of scale with the neighborhood. Mayoral candidate Eric Garcetti has argued that it would be too tall. But despite the many understandable concerns, the Millennium project appears to conform substantially to the Hollywood Community Plan. If it does, it should be allowed to proceed.

That doesn't mean the opposition should stop monitoring the project (as if they would, no matter what we counseled them to do) or that the members of the City Council should not ask hard questions when the project and its developers come before that body seeking approval. For instance: Is the project's traffic study as extensive as it should be? The planning commission thought it was, but Caltrans did not.

There's no doubt that this is a startlingly expansive project, and its towers will do just that -- tower over the Capitol Records building. But height alone is not a deal breaker. There's no reason why an artful design cannot incorporate the historic building much the same way the downtown Central Library is not so much dwarfed by its skyscraping neighbors as it nestles like a jewel in the embrace of those buildings. From the projections on the developer's website, Millennium doesn't quite hover around the Capitol Records building that same way, but developer Philip Aarons speaks of the expansive ground level public spaces of the project as offering vantage points from which to view the building.

It's also worth remembering that when the Capitol Records building itself was erected in the 1950s, it, too, towered over most of the buildings that then existed in Hollywood.

The height of the new towers falls within the density limits of the Hollywood plan, which specifically allows the planning commission to approve an increase in the floor-to-area ratio for this part of Hollywood. The other, smaller variances and conditional-use permits the developers seek appear to be appropriate and reasonable. (For example, they've asked for a variance for above ground-floor outdoor dining.)

The project has benefits for the city, including many construction jobs. Developers have agreed to make this a union project and to offer local workers priority consideration for jobs. The developers are also contributing $4.8 million to the city housing department which will be put toward 106 units of affordable housing being built at two projects, one near Hollywood Boulevard and Western Avenue and the other in Westlake. The developers will give the city $2 million toward traffic mitigation.

This project furthers the goals of the Hollywood community plan without exceeding its specific limits. If the plan itself is unpopular or goes too far, it should be challenged (and, indeed, at least three lawsuits against it have already been filed). But for the moment, it is the best guide that exists to how Hollywood should be developed in the years ahead. Barring a powerful argument to the

AR0068260

contrary, a project that meets its requirements should be approved, and one that violates them should be rejected.

Not that all discretion should (or ever will be) done away with. There will always be an element of negotiation between developers, planners, communities and politicians, as there should be. But the process in recent years has been a mess; all the parties need greater certainty. The city has to stop treating land use approvals as individual transactions — a system that can be gamed — and instead should approach them in the context of smart, forward-looking planning law.

Hi Kyndra,

12.22C20(d) allows balconies not covered by a roof or canopy to project into a required rear yard not more than 4' and into a required front yard, passageway, other open space, or the side yard adjoining the street lot line of a reverse lot, not more than 30".

Vertical projections are those architectural projections that exceed 4' in vertical height. Please see the attached LADBS info bulletin regarding allowable projections. I've highlighted the reference made to vertical projections on page 2.

Please let me know if you have any further questions.

Charmie,

To follow-up on our brief discussion on Monday re balconies, here are the questions that the architects have regarding balconies/projections (below is an excerpt from the architect's email re balconies/projections:

"We need greater clarification from you on the applicable rules and if we can make the below assumptions or not.

Reviewing section 12.22.c.20 regarding projections into yards:

Does not refer to "balconies" specifically as far as I can tell. Does speak to other projections (eaves, sills or other such features - though explicitly excludes vertical projections which we would want in the sideyard)

If I'm reading this correct, gives the following rules:
2" for every 1' of sideyard. So for a 16' sideyard (req for res at this height) we could project max 32"). This is not enough for us.

We would like to project architectural features, including balconies, up to 6' into required side and rear yards.

Please confirm if we can make this assumption?

He also wanted clarification as to what "vertical projections" are in regard to LAMC section 12.22.C.20

Thank you for your help with this!

Best,
Kyndra

Charmie-see attached and email below from architect. Thanks!

Kyndra-

Per our discussion last week, I might you please confirm this statement by your contact at Building department?

Our questions/assumptions:

Sketch 1:
1. No part of balcony counts towards FAR. - correct, since it is projecting from the exterior wall of the building.

2. So long as width does not exceed 5', length does not matter? - width can go beyond 5' as per ZA 2007-3430(2A1) as long as it projects beyond the perimeter of the building. And yes, length does not matter

Sketch 2:
1. Does any area greater than 5' in width count as floor area and thus create an assumed building wall even if not covered by a roof (only other balconies)? - See my answer above.

2. If so, how is this different than a roof terrace (public or private) or amenity terrace? Assume these do not count as floor area? FYI, roof terrace that are uncovered do not constitute floor area.

Sketch 3:
1. If there is an architectural feature beyond the balcony (such as a screen wall, horizontal or vertical expression band) does it affect what is considered floor area? If so, how? Yes, an architectural feature such as a screen covering stacking balconies would render the balconies as enclosed and count towards floor area.

Questionaire Issues for the City Departments.

AR0068271

CO-0001-1024

1.) Planning/Building & Safety:Confirmation of required entitlements with respect to the proposed project (are any other entitlements required?) Confirmation of setbacks provided Are there minimum distance requirements between the two towers? Are there minimum distance requirements regarding light and air for windows facing windows, alleys or lot lines? Confirm loading spaces required for the project and their required dimensions Discuss balcony enclosure and screening issues (ZA 2007-3450(ZAI) Memo)

2.) Public Works:Are any offsite improvements required, such as street widening, other than what a traffic study might suggest? Confirm sidewalk and street dedication requirements Sewer facility charge and credit Adequacy of storm drain system near project Confirmation of sewer capacity availability Are there any requirements for on-site storm water retention, treatment, discharge during construction and/or operation? What are the required public improvements regarding street trees etc? What are the required public improvements regarding street lights? How will the Walk of Fame be handled during construction? Task force to determine viability of underground tunnel and obtaining a franchise

3.) LAFD & Fire Hydrants and Access:What are the type and location of desired Fire Dept. turnarounds? Where should on-site hydrants be located? What fire lane access is required to the buildings? How do hydrant and fire equipment access requirements impact the layout of units? General review of and input related to the proposed site plan regarding Fire Department requirements. Observation deck fire access issues, including capacity, fire escape and elevator.

4.) DWP: Will we be required to provide public or private utilities? Requirements for undergrounding utilities, if any. How will project be metered relative to the air lot subdivision? Potential relocation of traffic stand and right-hand turn lane at corner of Yucca and Argyle to create a park. General review and input regarding the proposed site plan and DWP requirements, including water and power service availability, water and power connections and clear distance from existing or future power lines

Your attendance is greatly appreciated. If you cannot attend, please reply to me via email with your comments and any information you can pass along to the Applicant to address their concerns/issues.

Attached are some of the project files. I will be sending an additional 4 other emails containing the project files.

Thank you

Subject: Millennium Hollywood Development: Balcony Discussion

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in or all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Subject: Millennium Hollywood Development: Balcony Discussion

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it

"remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Subject: Millennium Hollywood Development: Balcony Discussion

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required,

however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Venture use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies,

similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Hi Charmie,

See if this helps. I have made a quick indication on "sketch 3" how the unit type distributions may work. Generally we are locating a living room at the end of each of the projecting "miradors." Other function may ultimately end up within that area. One possibility is an open loft style kitchen that would flow out to the primary living space.

Let me know if this helps or if you need further clarification.

Thanks

Subject: Re: Millennium Hollywood Development: Balcony Discussion

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on an existing ZA's interpretation.

Please let me know if you have any questions.

Hi Charmie,

I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.

On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.

The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the"

guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass certain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for

Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

possibly tomorrow or next week - really busy today dealing with signs. I can provide you with my opinion, but I still think that technically it has to be DBS's "call" as to how to apply the ZAI to a specific project, since DBS is responsible for interpreting and enforcing the city's zoning ordinances under 12.26. that said, we should talk, and of course I'd be happy to give you my 2 cents.

>>> Charmie Huynh 11/25/2008 12:31 AM >>>
Hi Alan,

I sent this email out yesterday regarding the Millenium Hollywood high rise project and the issue of FAR and Balconies. The topic at hand is regarding the wood louvers and glass wind breaks. I understand from a voicemail message from Alfredo that you feel that LADBS should take the call on this one. I've already spoken with Jameson and we've made the decision to consider these "screens" as enclosures for the balconies and thus creating FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The lawyers want LADBS to consider their interpretation on the ZAI (ZA2007-3430), however, LADBS cannot make an interpretation on a ZA's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back in on Monday. I'd love to get your feedback on this. Jameson and Alfredo are cc'd to this email as well.

Thanks and have a Happy Thanksgiving!

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrators memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "projections or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required

AR0068293

guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Subject: Fwd: Re: Millennium Hollywood Development: Balcony Discussion

Hi Charmie. I've reviewed the materials you sent me (below) for Millennium Hollywood Development. The Department of Building & Safety's interpretation and application of ZA 2007-3430 (ZAI) concerning FAR and private open space is correct. As the ZAI clearly states, balconies and decks shall not be considered "floor area" for purposes of calculating FAR, only so long as three conditions are met, including condition #2, which is that the balcony or deck remains "unenclosed except for the guard rails required by the Building Code."

The proposed additional screening above the guard rail removes space that would otherwise be open. The proposed screens, which are parallel to the building wall, do not serve the same purpose as the perpendicular wing walls and privacy screens discussed on p. 4 of the ZAI, which are intended to divide large balconies or decks shared by two or more residential dwelling units.

If you have any questions, please let me know.

possibly tomorrow or next week - really busy today dealing with appeals. I can provide you with my opinion, but I still think that technically it has to be DBS's "call" as to how to apply the ZAI to a specific project, since DBS is responsible for interpreting and enforcing the city's zoning ordinances under LAMC 12.26. That said, we should talk, and of course I'd be happy to give you my 2 cents.

>>> Charmie Huynh 12/25/2008 10:31 AM >>>
Hi Alan,

I sent this email out yesterday regarding the Millennium Hollywood high rise project and the issue of FAR and Balconies. The topic at hand is regarding the wood louvers and glass wind breaks. I understand from a voicemail message from Alfredo that you feel that LADBS should defer the call on this one. I've already spoken with Jamieson and we've made the decision to consider these "screens" as enclosures for the balconies and thus counting FAR for the project. We feel that the ZAI does not specifically address these types of wood louvers and glass wind break screens. The owners want LADBS to consider their interpretation on the ZAI (ZA2007-3430), however, LADBS cannot make an interpretation on a ZA's interpretation. That's why we have referred them to Planning for an interpretation on the ZAI.

I'll be out of the office starting this afternoon and back in on Monday. I'd love to get your feedback on this. Jamieson and Alfredo are cc'd to this email as well.

Thanks and have a happy Thanksgiving!

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-4988-ZAI) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would not consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide certification on an existing ZAI interpretation.

Please let me know if you have any questions.

Thanks

Hi Charnie,
I'm following up with you and Planning regarding the balcony enclosures raised at our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting. On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we received at the pre-development meeting states that a balcony will not be counted in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]lanters or decks which are enclosed with insect screening." Since insect screening must completely surround a planter or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "all enclosed subdivision in a residential building," and specifies that a mezzanine room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03). Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wall breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Instead, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4). Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the balconies and do not connect to the glass rail floor to ceiling the total vertical length of the building. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are comprised of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from

AR0068307

the units and balconies are one of the project's biggest attractions and the towers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break can not be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed by the structural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to enclosure or sunroom, from being excluded from FAR. Accordingly, balconies like those proposed for the project, that are primarily open to the elements on at least one side as observed are not enclosed balconies and should be excluded from FAR.
Please give me a call to discuss this issue. And thanks again for your attention to this project.

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre-development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires

guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.

Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.

Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative features that were added to the design to increase visual interest and improve aesthetics to the buildings, in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.

In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.

Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2008 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.

Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Charmie,

On the issue of space under a projection (i.e., ground floor or balcony space under a habitable room) that would be counted as FAR, can you refer us to the related Building or Zoning Code section for reference?

Thanks in advance.

Hi Alfred,

I discussed this issue with Jameson Lee, our Case Management Director. We still feel that the ZAI (ZA2007-3430 (ZAI)) does not specifically address the project's wooden louvers and glass wind breaks. Thus, LADBS would still consider these elements as enclosing the balconies and making them count towards the project's FAR. I would suggest that you ask the Chief Zoning Administrator to provide an interpretation/clarification on these screens for your project. Basically, LADBS cannot provide clarification on an existing ZA's interpretation.

Please let me know if you have any questions.

Thanks

Hi Charmie,
I'm following up with you and Planning regarding the balcony enclosures based on our brief discussion at the Pre-development meeting. Attached are copies of the materials we shared with you and Planning during the meeting.
On the subject of whether the screens create an enclosure, we would like to submit the following information. In summary, the wooden louvers and glass wind breaks should not be considered building walls creating enclosures based on their design, construction and use.
The Chief Zoning Administrator's memo ("ZAI") we reviewed at the pre development meeting states that a balcony will not be included in FAR if it "remains unenclosed except for the guardrails required by the Building Code." The term "enclosed" or "enclosure" is not defined in the LA Zoning or Building Codes. In considering when guards or guardrails are required, however, the 2007 California Building Code ("Building Code") uses the term enclosed to mean completely closed in or surrounded. Section 1013.4 of the Building Code requires guardrails for certain "[p]orches or decks which are enclosed with insect screening." Since insect screening must completely surround a porch or deck to be effective, it is clear that the Building Code is using the term enclosed to mean closed in on all sides or surrounded.
Additionally, in the definition of habitable room, the LAMC also uses the term enclosed to mean closed in on all sides or surrounded on all sides. The LAMC defines a habitable room as "an enclosed subdivision in a residential building," and specifies that a recess from a room or an alcove, which is enclosed only on three sides, is considered a habitable room only if it exceeds certain square footage and can be partitioned off along the fourth side to form a habitable room. (LAMC Section 12.03) Here, none of the proposed balconies are closed in on all sides or surrounded by the glass curtain wind breaks or the fixed wood louvers as contemplated by the Building Code and the LAMC. Indeed, all balcony designs leave one or more wall areas open except for the required guardrails.
Additionally, the wooden louvers and glass breaks create a screen against the natural elements and adjoining balconies consistent with privacy screens defined in the Chief Zoning Administrator's memo ("ZAI"). The ZAI defines a privacy screen as "a decorative feature fastened to a building but that does not provide structural support." (ZAI, p. 4) Here, the fixed wooden louvers fully meet this definition: the louvers are decorative

features that were added to the design to increase visual interest and improve aesthetics to the buildings in line with similar concepts for other world-class buildings (see attached photos). They also do not provide structural support for the buildings and do not extend to the ground floor or occupy the total vertical length of the buildings. As the attached renderings show, the wooden louvers are attached or fastened to the building. They are constructed of widely spaced wooden panels (to be built to Building Code specifications) that provide solar screening but leave the majority of the balcony open to the elements. The views from the units and balconies are one of the project's biggest attractions and the louvers are specifically designed to create consistency or uniformity in the towers while leaving the balconies open to preserve view from the units. Accordingly, the fixed wooden louvers are privacy screens that are not considered exterior walls under the terms of the ZAI regardless of height and do not function to enclose the balconies for FAR purposes.
In addition, the glass curtain walls provided for a wind break cannot be considered to enclose the balconies. They would be separated from the balcony structures by a distance of approximately one foot (1'-0"). As can be seen from the attached section drawings, the glass curtain walls are outside and in addition to the required guardrails. The glass wind break cannot be considered to enclose the balconies.
Based on our research we also found that other local municipalities like City of Ventura use the term enclosed balconies to denote balconies that have been completely sealed off from the outdoors for the purpose of affording the occupant the use and enjoyment of the balcony in all weather and to buffer outside noise. The City of Ventura's 2009 Design Guidelines for Balconies provide that "standard balconies should not be completely enclosed to the natural elements." As discussed below, the intent of the ZAI was to prevent fully enclosed balconies, similar to atriums or sunrooms, from being excluded from FAR. Accordingly, balconies, like those proposed for the project, that are primarily open to the elements on at least one side or screened are not enclosed balconies and should be excluded from FAR.
Please let me know how we should proceed on this issue. And thanks again for your attention to the project.

Hi Charmie,
I met yesterday with one of the applicant's for the Millennium project in Hollywood. I know that they had scheduled a case management meeting with you a while ago. He told me he wanted to "restart" that process with you and wasn't sure his next steps. It's a big project. 1 million SF at the Capital Records site. Can you help?
Thanks!
Blake

Hi Ray

Thank you for taking our call yesterday. The property address is 1750 North Vine Street.

We are looking for information on the building code regulations that apply to development within a fault zone or prohibitions on development related to fault areas. We were informed by Mr. Dave Prevost that a limited fault investigation would be required in the portion of the subject site. There is a Hollywood Fault trace mapped by the California Geological Survey that prompted the discussion with Mr. Prevost.

The property extends on two adjacent sites along Vine Street and is generally bounded by Yucca Street, Argyle Avenue and Vine. Below is a general map of the site.

Thanks you in advance for your assistance.

Hi Ray,

I spoke to Dana Prevost regarding the Millenium project at 1750 N Vine St. He mentioned that he met with the project team to discuss the Hollywood Fault line that could potentially be crossing the property. Here are some bullet points on what we discussed.

- Currently, the Hollywood Fault line is not mapped and may be addressed by the State Geologist in the next 4-5 years minimum.
- Per code section 1803.5.13, a geotechnical report shall be conducted for the site to address (among other things) surface displacement due to faulting or lateral spreading. Dana advised the project team that they need to do their own investigation to locate the fault per this code section
- Per the Alquist Priolo Earthquake Fault Zoning Act, no structure for human occupancy shall be permitted to be placed on or across an active fault trace. I've attached a copy of an info bulletin and highlighted this condition (#2). It also describes a min 50' no build zone. However, Dana discussed with the project team that he has granted one modification in the past on another project that allowed them to build right adjacent to the fault line.

Please let me know if you have any questions.

Thanks.

Dan:
Looks good. I would just like to note that full scope of the investigation will ultimately depend, of course, on the quality of the data from the borings. Also, the allowable building envelope will probably be some distance south of B-1, as I indicated in the meeting. We look forward to seeing the results.

Dana

On Tue, Jul 3, 2012 at 7:00 AM, Dan Eberhart <deberhart@langan.com> wrote:

Dana / Jeffrey

Thanks for meeting us yesterday. The following will summarize our meeting of 2 July 2012 at your office.

1. A fault investigation for the Hollywood fault will be required prior to approval of the tentative map. The investigation was agreed to be limited to the western parcel of the tentative map (that portion west of Vine Street).

2. The subsurface investigation scope as indicated on the attached map and section has been agreed to by the city.

3. Should the building envelope extend north of B1, additional subsurface investigation will be required prior to the issuance of building permits.

4. Should the investigation find evidence of recent fault activity, a restricted use area will be identified by Langan.

5. Should datable materials be found, carbon dating will be performed.

6. Langan will have a meeting with the city to discuss our findings from the fault investigation prior to report submittal.

7. The final geotechnical engineering study as recommended in the city review sheet dated May 23, 2012 is not required prior to approval of the vesting tentative map and will be deferred until the buildings have been designed. The report will be prepared prior to building permit issuance.

Jeff,

Langan's client elected to have the subject log expedited, thus an additional payment was made to the City for the fee difference between standard and expedited turn around. Please confirm you and Dana received such notice and advise where the report is within the queue of reports to be reviewed.

Once reviewed and prior to you and Dana issuing a review letter, Langan would like to meet with you and Dana to discuss your comments. Please advise when this meeting is feasible.
Thank you very much for your time and efforts.

Re: Response to City of Los Angeles Geology and Soils Report Correction Letter
Log # 77007, Soils/Geology File - 2
Vesting Tentative Tract 71837
Hollywood Development
1720 – 1770 N. Vine Street, 1745-1753 N. Vine Street, 6236-6334 W. Yucca Street, 1733-1741 N. Argyle Avenue & 1746-1764 Ivar Street
Hollywood, Los Angeles, California
Langan Project No.: 700019502

Dear Mr. Prevost,

Langan Engineering & Environmental Services (Langan) has prepared these comments as well as a Fault Investigation Report, dated 30 November 2012 in response to your Geology and Soils Report Correction Letter, dated 29 May 2012 for the Hollywood Development, Vesting Tentative Tract 71837.

City Comment 1: Provide a final geotechnical engineering study for the project development in accordance to Section 1803 of the Code and P/BC 2011-113, and as recommended by the consultant on page 9 of the report. The report shall include but not be limited to:

a. A geologic map and cross sections drawn to a suitable scale for a clearly legible reproduction or purposes showing top and bottom of slopes, formation contacts, locations of faults relative to the subject site, existing and proposed topographic profiles, existing and proposed structures and required Code setbacks (7006.3.2);
b. Additional borings, test pits and laboratory testing;
c. During and after construction groundwater control measures;
d. Temporary excavation recommendations considering groundwater, and potential removal of lateral support of adjacent structures, property and/or public way;
e. Allowable lateral shoring deflection;
f. Basement and retaining wall design recommendations considering hydrostatic conditions, surcharge loads and or seismic-induced lateral pressures;
g. Total and differential seismic and static settlements considering total dead and live loads;
h. Proper calculations to substantiate design recommendations.

Langan Response: The referenced geotechnical engineering report is a preliminary study that was prepared in support of ZAR. Per our discussion during the meeting on 2 July 2012, additional fieldwork will be performed and the corresponding geotechnical evaluations and substantiating data will be provided in a final design geotechnical report when the final design plans (building footprint area, height, below grade depths, and column loads) are available.

City Comment 2: Provide a geological investigation to evaluate surface displacement due to faulting. (1803.5.11)

Langan Response: Langan performed a fault rupture investigation within the southern portion of Site as requested and discussed with representatives of the City of Los Angeles Department of Building and Safety. The results of our investigation are presented in our report "Fault Investigation Report for the Hollywood Development, Hollywood, California," dated 30 November 2012. We concluded that active faulting was not present within the investigated portion of the Site.

The northwest portion of the Site, north of our fault investigation boring B4 is currently unexplored since the area is occupied by an Enterprise Rent-A-Car facility. If a structure or portion thereof is proposed for this area of the Site, a fault investigation will be performed within the unexplored portion of the Site. Currently, the unexplored portion of the Site is recommended to be a restricted use area until the absence/presence of active faulting is determined in this area.

City Comment 3: All testing is required to be conducted by a City of Los Angeles lab oratory testing agency. Provide evidence that all laboratory testing is performed by a City of Los Angeles approved testing agency. If soil testing is performed by a different consultant that is a City of Los Angeles approved testing agency a complete laboratory testing report shall be prepared, signed and stamped by the engineer in responsible charge of the testing and shall include testing description and procedure. In addition, a Statement of Responsibility by the Geotechnical Engineer of record concurring with the data stipulated in other consultant's reports and accepting the responsibility of using the data shall be provided.

Langan Response: The requested information will be included in the final geotechnical engineering design report after the building design has been finalized.

We are available to discuss any questions you may have regarding this submittal. Please contact us if you have any questions.

Sincerely,
Langan Engineering and Environmental Services, Inc.

GEOLOGY AND SOILS REPORT CORRECTION LETTER

May 23, 2012

LOG # 77007
SOILS/GEOLOGY FILE - 2

To: Jim Tokunaga, Deputy Advisory Agency
Department of City Planning
200 N. Spring Street, 7th Floor, Room 750

From: Dana Prevost, Engineering Geologist II
Department of Building and Safety

Vesting Tentative Tract: 71837
LOT(S): 1-41 Mixed-Use Subdivision
LOCATION: 1720-1770 N. Vine Street, 1745-1753 N. Vine Street, 6236-6334 W. Yucca Street, 1733-1742 N. Argyle Avenue, 1746-1764 N. Ivar Street

CURRENT REFERENCE REPORT/LETTER(S)	REPORT No.	DATE(S) OF DOCUMENT	PREPARED BY
Soils Report	70001950	11/22/2011	Langan

The Grading Division of the Department of Building and Safety has reviewed the Vesting Tentative Tract 71837 and the referenced preliminary report concerning the proposed approximately 1,166,870 square feet of residential, commercial, retail, and hotel development. The site is bisected by Vine Street, which thereby creates two development sub-areas referred as the West Site and the East Site.

The East Site of the proposed development consists of the 13-story Capitol Records Building with a single-below grade vault chamber, and the two-story Gogerty office building to the north of the Capitol Records Building. The remainder of the East Site is an asphalt paved parking lot. The West Site is presently occupied by on-grade parking lots, with a one-story Enterprise Rent-A-Car building.

Proposed development includes up to 220-foot high towers on the northwest corner of the West Site of the development and up to 585-foot high towers on the east side of the East Site. Up to 4 levels of excavation beneath the West Site and up to 6 levels of excavation below the East Site are proposed.

Total depth of preliminary exploratory excavations was 101.5 feet below grade. Ground water was encountered at 57 feet below grade. The earth materials at the subsurface exploration locations consist of Holocene and Late Pleistocene Age alluvial deposits of gravel, sand and silt overlying older late to middle Pleistocene age alluvial deposits of silt, sand, and gravel. The consultants recommend to support the proposed towers and other heavily loaded structures on mat foundations and/or pile foundations. Lighter low-rise structures are recommended to be supported on conventional foundations. The native undisturbed soils is the recommended bearing material.

According to the Fault Activity Map of California, dated 2010, prepared by the California Geological Survey the Hollywood Fault is considered active and appears to exist in the vicinity of the subject

site. Therefore, a fault investigation report should be performed as required by Code Section 1803.5.11 of the Los Angeles Building Code.

The review of the subject report can not be completed at this time and will be continued upon submittal of an addendum to the report which shall include, but not be limited to, the following.

(Note: Numbers in parenthesis ( ) refer to applicable sections of the 2011 City of LA Building Code. LABC numbers refer the applicable Information Bulletin. Information Bulletins can be accessed on the Internet at LADBS.ORG.)

1. Provide a final geotechnical engineering study for the project development in accordance to Section 1803 of the Code and LABC 2011-113, and as recommended by the consultant on page 9 of their report. The report shall include but not to be limited to:
   a. a geologic map and cross sections drawn to a suitable scale for archiving and reproduction purposes showing top and bottom of slopes, lithologic contacts, locations of faults relative to the subject site, existing and proposed topographic profiles, existing and proposed structures and required Code setbacks (7006.3.2);
   b. additional borings, test pits, and laboratory testing;
   c. during and after construction groundwater control measures;
   d. temporary excavation recommendations considering groundwater, and potential removal of lateral support of adjacent structures, property and/or public way;
   e. allowable lateral shoring deflection;
   f. basement and retaining wall design recommendations considering hydrostatic conditions, surcharge loads and seismic-induced lateral pressures;
   g. total and differential seismic and static settlements considering total dead and live loads;
   h. proper calculations to substantiate design recommendations.

2. Provide a geological investigation to evaluate surface displacement due to faulting. (1803.5.11)

3. All testing is required to be conducted by a City of Los Angeles licensed testing agency. Provide evidence that all laboratory testing is performed by a City of Los Angeles approved testing agency. If soil testing is performed by a different consultant that is a City of Los Angeles approved testing agency, a complete laboratory testing report shall be prepared signed and stamped by the engineer in responsible charge of the testing and shall include testing description and procedure. In addition, a Statement of Responsibility by the Geotechnical Engineer of record concurring with the data stipulated in other consultants reports and accepting the responsibility of using these data shall be provided.

The geologist and soils engineer shall prepare a report containing the corrections indicated in this letter. The report shall be in the form of an itemized response. It is recommended that once all correction items have been addressed in a response report, to contact the report review engineer and/or geologist to schedule a verification appointment to demonstrate compliance with all the corrections. Do not schedule an appointment until all corrections have been addressed. Bring three

copies of the response report, including one unbound wet-signed original for microfilming in the event that the report is found to be acceptable.

Balconies

7 messages

Kyndra Casper <KCasper@sheppardmullin.com> Thu, May 16, 2013 at 2:25 PM
To: "Charmie Huynh (charmie.huynh@lacity.org)" <charmie.huynh@lacity.org>

Charmie,

To follow-up on our brief discussion on Monday re balconies, here are the questions that the architects have regarding balconies/projections (below is an excerpt from the architect's email re balconies/projections:

"We need greater clarification from you on the applicable rules and if we can make the below assumptions or not.

Reviewing section 12.22.c.20 regarding projections into yards.

Does not refer to "balconies" specifically as far as I can tell. Does speak to other projections (eaves, sills or other similar features - though explicitly excludes vertical projections which we would want in the sideyard)

If I'm reading this correct, gives the following rules:

2" for every 1' of sideyard. So for a 16' sideyard (req for rest at this height) we could project max 32"? This is not enough for us.

We would like to project architectural features, including balconies, up to 6' into required side and rear yards.

Please confirm if we can make this assumption"

We also wanted clarification as to what "vertical projections" are in regard to LAMC section 12.22.c.20

Thank you for your help with this!

Best,

Kyndra

To: Kyndra Casper <KCasper@sheppardmullin.com>

Hi Kyndra,

12.22C20(d) allows balconies not covered by a roof or canopy to project into a required rear yard not more than 4' and into a required front yard, passageway, other open space, or the side yard adjoining the street lot line of a corner lot, not more than 30".

Vertical projections are those architectural projections that exceed 4' in vertical height. Please see the attached LADBS info bulletin regarding allowable projections. I've highlighted the reference made to vertical projections on page 2.

Please let me know if you have any further questions.

Thanks.

To: Charmie Huynh <charmie.huynh@lacity.org>

Thanks, Charmie! A couple more questions from the architects:

"Based on the zoning interpretation documents that we have available, it is unclear to us whether the portion of a balcony closest to the building on balconies greater than 5' in width constitutes floor area, and also 'assumed building wall' 5' in from the edge of balcony."

Thanks,

Kyndra

FW: Balcony Diagram

4 messages

Kyndra Casper <KCasper@sheppardmullin.com> Wed, May 29, 2013 at 4:38 PM
To: Charmie Huynh (charmie.huynh@lacity.org)" <charmie.huynh@lacity.org>

Charmie- see attached and email below from architect. Thanks!

Kyndra

Per our discussion last week, could you please run this diagram by your contact at Building department?

Our questions/assumptions:

Sketch 1:

1. No part of balcony counts towards FAR.
2. So long as wall does not exceed 5', length does not matter?

Sketch 2:

1. Does any area greater than 5' in width count as floor area and thus create an assumed building wall even if not covered by a roof (only other balconies)?
2. If so, how is this different than a roof terrace (public or private) or amenity terrace? Assume those do not count as floor area?

Sketch 3:

1. If there is an architectural feature beyond the balcony (such as a screen wall, horizontal or vertical expressor, band) does it affect what is considered floor area? If so, how?

We really appreciate your help with these issues.

Kyndra

>
> Sketch 1:
>
> 1. No part of balcony counts towards FAR - *correct, since it is projecting from the exterior wall of the building.*
>
> 2. So long as width does not exceed 5', length does not matter? - *width can go beyond 5' as per ZA-2007-3430(ZAI) as long as it projects beyond the perimeter of the building. And yes, length does not matter.*
>
> Sketch 2:
>
> 1. Does any area greater than 5' in width count as floor area and thus create an assumed building wall even if not covered by a roof (only other balconies)? - *See my answer above.*

2. If so, how is this different than a roof terrace (public or private) or amenity terrace? Assume these do not count as floor area? *FYI, roof terrace that are uncovered do not constitute floor area.*

Sketch 3:

1. Where is an architectural feature beyond the balcony (such as a screen wall, horizontal or vertical expression band) does it affect what is considered floor area? If so, how? *Yes, an architectural feature such as a screen covering stacking balconies would render the balconies as enclosed and count towards floor area.*

We really appreciate your help with these issues.

Kyrcra

Hi Bruce

Just so FYI that Michael Ritzik interviewed Tomas Carranza today on the subject topic. He specifically was interested in Caltrans concerns that the project was not adequately addressing roadway impacts. Tomas emphasized the process which the department goes through to define and mitigate traffic impacts and how those became recommendations to the City Planning Department. He noted the mitigations the department recommended and referred Michael to Caltrans and the Planning department for information about Caltrans concerns. The planning and land use management committee meets on this particular project tomorrow.

Here is past editorial from the LA Times regarding this project which is generally neutral, but does mention Caltrans briefly:

http://articles.latimes.com/2013/apr/04/opinion/la-ed-0404-hollywood-20130404

Maximum size of the community is scheduled to run on Wednesday.

Please let me know if you have any questions.

Jonathan

Only a few of the many unresolved problems with Millennium Projects

Caltrans never met them on Millennium Policy/Goal projects

Caltrans has made it clear that without significant changes in the plans

Millennium Policy/Goal projects, the Mitigation on the SR1 Freeway will be disastrous

Caltrans – Millennium Hollywood Issues
Department of City Planning Response

Main Issues

Caltrans issued a variety of concerns over the course of the two year environmental process (2011-2013) for the Millennium Hollywood Project with respect to the impacts the project will have on the US-101 Freeway.

1) The primary issue is that **Caltrans and LADOT use different methodologies** in analyzing impacts.

2) Another issue discussed is **Caltrans' belief that the project's adopted mitigation measures do not sufficiently address the anticipated impacts** on the freeway system.

Different Methodologies

The Department of City Planning (DCP) uses LADOT staff as the primary transportation engineering analysts for the environmental documents.

Caltrans uses much more conservative metrics that result in more vehicle trips and typically do not analyze alternative transportation options. LADOT uses methodologies that focus on alternative trips for urban infill projects as prescribed and adopted in the recent Hollywood Community Plan.

The following summarizes the different methodologies employed by the two agencies:

Caltrans	DCP/LADOT Response
Select Zone Analysis	Select Zone Analysis does not take intercepted trips into account, which are a major factor for urban infill projects. The project used a manual approach.
Trip Generation Tables	Land use code and independent variables dictate which formulas were to be used for trip generation. Tables were not used.
Highway Capacity Manual 85th Percentile Queuing	This methodology would be dependent on the area signal timing remaining fixed through 2035, whereas the City varies the signal timing on an instantaneous basis. LADOT also specifies the use of Critical Movement Analysis (CMA) as opposed to Caltrans' recommendation.

Mitigation Measures

Caltrans also identified several on- or off-ramp intersections that were not analyzed, as well as proposed mitigation measures that will not appropriately reduce traffic.

Caltrans – Millennium Hollywood Issues
Department of City Planning Response

DCP's response is that the locations where traffic impacts will be significant are the critical constraints that should be analyzed. The only locations identified in the study were local, signalized intersections of the area roadway system. The freeway ramps, including meters and weave sections, are not part of the roadway constraints in the Hollywood area.

DCP's response regarding mitigation measures is that the project has committed to significant upgrades to the regional transportation system by funding or implementing programs called for in MTA's Long Range Transportation Plan and the Hollywood Community Transportation Improvement and Mitigation Plan. This includes:

- Signal system upgrades
- Upgrades to the transit system (bus stops, ped linkages, etc)
- Transportation Demand Management program as part of the development

Also, given the robust transit system in the Project's vicinity, a main focus of the mitigation program is to reduce automobile trips by enhancing pedestrian and bicycle linkages to the transit system and investing in multi-modal transportation improvements (consistent with the Hollywood Community Plan update).

Discussion

Caltrans brings up appropriate issues regarding the existing conditions and future impacts of the Hollywood Project on the surrounding freeway system.

However, as they note in their Comment No 03-4, the freeway system is already currently operating at a Level of Service F.

It should not be the responsibility of the project to reduce congestion on the freeway, it should be the responsibility of the project to encourage new and existing residents to use alternative transportation options to reduce future impacts on the system.

The project accomplishes this with the variety of improvements provided through their mitigation program.

The project also appropriately analyzes and addresses the impacts to the surrounding residential streets using City of LA accepted methodologies and approaches.

Hi Dakota

See response below in blue box

> Does LADOT agree with Caltrans' assessment that many traffic studies should have been completed?

The traffic impact study for the Millennium Hollywood project was prepared in accordance with LADOT's traffic study policies and procedures. These procedures are consistently used by all proposed development projects. LADOT's procedures were used to assess the project's potential impacts on the area's streets and intersections.

The traffic impact study also included a Congestion Management Program (CMP) analysis. The CMP is a state-mandated program that was developed following the passage of Proposition 111 in 1990. One of the requirements of the CMP, which is administered by the Los Angeles County Metropolitan Transportation Authority (Metro), is for projects to analyze their potential impacts on the freeway systems. The traffic study for the Millennium Hollywood project included the required CMP analysis.

> Also, LADOT met with planning and Caltrans in 2011. Did you expect then that a highway traffic project would be completed?

Our staff does not recollect a meeting with planning and Caltrans in 2011 and are unsure what traffic project you are referring to. You may have to contact the Department of City Planning to see what scoping meetings were held with Caltrans prior to the EIR preparation.

Hope that helps.

Jonathan

Hi everyone,
Planning got inquiries from Dakota yesterday. Tom and I worked on our response as he mentioned, and which was transmitted by Michael LoGrande.
Thank you.
Luci

Hi Carolyn,

See response below for a hold:

> Does LADOT agree with Caltrans' assessment that more traffic studies should have been completed?

The traffic impact study for the Millennium Hollywood project was prepared in accordance with LADOT's traffic study policies and procedures. These procedures are consistently used by all proposed development projects. LADOT's procedures were used to assess the project's potential impacts on the area's streets and intersections.

The traffic impact study also included a Congestion Management Program (CMP) analysis. The CMP is a state-mandated program that was developed following the passage of Proposition 111 in 1990. One of the requirements of the CMP, which is administered by the Los Angeles County Metropolitan Transportation Authority (Metro), is for projects to analyze their potential impacts on the freeway systems. The traffic study for the Millennium Hollywood project included the required CMP analysis.

Also, LADOT met with planning and Caltrans in 2011. Did you expect then that a highway traffic project would be completed?

Our staff does not recollect a meeting with planning and Caltrans in 2011 and are unsure what traffic project you are referring to. You may have to contact the Department of City Planning to see what scoping meetings were held with Caltrans prior to the EIR preparation.

Hope that helps.

Jon Finn

Thanks so much.
Dakota

Hi Dakota,
As the Lead Agency, we are tasked with choosing the appropriate methodology to analyze impacts. With respect to traffic on the city's streets and intersections, the project's transportation analysis was prepared consistent with LADOT's Traffic Study Policies and Procedures. The transportation study also utilized Metro's Congestion Management Program (CMP) to analyze the project's potential impacts to the transit and freeway systems. MTA (Metro) developed the state-mandated CMP following the passage of Prop 111 in 1990. The CMP directs all projects in the County that required to prepare an EIR to conduct transit and freeway impact analyses. While Caltrans argues that the CMP is insufficient, Caltrans' "Guide for the Preparation of Traffic Impact Studies" does not provide adequate clarity as to what constitutes an impact, which the CMP does. In the interest of transparency and consistency and to comply with the Metro's CMP requirements, the project's transportation study included the appropriate CMP analysis. The Planning Department is confident in the level of analysis and mitigation required of this development.

Los Angeles, CA 90012

Re California Public Records Act Requests – Millennium Project

Dear Ms. Harris:

This request is made under the California Public Records Act pursuant to Government Code Section 6250, et seq. Please provide copies of the following from the City (as "City" is defined below).

For ease of reference in this document, please refer to the following **defined terms.**

The "City" shall refer to all officials, employees, consultants, and agents of the Department of Building and Safety, City of Los Angeles, including the City Attorney's office and any and all outside counsel retained by the City.

"Millennium Hollywood" shall refer to Millennium Hollywood, LLC, all related or affiliated companies, and all principals, including Phil Ahrens, officers, employees, attorneys, agents and/or consultants, including but not limited to Langan Engineering and Environmental Sciences, Inc., and the law firm of Sheppard, Mullin

"Project" shall refer to the proposed Millennium Hollywood Project as located at 1720-1770 N. Vine Street, 1745-1753 N. Vine Street, 6236-6334 W. Yucca Street, 1733-1741 N. Argyle Street, 1746-1764 N. Ivar Street, Hollywood, California

"Document," as defined in Govt. Code Section 6252(g), shall mean any handwriting, typewriting, printing, photostating, photographing, photocopying, transmitting by electronic mail or facsimile, and every other means of recording

upon any tangible thing any form of communication or representation, including letters, words, pictures, sounds, or symbols, or combinations thereof, and any record thereby created, regardless of the manner in which the record has been stored.

The public records requests include:

(1) All communications to or from any and all email accounts (including alias accounts set up on the City's email system) of Dana Prevost, John Weight, Pascal Challita, Bud Ovrum, Ray Chan or David Lara from May 1, 2012 through the date of your compliance with this request that relate in any way to the May 2013 Langan Engineering and Environmental Science's Preliminary Geotechnical Report for the Millennium Hollywood Project.

(2) All communications to or from any and all email accounts (including alias accounts set up on the City's email system) of Dana Prevost, John Weight, Pascal Challita, Bud Ovrum, Ray Chan or David Lara from May 1, 2012 through the date of your compliance with this request that relate in any way to the November 2012 Langan Engineering and Environmental Science's Fault Investigation Report for the Millennium Hollywood Project.

(3) All communications to or from any and all email accounts (including alias accounts set up on the City's email system) of Dana Prevost, John Weight, Pascal Challita, Bud Ovrum, Ray Chan or David Lara from May 1, 2012 through the date of your compliance with this request that relate in any way to the Millennium Hollywood Project.

(4) All communications from May 1, 2012 through the date of your compliance with this request between, on the one hand, any and all email accounts (including alias accounts set up on the City's email system) of Dana Prevost, John Weight, Pascal Challita, Bud Ovrum, Ray Chan or David Lara, and on the other hand, any and all email accounts of Millennium Hollywood, and of its EIR Consultants, or its Geotechnical Consultant Langan Engineering and Environmental Sciences, or any of its attorneys from the law firm of Sheppard, Mullin, Richter & Hampton, LLP, including but not limited to Phil Ahrens, CAJA Environmental Services, Dan Eberhart, Rudolph Frizzi, Alfred Fraijo, and/or Jerry Neuman.

I draw the City's attention to Government Code Section 6253.1, which requires a public agency to assist the public in making a focused and effective request by: (1) identifying records and information responsive to the request, (2) describing the information technology and physical location of the records, and (3) providing suggestions for overcoming any practical basis for denying access to the records or information sought.

If the City determines that any information is exempt from disclosure, I ask that the City reconsider that determination in view of Proposition 59 which amended the State Constitution to require that all exemptions be "narrowly construed." Proposition 59 may modify or overturn authorities on which the City has relied in the past.

If the City determines that any requested records are subject to a still-valid exemption, I request that the City exercise its discretion to disclose some or all of the records notwithstanding the exemption and with respect to records containing both exempt and non-exempt content, the City redact the exempt content and disclose the rest. Should the City deny any part of this request, the City is required to provide a written response describing the legal authority on which the City relies.

Please be advised that Government Code Section 6253(c) states in pertinent part that the agency "shall promptly notify the person making the request of the determination **and the reasons therefore**." (Emphasis added.) Section 6253(d) further states that nothing in this chapter "shall be construed to permit an agency to delay or obstruct the inspection or copying of public records. The **notification of denial** of any request for records required by Section 6255 shall set forth the names and titles or positions of each person responsible for the denial."

Additionally, Government Code Section 6255(a) states that the "agency shall justify withholding any record by demonstrating that the record in question is exempt under expressed provisions of this chapter or that on the facts of the particular case the public interest served by not disclosing the record clearly outweighs the public interest served by disclosure of the record." (Emphasis added.) This provision makes clear that the agency is required to justify withholding any record **with particularity as to "the record in question."** (Emphasis added.)

Please clearly state in writing pursuant to Section 6255(b): (1) if the City is withholding any documents, (2) if the City is redacting any documents; (3) what documents the City is so withholding and/or redacting, and (4) the alleged legal bases for

withholding and/or redacting as to the particular documents. It should also be noted that to the extent documents are being withheld, should those documents also contain material that is not subject to any applicable exemption to disclosure, then the discloseable portions of the documents must be segregated and produced.

We request that you preserve intact all documents and computer communications and attachments thereto, including but not limited to all emails and computer files, wherever originated, received or copied, regarding the subject matter of the above-referenced requests, including archives thereof preserved on tape, hard drive, disc, or any other archival medium, and including also any printouts, blowbacks, or other reproduction of any such computer communications.

If the copy costs for these requests do not exceed $200, please make the copies and bill this office. If the copy costs exceed $200, please contact me in advance to arrange a time and place where I can inspect the records. As required by Government Code Section 6253, please respond to this request within ten days. Because I am faxing this request on June 25, 2013, please ensure that your response is provided to me by no later than **July 5, 2013**. Thank you.

Very truly yours,

Cc: Bruce Gilman <bruce.gillman@lacity.org>, Jaime de la Vega <jaime.delavega@lacity.org>, Nat Gale <nat.gale@lacity.org>, Sonja Trauss <sonja.trauss@lacity.org>, Marcel Porras <marcel.porras@lacity.org>, Michael LoGrande <michael.logrande@lacity.org>, Tomas Carranza <tomas.carranza@lacity.org>, Jay Kim <jay.kim@lacity.org>

Hi Vicki,

I just wanted to keep you apprised of a media query we got regarding the Hollywood Millennium Project. You may already be aware that the Caltrans has sent letters to the City contesting the adequacy of the FEIR and LADOT's recommendations from the development traffic impact study.

In the past the department has consistently conveyed to both the LA Planning Department as well as the media that our traffic impact studies are in compliance with the City's requirements.

We have met with the Caltrans public relations office today and they have conveyed to the media that they have sent letters to the City without receiving any response.

The planning department's recommendations are scheduled to go to the full council July 24th.

Does the mayor's office have a preferred message to convey to the media about this project?

You can see the previous story here:

http://www.dailynews.com/ci_23521930/planned-hollywood-millennium-skyscrapers-project-courses-controversy

Please let me know if you have any questions.

Thanks,

Jonathan

>Hi Bruce and Jonathan
>Thanks for your help on the Millennium project.
>I spoke with Caltrans and they said they had a meeting with LADOT last week
>Would either of you have 10 minutes to talk today or tomorrow?
>Best,

Hi Vicki

I just wanted to keep you apprised of a media query we got regarding the Hollywood Millennium Project. You may already be aware that the Caltrans has sent letters to the City contesting the findings of the FEIR, and LADOT's recommendations from the developer's traffic impact study.

In the past the department has consistently conveyed to both the LA Planning department as well as the media that the traffic impact studies are in compliance with the City's requirements.

We have met with the Caltrans public relations office today and they have conveyed to the media that they have sent letters to the City without receiving any responses.

The planning department's recommendations are scheduled to go to the full council July 24th.

Does the mayor's office have a preferred message to convey to the media about this project?

You can see our previous story here:

http://www.dailynews.com/ci_23521933/[illegible]-millennium-hollywood-project-draws-concern

Please let me know if you have any questions.

Thanks,

Jonathan

>Hi Bruce and Jonathan:
>Thanks for your help on the Millennium project.
>I spoke with Caltrans and they said they had a meeting with LADOT last week.
>Would either of you have 10 minutes to talk today or tomorrow?

Honorable Eric Garcetti
Mayor
City of Los Angeles
200 N. Spring Street
Los Angeles, CA 90012

Re: Items 21 & 22, Hollywood Millennium Project

Dear Mayor Garcetti:

Today, we will be voting on a series of items related to the Millennium project in Council District 13. This is a mixed-use development in the heart of Hollywood that will transform underutilized surface parking lots into a center for office, retail, hospitality and residential uses. This project will act as the gateway to Hollywood and brings great economic development through the creation of 2,900 construction jobs and 1,257 full-time permanent jobs. These are good jobs that will give preference to local, City of Los Angeles residents through the implementation of a Project Labor Agreement and a Hotel Labor Agreement. Additionally, this project will bring an estimated $4.9 million in new tax revenue annually to the City's General Fund, which can support vital public services, such as police and fire.

Hollywood is a dynamic neighborhood and the ideal place to develop high-rise construction. The Millennium project will consist of two high rise towers; a 35 and a 39 story tower adjacent to mid-rise towers on opposite sides of Vine Street near the Capitol Records building. These building heights were significantly reduced from their original plans, as I requested, without sacrificing the public space below. The project will respect the historic Capitol Records building by making it the central focus of the project, maintaining view sheds through open space and setback requirements and imposing strict conditions throughout the construction process, so as to not disrupt recording sessions. The Millennium project recognizes the significant history of Hollywood and will pay tribute through the preservation and restoration of the Walk of Fame and the Jazz Mural, while embracing the future of Hollywood through new community area programming in the project's public plazas.

This project is consistent with the long range vision for Hollywood and will build upon the fact that Hollywood is a tourist destination, a business hub for entertainment related uses and a booming residential community served by an extensive network of public transit options, including the Metro Red Line. The Millennium project supports the idea of an all inclusive Hollywood through sustainable development principles and the provision of extensive community benefits to address issues such as traffic, affordable housing, park space and the promotion of the arts. To that end, the Millennium project is providing a comprehensive set of project features that support community goals and objectives.

CITY HALL: 200 N. Spring St., Room 450, Los Angeles, CA 90012-4801, PHONE: 213-473-7013, FAX: 213-473-7934
DISTRICT OFFICE: 6500 Hollywood Boulevard, Los Angeles, CA 90028, PHONE: 323-957-4500, FAX: 323-957-4520
www.cd13.lacity.org

Throughout the entitlement process the development team has engaged community stakeholders and the City family to determine necessary project mitigations and conditions. Specifically related to transportation enhancements, the project will support the improvement of more than 30 signalized intersections to enable them to respond to real-time traffic demands and the creation of a Transportation Management Organization, which will encourage transit solutions for the entire Hollywood area through partnerships with other major employment and housing centers. It will also support a mobility hub, pedestrian improvements at Ivar and Argyle Avenues, a $250,000 contribution to the Bike Plan Trust Fund, and improvements to the Argyle & Franklin–US 101 Northbound Freeway On-ramp. The project will provide funding to launch the Parking Express program in Hollywood, additional DASH routes with extended schedules, as well as a Neighborhood Circulation Shuttle. Traffic is always a primary concern when new development is proposed and I believe this project addresses the traffic issues through the utilization of public transit and new proposals such as the Parking Express program.

The Millennium project is utilizing the Land Use Equivalency Program (LUEP) and has strong Development Regulations in place to ensure a well-designed project. The LUEP is a planning tool that allows uses to be exchanged within a pre-determined building envelope while allowing flexibility of allowable uses. This program allows multi-phased developments to respond to market demands and community needs, as long as the project is consistent with the impacts analyzed in the Environmental Impact Report.

Under the LUEP, it can be challenging to assure community stakeholders of the final project with certainty, and in order to address that, I have worked with the development team to add a condition of approval that requires, upon the issuance of building permits, that the development team will work with my office to notify the public regarding the ultimate uses and related construction schedule. This provision, along with the Development Regulations, provides the necessary guidelines to feel confident that the Millennium project will be a well-designed development. The Development Regulations are extremely prescriptive and dictate everything from how the building relates to the street to the width and height of each tower per established standards. The Millennium project is the first major project in the City to use the LUEP in conjunction with Development Regulations.

There have also been significant concerns raised regarding seismic issues and Building and Safety representatives will be at today's Council meeting to address any questions related to this matter. I take all issues related to public safety very seriously and will continue to work with Building & Safety on this matter and make sure all information is available to the public.

I support the revised Millennium project and hope you agree that it is a grand-scaled ongoing project that will further establish Hollywood as a regional destination. It is a thoughtful project that embraces Hollywood and its future. It encourages multi-modal transit options, improves the area infrastructure and supports the development of new affordable housing through a $4.8 million contribution to the City's Affordable Housing Trust Fund. The revitalization of Hollywood will continue to be a priority of my administration and I will support development that advances this goal.

With Kind Regards,

MITCH O'FARRELL
Councilmember

Millennium Project
FAQ's

1. When will the project be built and completed?

It is a multi-phased project that is expected to be completed by year 2020

2. How does the Millennium Project utilize the Land Use Equivalency Program (LUEP)?

The LUEP provides development flexibility so that the project can respond to the growth of Hollywood and market conditions over the build-out duration of the development. It is a tool meant to address future needs and demands while defining the parameters for the land use types and intensity on the project site, all within the scope of analysis in the Environmental Impact Report (EIR).

The LUEP allows for modifications to the final development scenario but requires that the project's peak hour trip generation remain the same or decrease. To that end, the intensity and type of land uses on the project site including residential, commercial, retail, office, restaurant and fitness will be modified to meet market demand while NOT being permitted to exceed the trip cap of 1,498 total peak hour trips.

The proposed number of parking spaces included at the project will be dependent upon the ultimate configuration of land uses but will be in accordance with the number required by the Los Angeles Municipal Code.

3. What is the purpose of the Development Regulations?

The Development Regulations include guidelines and standards that establish minimum and maximum requirements with respect to height, massing, density, open space, landscaping, parking, setbacks and signage that ensures development is compatible with the district and nearby historic buildings. Additionally, the regulations include site wide development criteria and a set of controls that ensure a quality development including façade articulation and materials.

4. Why does this project utilize Floor Area Averaging (FAA)?

FAA will enable the project to provide an appropriate mix of uses across the two project sites on opposite sides of Vine Street. As a perfect development, the project will maximize open space, walkability and unify public improvements. In addition, the project will provide mid-block connections with pedestrian walkways and plazas. FAA supports a unified development concept.

5. Is the project height and density appropriate for Hollywood?

The project proposes to utilize 6:1 Floor Area Ratio (FAR) to provide a mixed-use development that includes residential, hotel, retail and offices uses to be consistent with the Regional Center designation. The provision of residential and commercial uses contributes to the jobs and housing balance intended for Regional Center areas served by extensive public transit.

The Hollywood Community and Redevelopment Plans (past and present) does not limit height and allows 6:1 FAR through discretionary approval. Additionally, the zoning of the project site allows a limitation of 200 sq. ft. per dwelling unit, or a maximum of 972 units for the 194,438 sq. ft. project site. The project is contemplating 492 residential units, which is well below the allowable density of the project site.

6. How does the proposed project respond to traffic issues?

Traffic for the project was analyzed in the same manner as comparable projects throughout the City. The project is improving 39+ signalized intersections with updated technology to allow real-time response to traffic demands. In addition, the project will be required to create an extensive Transportation Demand Management Plan and initiate the development of a Transportation Management Organization. Both of these programs are intended to support the utilization of public transit, vanpools, car sharing, bikes and other alternative means of transportation. The project will also provide critical funding to shuttle circulators, DASH buses, Express Picking technology and pedestrian linkages.

7. What impact will the development have on Public Safety resources?

The project will provide for on-site security personnel and a controlled access system for residents to minimize the demand on police and fire protection services. Furthermore, the EIR found no impact to public services. Additionally, the project will generate new revenue for the City's General Fund that could be applied towards the provision of new police and fire resources.

8. What is the economic impact associated with the Millennium Development?

The development will result in a long term increase of tax revenue for the City of Los Angeles by increasing the property tax base of the project site, generating additional sales tax and possible transit occupancy tax, if a hotel is built. All tax revenue will be allocated to the City's General Fund and can be used to fund basic City services such as police, fire, tree trimming, sidewalk repair and graffiti removal.

Further, the development creates new 2,500 construction jobs and 1,251 full-time permanent jobs. City of Los Angeles residents will be given preference for all employment opportunities.

9. What community benefits are associated with the development?

The community benefits include but are not limited to the provision of $4.8 million dedicated to the creation of affordable housing within the immediate area as well as funds to improve the Hollywood Sign, restore the Walk of Fame and the development of new park space.

10. How will the development respect the historic Capitol Records building?

The Capitol Records building will be maintained and view shafts will be protected. Additionally, the Cultural Recording Rooms associated with Capitol Records will be protected and given special consideration throughout construction. Setbacks are more restrictive than code requirements and have been designed to respect Capitol Records as a historic monument that is the centerpiece of the project.

11. There have been concerns raised regarding seismic issues, how is this being addressed?

The Department of Building & Safety will continue to review this project and additional studies to ensure public safety. All materials will be made available to the public upon request.

MILLENNIUM CHRONOLOGY
1720 - 1770 VINE STREET

1	03/23/2012	Fee paid, tract map (VTT71837) stamped and Langan report, dated 11/22/2011, taken in and placed in holding area pending receipt of letter map from City Planning.
2.	04/18/2012	Soil report by Langan, dated 11/22/2012, was keyed in for review.
3.	05/23/2012	LADBS Correction letter issued. Reviewed by Jeffrey Wilson and Jesus Acosta. Requested detailed geotechnical study and requested geologic investigation for potential surface displacement on the Hollywood Fault
4	07/02/2012	Meeting between Grading Division and Langan (Dan Eberhart) regarding the need for a fault investigation
5	11/08/2012	Meeting between Grading Division and Langan (Dan Eberhart) regarding proposed exploration plan for fault investigation
6.	12/17/2012	Reports by Langan, dated 11/30/2012 (fault investigation) and 12/03/2012 (soil report) submitted.
7	01/31/2013	LADBS issued approval letter for tentative tract and fault investigation report. Detailed geotechnical study to be provided prior to issuance of permits and/or recordation of tract map. Also additional fault studies to be done if development is proposed on northern portion of site, now occupied by Enterprise Car Rental.
8.	06/04/2013	Received first call from Dr. James Dolan (geology professor at USC) and recognized as expert on Hollywood Fault. Arranged for him to view fault report
9	06/05/2013	Received email from Dolan expressing concerns about the lack of correlation between boreholes. In phone conversation he requested that I take a look at the report.
10.	6/10/2013 to 6/13/2013	L.A. DBS Grading Division reviewed report again and had comments about lack of core recovery in addition to Dolan's concerns of lack of correlation between boreholes.
	06/11/2013	Received email from a George Abrahams requesting access to Langan report. (Did not know George Abrahams)
11.	6/13/2013	Left a message with Langan geologist, Dan Eberhart about concerns and

		indicated that we would like to discuss the investigation because based on a closer look at the report we may have to rescind our approval and require additional exploration
12	6/14/2013 to 6/23/2013	Dana Prevost on Vacation. Jeffrey Wilson spoke with Eberhart during this time and did not receive satisfactory answers to our concerns
13.	06/23/2013	Left message with Eberhart that due to concerns over the investigation and the lack of a satisfactory explanation it appeared that we would need to rescind our approval and require additional exploration.
14	06/25/2013	received email from George Abrahams, expressing his concern about the fault investigation. Attached to the email was the Silverstein Report dated 06/18/2013 that was part of an appeal being heard by PUCM
15.	06/28/2013	Received first phone call from George Abrahams, Director of Beachwood Canyon Neighborhood Assoc, expressing their concerns over the fault investigation.
16.	07/01/2013	Phone message from Eberhart that he wanted to meet.
17.	07/03/2013	Received email from SheppardMullin that Jerry Neuman would like to meet with Dana Prevost, Ray Chan and Dan Eberhart.
18	07/12/2013	Silverstein Law Firm issues Public Records Act Request to Hazel Hariz and Dana Prevost
19.	07/12/2013	Received call from John Parrish, Calif. State Geologist over the Calif Geologic Survey, expressing concerns about the Millennium Fault investigation.
20.	07/15/2013	Silverstein Law Firm issues letter to LADBS regarding "Objections to Millennium Hollywood Project: Inadequate Review of Geology/Seismology"
21.	07/16/2013	Meeting with Millennium geologists and attorneys. Ray Chan and Bob Steinbach also present at meeting. The result of the meeting is that Langan will do additional fault investigation.

Regional Administrator
Community Redevelopment Agency of the
City of Los Angeles
Hollywood/East Hollywood Office
6255 Sunset Boulevard, Suite 2206
Los Angeles, California 90028

Re: Comments to the Hollywood Boulevard District and Franklin Avenue Design District Urban Design Standards and Guidelines

Dear Ms. Lambert:

As you know, we represent Millennium Partners and Argent Ventures ("Millennium/Argent") in connection with their proposed redevelopment project on Vine Street that incorporates the Capitol Records Tower and Gogerty Building. The Millennium/Argent project extends on both east and west sides of Vine Street and proposes a transit oriented development with a mix of residential, commercial and office uses (the "Project"). The development objectives for the Project include realizing a new downtown Hollywood, supporting the expansion of entertainment businesses in Hollywood, and providing new day and evening amenities for current and future residents. A central priority also is to preserve the views and function of the Capitol Records Tower as a gateway to Hollywood through smart design that frames the iconic structure.

The Project site is within the Hollywood Redevelopment Project Area. Accordingly, the Project must consider the policies set forth by the Community Redevelopment Agency of the City of Los Angeles ("Agency"), including the development objectives in the Hollywood Redevelopment Plan ("Redevelopment Plan" or "Plan") and the 5-Year Implementation Plan ("5-Year Plan"). In this regard, we have reviewed the draft Hollywood Boulevard District and Franklin Avenue Design District Urban Design Standards and Guidelines ("Draft Guidelines" or "Guidelines") dated March 30, 2010.

We respectfully submit the following comments to the Guidelines. Though our letter responds to the Agency's request for written comments on or prior to July 30th, our intent is to open a dialogue with the community and the Agency about these important development issues. As a stakeholder and developer in Hollywood, Millennium/Argent wants to ensure that the final form of the Guidelines permit the kind of development that honors and continues Hollywood's legacy of innovation and its sense of place recognized worldwide.

INTRODUCTION

First and foremost, we are grateful for the Agency's efforts to prepare the Draft Guidelines and with their publication further a critical planning goal set forth in the Redevelopment Plan. Planning a vision for the future of Hollywood that incorporates its legacy and cultural and physical diversity is an extraordinary task. The Draft Guidelines attempt to marry complex design priorities in response to a range of development possibilities as broad as the points of view in Hollywood. We are very appreciative for the Agency's leadership in this endeavor.

In its current form, however, the Draft Guidelines fail to integrate the flexibility needed to build from rather than imitate the historic forms in Hollywood. This flexibility is important to ensure that new development reflects the kind of creativity and departures from tradition that influenced the most iconic structures in Hollywood. Including development flexibility and a range of compliance options furthers the Agency's core redevelopment objectives in Hollywood.

The Guidelines demand rigid adherence to traditional forms rather than enabling new design and ingenuity. Stated differently, the Guidelines reflect an emphasis on rules rather than opportunities. In so doing, they limit new construction that is forward thinking in terms of design and programming of uses. This approach also conflicts with the City's and Agency's plans and policies for Hollywood.

Our concerns are summarized below and addressed in detail in the following sections:

Comment 1. The Draft Guidelines do not embrace a vision of Hollywood as a regional center

Comment 2. The Draft Guidelines conflict with the Development Objectives in the Redevelopment Plan.

Comment 3. The Draft Guidelines encourage imitation instead of innovation.

Comment 4. The Draft Guidelines conflict with the Project and development trends in Hollywood.

Comment 5. The Draft Guidelines' strict standards regarding height, massing, and ground floor retail are in conflict with the encouragement of open urban spaces.

Comment 6 The Draft Guidelines should be a guide for development and not a platform for controversy.

COMMENTS

1. The Draft Guidelines Do Not Embrace a Vision of Hollywood as a Regional Center.

Hollywood is one of seven regional centers in the Los Angeles metro area that includes Downtown, the Wilshire Corridor and Century City. The Hollywood Boulevard District anchored by Hollywood Boulevard, Sunset Boulevard and Vine Street is recognized by the City as well as the Agency as an important commercial district or center. Similarly, businesses and developers see the district as a gateway to the Los Angeles basin with important regional commercial destinations.

Hollywood's extraordinary history with motion picture production and its status as the entertainment capital of the world fuels its regional importance but also supports a unique and diverse residential community. Yet, the Draft Guidelines do not clearly identify nor further the vision of Hollywood as a regional center with unique potential to attract and retain residents and world-class businesses. This approach overlooks the historical and current realities of Hollywood as well as broader planning goals set forth by the Agency and the City.

a. *The Draft Guidelines are inconsistent with the Hollywood Community Plan and the Redevelopment Plan because it does not identify the District as a regional center.*

The Guidelines, as drafted, are inconsistent with the policies and objectives of promoting Hollywood as a commercial regional center in the Redevelopment Plan and the City's Hollywood Community Plan update ("Draft Community Plan"). State law mandates consistency between redevelopment plans and the applicable local general plan. California Health and Safety Code § 33331. In this case, the Redevelopment Plan must be consistent with the planning priorities for Hollywood in the City of Los Angeles General Plan ("General Plan"). The Draft Community Plan furthers the General Plan priorities in the same way that the Draft Guidelines further the Agency's objectives for Hollywood in the Redevelopment Plan. It stands to bear, that these planning documents should reflect consistency in accordance with state law.

The Draft Community Plan designates the areas east of La Brea Avenue, south of Yucca Street, west of Gower Street and north of De Longpre Avenue in Hollywood as a "downtown regional center". This region, according to the Community Plan, is the "most intensely developed commercial area" in Hollywood and consequently functions as the "heart of Hollywood". Draft Community Plan, pp. 13, 38. The Draft Community Plan further describes the commercial regional center as a "highly urbanized area with considerable pedestrian activity" with resurging growth and a number of new mixed-use developments. *Id.* at 39.

Similarly, the Redevelopment Plan identifies the region of Hollywood along Vine Street and Sunset and Hollywood Boulevard as part of the Regional Center Commercial core, which

includes uses such as theatres, restaurants, hotels, offices and retail or other businesses. Redevelopment Plan, Section 506.2. Importantly, one of the goals of the Redevelopment Plan is to "promote the development of Hollywood Boulevard within the Hollywood commercial core." Redevelopment Plan, Section 300. In this sense, the Redevelopment Plan recognizes the Hollywood district as an important regional commercial center and promotes the development of new commercial and entertainment uses to continue current redevelopment trends in Hollywood.

The Draft Guidelines should identify and promote the District as a growing regional commercial center consistent with both the Redevelopment Plan and the Draft Community Plan. By contrast, as currently drafted, the Guidelines reflect a resistance to this vision and current trends with its demands for "conserving" existing settings and street scenes and "preserving" current street scenes. *See, e.g.*, Draft Guidelines, pp. and 8 – 11, 20 – 22. None of the provisions of the Draft Guidelines promote the policies of the Draft Community Plan or the objectives of the Redevelopment Plan to incentivize growth of the District as a regional commercial center. As currently proposed, the Draft Guidelines provide no explicit recognition in the Introduction or Vision sections (Sections 1.0 and 2.0) regarding the District's role as a growing commercial center for the region.

b. The Draft Guidelines do not promote new and innovative commercial growth in Hollywood as contemplated by the Draft Community Plan and the Redevelopment Plan.

Section 1.2 states that the purposes of the Guidelines are to "define compatibility of new construction and additions in relationship to existing historic and natural settings." Draft Guidelines, p. 6. There are no specific references, however, to new standards of design or efficiencies of space on the ground floor to promote pedestrian activity, new patterns of circulation, greater open space and new iconic structures. The sole objective appears to measure new development against the old. In this regard, the result of the Draft Guidelines is to restrict rather than incentivize dynamic growth in Hollywood.

We know adding new retail and commercial experiences to the eclectic tattoo parlors and t-shirt shops along the boulevard are important ingredients to bolstering Hollywood's evolving identity and support new and existing residents. Entertainment, media and other major businesses that would occupy new class-A office space in Hollywood must be supported with a new range of retail products and services. Attracting this broader range of ground floor retail experience requires innovative settings that may need to – indeed, should be permitted to – depart from traditional or historic forms. This is consistent with Hollywood's spirit of experimentation and innovation of place and design. The Guidelines should aim to keep the Hollywood tradition not the traditional form.

The Guidelines do not identify or promote, for example, ways in which developers can attract and retain new businesses with the built environment using dramatic variation in design

Yet, attracting new businesses and office tenants is an important goal in the Redevelopment Plan and the 5-Year Plan. An emphasis on established forms as precedent rather than context does little to engage developers in designing and developing the next generation of iconic structures and new open space that respond to a growing range of community needs. Consider for example, that new pedestrian and open space connections to the Hollywood Freeway Central Park and the Walk of Fame will be important considerations for future development. The Draft Guidelines should encourage and allow implementation of non-traditional building plans, publicly accessible open space and groundfloor design to connect new development to these important resources. By mostly measuring new development against the existing environment, the Draft Guidelines fail to allow new construction to respond to Hollywood's growth and broader contemporary trends in urban design and planning.

The Guidelines refer to the promotion of Hollywood as an "entertainment destination" and repeatedly refers to Hollywood's "golden era." Draft Guidelines, p. 8. However, the vision for Hollywood in 2030 appears to gravitate to a regular "tourists" haven rather than a gateway to the world. The Guidelines simply demand that new development "maintain" and "conserve the existing historic setting" (Draft Guidelines, pp. 10 and 20) and even limit extension of the skyline as discussed below. Instead of enabling novel concepts and providing guidance for new forms to expand Hollywood's regional commercial development with the built environment as

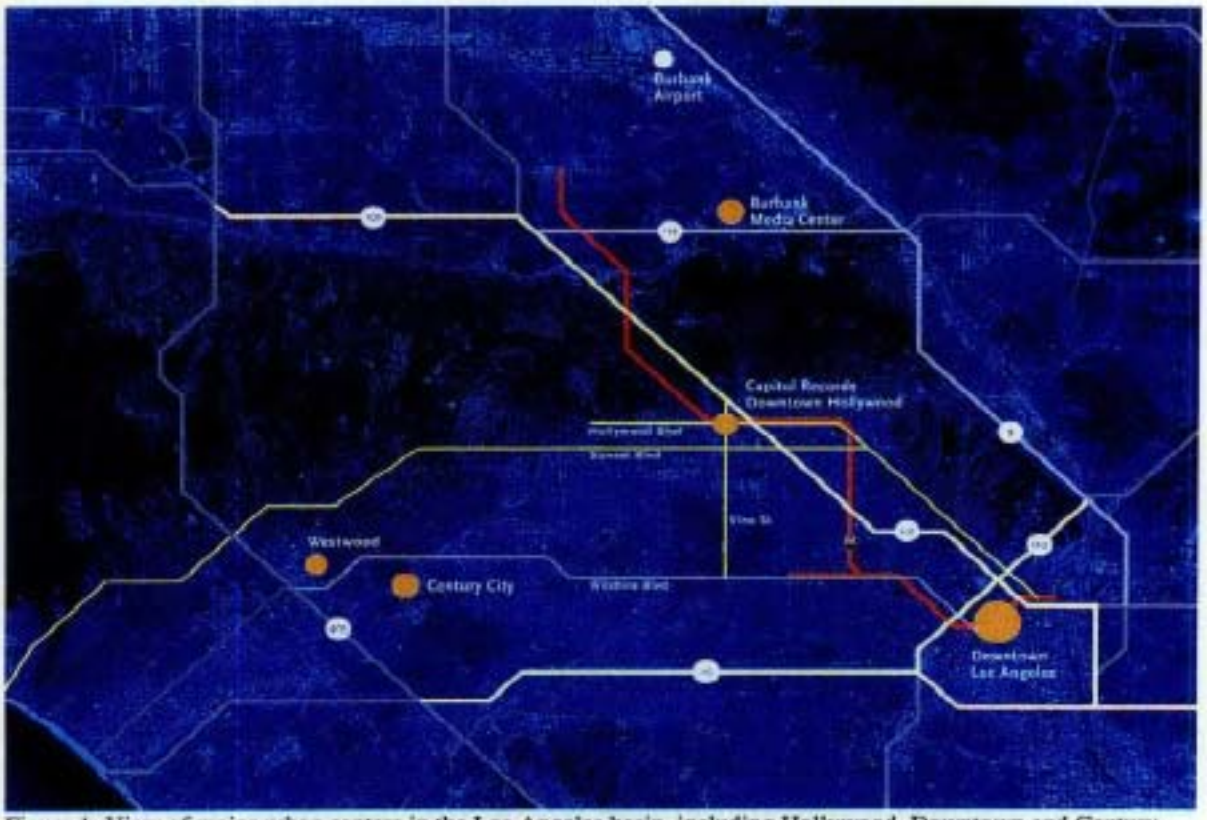

Figure 1: View of major urban centers in the Los Angeles basin, including Hollywood, Downtown and Century City regional centers. (Source: prepared for Millennium Partners.)

context, the restrictions in the Guidelines drop an anchor in the creative soul of Hollywood. The Hollywood community deserves more invention and vision from the Guidelines to match its current and future growth.

In Section 2.1, the Draft Guidelines envision Hollywood as a place to "live, work, walk and shop locally" but there are no planning references or suggestions for developing this mixed-use, regional center concept necessary to sustain a 24-hour lifestyle. Instead, the Draft Guidelines emphasize the need to protect the "quietude" in residential areas (a critical priority in itself) and increase "sidewalk activity." Should the vision for Hollywood in 2030 be mostly that the current "street scenes are conserved" as stated at Section 2.1?

Many stakeholders in Hollywood want to see new retailers and greater variety of commercial services and amenities as discussed above. In response, we are seeing the emergence of a new commercial and shopping experience along the Walk of Fame and other parts of Hollywood. Consider, for example, the current culinary renaissance thanks to top-notch restaurants sprouting all along Hollywood Boulevard from Highland to Vine. You may not need to sacrifice one type of retail for another but you need to acknowledge diversity and identify planning opportunities that encourage a broader range of retail experiences.

Additionally, the Draft Guidelines seem out of step with the Agency's own objectives. The 5-Year Plan specifically acknowledges the change in retail needs of the Hollywood community and identifies new opportunities for development in Hollywood. It calls for the creation of new office and retail uses to address "economic stagnation due to the lack of first-class office space and ***shifting commercial uses***." As set forth in Section 3 below, the Draft Guidelines should be designed with enough flexibility to accommodate a wide range of retail experiences and new ground floor urban spaces that reflect important changes in Hollywood. The build-to-property-line requirement along Hollywood Boulevard and the requirement that new buildings imitate or "maintain" current street walls, to name a few, will ensure that old forms will be duplicated without innovation.

Ironically, even historic Hollywood does not conform to the requirements in the Draft Guidelines. The historic Egyptian Theatre would violate many of the floor plate requirements for Hollywood Boulevard in Section 3.0. Yet, its open courtyard is a marvel of urban space enjoyed daily by hundreds of residents and visitors. The new Hollywood W Hotel development with its courtyard and entrance to the Metro station along Hollywood Boulevard similarly would violate certain requirements in the Draft Guidelines. The Draft Guidelines must permit a range of design opportunities and suggest priorities without the need for rigid requirements or triggering discretionary approval processes.

2. The Draft Guidelines Conflict with the Development Objectives in the Redevelopment Plan.

The Redevelopment Plan sets forth an array of goals that include encouraging economic development, promoting and retaining the entertainment industry, revitalizing the historic core, meeting social needs of area residents, providing urban design guidelines, and preserving historically significant structures. Regarding the Regional Commercial Center, new development must meet the following objectives:

1. Encourage preservation, restoration and appropriate reuse of historically or architecturally significant structures;
2. Assure that new development is sympathetic to and complements the existing scale of development;
3. Provide pedestrian oriented retail uses along the street level;
4. Encourage entertainment, theater and tourist related uses;
5. Provide adequate parking for new and existing uses; and
6. Reinforce and enhance the existing pedestrian environment.

Redevelopment Plan, Section 506.2.1.

The Redevelopment Plan requires the adoption of urban design guidelines to "achieve these objectives". *Id.* It is our understanding that the Draft Guidelines were developed by the Agency in response to this requirement. Unfortunately, the Draft Guidelines, as written, appear inconsistent with and deviate from these objectives.

As discussed above, development in the Regional Commercial Center must be "sympathetic to and

Figure 2: Heritage of tall structures in Hollywood – Taft Building, 1921.

complement[] the existing scale of development." *Id.* at Section 506.2.1. The terms "sympathetic" and "complementary" have no precise legal meaning or legal significance. It is, however, a well-established canon of statutory construction that legislative actions are to be interpreted according to the ordinary meaning of the words adopted by the body taking the action unless the meaning of the statute or ordinance is ambiguous or the words are unclear. *Kimmel v. Goland* (1990) 51 Cal. 3d 202, 208; *Kizer v. Hanna* (1989) 48 Cal. 3d 152, 155.

There is no reason to conclude that the Redevelopment Plan lacks clarity and the terms "sympathetic" and "complementary" should therefore be interpreted according to their ordinary definitions. Since courts will interpret statutory words and phrases in accordance with their plain meanings, we assume that the Agency deliberately chose the terms "complementary" and "sympathetic" in lieu of other equally significant design or architecture terms such as "compatible" or "consistent," which carry different meanings.

Figure 3: Variation in design and massing create a dynamic backdrop for activity along Hollywood Boulevard. (Source: www.yesterdayla.com/hollywood.html)

However, the Draft Guidelines introduce many terms that are inconsistent with the Redevelopment Plan. It shifts from "complementary" to "compatibility" (Section 2.2.4) and "sympathetic" to adherence (Section 2.2.3) with historic Hollywood. For example, Section 2.2.4 states that the height of new buildings and additions should "generally relate" to and "respect" the heights of historic districts and buildings. Draft Guidelines, pp. 11 and 12. Similarly, new buildings should "be observant" of historic settings while the existing buildings provide the framework for "conserving" existing settings. Section 2.2.4 states that new buildings should "respect" building heights in the Hollywood district. *Id.*, at p. 10.

Rather than track the adopted language in the Redevelopment Plan or provide a clear roadmap for complying with the objectives of the Plan, these new provisions set the stage for conflicting interpretations and create controversy over the application of the Draft Guidelines in relation to the Redevelopment Plan. It thwarts the objectives of the Agency's Plan and chills development efforts in the process. Instead of furthering the objectives of the Redevelopment Plan, the Draft Guidelines create competing objectives and requirements. The Draft Guidelines must therefore be revised to reflect the operative language in the Redevelopment Plan and set clearer standards for compliance.

3. The Draft Guidelines Encourage Imitation Instead of Innovation.

The Draft Guidelines attempt to honor Hollywood's rich history by requiring new construction to imitate the architectural styles and details of iconic Hollywood structures. While well intentioned, these requirements in fact make Hollywood's icons less iconic by encouraging imitation rather than contrast and distinction. Hollywood has been and should continue to be an environment for bold and experimental architecture. Building design pushed standard forms in the same way that tall buildings pushed standard conventions of verticality in Hollywood since the 1920s. For example, the Taft Building built in 1921 was a radical departure from the height datum that existed at the time in Hollywood (see Figure 2).

From the Egyptian Theatre to the Magic Castle, to the Crossroads of the World (see Figure 6) to the Grauman's Chinese Theatre (see Figure 4), diversity of design and eclecticism in experience defined Hollywood in its golden years. These developments turned Hollywood into a diverse design mosaic and world-class attraction by bucking contemporary trends. Although these and other buildings in Hollywood may have been controversial at the time of their construction we see them now as beloved icons. They are considered symbols of the spirit of adventure that defines Hollywood. The most important function of the Draft Guidelines should be to embrace and encourage new building forms and experimentation with a respect for the past.

New construction should not be forced to imitate or reproduce historic styles. It can compliment historic structures and datums with similarities as well as differences. The contrast between the modern, newer buildings and the historic structures allow the historic structures to

Figures 4 and 5: View of Grauman's Chinese Theatre (left) and Capitol Records Tower. Both trailblazers of design and building form were destined to become international attractions. (Source: historic postcards, circa 1950s.)

stand out as a monument to Hollywood's history against the backdrop of a thriving, modern commercial center that is Hollywood's future.

Section 4. below, addresses many of the provisions of the Draft Guidelines that require rigid imitation or adherence to historic design. The practical effect is a heavy handed document that discourages unique development forms and has the potential to permanently stall Hollywood's growth as an entertainment center.

4. The Draft Guidelines Conflict with the Project and Development Trends in Hollywood.

The following table describes specific provisions of the text that conflict with important design principles for new construction including the Millennium/Argent Project.

	Draft Guidelines	Comments
4.A	The height of new buildings and additions should be generally related to the heights of historic districts and buildings. Section 2.2 4.B.	Comment 4.A: Delete or revise this guideline. Without additional guidance the requirement is confusing and unnecessarily ambiguous. It suggests imitation and/or strict adherence to current height datum's in Hollywood although other sections in the Draft Guidelines acknowledge and encourage new height parameters. Refer also to Section 2, above.
4.B	Build to less than or equal to 18 inches from the property line. Figure 3-2.	Comment 4.B: Delete this standard. This requirement does not permit, much less encourage, the creation of publicly accessible open space on the ground floor. It would significantly restrict the creation of active pedestrian corridors and other important open space programming for new retail, commercial, office and residential uses along Hollywood Boulevard, Vine Street, Cahuenga Boulevard and Highland Avenue. The Draft Guidelines should encourage not restrict the creation of more open space for residents and visitors.

	Draft Guidelines	Comments
		Comment 4.B, continued The requirement also does not address the importance of considering setbacks whenever appropriate to address proximity to historic structures and to comply with other Agency requirements. For instance, the requirement would prohibit setbacks integrated in the Project's design to protect public view corridors to Capitol Records and views to the Hollywood Hills. These and other view corridors identified by the Agency for preservation could be negatively impacted if a strict adherence to this standard is required. The standard therefore conflicts with existing Agency policy.
4.C	A minimum twenty-four (24) foot high street wall shall be maintained along a minimum of 70 percent of the length of the property line adjoining the public right-of-way. Section 3.1.3.B.	Comment 4.C: Delete this standard. Generic and over-inclusive. Requirement constrains wide range of building types without exceptions. Overly restricts flexibility for buildings that are setback from the property line. See. also. Comment 6.B.
4.D	Maintain the integrity of heights, massing and bulk observed in the district Section 3.2.2.	Comment 4.D: Delete this guideline. Internally inconsistent and conflicts with other requirements in the Draft Guidelines, including the creation of new buildings "that imaginatively extend into the skyline and thereby strengthen the identity and spirit of Hollywood". Section 3.2.2. See. also. Comment 6.B above.

	Draft Guidelines	Comments
4.E	New buildings and additions may be developed to a maximum height of 220 provided that the gross lot coverage shall not exceed 70% of the lot area. Section 3.2.2.I.a.	Comment 4.E: Delete this standard. Does not reflect the range of development and design in Hollywood. Unnecessarily restricts existing property rights without accommodation for land use programming on the groundfloor, larger floor plates for office uses, diverse lot and parcel configuration or context to surrounding environment. Combined with other lot-line development standards it would result in lost groundfloor open space including potentially the formation of random alleyways without any connections to existing pedestrian corridors.
4.F	New buildings and additions may be developed to a maximum height of 220 provided that any floor area above a height of 150 feet shall have a maximum plan diagonal that does not exceed 155 feet in length. Section 3.2.2.I.b.	Comment 4.F: Delete this standard. Restriction is highly damaging and prohibitive for all future development including future development acknowledged in the Draft Guidelines. Unnecessarily restricts existing development rights without any accommodation for land use programming on the groundfloor, diverse lot and parcel configuration or context to surrounding environment.
4.G	The footprint of all architectural extensions shall not exceed 25% of the gross square footage of a building's top inhabited floor. Section 3.2.3.K.ii.	Comment 4.G. Delete or revise standard to allow for greater range of variation. Practical effect is to limit extension to small spires or narrow poles in best-case scenario. Instead, building form and type should dictate architectural extension. Limits seems arbitrary and narrow in perspective.

	Draft Guidelines	Comments
4.H	Variation or modulation in the design of architectural massing for street walls ≤ 18 in. from property line, facades facing these frontages shall express modulation or variation in the design of architectural massing and/or bulk at least once every 125 feet. > 18 in. from property line, every 75 feet Section 3.3.3.A.	Comment 4.H: Delete standard. Guidelines should emphasize variation of design. References to "architectural massing" are incompatible with standard interpretation of the terms "modulation" and "variation" in design for street wall and façade treatments. Change in material and design treatments cannot achieve the type of bulk or "massing" changes required.
4.I	Ground-Related Entries < 18 in. from property line at least once every 75 feet. Entry cannot be higher than 12" above sidewalk. > 18 in. from property line at least once every 50 feet. Entry cannot be higher than 30" above sidewalk. Section 3.3.3.B.	Comment 4.I: Revise standard to allow for a variety of commercial uses and tenant operations. The Plan should differentiate commercial building types and allow for flexibility without discretionary review or approval pursuant to Section 5. For example, for studio, entertainment or other uses, the Draft Guidelines must accommodate unique ground-floor designs to address security or related programming needs. Entrances, pedestrian visibility along primary streets, may need to be limited to accommodate for special security needs.
4.J	Maximum horizontal dimension of façade bays from center of bay to center of bay and the maximum horizontal dimension of un-subdivided glass expanses shall be thirty (30) feet within thirty (30) feet of grade. Section 3.3.3.C.i.	Comment 4.J: Delete or revise standard to allow for a variety of commercial uses and operations. For example, plan for use of glass and bays will vary based on commercial programming and tenant-type. See. also, Comment 4.I.

	Draft Guidelines	Comments
4.K	Balconies cannot project more than one foot from a building's façade surface. Section 3.3.3.G.i	Comment 4.K: Delete. Standard is overly restrictive. Inconsistent with current building and zoning standards for the City of Los Angeles. Substantially limits design and programming for residential and mixed-used building types. Has the practical effect of requiring all balconies to be recessed and may cause residential units to be unmarketable in an already challenged economy.
4.L	Minimum 40-foot deep storefront required along Vine Street Figure 3.4.3.C.	Comment 4.L: Delete or revise this standard consistent with the existing diversity of storefronts and building walls along Vine Street, Hollywood Boulevard, Cahuenga Boulevard. Many building operators and tenants (i.e., studio and entertainment uses) may have special programming and security needs for its operations.
4.M	Storefront requirements:	
a	Shall not be more than 12" higher than adjacent sidewalk. Section 3.4.3.	Comment 4.M.a: Revise this standard. Standard is overly restrictive. Storefront walls should be permitted to respond to site-specific elevations, adjoining building wall context and development intent. As with comments regarding other storefront requirements (see Comments 4.M.b – 4.M.e, below), the Draft Guidelines do not provide enough flexibility and are over inclusive. The standard constrains all buildings no matter the proposed building type or ground-floor use.
b.	Shall not exceed 30 feet in length and shall be separated from other storefronts by columns, pilasters, vertical separations, and/or other vertical architectural elements. Section 3.4.3	Comment 4.M.b: Delete or revise this standard. Overly rigid and does not permit changes to reflect context. Consider revising to require only that storefront opening be no wider than 100 feet and no smaller than 15 feet to permit flexibility as appropriate.

	Draft Guidelines	Comments
c.	The overall proportion of storefront bays should be approximately square and have a maximum ratio of 1.5 feet of height for each foot of length. Section 3.4.3.	Comment 4.M.c: Delete this standard as it is overly restrictive. Building wall should be permitted to respond to existing diverse building contexts along Hollywood Boulevard, Vine Street and Cahuenga Boulevard.
d.	Storefront sills shall be set a minimum of 18 inches and a maximum of 30 inches above the adjoining grade Section 3.4.3.	Comment 4.M.d: Revise this standard. It is overly restrictive and bears limited relationship to any community benefit compared to the design of a more flexible compliance matrix for street walls and storefronts design. For instance, as an alternative, limit standard to maximum and not minimum range to respond to historic and proposed context. Limit standard to maximum of 4 feet above adjoining grade to ensure proper flexibility. The current guidelines require only that storefront sills be set a maximum of 4 feet above the adjoining grade.
e.	Storefront glazing should comprise a minimum of 60 percent of the storefront area. Section 3.4.3.	Comment 4.M.e: Revise this standard. It is overly restrictive. Building wall should be permitted to respond to existing building wall context. Minimum standard should be reduced to reflect currently proposed development projects.
f.	Ground-related storefronts shall be set back from the exterior facade plane and/or an adjacent exterior wall surface of a structure a minimum of 3 inches. Section 3.4.3.	Comment 4.M.f: Revise or delete this standard. It is overly restrictive. Building wall should be permitted to respond to existing building wall context.

Draft Guidelines		Comments
4.N	Above-grade parking structures shall be set-back a minimum of sixty-five (65) feet from the property line and setback to be landscaped. Section 3.6.3.C.	Comment 4.N: Revise this standard to allow for modification as necessary based on cost considerations, programming and lot configuration. Best and highest use of a site consistent with community objectives should not be constrained. The standard should be rewritten to anticipate a range of options and may not be appropriate in every instance. Range of modifications or alternatives should be permitted to reflect site-specific realities (lot size, building orientation, use of lot space, etc.) and should not require discretionary approval or exceptions subject to Section 5.0. Insert "where feasible" language to standard Comments 4.R and 4.S are also incorporated by reference.
4.O	Above-grade parking structures shall not be "visible from" Vine Street Section 3.6.3.C.	Comment 4.O: Revise this standard to allow for modification as necessary based on cost, programming and lot configuration. Insert "where feasible" language to standard. May not be appropriate in every instance and range of modifications or alternations to reflect site-specific realities (lot size, building orientation, use of lot space, etc.) should not require discretionary approval or exceptions subject to Section 5.0 in the Guidelines.
4.P	Any portion of parking structures adjacent to streets (other than Vine Street) shall be architecturally treated and incorporate storefronts and uses (3.6.3.D)	Comment 4.P: Revise this standard to allow for modification as necessary based on cost, programming and lot configuration. May not be appropriate in every instance and range of modification should not require discretionary approval or exceptions subject to Section 5.0. Insert "where feasible" language to standard.

	Draft Guidelines	Comments
4.Q	Planting areas to be provided where front and rear yard setbacks are required. Section 3.7.3.	Comment 4.Q: Delete standard. Standard is ambiguous and lacks specificity. Planting may not be appropriate in every instance and planting for rear yard setbacks may be inappropriate from an urban design standpoint.
4.R	Any new or additional parking associated with new construction and/or additions within certain areas shall be located below or partially below grade Figure 3-72.	Comment 4.R: Delete this standard. This standard significantly restricts new development and in many certain instances may eliminate development rights altogether given the extraordinary cost associated with compliance. Below-grade parking construction is substantially more expensive than above-grade construction. The costs increase dramatically for construction of more than two levels below grade.
4.S	A minimum of one 36-inch box tree with mature height of 30 feet and canopy of 20 feet should be planted for each 1,000 square feet of on site ground related open space Figure 3-76.	Comment 4.S: Delete or revise this standard to permit a range of landscaping and planting scenarios to enhance the pedestrian experience. Standard is overly restrictive and does not permit a greater variety of open space and landscaping possibilities to reflect the needs of different land use programs and size of lots. The standard should be revised or deleted to reflect a range of possibilities.
4.T	Prior to approval, provide a materials and colors board and prepare a rendering or model illustrating the Project "in context". Sections 5.2.2.A and B.	Comment 4.T: Delete standard. Draft Guidelines set no justification why every project no matter the size should incur the expense of preparing renderings or models. See. also. Comment 2.

5. The Draft Guidelines' Standards Regarding Height, Massing, and Ground Floor Retail are in Conflict with the Encouragement of Open Urban Spaces.

We are pleased that one of the goals of the Draft Guidelines is to "realize new public and private open spaces." Draft Guidelines, p. 11. As you may know, Los Angeles is far below the national average of open space per citizen. Hollywood is the most deficient of any area in Los Angeles with approximately .5 acres per 1,000 residents or 0.005 acres of open space per resident – the lowest number in the nation. We are concerned that the compliance with numerous setback and massing requirements in the Draft Guidelines will result in the creation of less, not more, publicly accessible and pedestrian friendly open space in Hollywood.

Figure 6: Setbacks from property line create new urban open space in Crossroads of the World. (Source: www.yesterdayla.com/hollywood.html)

For example, the setback standards, including building to less than or equal to 18 inches from the property line, are contrary to the creation of open space along appropriate pedestrian corridors. Draft Guidelines, p. 15. This setback requirement may be appropriate in some instances but a developer should be encouraged to explore opportunities for creating publicly accessible open space on the ground floor as appropriate. As a general standard rather than a guideline, this requirement would restrict the creation of active pedestrian corridors and other important open space programming for new retail, commercial, office and residential uses along – for example – Hollywood Boulevard, Vine Street, Cahuenga Boulevard and Highland Avenue. It is another instance in the Guidelines that new opportunities for community benefits and smart design are sacrificed in favor of a rigid adherence to establish forms.

Other massing requirements in the Draft Guidelines (see, e.g., Section 3.2.2) also do not permit, much less, encourage, the development of new public and private open spaces on the ground floor. For example, "[n]ew buildings and additions may be developed to a maximum height of 220 provided that the gross lot coverage shall not exceed 70% of the lot area." Draft Guidelines, p. 25. Further, Section 3.2.2.I.b. allows development to a maximum height of 220 provided that any floor area above a height of 150 feet shall have a maximum plan diagonal that does not exceed 155 feet in length. *Id.* These requirements are unnecessarily restrictive and

combined with lot line development standards would result in lost ground floor open space including the formation of alleys without any circulation or connections to pedestrian corridors.

We applaud the Agency's efforts to promote the creation of open space in the Draft Guidelines. However, this intent conflicts with current setback and massing requirements. Revisions to the Draft Guidelines should resolve this internal inconsistency in favor of encouraging new public and private open spaces.

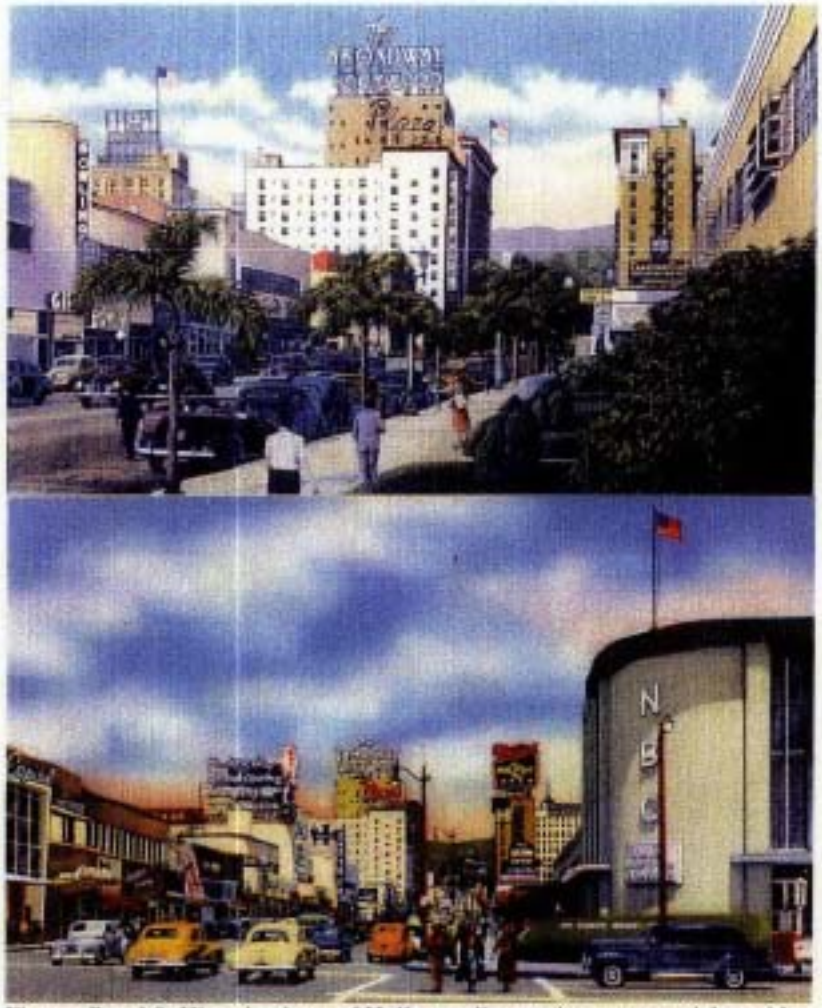
6. The Draft Guidelines Should be a Guide for Development and Not a Platform for Controversy.

The Draft Guidelines introduce a new review and approval process contrary to the intent of the Redevelopment Plan and in conflict with the City's mandate to streamline project approvals to promote economic development. Additionally, the Draft Guidelines set numerous strict standards for new projects rather than the flexibility to permit a range of options for new construction to comply with the guidelines. Revisions should be made to the Draft Guidelines to address the need for more flexibility.

a. *The Draft Guidelines create a new project approval framework that is inconsistent with the Redevelopment Plan, contrary to public policy and prohibitive.*

Imposing an additional project approval process is not the objective of the Draft Guidelines as set forth in the Redevelopment Plan. As discussed above, the Redevelopment Plan sets forth a number of objectives for the area and requires the CRA to adopt guidelines to ensure such objectives are met. Redevelopment Plan, Section 506.2.1. The creation of another discretionary review process in the Draft Guidelines are not mandated or contemplated by the Redevelopment Plan

Further, at a time when the City is trying to streamline development regulations and project review, the Draft Guidelines' imposition of another set of discretionary review procedures is counter-productive and creates another avenue for opposing a project. Sections 5.1 and 5.2 of the Draft Guidelines mandate that only projects in compliance with the standards of the Draft Guidelines will be approved by the Agency. Draft Guidelines, p. 54. The Draft Guidelines further state that "[i]f a project is not in compliance with the standards of this Plan, the project will not be cleared. In these cases the applicant can revise the Project design to bring it into compliance with the standards and guidelines of this Plan, or seek an exception." Draft Guidelines, p. 55. This is problematic because not only does it formalizes the Draft Guideline's mandatory nature as discussed below, but it also slows down the approval process and empowers opposition groups, the public, or City departments to stop projects even when the public interest would not be better served.



Figures 7 and 8: Historic views of Hollywood's growing commercial corridor with ground floor open space and variations in vertical and horizontal massing. Views of Vine Street looking north from Hollywood Boulevard (top) and from Sunset Boulevard (bottom). (Source: historic Hollywood postcards, Western Publishing & Novelty Co., circa 1940s.)

We understand that the Draft Guidelines allow "exceptions" for projects that may not comply. It provides that "[i]n certain extraordinary circumstances there may be situations where the intent of this Plan cannot be met through application of the design standards. In these cases the applicant may seek an exception to the Plan through an action of the CRA/LA." *Id.* We see at least two problems here. First, the Agency has set a very high and unrealistic bar (*i.e.*, "extraordinary circumstances") to qualify for an exception. Second, the Agency has developed yet another discretionary process that developers must trudge through for project approvals. In addition, the current finding statements are too open-ended and could allow the Agency unfettered discretion to approve or deny projects. We believe that these requirements are inappropriate given the current economic conditions and the fact that the Draft Guidelines were intended to ensure the objectives of the Redevelopment Plan are met, not to provide for additional barriers to development.

b. *Subject to limited exceptions, the Draft Guidelines should be guidelines for development not mandatory requirements.*

Besides creating a new approval process, the Draft Guidelines seem to impose mandatory requirements rather than guidelines as intended by Section 506.2.1 of the Redevelopment Plan as discussed above. The Introduction section of the Draft Guidelines established compliance with

the Draft Guidelines as a mandatory requirement for every project within the District. For example, Section 1.4 states that the Draft Guidelines "shall be used for all new construction, addition and conservation projects within the Hollywood Boulevard and Franklin Avenue Design Districts." Draft Guidelines, p. 6. In addition, it states that the Agency ". . .uses this Plan [the Draft Guidelines], as well as the Redevelopment Plan, and other CRA/LA policies, to review and approve proposed projects in these districts." Draft Guidelines, p. 6. Further, it provides that "a final clearance from CRA/LA will be required that ensures continued adherence to CRA/LA policies and these design standards and guidelines." Draft Guidelines, p. 6. Theses provisions expressly require strict compliance with the Draft Guidelines.

In contrast to the provisions above, we believe that the Draft Guidelines should guide development instead of control it. To be most effective in promoting innovation consistent with the historic and future growth of Hollywood, the Draft Guidelines cannot be primarily mandatory. We agree that as an implementation document the Draft Guidelines should establish requirements to ensure the objectives of the Redevelopment Plan are met. For example, requirements such as preserving historic icons and view corridors, maintaining historic storefronts, promoting new public and private open spaces and requiring ground floor development to engage the sidewalk should be created in the Draft Guidelines because those kinds of requirements ensure the objectives of the Redevelopment Plan are met. However, as drafted, the Draft Guidelines create mandatory provisions – a number of which conflict with the Redevelopment Plan – that do not allow for flexibility or a range of possible designs that would in fact fulfill the objectives of the Redevelopment Plan and further the public interest.

CONCLUSION

For the reasons set forth above, contrary to their fundamental objectives as a planning document for Hollywood, the Draft Guidelines do not succeed in encouraging bold development that honors Hollywood's rich architecture and historic environment. Instead, they appear anachronistic in their application rather than forward thinking. The Draft Guidelines cling to too many rigid and prescriptive measures that will stall rather than encourage development at a critical time in Hollywood. Sadly, the overall result of the Draft Guidelines is to under imagine and over prescribe.

Please do not hesitate to reach us with any questions. We look forward to your response. Thank you for considering these comments.

Very truly yours,

Jerry Neuman

HOLLYWOOD MILLENNIUM PROJECT

DEVELOPMENT REGULATIONS: GUIDELINES AND STANDARDS

ORDINANCE NUMBER _____; EFFECTIVE DATE _____

HOLLYWOOD MILLENNIUM PROJECT

SCOPE OF DEVELOPMENT: DESIGN GUIDELINES AND STANDARDS

TABLE OF CONTENTS

Page

1. PURPOSE AND OBJECTIVES 1

1.1 Purpose 1
1.2 Development Objectives 2
1.3 Development Standards and Guidelines 5
1.4 Relationship to the Los Angeles Municipal Code 5

2. BACKGROUND 6

2.1 Project Site 6
2.2 Site Zoning and Permitted Floor Area 7

3. DENSITY 8

3.1 Floor Area Ratio Averaging and Density Transfer 8
3.2 Maximum OESF Density Per Area 8
3.3 Use Coordination / Use Compatibility 8

4. HEIGHT 9

4.1 Building Height Standards 9

5. BUILDING AND STREET EXPERIENCE 10

5.1 Tower Massing Standards 10
5.2 Street Walls 22
5.3 Street Wall Standards 22
5.4 Street Wall Guidelines 24
5.5 Yard Standards 25
5.6 Building Materials and Color Guidelines 25
5.7 Grade Level Standards 26
5.8 Podium Standards 27
5.9 Podium Guidelines 27
5.10 Street and Sidewalk Standards 28
5.11 Screening Standards 28

6. TOWERS 29

6.1 Purpose 29
6.2 Projections 29
6.3 General Standards 29
6.4 Wall Standards 30
6.5 Spacing Standards 32
6.6 Rooftops Guidelines 33

6.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards 33

7. OPEN SPACE 34

7.1 The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Tower and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities. This section sets forth the standards and guidelines for all open space areas for the Project: areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space) 34

7.2 Grade Level Open Space Standards 34

7.3 Passageway Standards 36

7.4 Roof-top Open Space 39

RESIDENTIAL OPEN SPACE STANDARDS – COMMON AND PRIVATE OPEN SPACE 39

7.5 Residential Common Open Space 39

7.6 Residential Private Open Space 40

8. LANDSCAPE 41

8.1 Grade Level Open Space Standards 41

8.2 Common Open Space Standards 41

8.3 Standards For Open Air Portions of PAP 42

8.4 Tree Planting Guidelines 44

8.5 Lighting Standards 44

8.6 PAP Lighting Standards 45

8.7 Continuity of Design 45

9. PARKING 46

9.1 Automobile Standards 46

9.2 Bicycle Standards 47

9.3 Transportation Demand Management Plan 48

10. SIGNAGE 49

10.2 Modification to Guidelines 49

11. SUSTAINABILITY 50

11.1 Nonresidential Projects. 50

11.2 Other Projects 50

1. PURPOSE AND OBJECTIVES

1.1 Purpose

1.1.1 The Development Regulations ("Regulations") govern new development on the Project Site. Specifically, the Regulations:

a. Establish standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

b. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project.

c. Establish basic site-wide development standards and criteria that serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

d. Permit design flexibility while establishing a set of controls that will guide the development for the Project site.

e. Ensure compliance with the Development Objectives.

1.2 Development Objectives

1.2.1 The development objectives are intended to transform the Project Site consistent with the priorities and unique vision for the site shared by various Hollywood stakeholders. The Development Regulations will in turn ensure that new development on the Project Site is consistent with these objectives

1.2.2 The objectives for new development on the Project Site are to:

a. Preserve Capitol Records Tower and Gogerty Building

b. Preserve public views to the Capitol Records Tower by creating grade level open space, civic plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.

c. Preserve existing view corridors to the Hollywood hills.

Fig. 1.2.2.b-c: Capitol Records View Corridors

d. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban node; creating The Hollywood Walk of Fame Plaza. Reinforce the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.

e. Encourage street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.

f. Create vibrant urban spaces that permit active and passive recreational facilities for both the on-site and off-site population

fig 1.2.2.d: View North Along Vine Street

g. Create a 24 hr community by the creation of a Thriving Mixed Use Development.

h. Eliminate the visual impact of the current on site parking.

i. Establish where feasible pedestrian linkages to existing public transportation routes in proximity of the Project Site, including the Metro Red Line Station at Hollywood Boulevard and Vine Street and existing bus routes.

j. Establish of a standard intended to promote architectural excellence.

k. Provide designs that take into account the context and make an effort to respect it and fit in visually.

l. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.

m. Create buildings that emphasize the vertical architecture and become visible icons.

n. Develop a visual gateway to Hollywood Boulevard from the Hollywood Freeway.

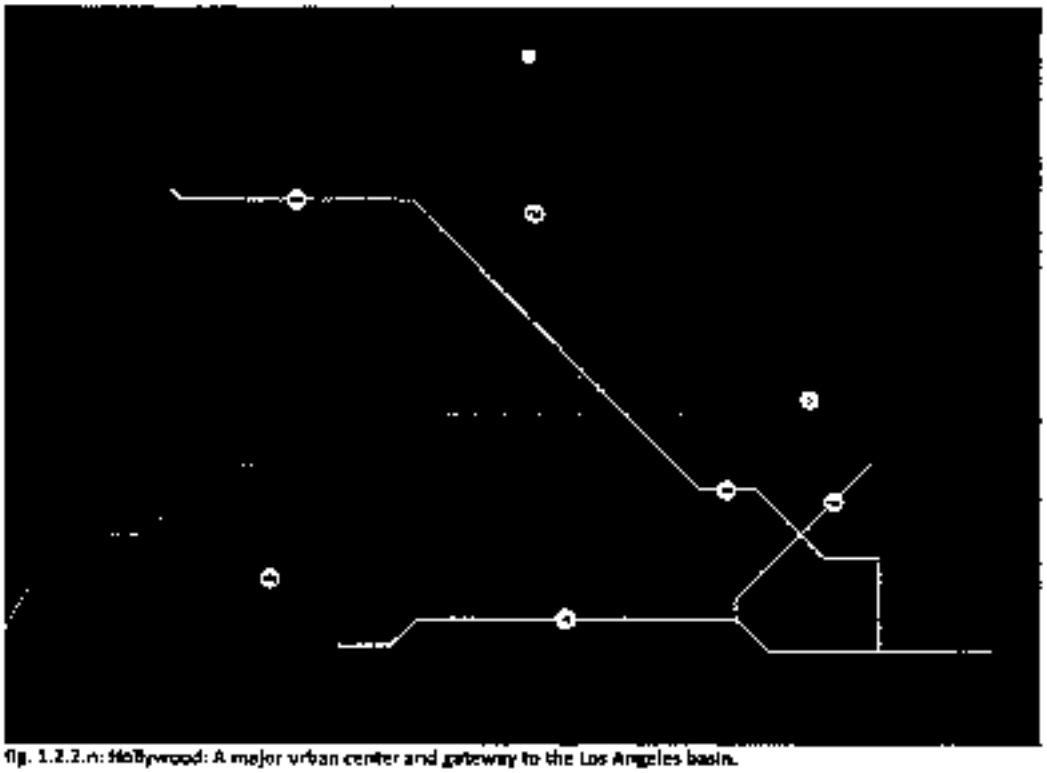

fig. 1.2.2.n: Hollywood: A major urban center and gateway to the Los Angeles basin.

1.3 Development Standards and Guidelines

The Development Regulations consist of standards and guidelines. The standards impose strict compliance or measures for new development. For example, the Regulations include specific setback requirements along Vine Street. There are also mandatory requirements or standards for minimum open space on the ground floor as well as maximum building heights. By comparison, the guidelines are measures that may include a range of choices and require a degree of interpretation by the architect and design team to achieve compliance with the Regulations. The purpose of these guidelines is to create a principal design theme or objective without comprising high quality design. The purpose is to provide a range of flexibility to permit the selection of the most appropriate design feature based on the final development scenario. For instance, façade treatments for new development may take different form depending on the final design plans. The Regulations will guide the ultimate façade treatment by providing a limited range of choices in the use of material and color for the façades.

1.4 Relationship to the Los Angeles Municipal Code

1.4.1 They are approved by the City of Los Angeles City Council and are incorporated in the Development Agreement, authorized pursuant to California Government Code 65864, et seq., entered into by the City of Los Angeles and __. ___. ___. ___ ___. ("Millennium Development Agreement") on __. ___. ___ __. .

1.4.2 The following sections in the Regulations differ from corresponding provisions (as written at the time of approval) in the LAMC. 2.2.1, 2.2.3, 5.5.3.a, 7.3.4.b, 9.1.6.a and 10.2.

1.4.3 Wherever the Regulations contain provisions which establish regulations that are different from or more or less restrictive than the zoning or land use regulations in the Los Angeles Municipal Code ("LAMC") the Regulations that apply to the Project Site, the Regulations shall prevail pursuant to the Millennium Development Agreement approved by the City Council

2. BACKGROUND

2.1 Project Site

2.1.1 The Project Site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site.

The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site.

The East Site and the West Site make up the Project Site.

2.1.2 The Project Site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

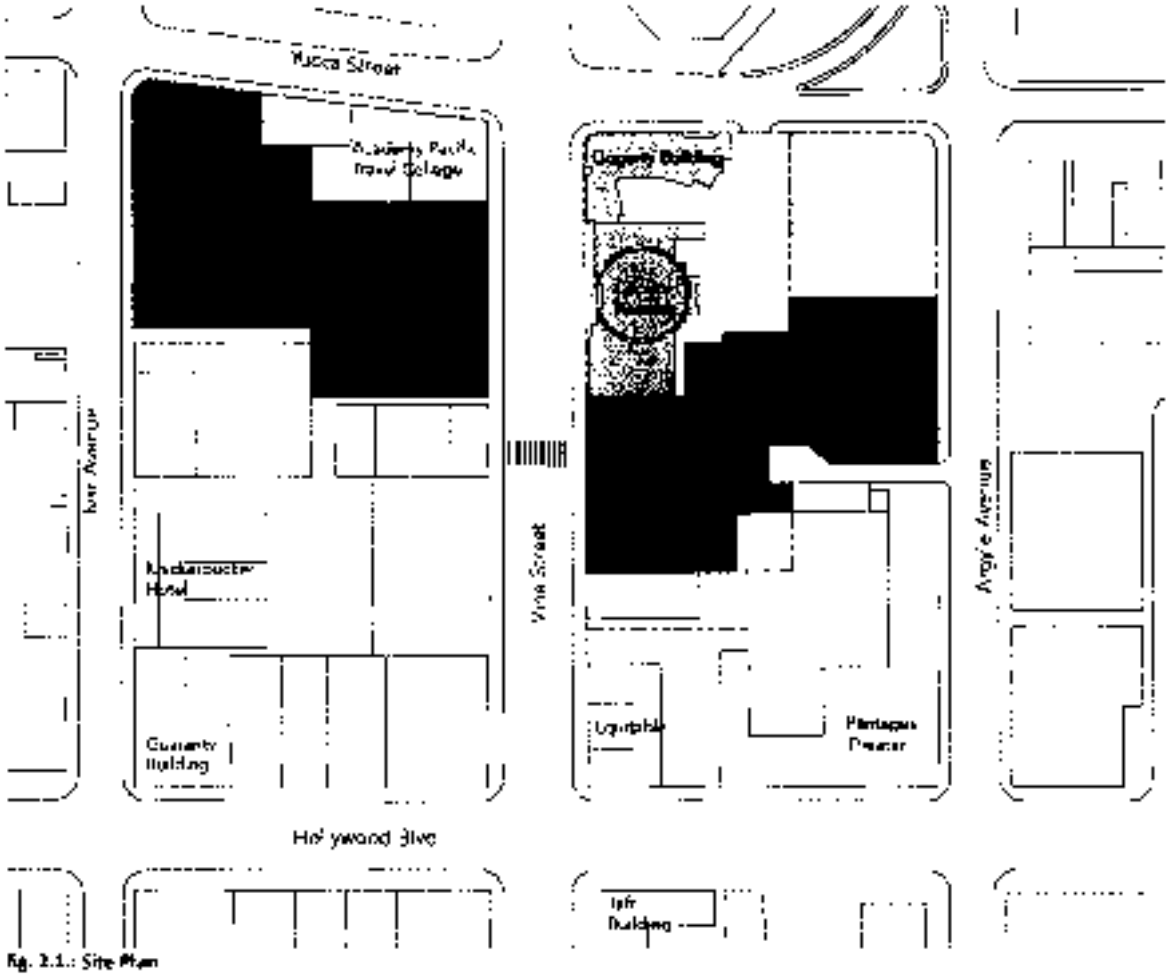

Fig. 2.1.: Site Plan

2.2 Site Zoning and Permitted Floor Area

2.2.1 Project Site is zoned Commercial (C2). City General Plan land use designation: Regional Center commercial.

2.2.2 Project Site is within the Special Sign District and within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.

2.2.3 Floor Area Ratio: 6:1

2.2.4 Height District: No. 2

3. DENSITY

3.1 Floor Area Ratio Averaging and Density Transfer

Owner may transfer density and buildable floor area from one parcel within the Project Site to another parcel within the Project Site, as long as the minimum and maximum building heights in the Regulations are maintained and the entire Project does not exceed the cumulative, allowable density and floor area of the zoning for the individual parcels.

To allow for the spatial distribution of the development on the Project Site and ensure relationship and sensitivity with the uses surrounding the Project Site, parking, open space and related development requirements for any component of the Project may be developed in any location within the Project Site.

3.2 Maximum QESF Density Per Area

[To be completed as part of the EIR.]

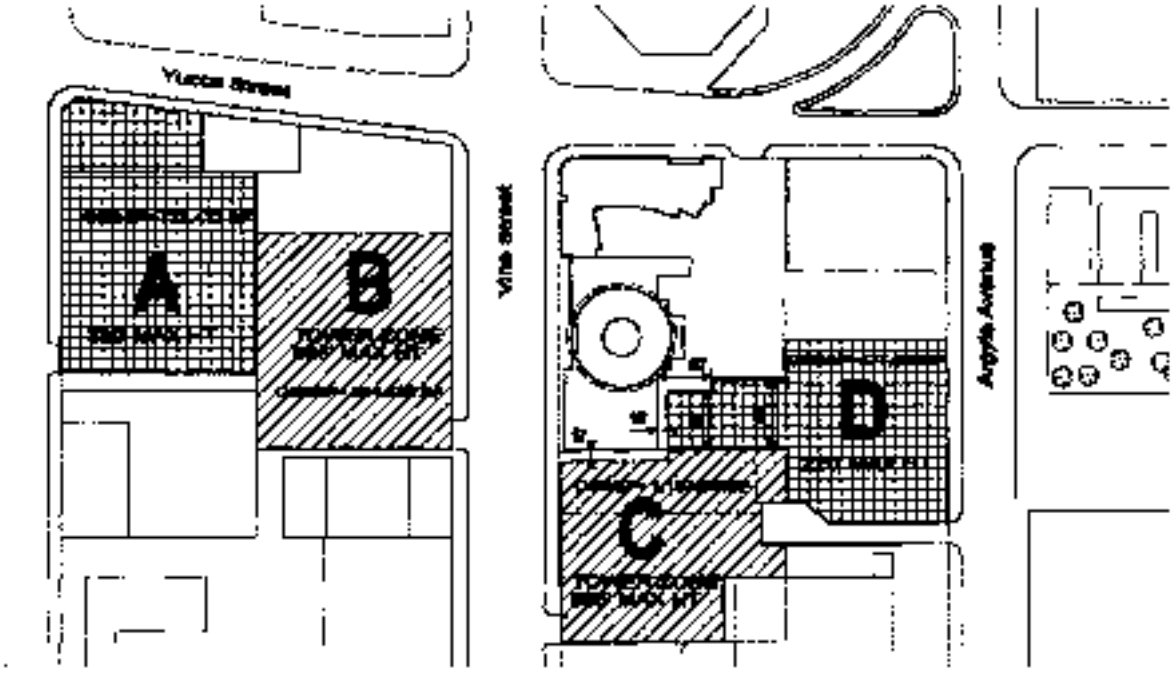
3.3 Use Coordination / Use Compatibility

[To be completed.]

4. HEIGHT

4.1 Building Height Standards

The Regulations establish heights zones (A, B, C and D) to limit maximum building heights and control bulk in response to the Development Objectives including context with the built environment and to reinforce view corridors to the Capital Records Tower.



5. BUILDING AND STREET EXPERIENCE

5.1 Tower Massing Standards

5.1.1 The Tower Massing Standards apply to the portion of a building located 150 feet above curb level – see Table 5.1.1

11.5	50	13,325 East Site 9,042 West Site	10	12	5.1.2.e.1 5.1.2.e.2
15	50	17,380 East Site 11,794 West Site	10	10	5.1.2.d.1 5.1.2.d.2
28	50	22,745 East Site 22,016 West Site	10	8	5.1.2.c.1 5.1.2.c.2
48	n/a	55,616 East Site 37,742 West Site	10	5	5.1.2.b.1 5.1.2.b.2

Table 5.1.1.

5.1.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See Figs. 5.1.2.a.1 – 2.)

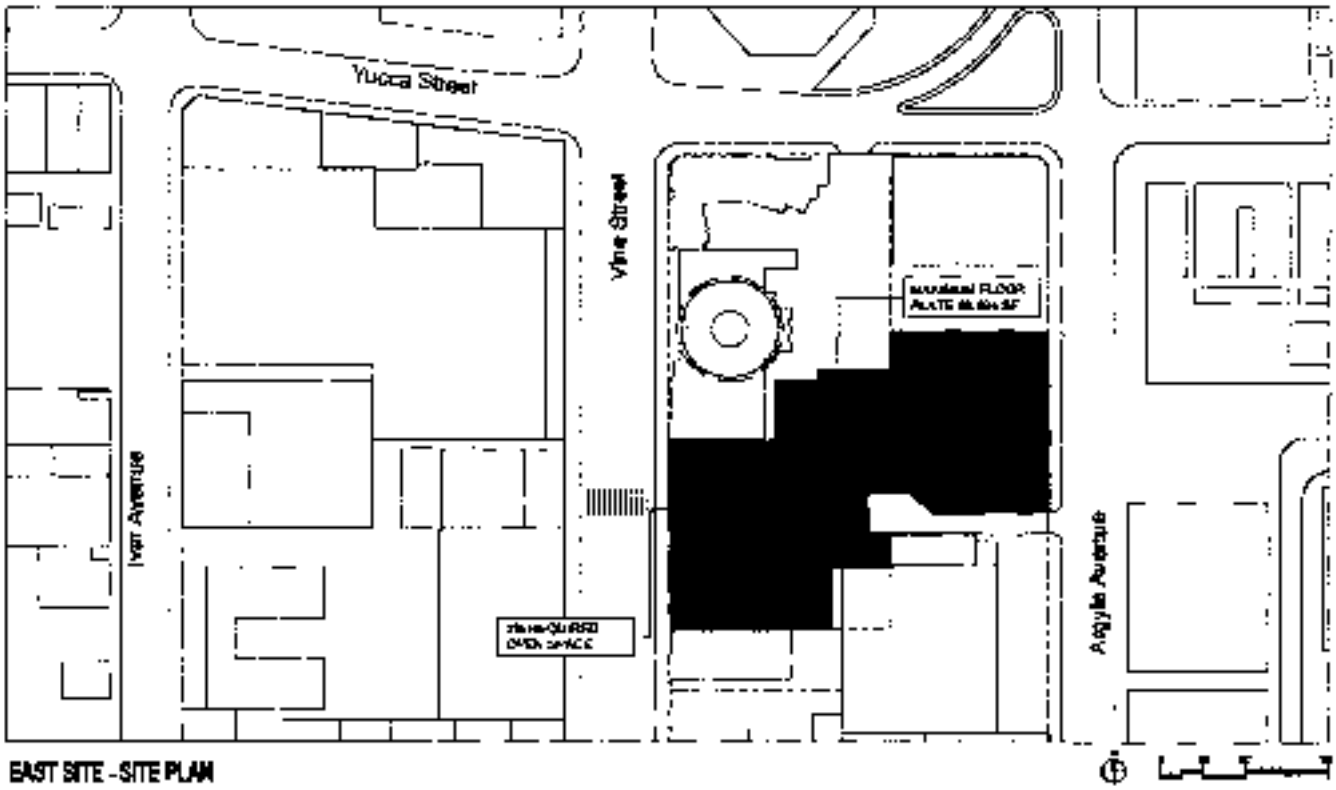
5.1.3 At least 50% of total floor area must be located below 220 feet

5.1.4 Setback and articulation of tower walls and crown

a. Towers are not required to step back

b. Minimum 10% of tower

Maximum Lot Coverage and Tower Floor Plate – Figs. 5.1.2.a – d.



EAST SITE - SITE PLAN

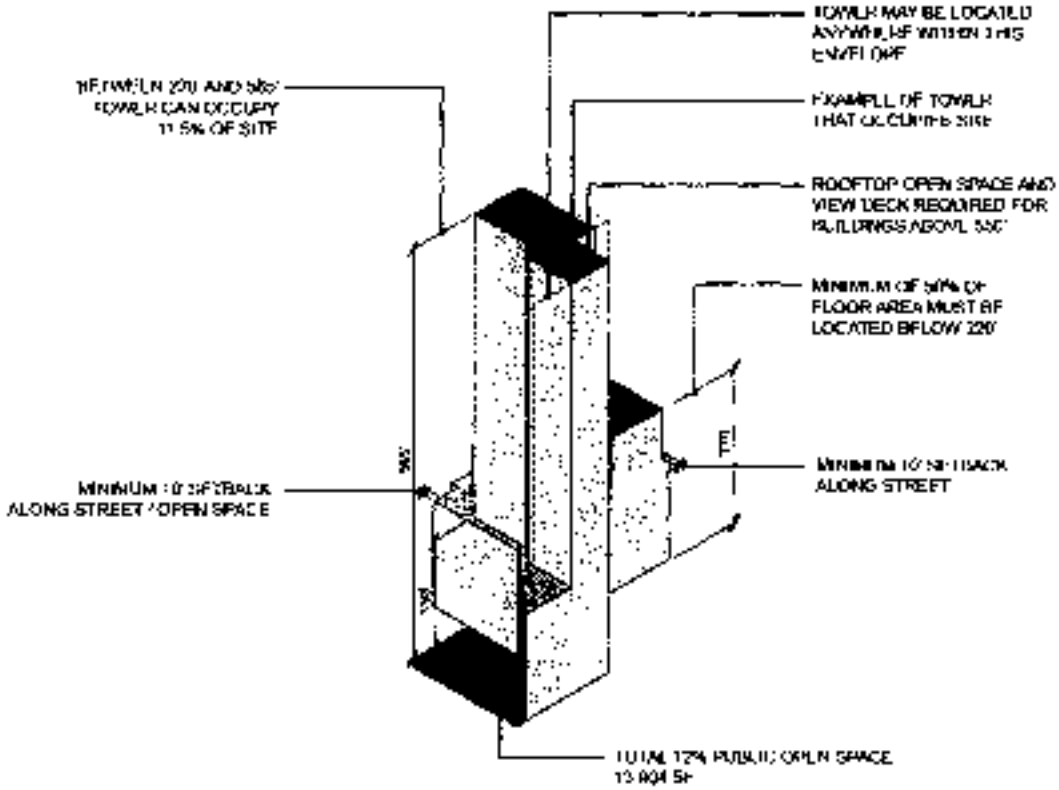

fig. 5-1.2.e.1: East Site

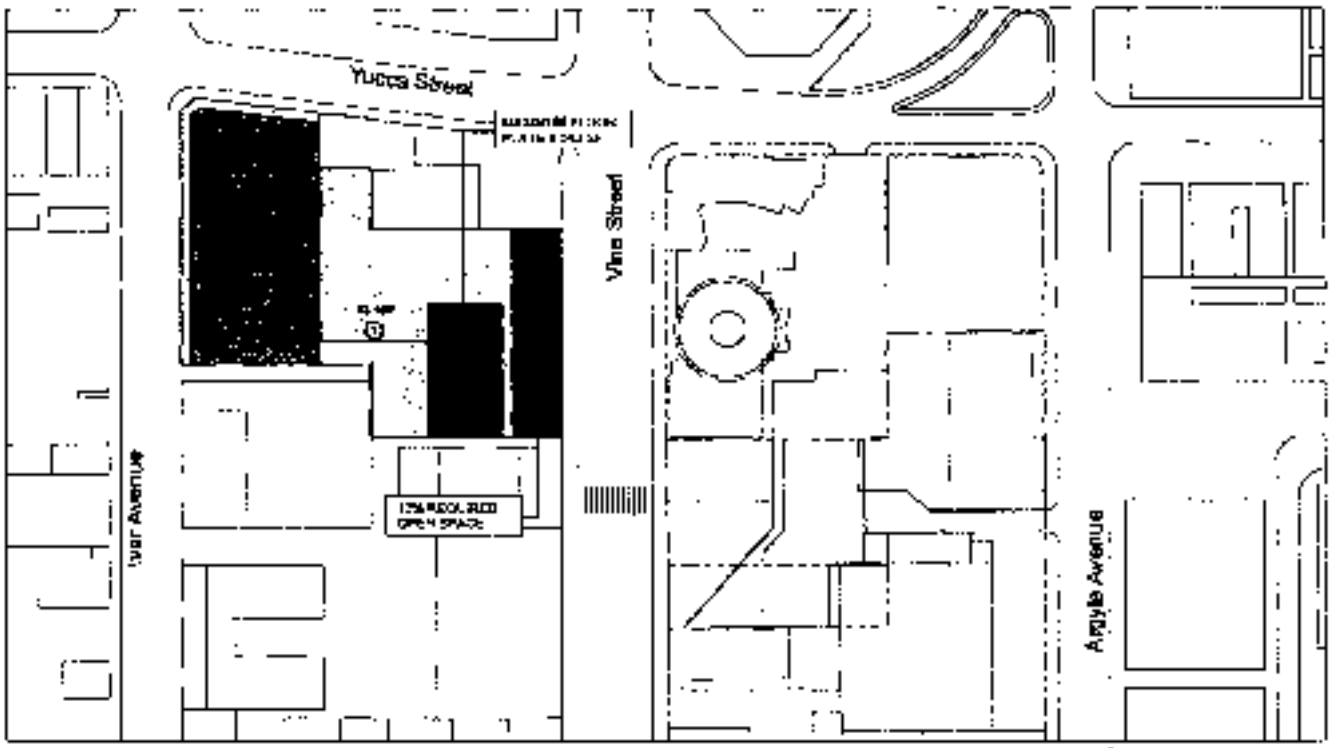

WEST SITE - SITE PLAN

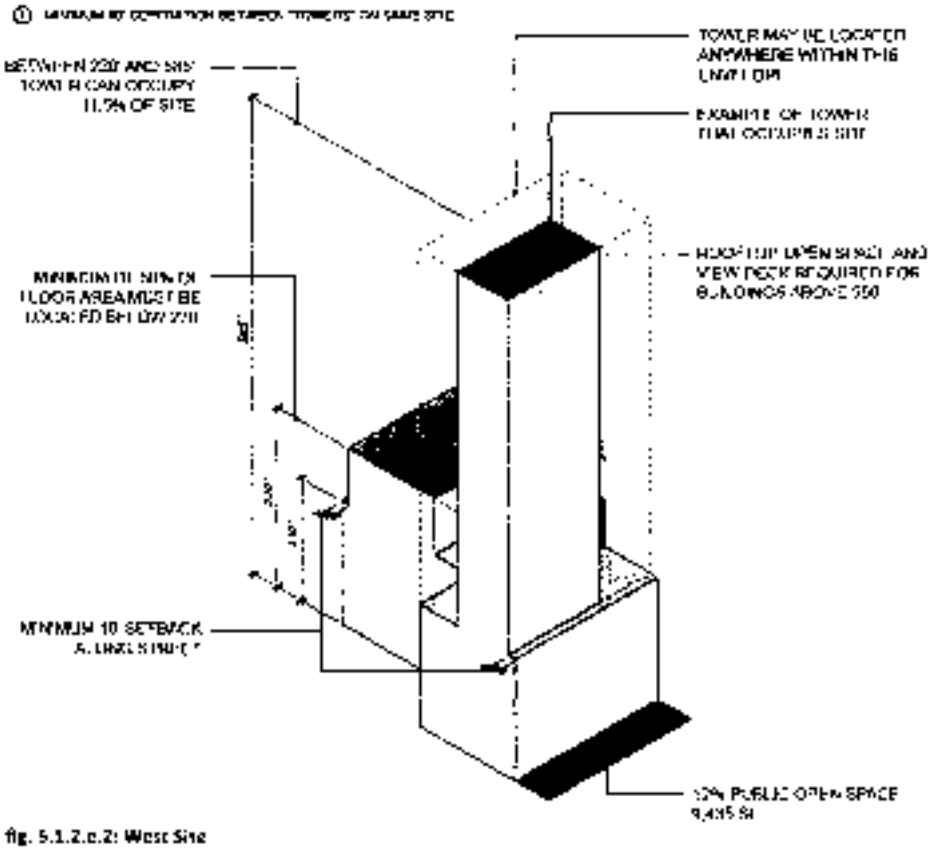

fig. 5.1.2.c.2: West Site

5.1.5 Types of permitted articulations for tower walls:

a Recess. recesses shall be permitted to a maximum depth of 15'-0".

b. Balcony: a balcony may project a minimum of 3'-0" from a required street wall over a grade level open space.

c. Bay window: a bay window may project from a required street wall over a grade level open space

d. Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

5.2 Street Walls

A street wall is a wall or portion of a wall of a building facing a street or a grade level open space. Street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation

5.3 Street Wall Standards

5.3.1 Location of a required street wall.

a. Parcels with a grade level open space, the required street wall shall be located minimum 5 feet from the property line.

b. Parcels or portions of parcels without a grade level open space: the required street wall shall be located on the property line.

5.3.2 Height of required street wall:

a Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) below.

b. 40% of aggregate width of required street wall frontage on each street can exceed maximum street wall height up to the maximum tower height.

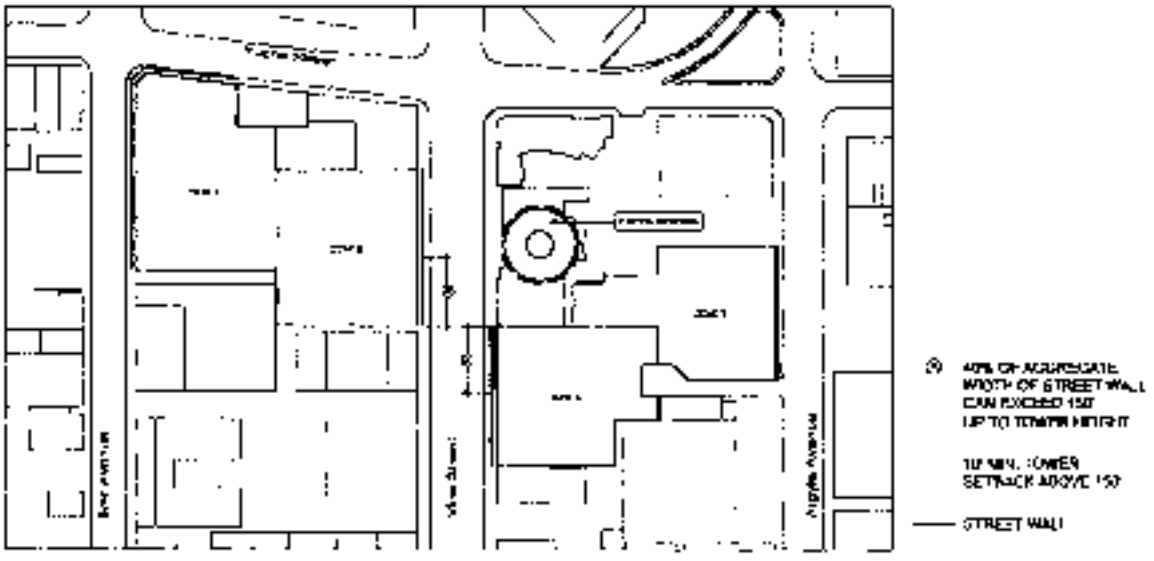

fig 5.3.2: Street Wall

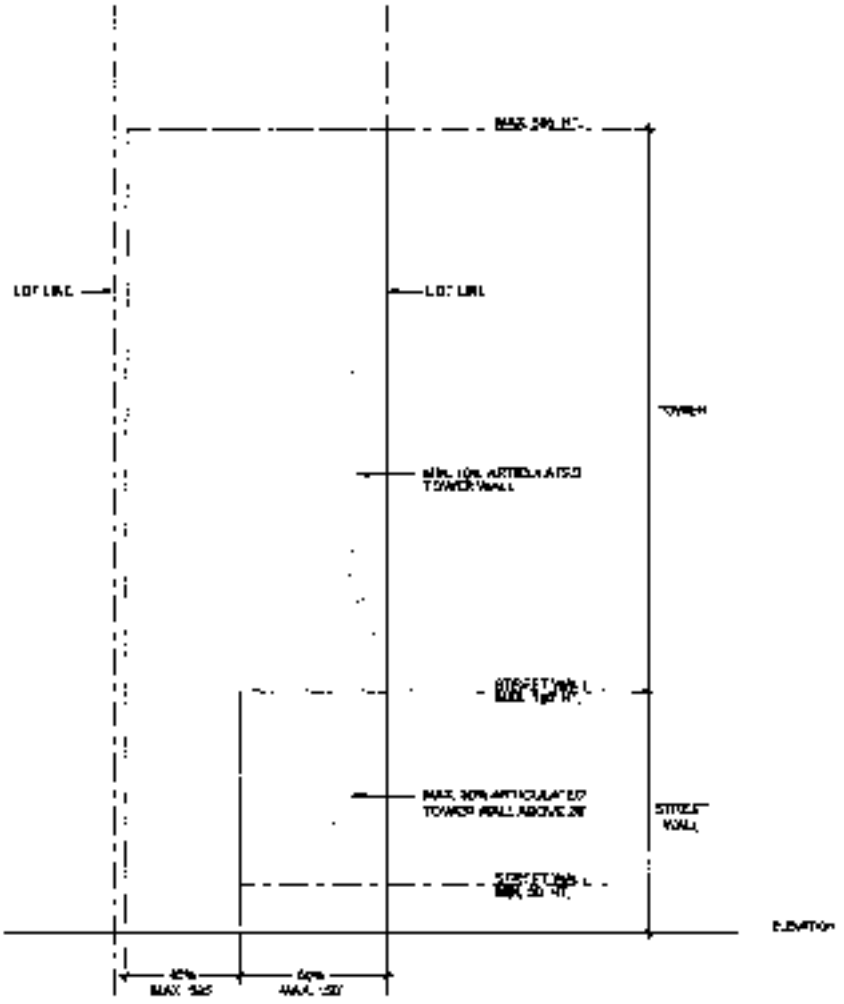

fig. 5.3.3: Street Wall Articulation

5.3.3 Amount of articulation of required street wall:

The aggregate width of required street wall articulation at the level of any story above the level of the second story ceiling or 28'-0" above curb level, whichever is less, shall not exceed 50% of the required street wall.

5.3.4 Other permitted projections: elements which project beyond the property line from a required street wall shall comply with the Building Code.

a Architectural facade elements such as expression bands, cornices; eaves, gutters, and downspouts may project from a required street wall over a grade level open space.

b. Steps and ramps may project from a required street wall over a grade level open space.

c. Marquees, canopies and awnings.

d. Retail storefronts: may project from a required street wall over a grade level open space by a maximum depth of 5' 0". The maximum height of these projections for each parcel shall not exceed two stories or 28' 0" above curb level, whichever is less.

5.4 Street Wall Guidelines

5.4.1 Pedestrian pass-through areas, public plazas, marquees, canopies, awnings and retail storefronts are permitted within the street wall area.

5.4.2 Pedestrian steps and ramps, entry forecourts, hotel drop offs and loading entries and exits and vehicular access driveways are also permitted within the street wall area.

5.5 Yard Standards

5.5.1 Yard is an open space other than a court that is unoccupied and unobstructed from the ground upward.

5.5.2 Commercial Use: no front, side or rear yard set backs are required

5.5.3 Residential Use.

a Front Yard: none

b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet, for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet

5.6 Building Materials and Color Guidelines

5.6 1 Building materials and color will be subject to the following guidelines. These guidelines also address the façade treatment for both residential and commercial portions of buildings.

5.6.2 Building shall feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane

5.6.3 Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

5.6.4 Podium levels up to 150 feet will be predominantly light in color Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas

5 6.5 The building's skin, especially for towers, should be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required achieving energy efficiency standards.

5 6.6 In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.

5.6.7 To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

5.6 8 Rooftop mechanical equipment: shall be screened with materials and design consistent with the building architecture.

5.6 9 Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

5.7 Grade Level Standards

5 7 1 The purpose of the grade level standards is to promote pedestrian-scaled architecture by regulating street wall massing, articulation and detail, street level entrances and storefront windows and doors, as well as the use of quality materials and decorative details. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and should be integral to the architecture of the building.

5.7.2 Ground floor height

a. Minimum 12'-0" height floor to ceiling.

5.7 3 Building entrances:

a. The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, grade level open space, or PAP. Entries <18 inches from the property line shall not be higher than 37 inches above the elevation of the sidewalk; entries >18" from property line shall be within 30 inches of the adjacent grade level along the street frontages. Where possible entries shall be marked using architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.

b. Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.

5 7.4 Ground floor glazing

a. Use of clear, colorless and transparent glazing is required within the first 30 feet of grade

b. Use of reflective glass is prohibited.

c. Along street frontages with a required build-to line less than or equal to 18 inches from the property line, glazing should constitute a minimum of 30% of the area of a building face and should not exceed 80% of the area of a building face.

5.7.5 Arcades

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 5.0-foot candles.

5 7.6 Service and refuse

a Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible to a curb cut.

5.7.7 Retail storefronts

a. Storefronts shall comprise a minimum of 70% of the building's street level façade and be recessed where necessary.

b. Storefront glazing should comprise a minimum of 60% of the storefront area along Vine Street and 40% glazing along all other streets. Glazed section shall comprise a calculated average of a minimum of 3 feet and 8 feet band of glazing measured from the ground floor.

c. All retail space shall have a minimum 12 feet finished ceiling clearance.

d. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.

e. Storefront sills shall be a minimum of 18 inches and a maximum of 30 inches above the adjoining grade.

f. Security grills will be located behind glass and be at minimum 70% open

g. At-grade storefront glazing at, or adjacent to, and/or facing any public right-of-way shall incorporate transparent, clear, colorless glazing with no reflectivity.

5.8 Podium Standards

5.8.1 The purpose of the Podium Standards is to provide a modern interpretation of the historical context of Hollywood by establishing different treatment from the building's base, middle and top; through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

5.8.2 Podium height

Minimum 30'-0" to a maximum of 150 feet.

5.9 Podium Guidelines

5.9.1 Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means.

5.9.2 Podium level windows shall be vertically oriented.

5.9.3 Podium levels shall be predominantly light in color.

5.9.4 Expression band shall be provided at the highest story within the podium.

5.9.5 While blank street wall façades shall be avoided, an exception may be made for integration of public art or an articulated façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (using cutouts, insets or pop-outs). It should employ different scales of elements as viewed when seeing the entire building massing.

5.9.6 Louvers and wall openings shall be designed to integrate with building architecture.

5.10 Street and Sidewalk Standards

5.10.1 The cohesiveness and variety of public open spaces and streets are key features of the Project. The combination of landscaped plazas, PAP and landscaped streets creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

5.10.2 Hotel and Commercial / Office / Retail that abut an alley

a. Every required loading space shall be located and arranged that delivery vehicles may be driven upon or into said space from the alley. Such loading space shall have a minimum height of 14 feet and accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

b. Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

c. Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet, a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building

5.10.3 Condominiums

a None

5.10.4 Rental

a. None

5.11 Screening Standards

5.11.1 Screen

5.11.2 Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets

5.11.3 Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets

6. TOWERS

6.1 Purpose

6.1.1 Towers should have their massing designed to reduce overall bulk and to appear slender.

6.1.2 Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over-manipulated elements

6.1.3 Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.

6.1.4 If a project has more than one tower, the towers should be complementary to each other and employ the same architectural design approach.

6.1.5 Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

6.2 Projections

6.2.1 The following building elements and operations equipment can project beyond the maximum permitted building height:

a. roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building;

b. skylights, towers, steeples, flagpoles, water tanks, silos;

c. wireless masts;

d. solar energy devices and similar structures.

6.2.2 Permitted building elements or equipment in Section 6.2.1 shall be screened as practical and based on building design except if such projections – i.e., flagpoles or steeples – are part of the architecture or design. The use of creative materials and forms for screening is encouraged.

6.2.3 Enclosures for bulkheads shall not count against building height

6.3 General Standards

6.3.1 A tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

6.3.2 Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

6.4 Wall Standards

6.4.1 wall required to be articulated.

6.4.2 Types of permitted articulation of a tower wall:

a. Recess

b. Standard balconies may be projecting or recessed or a combination of both.

c. Bay windows

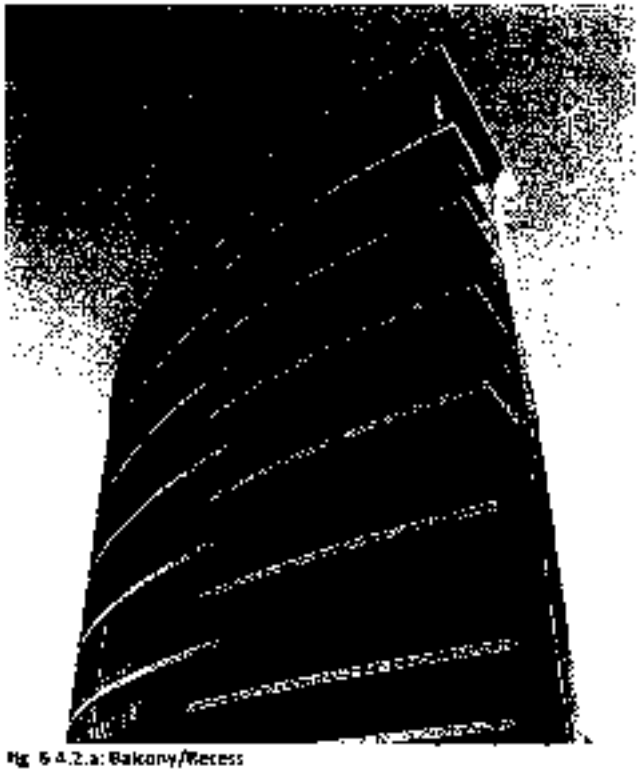

fig. 6.4.2.a: Balcony/Recess

fig. 6.4.2.b: Bay Window

6.4.3 Balcony: a balcony shall be integral to the façade (see figs. 6.4.3.a) and shall not create a relentless horizontal and vertical stacking pattern (see figs. 6.4.3.b). They are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations.

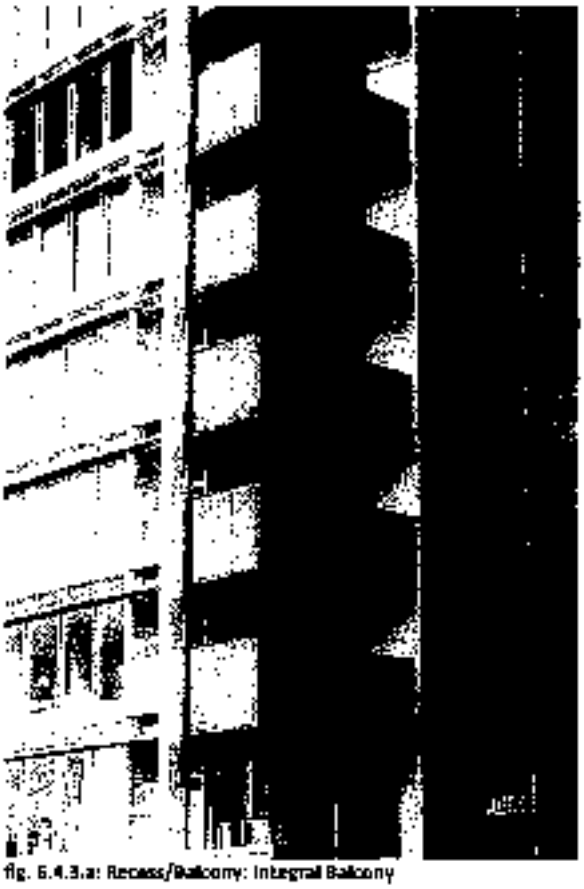

fig. 6.4.3.a: Recess/Balcony: Integral Balcony

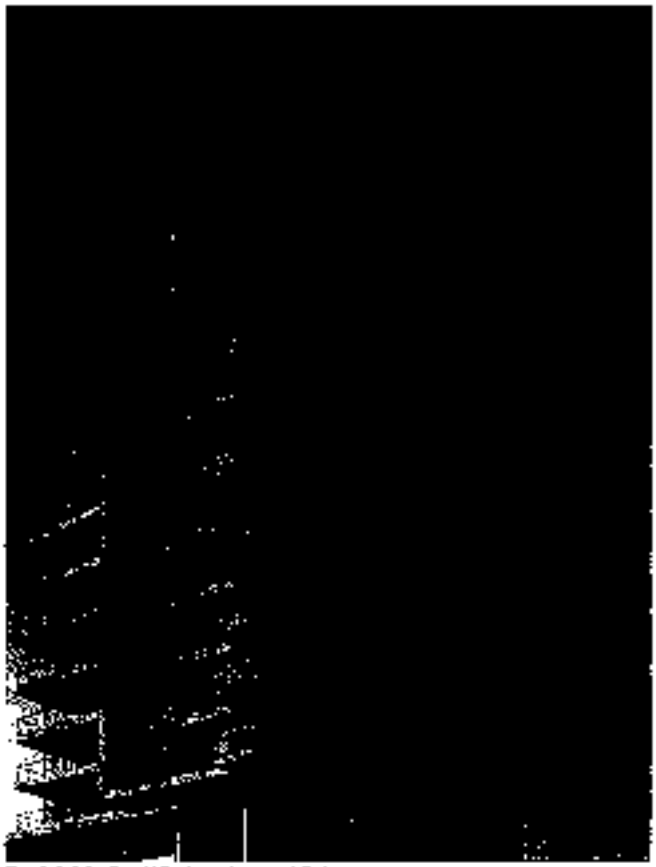

fig. 6.4.3.b: Bay Window: Integral Balcony

6.5 Spacing Standards

6.5.1 Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

6.5.2 Generally, the portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except the following which will meet code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled. See fig. 6.5.2.

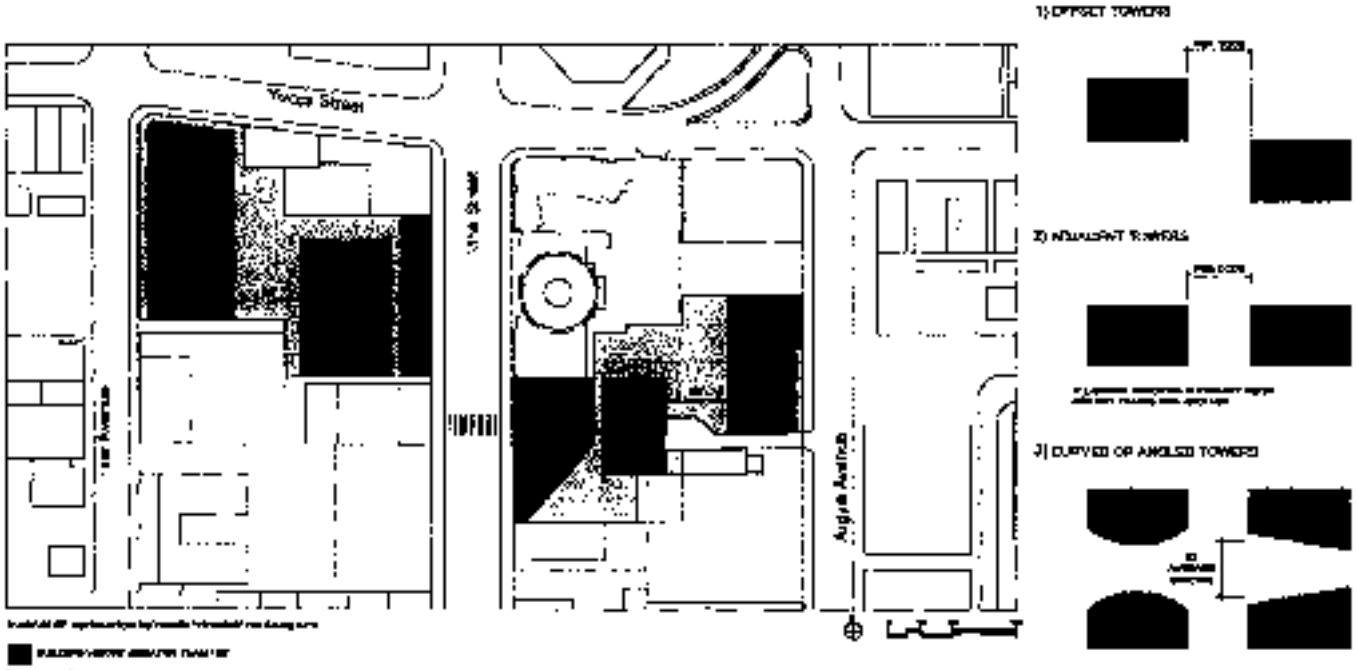

fig. 6.5.2: Tower Spacing

6.6 Rooftops Guidelines

6.6.1 Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and be visually attractive when viewed from locations adjacent and above.

6.6.2 For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section 7.2.

6.6.3 All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors.

6.6.4 All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

6.7 Parapets, Handrails, Roof Mechanical Equipment Screening Standards

6.7.1 Parapets and handrails shall be finished in a distinctive manner if part of an expression band or expression line.

6.7.2 Materials and design for roof mechanical equipment to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building

6.7.3 Roof mechanical equipment shall be screened.

7. OPEN SPACE

7.1 The development of open space is an important objective for the overall Project design. Open space will be used to enhance the experience of the visitor and resident. Open space also will enable important pedestrian linkages and through-block connections for the Project. Grade level open space also will be designed to showcase the Capital Records Tower and Jazz Mural and will include design features and outdoor furniture to activate the ground floor amenities.

This section sets forth the standards and guidelines for all open space areas for the Project, areas to be accessible to the public (Grade Level Open Space, Publicly Accessible Passageways and Rooftop Open Space) and areas to be designed for the residential uses (Common Open Space and Private Open Space).

7.2 Grade Level Open Space Standards

7.2.1 Grade level open space is a continuous open space fronting the street and open to the sky. The purpose of a grade level open space is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records and accentuate the low scale character.

7.2.2 Minimum grade level open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet. (See, Fig. 5.1.2.a.1 - 2.)

7.2.3 An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet.

7.2.4 An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet.

7.2.5 An additional 7% (total 12%) of open space required for buildings taller than 550 feet.

7.2.6 Location

a. East site: adjacent to the Jazz Mural and Capitol Records Tower; West site: across from the Capitol Records Tower along Vine Street.

b Minimum depth: no horizontal dimension less than 5 feet when measured perpendicular from any point on each of the boundaries of the open space area.

figs 7.1.2 – 7.1.5: Grade level Open Space

Fig 7.1.5

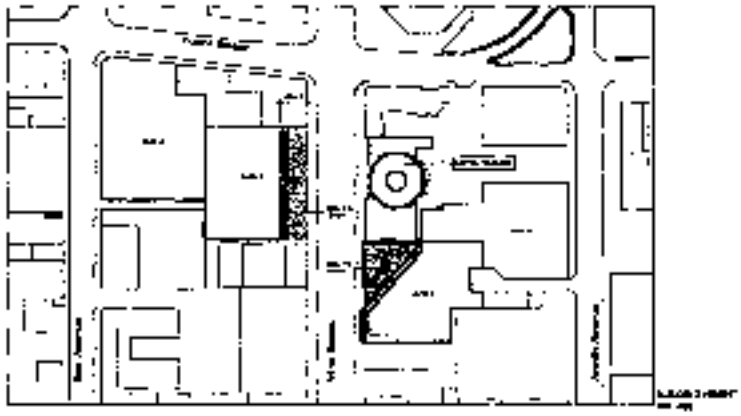

Fig 7.1.4

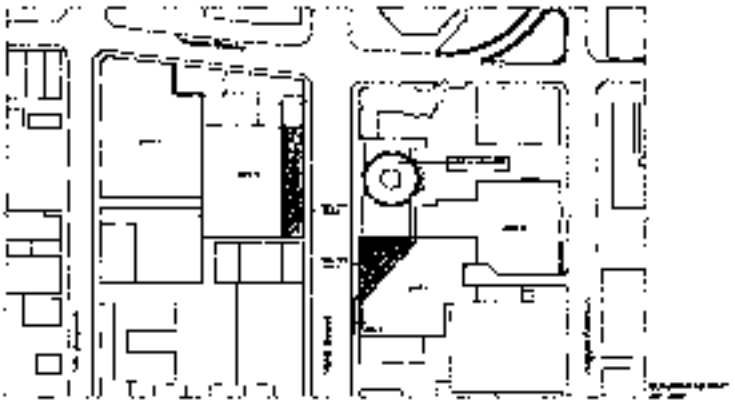

Fig 7.1.3

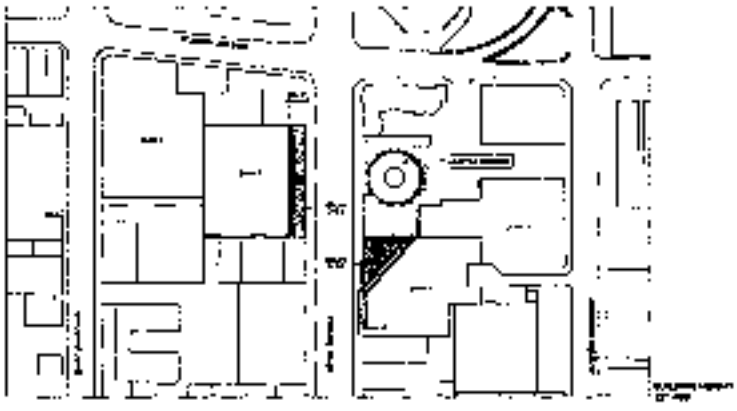

Fig 7.1.2

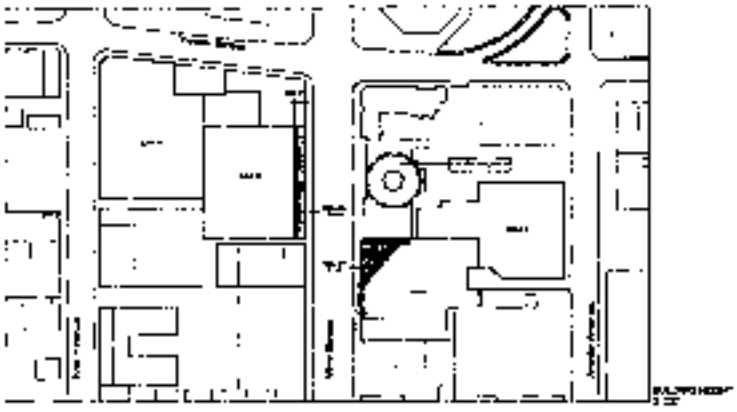

7.3 Passageway Standards

7.3.1 *A publicly accessible passageway (PAP)* is a continuous through block public connection between two parallel streets, located on privately owned land. The passageway may be either enclosed or open to the sky or a combination of both.

7.3.2 Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

7.3.3 Location and Size standards:

a. The major portion of a *PAP* is the largest area of the *PAP* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total *PAP* area and shall not be less than 20'-0" wide.

b Minor portions of *PAP* are secondary areas that allow for additional flexibility in the shape and configuration of a *PAP*. Minor portions shall not occupy more than 25 percent of the total area of the *PAP*. The minor portion shall have a minimum width of 10 feet.

c The minor portion must be directly adjacent to the major portion.

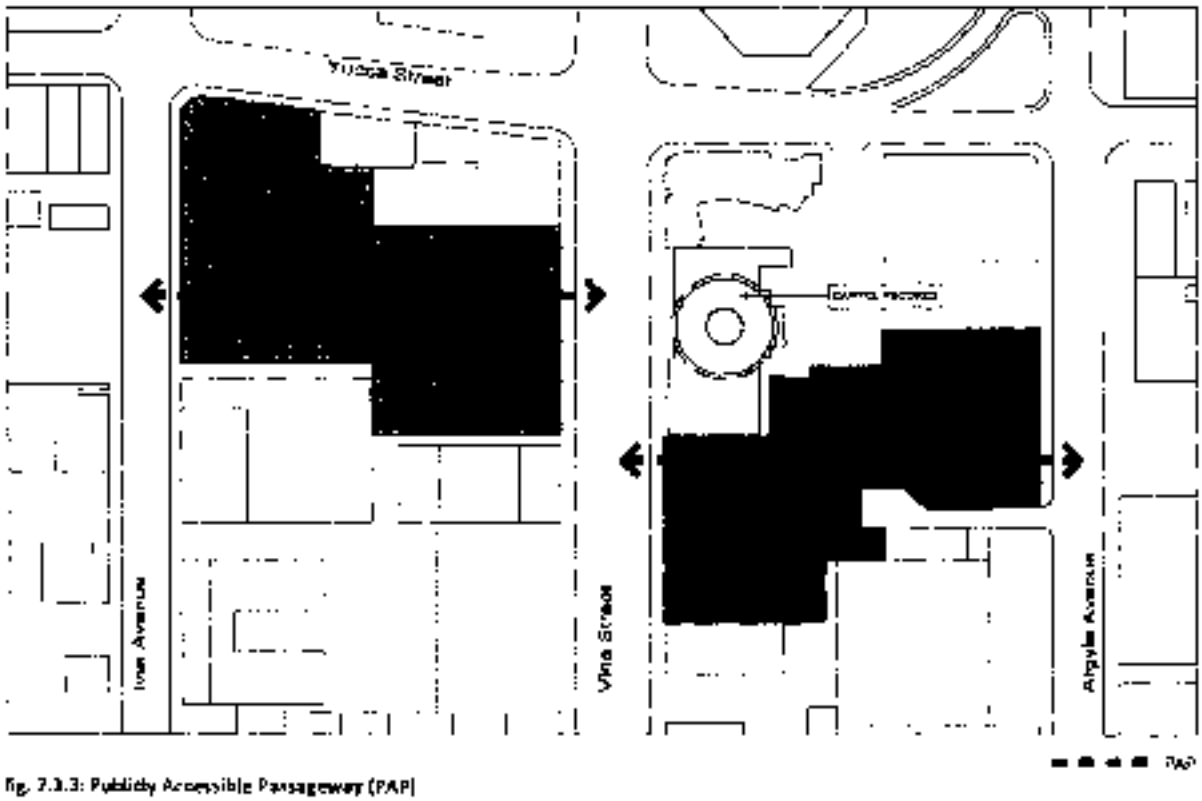

fig. 7.3.3: Publicly Accessible Passageway (PAP)

7.3.4 Permitted Obstructions:

a. Minimum percentage of PAP area to be open to the sky (East and West Sites combined) shall be as follows:

(i) Development with maximum building height of 150 feet: 0%

(ii) Development with maximum building height of 220 feet: 20%

(iii) Development with maximum building height of 400 feet: 30%

(iv) Development with maximum building height of 550 feet: 40% (at least __% of open air area to be on the East Site)

(v) Development with maximum building height of 585 feet: 50% (at least __% of open air area to be on the East Site)

b. Permitted obstructions within major portion of an open air PAP: any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions; balconies, bay windows, awnings, canopies and marquees; stairs, ramps and bollards.

fig. 7.3.4: View from Argyle Avenue Along PAP Towards Capitol Records

7.3.5 Kiosk

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not: count as floor area, exceed 3% of the total area of the *PAP*, and occupy an area of more than 250 square feet.

b. A kiosk may be freestanding or may be attached on only one side to a wall of the building.

c Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, and food preparation for open-air cafes, flower stands or public service/information booths.

d All kiosks exceeding 3% of total PAP area or greater than 250 square feet are permitted but will count as floor area.

7.3.6 Open Air Cafe

a. Where an open air cafe is provided it shall be an unenclosed restaurant, eating, or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies

b. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the *PAP*. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers.

c. An open-air cafe may occupy an aggregate area not more than 20% of the total area of the *PAP*. No cooking equipment shall be installed within an open-air cafe. Cooking equipment may be contained in a kiosk adjoining the open-air cafe. An open-air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

7.3.7 Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on *PAP* through open windows

7.3.8 Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No buildings refuse storage areas or refuse storage from a kiosk or open-air café are permitted on any *PAP*

b. No exhaust vents are permitted on any PAP or on any building wall of the development fronting upon the PAP except where such vents are more than 10'-6" above the level of the *PAP*

7.3.9 Frontages

a Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a *PAP* shall be allocated for occupancy by permitted retail, restaurants and cultural uses.

b. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the *PAP* with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

7.3.10 Maintenance:

a Responsibility: the building owner shall be responsible for the maintenance of the *PAP* including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk area adjacent to the parcel.

b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of *PAP* area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of *PAP* in connection with outdoor eating services or other uses permitted on *PAP* which generate litter.

7.4 Roof-top Open Space

7.4.1 Buildings above 550 feet to include roof top open space.

7.4.2 Roof-top open space to include an observation area (i.e., viewing deck) accessible to the public.

7.4.3 Roof top open space may include a café.

RESIDENTIAL OPEN SPACE STANDARDS – COMMON AND PRIVATE OPEN SPACE

7.5 Residential Common Open Space

7.5.1 Common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above. The publicly accessible passageway cannot be used to meet the residential open space requirements.

7.5.2 Common Open Space Standards

a. Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms

b. Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein

c Be open to the sky and have no structures that project into the common open space area, except as permitted in the zoning code.

d. Be readily accessible to all the residents of the site.

e Have a minimum area of 400 sq. ft. with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

f Constitute at least 50% of the total required usable open space in developments built.

E Common open space areas shall incorporate recreational amenities including but not limited to, swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

h. Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as common open space.

7.6 Residential Private Open Space

7.6 1 A private open space area is an area contiguous to and immediately accessible from a single dwelling unit.

7.6 2 Residential Open Space Standards

a. Contain a minimum of 50 square feet of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

b. Have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

c Provide a minimum eight-foot vertical clearance under any projection, except as provided in zoning code.

d. That portion of a balcony which extends or projects into a required front yard in compliance with zoning code may qualify as usable open space provided it meets each of the above specified requirements noted in items i-iii

B. LANDSCAPE

B.1 Grade Level Open Space Standards

B.1.1 Planting requirements. Minimum 10% of grade level open space shall be landscaped with softscape or water features.

B.1.2 Landscaped area(s) shall be planted with seasonally diverse plant material.

B.1.3 The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

B.1.4 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

B.1.5 Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

B.1.6 Permitted obstructions: the following are permitted obstructions which may occur in the *grade level open space*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining; and

b. retail storefronts.

B.1.7 Open-air publicly accessible passageways (PAP) are not to be included in the grade level open space requirements.

B.2 Common Open Space Standards

B.2.1 A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

B.2.2 At least one 24-inch box tree for every four dwelling units shall be provided on site and may include street trees in the parkway.

B.2.3 For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30 inches in depth, and lawn or ground cover shall be at least 12 inches in depth.

B.2.4 All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

Fig. 8.3-a: Movable Seating

fig. 8.3-b: Open Air Cafe

8.3 Standards For Open Air Portions of PAP

8.3.1 The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

8.3.2 The minimum soil depths for planting are:

a. Trees: 42"

b. Shrubs: 30"

c. Lawns, ground cover: 18"

8.3.3 Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation, and waterproof electrical outlets.

8.3.4 Planting requirements:

a Minimum of 10% of open air PAP shall be landscaped.

b For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor ornamental trees.

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

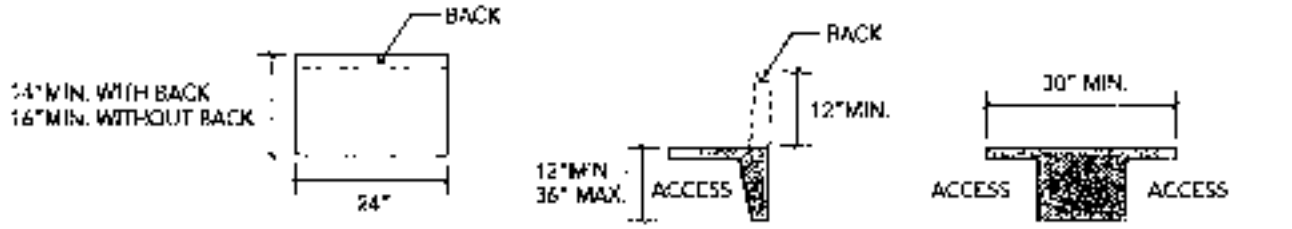

Fig. 8.3.5c Seating Standards

8.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *PAP* excluding the area of an open-air cafe.

b. One seat shall equal 2 linear feet

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons, a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d Moveable seating or chairs, excluding seating of open-air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open-air cafes do not count toward meeting the seating requirements.

8.4 Tree Planting Guidelines

8.4.1 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

8.4.2 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

8.4.3 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree planting pattern.

8.5 Lighting Standards

8.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain

8.5.2 Supplemental lighting shall meet the following minimum requirements

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open PAP.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0-foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements

8.5.3 Responsibility for maintenance

a. Building owner is responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner.

8.5.4 Lighting for areas located inside the lot line and visible from the street: such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires

8.5.5 Lighting for above grade parking garage facilities: shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

8.6 PAP Lighting Standards

8.6.1 A PAP shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade.

8.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

8.7 Continuity of Design

8.7.1 Design elements and architectural clues that reinforce where appropriate continuity between open and enclosed spaces at grade level is encouraged. Continuity of design may reinforce pedestrian circulation and support the Project's way-finding features.

8.7.2 Where possible, materials, lighting, site elements and landscape should be similar between different open and enclosed public spaces at the grade level.

9. PARKING

9.1 Automobile Standards

9.1.1 Commercial / Office / Retail/Sports Club:

At least two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot. The Regulation incorporate applicable parking requirements in the LAMC as set forth below.

9.1.2 Condominiums

a. At least two parking spaces per each dwelling unit

b. One quarter parking spaces per each dwelling unit for guest parking

9.1.3 Rental

At least one parking space for each dwelling unit of less than three habitable rooms, one and one-half parking space for each dwelling unit of three habitable rooms, and two parking spaces for each dwelling unit of more than three habitable rooms.

9.1.4 Combination of uses

Where there is a combination of uses of a lot, the number of parking spaces required shall be the sum of the requirements of the various uses.

9.1.5 Shared parking

a. Shared parking may be applied on the site when the uses have different parking requirements and different demand patterns in a 24-hour cycle. The intent is to maximize efficient use of the site by matching parking demand with complimentary uses.

b. Calculating Shared Parking:

(i) Step I: Determine the aggregate minimum number of spaces required pursuant to the Code requirements for all land uses.

(ii) Step II: Based on the hourly variation in parking demand, determine the peak parking demand for the combined demand of all the land uses in the development.

(iii) Step III: Compare the calculations in Steps I and II, and the lesser of the two parking demands shall be used as the minimum number of parking spaces to be provided.

c. When a sports club is located in an office building with 50,000 square feet of office space, the general commercial use parking requirements apply and one parking space is required for 500 square feet of floor area for the building.

9.1.6 Additional regulations:

a. Location of accessory commercial, office and retail off-street spaces may be located on the same parcel as the use to which they are accessory or on the opposing development.

b. The automobile parking spaces required by Paragraphs (b), (c), (d) and (e) hereof, shall be provided either on the same lot as the use for which they are intended to serve or on another lot not more than 750 feet distant there from; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

c Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

d Access driveways to parking facilities will not exceed 28 feet in width The minimum separation between drives located along the same frontage shall be 50 feet.

e. Parking and loading access will be shared where feasible.

9.1 7 Screening

a. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and designed to look like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks.

9.2 Bicycle Standards

9.2.1 Requirements for each use:

a. Commercial / Office / Retail:

Any portion of a building used for non-residential purposes which contains a floor area in excess of 10,000 square feet, bicycle parking spaces shall be provided at the rate of two percent of the number of automobile parking spaces required by this section for such non-residential uses; provided, however, that at least one bicycle parking space shall be provided for any such building having a floor area in excess of 10,000 square feet of non-residential use. If the calculation of the number of required spaces results in a number including a fraction, the next highest whole number shall be the number of spaces required.

b. Condominiums

At least one secure bicycle parking space shall be provided for every two residential units

c Rental

None

9.3 Transportation Demand Management Plan

9.3.1 Project approvals to incorporate a comprehensive plan to manage vehicular and pedestrian circulation within the Project Site

9.3.2 The transportation demand management plan will promote smart onsite pedestrian and vehicular circulation and create linkages to public and private amenities outside the Project Site

10. SIGNAGE

10.1 Hollywood Signage Supplemental Use District

Signage shall be subject to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

10.2 Modification to Guidelines

Notwithstanding Section 10.1, high-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted. See fig.

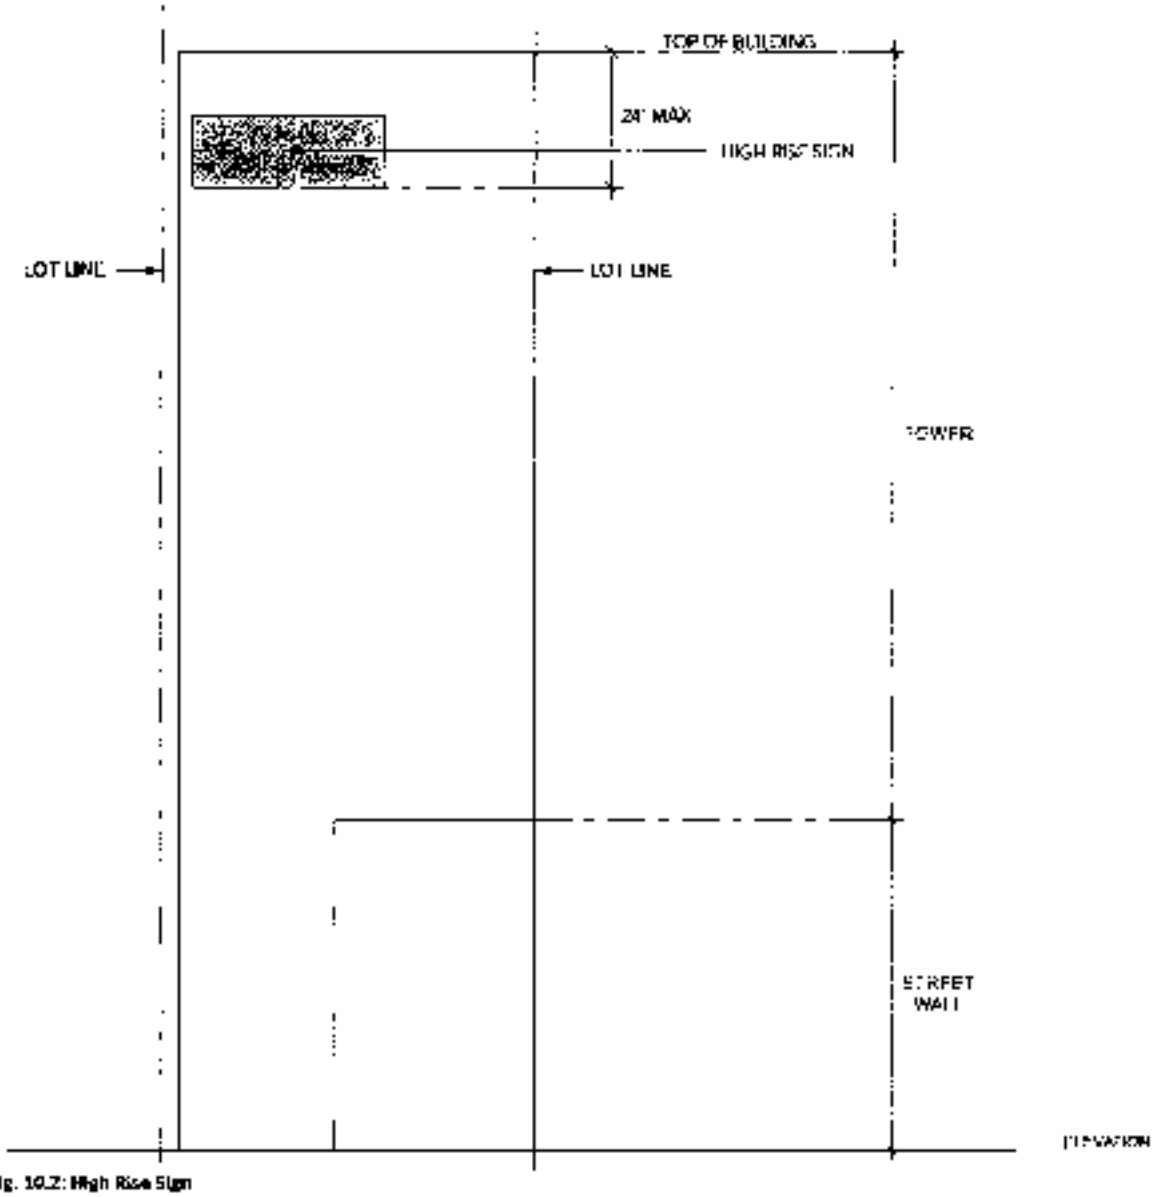

fig. 10.2: High Rise Sign

AR0068496

11. SUSTAINABILITY

11.1 Nonresidential Projects

The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.

11.2 Other Projects

The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required

SCOPE OF DEVELOPMENT

AR0068518

DESIGN STANDARDS FOR DEVELOPMENT

I. INTRODUCTION

The following design guidelines and standards (**"Design Guidelines"**) serve as the overarching plan controlling development of the Project. They are intended to enable the flexibility permitted in the Development Agreement while preserving and promoting comprehensive urban planning goals for the City and transportation-oriented development. They ensure that the transformation of the Development Site is compatible with the surrounding urban context by establishing parameters for all new physical improvements.

The Design Guidelines guarantee that the development of the entire Development Site is cohesive and developed as a unified development notwithstanding build-out over the Term of the Agreement.

The design principles underlying the Design Guidelines are:

a. historic preservation;

b. public open space and civic space;

c. pedestrian circulation;

d. preservation of view corridors to the Capital Records Building; and

e. maintenance of appropriate setbacks from Vine Street.

Further, the Design Guidelines establish standards specific to changes in the height of buildings whenever consistent with the permitted density as shown in Exhibit "E".

[The Development Guarantees and Development Guidelines will be completed with City and CRA input.]

II. OUTLINE OF DEVELOPMENT GUARANTEES

The Design Guarantees apply to any Phase of development permitted by the Agreement. Each Phase shall be developed to ensure compliance with the following Guarantees for the Project:

a Preservation of the Capitol Records Tower and Gogerty Building

b. Preserve public views to the Capitol Records Tower

c. Create unique retail at ground level to enliven all sidewalks and open space

d. Minimum set backs from Vine Street to preserve views of Capitol Records and create public open space

e. Civic plazas located on the east site adjacent to Vine Street and west site across from the Capitol Records Tower

f. Open space preserved along Vine Street frontage of east site to preserve views of the Jazz Mural and Capitol Records Tower

g. Through-block connections on both sites along Vine Street

h. Create a genuine Hollywood environment with lush landscaping for locals and visitors

i. Minimum ground floor open space will be 5% of total lot area of the Development Site

III. OUTLINE OF DEVELOPMENT GUIDELINES

1. Open Space

a. Emphasize green space networks

b. Open space connections to existing open space

2. Guidelines Based on Height

a. Building Heights Up to 150'

i. Massing established by protected view corridors and fire access

ii. Street wall and façade modulation up to 150'

iii. Subject to Zoning Standards (Section 3) and Building Design Parameters (Section 4)

b. Building Heights Up to 220'

i. Permitted for buildings with a maximum floor plate of 48% of lot coverage in designated zones up to 220'

ii. Subject to Zoning Standards (Section 3) and Architectural Guidelines (Section 5)

c. Building Heights Up to 400'

i. An additional 3% of open space must be provided. Minimum total open space is 8%.

ii. At least 50% of the floor area must be located below 220'

iii. Permitted for buildings with a maximum floor plate of approximately 28% of lot coverage between 220' and 400'

iv. Subject to Zoning Standards (Section 3) and Building Design Parameters (Section 4)

d. Building Heights Up to 510'

i. An additional 2% of open space must be provided. Minimum total open space is 10%.

ii. Permitted for buildings with a maximum floor plate of approximately 15% of lot coverage between 220' and 550'

iii. Subject to Zoning Standards (Section 3) and Building Design Parameters (Section 4)

e Building Heights Up to 585'

i. An additional 2% of open space must be provided. Minimum total open space is 12%.

ii. Permitted for buildings with a maximum floor plate of approximately 11.5% of lot coverage between 220' and 585'

iii. Buildings above 550' to include roof-top open space and viewing deck

iv. Subject to Zoning Standards (Section 3) and Building Design Parameters (Section 4)

3. Zoning Standards

a. Parking

i. Spaces Per Use

ii. Combination of Uses

iii. Design

iv. Bicycle Parking

1) At least one secure bicycle parking space shall be provided for every two residential units.

DESIGN STANDARDS FOR DEVELOPMENT

b. Setbacks

i. Side yard

ii. Rear yard

iii. Front yard

iv. Alleys

v. Lot Area

c. Open Space

i. Public Open Space – minimum 5% open space on ground floor

ii. Private Open Space

iii. Balcony Configuration

d. Loading

i. Except for the minimum ground level frontages required for all access, loading shall be screened from the view of adjacent public sidewalks and streets.

e. Access Driveways

4. Building Design Parameters

a. Materials and Colors

i. Materials, color, and fenestration of building frontages, located on or within 3' of a lot line facing a street, shall be similar to those found elsewhere in Hollywood.

ii. The building's masonry surfaces will be predominately light in color. Darker accent colors may be used to delineate building entrances and accents

iii. There will be clear contrast between the buildings surface materials and the building's glazed areas.

b. Rooftop and Parapets

c. Balconies

i. Balconies shall be integral to the building's form, mass, and or articulation.

d. Storefronts

e. Lighting

i. Exterior building lighting will be provided on all sides of the development to supplement street lighting.

ii. Lighting will be operated from dusk to dawn.

iii. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater.

iv. Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.

v. Lighting approach will be consistent on each parcel with not more than 30' between elements.

vi. Building owner will be responsible for maintaining all lighting used to meet these requirements. No luminaries used to meet these requirements shall be out of commission for more than 10 days.

vii. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner.

f. Arcades

i. Arcades at grade will maintain a minimum of 10' clear height.

ii. Arcades will be lit with a minimum of 1.0 foot candles.

g. Roof Treatments

i. Roof of parking structures will be landscaped to the extent possible to provide outdoor space.

ii. Rooftops and setbacks will be designed to the extent possible with consideration for use as public or privately accessible open space.

iii. Roofs used for mechanical purposes will be designed to minimize attention by incorporating non-reflective and low contrasting colors.

iv. Mechanical equipment shall be completely screened from lateral and pedestrian views. Mechanical penthouses will be designed to be consistent with the building's architecture and will utilize similar colors and materials as in other portions of the building.

v. Enclosures for bulkheads shall not count against building height.

h. Relief of Scale

i. Canopies and Awnings

i. Canopies will be provided for primary residential entrances. 10' minimum and 20' maximum clearance will be maintained above sidewalks, plazas, or walkways. A minimum of 2' will be provided from the face of canopy to the face of curb. The maximum width of a single canopy will be 30'.

j. Landscape

i. Plant material will be selected for diversity, neat appearance, suitability to solar orientation, and relationship to fenestration. The mature size of any plants shall not project more than 12' beyond the face of planters below the height of 10' relative to the adjacent sidewalk.

ii. Kiosks, carts and temporary structures may be permitted within public open spaces. No roofs of such structure shall extend more than 4' in any one direction.

k. Maintenance

l. Exhausts

m. Trash Enclosures

5. Architectural Guidelines

a. Building Entries

b. Drop-offs

c. Windows and Glazing

d. Street Level Façade

e. Parking Garage Walls

f. Public Walkways

g. Street and Sidewalk Planting

6. Signage

a. Wayfinding

i. Projecting signs shall align with major building elements. The width of projecting signs shall not exceed 4'. The spacing of such signs shall be no less than 20' with the exception that each individual retail tenant may be allowed one projecting sign not to exceed 2' in width.

b. No Off-Site Advertising

i. No pole type signage shall be used.

ii. No more than one rooftop/skyline sign shall be used per building. Spacing between rooftop signs shall be at least 50'.

iii. Rooftop signs shall be setback at least 10' from property lines or building lines.

iv. Rooftop signs shall be oriented towards and parallel to Hollywood Boulevard or at corners at 45 degree angles to the Boulevard district grid.

v. Opaque message surfaces shall not be used.

ASSIGNMENT AND ASSUMPTION AGREEMENT

EXAMPLE FORM OF ASSIGNMENT AND ASSUMPTION
APPLICABLE TO ASSIGNMENTS OF LESS THAN ENTIRE DEVELOPMENT SITE

Recording Requested By and
When Recorded Mail To:

Allen, Matkins, Leck, Gamble & Mallory LLP
515 South Figueroa Street, 9th Floor
Los Angeles, California 90071-3398
Attn: Jerry Neuman, Esq.

Assignment And Assumption Agreement

This ASSIGNMENT AND ASSUMPTION AGREEMENT ("**Agreement**") is made and entered into by and between MILLENNIUM PARTNERS, _____ a _____ ("**Assignor**"), and _____, a _____ ("**Assignee**").

R E C I T A L S:

WHEREAS, the City of Los Angeles ("**City**") and Assignor entered into that certain Development Agreement dated as of _____, 2009 (the "**Development Agreement**"), and recorded in the Official Records of Los Angeles County, California (the "**Official Records**") on _____, 2009 as Instrument No. 00-_____, with respect to that certain real property located in the City of Los Angeles, State of California as more particularly described in Exhibit "A" attached hereto and incorporated herein by this reference which is referred to in the Development Agreement as the "**Development Site**;"

WHEREAS, pursuant to the Development Agreement, Assignor has obtained from the City certain development approvals and permits with respect to the development of the Development Site; and

WHEREAS, Assignor is entitled under Section 6.8 of the Development Agreement to assign all of its rights and obligations with respect to portions of the Development Site under the Development Agreement to Assignee; and

WHEREAS, the Community Redevelopment Agency of the City of Los Angeles ("**Agency**") and Assignor entered into that certain Owner Participation Agreement dated as of _____, 2009 (the "**OPA**"), a memorandum of which was recorded in the Official Records on _____, 2009 as Instrument No. 00-_____, with respect to the Development Site;

WHEREAS, pursuant to the Development Agreement and OPA, Assignor has obtained certain rights and benefits with respect to the development of the Development Site; and

WHEREAS, Assignor is entitled under Section _____ of the OPA to assign certain of its rights and obligations with respect to the Development Site or portion thereof under the OPA to Assignee: and

WHEREAS, Assignor desires to assign to Assignee all (except as provided below) of Assignor's right, title, and interest in and to the Development Agreement and the OPA with respect to that portion of the Development Site more particularly described in Exhibit "B" attached hereto and incorporated herein by this reference (the "**Property**"); and

WHEREAS, Assignee desires to accept such assignment from Assignor and assume the obligations of Assignor under the Development Agreement with respect to the Property;

NOW, THEREFORE, in consideration of the foregoing recitals and for good and valuable consideration, the receipt of which is hereby acknowledged, the parties hereto agree as follows:

1. ASSIGNMENT BY ASSIGNOR TO ASSIGNEE.

1.1 ASSIGNMENT. Assignor hereby assigns and transfers to Assignee Assignor's right, title, and interest in and to the Development Agreement with respect to the Property, and Assignee hereby agrees to and does accept such assignment from Assignor. Such assignment includes delegation to Assignee of all of Assignor's obligations with respect to the Property and the allocation from Assignee to Assignor of the following development rights under the Development Agreement and the OPA:

1.1.1 Density. Assignee, its successors and assigns shall be entitled during the Term of the Development Agreement to develop and construct not more than _____ thousand (___, ___) square feet of Improvements (as such term is defined in the Development Agreement) on the Property in accordance with the Development Agreement (the "**Entitled Density**"). Nothing herein shall prohibit the Assignee from constructing less improvements containing less than the Entitled Density or from agreeing with the City to a reduction in the Entitled Density of the Property;

1.1.2 OEGSF. For purposes of compliance with the EIR (as defined in the Development Agreement), _____ square feet of "office equivalent gross square footage" or "**OEGSF**" (as defined in the Project EIR) shall be allocated to the Property, notwithstanding that the actual uses of Improvements hereafter constructed on the Property in accordance with the Development Agreement may not be office uses (the "**Maximum OEGSF**"). The Maximum OEGSF constitutes the maximum allowable density which may be constructed on the Property in compliance with the Project EIR; however, Assignee shall not be prohibited from consuming less or from releasing unused OEGSF on the Property to the City or with the City's consent to the owners of other properties. Notwithstanding the foregoing, Assignor agrees that it shall have no further right to use any portion of the Maximum OEGSF in connection with the development on its retained property, if any, even if the Assignee uses less than the Maximum OEGSF for development of the Property;

1.1.3 Further Assurances regarding Allocations. Each of Assignor and Assignee hereby covenant that it will, at any time and from time to time, upon written request therefore,

execute and deliver to the other party, such other party's successors, nominees and assigns, any new or confirmatory instruments which such other party, such other party's successors, nominees and assigns may reasonably request in order to fully assign and transfer to and vest in such other party, or such other party's successors, nominees and assigns, and to protect such other party, or such other party's successors, nominees and assigns right, title and interest in and to the Entitled Density and the Maximum OEGSF and retained density and OEGSF and otherwise realize upon or enjoy such rights in and to the Entitled Density and the Maximum OEGSF and retained density and OEGSF.

1.1.4 Specific Rights under the OPA. This Assignment includes all of Assignor's rights as "Participant" under the OPA with respect to the Property except for the following rights of Assignor, which are hereby reserved:

_____

_____

_____

_____

1.2 ASSUMPTION. Assignee expressly assumes and agrees to keep, perform, and fulfill all of the terms, conditions, covenants, and obligations required to be kept, performed, and fulfilled by Assignor under the Development Agreement and the OPA with respect to the Property. Assignee agrees to indemnify and hold harmless Assignor from any cost, liability, damage or expense (including attorneys' fees) arising out of or relating to Assignee's failure to perform any of the foregoing obligations assumed by Assignee hereunder.

2. EFFECTIVE DATE OF ASSIGNMENT. Said assignment and assumption shall be effective upon the recordation of this Agreement in the Official Records. From and after such effective date, the Assignee shall be the Developer under Development Agreement with respect to the Property subject and the Participant under the OPA with respect to the Property, subject to all of the terms and conditions in each such agreement to the extent they relate to the Property.

3. AGENCY AND CITY THIRD PARTY BENEFICIARIES. The Agency and the City shall be third party beneficiaries of this Agreement.

4. MISCELLANEOUS. In the event of the bringing of any action or suit by a party hereto against another party hereunder by reason of any breach of any of the covenants, conditions, agreements or provisions on the part of the other party arising out of this Assignment, then in that event the prevailing party shall be entitled to have and recover from the other party all costs and expenses of the action or suit, including reasonable attorneys' fees. This Assignment shall be binding upon and inure to the benefit of the successors, assignees, personal representatives and heirs of all the respective parties hereto. This Assignment shall be governed by, interpreted under, and construed and enforceable in accordance with, the laws of the State of California.

IN WITNESS WHEREOF, the parties hereto have executed this Assignment and Assumption Agreement as of the dates set forth next to their signatures below.

DRAFT – FOR DISCUSSION PURPOSES ONLY

From: "Kearns, Rick" <rkearns@handelarchitects.com>
To: "Blake Lamb" <Blake.Lamb@lacity.org>
CC: "Jon Tanury" <Jon.Tanury@lacity.org>, "Handel, Gary" <ghandel@handelarch...
Date: 3/24/2010 9:17 AM
Subject: RE: Millennium Towers Hollywood
Attachments: FAR Axonometrics.pdf; FAR PLAN.pdf

Blake - here are the FAR studies for each height. We did layouts for residential use and office use to show how the bulk will differ - typically residential plates are only 70 feet wide and square footage between 9K - 12K. Office plates are 110 -120 feet wide and square footage between 20K - 25K. We did not produce office schemes above 400 feet because the lot coverage restrictions above 400 feet make an office tower impractical on either site.

17, 3rd to LA

We will send street wall diagrams later today

We are working out the schedule with our trip to LA, ownership had a conflict and is planning to be out the following week, April 13, but I am out of town that week. I will let you know after I had a chance to confirm schedules with all parties. If it does move to the 13th, would that work for you?

Thanks

Hi Rick,
Actually I take back what I said about Weds - the best time would be April 6 around 1 pm. Thanks,
Blake

>>> "Kearns, Rick" <rkearns@handelarchitects.com> 3/23/2010 7:58 AM >>>
Blake - we are finishing up the diagrams you had requested (FAR massing at each height, street wall, through block connections) and will forward them to you within the next couple of days. We are also revising text pursuant to our meetings and follow-up discussions with ownership and should have them to you next week. We were planning another trip out to LA in early April and wanted to set up a meeting with you, John and Kevin. The purpose of the meeting would be to review any open items within the design guidelines and hopefully come to a mutual agreement on the text and diagrams. We would also use the meeting to outline our next steps.

Will April 6 or 7 work for you and your team?

Thanks

Hi Blake - here are the diagrams for street wall, open space (grade level setbacks) and publically accessible private space (PAPS). The PAPS diagrams also include photo examples of an enclosed PAPS and an open air PAPS. We also included refined language for the balcony and photo examples to help clarify what integral means. Let me know if you want to call and discuss the diagrams.

Dear Rick,
That is great, we look forward to receiving them. April 6 looks a little better since Wednesdays here are often busy, but either one is ok.

Design Guidelines
March 1, 2010

3. BUILDING HEIGHT AND MASSING

A. Street Wall

a. Design intent: required street walls determine the scale and character of the pedestrian environment. Articulation of the required street wall within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

b. Location of a required street wall:
   (i) Parcels with a grade level setback, the required street wall shall be located minimum 5 feet from the street line.
   (ii) Parcels or portions of parcels without a grade level setback, the required street wall shall be located on the street line.

c. Height of required street wall and dimension of initial setback
   (i) Street walls shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level with a minimum 10'-0" setback except as noted in item (ii) below.
   (ii) 40% of aggregate width of required street wall frontage on each street can exceed maximum street wall height up to the maximum building height.

d. Amount of articulation of required street wall.
   (i) The aggregate width of recessed street wall articulation at the level of any story shall not exceed 50% of the required street wall above the level of the second story ceiling or 28'-0" above curb level, whichever is less, to the floor level of the penultimate floor within the required street wall height within the lesser of 2 stories or 28'-0" above curb level. recesses, balconies and bay windows shall not be permitted. Pedestrian pass through, public plazas, entry forecourts, permitted vehicular access driveways, hotel drop-offs and loading entries and exits are permitted; steps, ramps, marquees, canopies, awnings and retail storefronts are permitted.

required street wall length?

e. Types of permitted articulation of a required street wall.
   (i) Recess, recesses shall be permitted to a maximum depth of 15'-0" with a 1:2 maximum depth to width ratio.
   (ii) Balcony, a balcony may project a maximum of 4'-0" from a required street wall over a grade level setback and each balcony may have a maximum length of 12'-0".
   (iii) Bay window: a bay window may project a maximum of 4'-0" from a required street wall over a grade level setback and each may have a maximum length of 12'-0".
   (iii) Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

f. Other permitted projections: elements which project beyond the street line from a required street wall shall comply with the Building Code.

req open space — what does it mean — exclusive of property line — consistent elsewhere?

(i) Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required street wall over a grade level setback by a maximum depth of 3'-0".

(ii) Steps and ramps may project from a required street wall over a grade level setback by a maximum depth of 5'-0"

(iii) Marquees, canopies and awnings: see Section xx

(iv) Retail storefronts may project from a required street wall over a grade level setback by a maximum depth of 5'-0". The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less

why?

B. Yards

a. Notwithstanding the requirements set forth in the LA Municipal Code, no building shall be required to provide front, side or rear yards

? this means what setback is? open space, building

C. Tower Controls

a. Design Intent.

- Towers should have their massing designed to reduce overall bulk and to appear slender
- Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over-manipulated elements.
- Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.
- If a project has more than one tower, they should be complementary to each other and employ the same architectural design approach.
- Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

do we want this?

b. Tower location: a tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

c. Setback and articulation of tower walls and crown

(i) Towers may extend directly up from up from the property line at the street and are not required to setback.

(ii) Minimum 10% of tower wall required to be articulated.

(iii) Distinctive tower crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical-equipment enclosure.

maybe?

d. Types of permitted articulation of a tower wall.

(i) Recess
(ii) Balconies
(iii) Bay windows

same guidelines as for structure?

e. Tower spacing

(i) Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.

(ii) ~~Generally~~, the portion of a tower above 150 feet shall be spaced at least 80 feet from all existing or possible future towers, both on the same block and across the street, except where 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled.

(iii) Where there is an existing adjacent tower, the distance should be measured from the wall of the existing adjacent tower to the proposed tower. Where there is no existing adjacent tower, but one could be constructed in the future, the proposed tower must be 40 feet from an interior property line and 40 feet from the alley center line shared with the potential new tower.

D. Maximum Building Height

a. For permitted maximum building height on each parcel as established in Figure xx *Designated Tower Zones*. The following are permitted obstructions which may penetrate the maximum building height: chimneys or flues; elevator or stair bulkheads, roof water tanks or cooling towers (including enclosures), flagpoles or aerials; ornamental church towers having no habitable floor area; parapet walls not more than 4'-0", spires or cupolas, wire, chain link, or other transparent fences.

[Insert] Figures for Tower Zone and Massing Diagrams

4. OPEN SPACE

A Grade Level Setback

a. Design intent: the purpose of a grade level setback is to provide a landscape amenity across from Capitol Reef Park, preserve views of the Taos Mural, accentuate the low scale character and punctuate the rhythm of entries with projecting raised planting areas.

b. Open space requirements

(i) Minimum ground floor open space will be 5% of total lot area of the Development Site for buildings up to a height of 220 feet. An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet. An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet and an additional 2% (total 12%) of open space required for buildings taller than 550 feet.

c. Materials

(i) Raised planters shall be faced on all exposed sides with stone or masonry compatible with the building façade materials.

(ii) Plant material shall be selected for suitability to solar orientation, heat appreciation, relationship to fenestration and seasonal diversity. The mature size of any plant shall not project more than 12" beyond the faces of the planter below a height of 10 feet above the adjacent sidewalk.

d. Permitted obstructions: the following are permitted obstructions which may occur in the grade level setback:
   (i) Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, and retail storefronts.

e. Other requirements:
   (i) Each planted area shall have provision for proper drainage and shall be equipped with waterproof electrical outlets and exterior water sources at a maximum interval of 50 feet or a minimum of one in each setback area.

B. Common Open Space – Residential Use Only

a. Design intent: a common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children, and to be visually attractive when viewed from apartments adjacent and above.

b. Size of common open space:
   (i) To qualify as private open space, the area shall be primarily at one level, have no dimension less than 15 feet, and be structurally designed to accommodate weight loads required for landscaping.
   (ii) The landscaped area shall comprise a minimum of 25% of the total private open space square footage. The remaining area shall have a durable, attractive paved surface.

c. Location of common open space:
   (i) Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as private open space.
   (ii) Buildings above 550 feet to include roof-top open space and viewing deck.

d. Access to common open space:
   (i) Common open space shall be directly accessible to all residents on the parcel through a lobby connecting to each elevator core. Such spaces shall be accessible to the handicapped. Ramps, elevators, corridors and doors shall be designed to accommodate wheelchairs.
   (ii) Common open space shall be accessible only from the residential portion of the building.
   (iii) At least 35% of each door to a common open space shall be transparent.

e. Permitted obstructions: the following are permitted obstructions which may occur in a common open space.
   (i) Terraces, balconies, bay windows, architectural facade details, accessory noncommercial greenhouses, planting boxes, steps and ramps for access by the hand capped, vents, bulkheads or other mechanical equipment, projecting not more than 5'-0".
   (ii) Eaves, gutters, or downspouts projecting not more than 26",
   (iii) Arbors, trellises, fences, flag poles, awnings or canopies,
   (iv) Chimneys projecting not more than 3'-0"; and
   (v) Recreational equipment.

f. General requirements:

(i) For every twenty (20) apartments on the parcel one fixed seat with a back shall be provided in private open space.

(ii) Common open spaces shall be separated from all apartments and outdoor areas serving individual apartments by a 4 foot high opaque fence, wall or year round screen of densely planted shrubs located at least 6 feet from a window or door of an apartment.

(iii) Areas with play equipment for young children may be provided. Play areas shall not be located within 20 feet of a residential unit and shall be visually and acoustically buffered from residential units and other non planter areas.

(iv) Vents, bulkheads or other mechanical equipment penetrations shall be located so as not to obstruct access to and usefulness of the private open space.

(v) Surface finishes of projecting structures shall be finished with materials compatible with vertical building materials.

(vi) No exhaust vents are permitted unless such intakes and vents are more than 10'-6" above the level of the private open space.

g. Landscape requirements:

(i) The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.

(ii) The minimum soil depths for planting are:

- Trees: 36"
- Shrubs: 30"
- Lawns, ground cover: 18"

deepen ?

(iii) Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

(iv) Planting requirements:

1. For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor trees.
2. The remaining landscaped area(s) shall be planted with seasonally diverse plant material appropriate for rooftops.
3. The landscaped area(s) shall be located such that they receive a minimum of 4 hours of direct sunlight as calculated on June 21.
4. The landscaped areas shall be contained by durable planters to accommodate the requirements specified in (i) above. Planters may be designed with a coping to provide additional seating if the coping is minimum 12" wide and does not exceed 18" in height. Planters may also be partially recessed into roof slab provided the overall requirements of (ii) above are met.

(v) Furnishings:

1. Furnishings such as seating, tables, gazebos or other shade structures are encouraged. Furnishings may be movable or fixed. If fixed, they shall be oriented to provide maximum variety in relationship to planted areas, sun and shade.

2. Surfacing beneath play equipment for young children shall comply with Federal safety standards and equipment shall be anchored in accordance with manufacturer's guidelines.
3. Provision for outdoor lighting: refer to Section xx.

C. Publicly Accessible Private Space (PAPS)

a. Design intent: a continuous through block connection, located on privately owned land, designated for and designed to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

b Location and size requirements:
i) 15'-0" minimum width and at least 50% open to the sky shall be provided along the entire southern side of western parcel and northern side of eastern parcel.

think about this width?

c Permitted obstructions:
i) Any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art; arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains and bicycle racks; open air cafes, kiosks, outdoor furniture, lights and lighting; stanchions, flag poles; public telephones; temporary exhibitions; balconies, bay windows, awnings, canopies and marquees; stairs, ramps and bollards.

Very well-proportioned

d Kiosk:
i) Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not exceed 3% of the total area of the PAPS and no one kiosk shall occupy an area of more than 250 square feet. A kiosk may be freestanding or may be attached on only one side to a wall of the building. Any area occupied by a kiosk shall be excluded from the definition of floor area, and may be occupied by news or magazine stands, candy stands, food preparation for open air cafes, flower stands or public service/information booths. Lighting and signage of kiosks shall conform to Section xx. Retail Guidelines

plazas?

e. Open air cafe:
i) Where an open air cafe is provided it shall be an unenclosed restaurant or eating or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the PAPS. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers. An open air cafe may occupy an aggregate area not more than 20% of the total area of the PAPS. No cooking equipment shall be installed within an open air cafe. Cooking equipment may be contained in a kiosk adjoining the open air cafe. An open air cafe qualifying as a permitted obstruction shall be

excluded from the definition of floor area. Lighting and signage of an open air cafe shall conform to Section xx, Retail Design Guidelines.

f. Service through windows:

(i) Outdoor eating services or just occupying kiosks may serve customers on PAPS through open windows.

g. Prohibition of parking spaces, loading bonths, exhaust vents and building refuse storage areas.

(i) No buildings refuse storage areas or refuse storage from a kiosk or open air cafe are permitted on any PAPS.

(ii) No exhaust vents are permitted on any PAPS or on any building wall of the development fronting upon the PAPS except where such vents are more than 10' 6" above the level of the PAPS.

h. Landscape requirements:

(i) The landscaped portion may be designed as a single area or multiple planter areas. The minimum size of a single planted area shall be 100 square feet.

(ii) The minimum soil depths for planting are:

- Trees: 36"
- Shrubs: 30"
- Lawns, ground cover: 18"

(iii) Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

(iv) Planting requirements:

1. Minimum of 10% of PAPS shall be landscaped.
2. For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor trees.
3. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

(v) Seating:

1. There shall be a minimum of one linear foot of seating for each 1000 square feet of PAPS excluding the area of an open air cafe. Not more than 50% of the linear seating capacity may be in moveable seats which may be stored between the hours of 7 p.m. and 7 a.m. Seating shall meet the following standards.
2. Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides.
3. Seating higher than 35" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.
4. The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

5. Moveable seating or chairs, excluding seating of open air cafes may be credited as 30 inches of linear seating per chair. Stools and seating in open air cafes do not count toward meeting the seating requirements

h. Lighting:

(i) A PAPS shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade. Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

i. Electrical power:

(i) Electrical power shall be supplied by one or more outlets furnishing a total of at least 3,000 watts of power for every 4,000 square feet, or fraction thereof, of a PAPS for maintenance equipment, special events and retail uses (kiosks, open air cafes, carts).

j. Signs:

(i) A PAPS shall be treated as a street for the purpose of the applicable sign regulations. Signs are permitted only accessory to uses permitted within and abutting the PAPS.

k. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a PAPS shall be allocated for occupancy by permitted retail, restaurants and cultural uses. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the PAPS with an entrance required every 50' as a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

l. Maintenance:

(i) Responsibility: the building owner shall be responsible for the maintenance of the PAPS including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk area adjacent to the parcel.

(ii) Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of PAPS area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of PAPS in connection with outdoor eating services or other uses permitted on PAPS which generate litter.

6. ARCHITECTURAL ELEMENTS

A. Building Materials and Color

a. Design intent: these Design Guidelines define the general design objectives for the material and color of distinct portions of the buildings and prescribe the treatment required for both residential and commercial portions of the building.

b. Guidelines.

AR0068547

(i) Feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane.

(ii) Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.

(iii) Podium levels up to 150 feet that include surfaces of masonry will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas.

(iv) Expression band shall be provided at the highest story within the podium.

(v) The building's skin, especially for towers, should be primarily transparent, the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.

(vi) In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.

(vii) To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.

(viii) Rooftop mechanical equipment shall be screened with materials and design consistent with the building architecture; see Section xx Tower crown.

(ix) Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

B. Grade Level Controls

a. Design intent:

(i) Street wall massing, articulation and detail, street level building entrances and storefront windows and doors, as well as the use of quality materials and decorative details, shall be used to promote pedestrian-scaled architecture along the street. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings and overhangs, are encouraged and should be integral to the architecture of the building.

b. Ground floor height:

(i) Minimum 12'-0" height floor to ceiling.

c. Building entrances.

(i) The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, plaza, or through block passage. Entries shall not be higher than 9 feet above the elevation of the sidewalk at its nearest

point to the entry. Where possible entries shall be marked through the use of architectural elements such as porches, gateways, entry alcoves, awnings, raincoles, or portals.

(b) Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.

(c) See Section xx marquees, canopies, awnings; Section xx for signage controls, and Section xx for lighting controls.

d. Ground floor glazing:

(i) Where any building wall adjoins a street line or grade level setback, at least 25% of the total surface area of such wall between curb level and 12' above curb level or to the ceiling of the ground floor, whichever is higher, shall be transparent. Door or window openings or unglazed openings within such walls shall be considered as transparent. Such openings shall have a minimum width of 2'-0". The lowest point of any transparency that is provided to satisfy the requirements of this section shall not be higher than 4'-0" above the curb level. Retail store/and ground floor glazing requires at least 50% transparency.

(ii) Any portion of such building wall, 50' or more in length, which contains no transparent elements between curb level and 12' above curb level or the ceiling of the ground floor, whichever is higher, or to its full height, shall be covered with vines or similar planting or contain art work or be treated so as to provide visual relief.

e. Arcades:

(i) Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

f. Service and refuse:

(i) Refer to Section xx Central Garbage Collection & Recycling

(ii) All refuse, except materials to be recycled, shall be mechanically compacted in accordance with applicable law. The storage of refuse shall occur entirely within an enclosed area on the parcel and appropriate locations within the parcel shall be delineated for this purpose: at least one for residential use and one for community facility and retail uses. Developments shall store compacted refuse in an on-site container acceptable to the Department of Sanitation. Each parcel shall have a minimum of one on-site loading berth; refer to Section xx Loading. A refuse disposal room meeting ADA requirements for access shall be provided on each story that has a corridor with two (2) or more entrances to apartments. The refuse disposal room shall contain vertical chute and bin containers and shelf space for the storage of recyclable materials. Each such refuse storage room and the central refuse storage and disposal room on each parcel shall be excluded from the definition of floor area.

(iii) Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off street. Refuse storage areas shall be directly and conveniently accessible to a curb cut; refer to Section xx Loading.

AR0068549

g. Retail storefronts:
   (i) Openings for storefronts. Windows and doors shall comprise a minimum of 40% of the building's street level façade and be recessed where necessary.
   (ii) Ground floor retail space will be a minimum of 20 feet deep and 12 feet clearance in height and have storefronts openings a minimum of 10 feet in height. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.
   (iii) Security grills will be located behind glass and be at minimum 80% open.
   (iv) Storefront glazing will be transparent.

C. Podium Controls

a. Podium height.
   (i) Minimum 30' 0" to a maximum of 150 feet, exclusive of the ground floor level.

b. Guidelines
   (i) Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means.
   (ii) Facades directly on the property line and facing a street will be vertically articulated by establishing different treatments for the building's base, middle and top through the use of balconies, projections, recesses, fenestration, or other elements.
   (iii) While blank street wall façades are prohibited, an exception may be made for integration of public artwork or graphics based façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (inlay cut outs, insets or pop outs). It should employ different scales of elements as viewed when seeing the entire building massing.

D. Marquees, Canopies, Awnings

a. Location by use.
   (i) Residential use: marquee or canopy shall be provided at the primary building entrance, canopy or awning is permitted at secondary entrances.
   (ii) Community facility use and professional office: canopy or awnings permitted.
   (iii) Commercial use: marquees or canopies are discouraged and shall only be permitted for office use. Marquees or canopies shall be permitted for hotel use. Awnings shall be permitted for retail use.

b. Marquees
   (i) 10'-0" minimum clear height and a maximum height of 20 feet shall be provided above the sidewalk; 2'-0" minimum horizontal distance from face of curb. Maximum width permitted of a marquee is 30 feet.

c. Canopies, awnings.
   (i) 8' 0" minimum clear height and a maximum height of 20 feet shall be provided above the sidewalk; 2'-0" minimum horizontal distance from face

of curb. Maximum continuous length permitted is 15', with a minimum of 2'-0" spacing between awnings.

(i) Awnings and canopies shall be fabricated of woven fabric, glass, metal or other permanent material compatible with the building architecture. Internally illuminated, vinyl awnings are not permitted.

E. Fenestration

a. Louvers, wall openings, shall be designed to integrate with building architecture.

F Rooftops and setbacks

a. General requirements:

(i) Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and to be visually attractive when viewed from locations adjacent and above.

(ii) For rooftops to be developed as usable outdoor area refer to requirements specified under private open space, Section xxx.

(iii) All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors. All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

(iv) Rooftops and setbacks adjacent to residential units. (1) Rooftops and setbacks exceeding 50 square feet shall be finished with materials suitable for use and landscaping. (2) Paving materials shall be durable; slope of surface shall not exceed 3%. (3) Waterproof electrical outlets and exterior water source shall be provided for each residential unit or at 50' intervals if a single unit abuts a rooftop or setback greater than 50' in length.

G. Parapets, Handrails, Roof Mechanical Equipment Screening

a Parapets and handrails: if part of an expression band or expression line, shall be finished in a distinctive manner.

b. Roof mechanical equipment, shall be screened; materials and design to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building. Enclosures for bulkheads shall not count against building height.

8.1 Requirements
8.2. Location and Size
8.3. Screening
8.4. Circulation

9. SIGNAGE

9.1 Guidelines

10. SUSTAINABILITY

10.1. LEED Certification

11. LIGHTING

12. NOISE

13. OPERATIONAL STANDARDS

13.1 Pet Controls
13.2. Antennas
13.3 Wireless Facilities

Design Guidelines
March 1, 2010
Revised April 8, 2010

1. INTRODUCTION

1.1. Purpose of Guidelines

1.1.1. The Design Guidelines ("Guidelines") have been prepared to regulate new development on the site with design guidelines and controls for development.

a. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project. The Design Guidelines establish basic site-wide design standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

b. Permit design flexibility while establishing a vocabulary which will guide the development for the Project site.

c. Consolidate and illustrate the implications of the established practices which will govern the physical development of the two sites, defining the standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

1.2. Goals and Objectives

1.2.1. The Design Guidelines serve to reinforce the design principles which will contribute to the shape of a successful project.

1.2.2. Those principles are as follows:

a. Preservation of the Capitol Records Tower and Gogerty Building.
b. Preserve public views to the Capitol Records Tower by creating *grade level setbacks*, civic plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.
c. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban node: creating The Hollywood Walk of Fame Plaza.
d. The reinforcement of the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.
e. The preservation of existing view corridor to the Hollywood hills.
f. The encouragement of street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.
g. The creation of vibrant urban spaces which permit active and passive recreational facilities for both the on-site and off-site population.
h. The creation of a 24 hr community by the creation of a Thriving Mixed-Use Development.
i. Eliminate the visual impact of the current on site parking.
j. TRANSPORTATION – awaiting comments from CPDI
k. The establishment of a standard intended to promote architectural excellence.
l. Provide designs that take into account the context and make an effort to respect it and fit in visually.

m. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.
n. The creation of two buildings that emphasize the vertical architecture and become a visible icon and gateway to Hollywood Boulevard from the Hollywood Freeway.

1.3. Relationship to the Los Angeles Municipal Code

1.3.1. The Guidelines were prepared in coordination with the Los Angeles City Planning Department and approved by the City Council.

1.3.2. Whenever the Guidelines contain provisions which establish regulations that are different from or more or less restrictive than allowed in the Los Angeles Municipal Code (LAMC) the Guidelines shall prevail pursuant to the Development Agreement approved by the City Council for the Project.

2. PROJECT BACKGROUND

2.1. Existing Site

2.1.1 The Project site consists of eight parcels on 4.47 acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site. The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site. The East Site and the West Site make up the Project Site. The Project site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

2.2. Zoning Classification

2.2.1. Classification: C2-2-SN (Proposed) within the Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency (CRA) of the City of Los Angeles.
- Currently zoned as a C4-2D-SN

2.2.2. The City General Plan land use designation: Regional Center commercial.

2.2.3. FAR: 6:1 (proposed)
- FAR 3:1 under "D" development limitation
- 4.5:1 under CRA Redevelopment Plan

2.3. Transfer of Floor Area

2.3.1. Owner may transfer floor area from one site to the other, as long as the minimum and maximum building heights are maintained. Either parcel can exceed the 6:1 FAR, as long as the FAR of the combined sites averaged together is no more than 6:1

2.4. Maximum OESF Density Per Area

2.5. Use Coordination / Use Compatibility

3. BUILDING HEIGHT AND MASSING

3.1. Street Wall

3.1.1. Definition of *street wall*: a wall or portion of a wall of a building facing a street or *a grade level setback*.

3.1.2 Design intent: required *street walls* determine the scale and character of the pedestrian environment. Articulation of the required *street wall* within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

3.1.3. Location of a required *street wall*:

a. Parcels with a *grade level setback*: the required *street wall* shall be located a minimum 5 feet from the property line.

b. Parcels or portions of parcels without a *grade level setback*: the required *street wall* shall be located on the property line.

3.1.2. Height of required *street wall* and dimension of initial setback:

a. *Street walls* shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) and (c) below.

b. 40% of aggregate width of required *street wall* frontage on each street can exceed maximum *street wall* height up to the maximum *tower* height.

c. 40% of aggregate width of required *street wall* frontage on a *publicly accessible private space* can exceed maximum *street wall* height up to the maximum *tower* height.

3.1.3. Amount of articulation of required *street wall*:

a. The aggregate width of required *street wall* articulation at the level of any story shall not exceed 50% of the required *street wall* above the level of the second story ceiling or 28'-0" above curb level, whichever is less, to the floor level of the penultimate floor within the required *street wall* height. Within the lesser of 2 stories or 28'-0" above curb level, recesses, balconies and bay windows shall not be permitted. Pedestrian pass-through, public plazas, entry forecourts, permitted vehicular access driveways, porte cochere drop offs and loading entries and exits are permitted; steps, ramps, marquees, canopies, awnings and retail storefronts are permitted.

3.1.4. Types of permitted articulation of a required *street wall*:

a. Recess: recesses shall be permitted to a maximum depth of 15'-0" with a 1:2 maximum depth to width ratio.

iii. Balcony: a balcony may project a minimum of 3'-0" from a required *street wall* over a *grade level setback*
iv. Bay window: a bay window may project from a required *street wall* over a *grade level setback*.
d. Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

3.1.5 Other permitted projections: elements which project beyond the property line from a required *street wall* shall comply with the Building Code

a. Architectural façade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required *street wall* over a *grade level setback*
b. Steps and ramps may project from a required *street wall* over a *grade level setback*
c. Marquees, canopies and awnings
d. Retail storefronts, may project from a required street wall over a *grade level setback* by a maximum depth of 5'-0". The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

3.2. Yards

3.2.1. Commercial Use: no front, side or rear yard set backs are required

3.2.2. Residential Use:
a. Front Yard – none (proposed).
- Code requires: There shall be a front yard of not less than 15 feet; provided, however, that on key lots the minimum front yard shall be 10 feet
b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.
c. Rear Yard: Minimum 15 feet, for a building more than three stories in height one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

3.3. Maximum Building Height

3.3.1. Height District No. 2

3.3.2. The total floor area contained in all the buildings on a lot in Height District No. 2 shall not represent six times the buildable area of said lot.
- : AB 3.1 under "D" development limitation
- 4.5.1 under CRA Redevelopment Plan

3.3.3. Refer to Figure xx Bulk Control Plan for permitted maximum building height on each parcel.

3.3.4. The following are permitted obstructions which may penetrate the maximum building height: roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building; skylights, towers, steeples, flagpoles, wireless masts, water tanks, silos, solar energy devices, or similar structures.

- [discuss] CAMC SEC. 1.2.21.B.2 "For each foot such structure exceeds the height limit, an equal setback from the roof perimeter is provided, except that stairways, chimneys and ventilation shafts shall not be required to be set back from the roof perimeter. No portion of any roof structure as provided for above shall exceed the specified height limit by more than five feet."

[Insert] Figures for Tower Zone and Massing Diagrams

3.4. Tower Controls

3.4.1. Definition of *tower*: the portion of a building located 150 feet above curb level

3.4.2. Maximum lot coverage of *tower*:

a. 150 – 220 feet 48%
b. 221 – 400 feet 28%
c. 221 – 550 feet 15%
d. 221 – 585 feet 11.5%

3.4.3. Refer to 4.1.3 open space requirements for corresponding ground level open space that is determined by tower height

3.4.4. 50% of total floor area must be located below 220 feet.

3.4.5. Tower location: a tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets

3.4.6. Setback and articulation of tower walls and crown:

a. *Towers* are not required to setback.
b. Minimum 10% of *tower* wall required to be articulated.
c. Distinctive *tower* crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

3.4.7. Types of permitted articulation of a *tower* wall

a. Recess.
b. Balcony: a balcony shall be integral to the façade and shall not create a relentless horizontal and vertical stacking pattern. They are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations.
   (i) Standard balconies may be projecting or recessed or a combination of both
c. Bay windows

3.4.8. Tower spacing

a. Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.
b. Generally, the portion of a tower shall be spaced at least 80 feet from all other towers on the same parcel, except the following which will meet code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled.

4. OPEN SPACE

4.1. Grade Level Setback

4.1.1. Definition of *grade level setback*: a continuous open space fronting the street.

4.1.2. Design intent: the purpose of a *grade level setback* is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records and accentuate the low scale character.

4.1.3. Open space requirements.

a. Minimum ground floor open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet.
b. An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet.
c. An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet.
d. An additional 7% (total 12%) of open space required for buildings taller than 550 feet.

4.1.4. Location

a. East side: adjacent to the Jazz Mural and Capitol Records Tower; West side across from the Capitol Records Tower along Vine Street.
b. Minimum depth: no horizontal dimension less than 5 feet when measured perpendicular from any point on each of the boundaries of the open space area.

4.1.5. Landscape requirements:

a. Planting requirements. Minimum 10% of *grade level setback* shall be landscaped.
b. Landscaped area(s) shall be planted with seasonally diverse plant material.
c. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
d. The minimum soil depths for planting are:
    (i) Shrubs: 30"
    (ii) Lawns, ground cover: 18"
e. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

4.1.6. Permitted obstructions: the following are permitted obstructions which may occur in the *grade level setback*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts

4.2. Residential Open Space

4.2.1. Design intent. A common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above.

a. Requirements:

(i) Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.

(ii) Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common areas as further defined and regulated herein.

4.2.2. Common Open Space

a. Requirements:

(i) Be open to the sky and have no structures that project into the common open space area, except as permitted in the zoning code.

(ii) Be readily accessible to all the residents of the site.

(iii) Have a minimum area of 400 sq. ft. with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

(iv) Constitute at least 50% of the total required usable open space in developments built.

(v) Common open space areas shall incorporate recreational amenities including but not limited to: swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

(vi) A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

(i) At least one 24-inch box tree for every four dwelling units shall be provided on site and may include street trees in the parkway.

(ii) For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

(iii) All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

b. Location of common open space:

(i) Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as common open space.

AR0068559

4.2.3. Private Open Space

a. Definition: a private open space area contiguous to and immediately accessible from a single dwelling unit.

b. Requirements
(i) Contain a minimum of 50 square feet of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.
(ii) Have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.
(iii) Provide a minimum eight foot vertical clearance under any projection, except as provided in zoning code.
(iv) That portion of a balcony which extends or projects into a required front yard in compliance with zoning code may qualify as usable open space provided it meets each of the above specified requirements noted in items 1-3.

4.3. Publicly Accessible Private Space (PAPS)

4.3.1. Definition of *publicly accessible private space (PAPS)*: a continuous through block connection, located on privately owned land.

4.3.2. Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

4.3.3. Location and size requirements:

a. The major portion of a *PAPS* is the largest area of the *PAPS* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total PAPS area and shall not be less than 20'-0" wide.
b. Minor portions of *PAPS* are secondary areas that allow for additional flexibility in the shape and configuration of a *PAPS*. Minor portions shall not occupy more than 25 percent of the total area of the *PAPS*. The minor portion shall have a minimum average width of 10 feet.
c. The minor portion must be directly adjacent to the major portion.

4.3.4. Permitted obstructions.

a. *PAPS* open air minimum requirements shall be as follows.

(i)	Development with maximum building height of 150 feet.	0%
(ii)	Development with maximum building height of 220 feet.	20%
(iii)	Development with maximum building height of 400 feet.	30%
(iv)	Development with maximum building height of 550 feet.	40%
(v)	Development with maximum building height of 585 feet.	50%

b. Permitted obstructions within open air *PAPS*: any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art.

arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles, public telephones, temporary exhibitions; balconies, bay windows; awnings, canopies and marquises; stairs, ramps and bollards. Metro station access?

4.3.5. Kiosk:

a. Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not exceed 3%of the total area of the PAPS and no one kiosk shall occupy an area of more than 250 square feet. A kiosk may be freestanding or may be attached on only one side to a wall of the building. Any area occupied by a kiosk shall be excluded from the definition of floor area [needs to be confirmed with CPD], and may be occupied by news or magazine stands, candy stands, food preparation for open air cafes, flower stands or public service/information booths.

4.3.6. Open air cafe

a. Where an open air cafe is provided it shall be an unenclosed restaurant or eating or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the PAPS. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers. An open air cafe may occupy an aggregate area not more than 20%of the total area of the PAPS. No cooking equipment shall be installed within an open air cafe. Cooking equipment may be contained in a kiosk adjoining the open air cafe. An open air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area.

4.3.7. Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on PAPS through open windows

4.3.8. Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No building refuse storage areas or refuse storage from a kiosk or open air café are permitted on any PAPS.
b. No exhaust vents are permitted on any PAPS or on any building wall of the development fronting upon the PAPS except where such vents are more than 10' 6" above the level of the PAPS.

4.3.9. Landscape requirements:

a. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
b. The minimum soil depths for planting are:
   (i) Trees: 30"

(ii) Shrubs: 30"
(iii) Lawns, ground cover: 18"

c. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets

d. Planting requirements:
(i) Minimum of 10% of open air PAPS shall be landscaped
(ii) For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor trees
(iii) The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

e Seating:
1. There shall be a minimum of one linear foot of seating for each 500 square feet of PAPS excluding the area of an open air cafe.
(i) One seat shall equal two linear feet
2. Not more than 50% of the linear seating capacity may be of moveable seats which may be stored between the hours of 7 p.m. and 7 a.m. Seating shall meet the following standards:
(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides
(ii) Seating higher than 35" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.
(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.
(iv) Moveable seating or chairs, excluding seating of open air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open air cafes do not count toward meeting the seating requirements.

4.3.10. Lighting.

a. A PAPS shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade. Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

4.3.11. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a PAPS shall be allocated for occupancy by permitted retail, restaurants and cultural uses. Such building frontage use requirement shall apply to both the mezzanines, if provided, and the street level. All such uses shall be directly accessible from the PAPS with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

4.3.12. Maintenance.

a. Responsibility: the building owner shall be responsible for the maintenance of the PAPS including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk area adjacent to the parcel.
b. Litter receptacles shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of PAPS area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of PAPS in connection with outdoor eating services or other uses permitted on PAPS which generate litter.

4.4. Rooftop Observation Deck

4.4.1. Buildings above 550 feet to include a public roof-top open space and viewing deck.

5. ARCHITECTURAL ELEMENTS

5.1. Building Materials and Color

5.1.1. Design intent: define the general design objectives for the material and color of distinct portions of the buildings and prescribe the treatment required for both residential and commercial portions of the building.

5.1.2. Guidelines

a. Feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane.
b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.
c. Podium levels up to 150 feet ~~that include surfaces of masonry~~ will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be clear contrast between the buildings surface material and the building's glazed areas.
d. The building's skin, especially for towers, should be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.
e. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.
f. To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface application.
g. Rooftop mechanical equipment shall be screened with materials and design consistent with the building architecture; ~~see Section 5c Tower Crown~~.
h. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

5.2. Grade Level Controls

5.2.1 Design intent: street wall massing, articulation and detail, street level building entrances and storefront windows and doors, as well as the use of quality materials and decorative details, shall be used to promote pedestrian-scaled architecture along the street. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and should be integral to the architecture of the building.

5.2.2. Ground floor height:

a. Minimum 12'-0" height floor to ceiling.

5.2.3. Building entrances:

a. The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, *grade level setback*, or *PMPS*. Entries shall not be higher than 4 feet above the elevation of the sidewalk at its nearest point to the entry. Where possible entries shall be marked through the use of architectural elements such as porticos, gateways, entry alcoves, awnings, canopies, or portals.
b. Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.
c. ~~See Section xx for marquees, canopies, awnings, Section xx for signage controls, and Section xx for lighting controls.~~

5.2.4. Ground floor glazing: [CPD pending text from CRA]

5.2.5. Arcades:

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

5.2.6. ~~Service~~ and refuse:

a. Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible to a curb cut; refer to Section xx Loading.

5.2.7. Retail storefronts.

a. Openings for storefronts, windows and doors shall comprise a minimum of 40% of the building's street level façade and be recessed where necessary.
b. Ground floor retail space will be a minimum of 20 feet deep and 12 feet clearance in height and have storefronts openings a minimum of 10 feet in height. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.
c. Security grills will be located behind glass and be at minimum 80% open.
d. Storefront glazing will be transparent.

5.3. Podium Controls

5.3.1. Design intent: provide a modern interpretation of the historical context of Hollywood by establishing different treatment from the building's base, middle and top through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

5.3.2. Podium height.

a. Minimum 30' 0" to a maximum of 150 feet, exclusive of the ground floor level.

5.3.3. Guidelines.

a. Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means.
b. Podium level windows shall be vertically oriented.
c. Podium levels shall be predominantly light in color.
d. Expression band shall be provided at the highest story within the podium.
e. While blank street wall façades are prohibited, an exception may be made for integration of public art or a graphic-based façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (using niches, reveals or pop-outs). It should employ different scales of elements as viewed when seeing the entire building massing.

5.4. Fenestration

5.4.1 Louvers, wall openings shall be designed to integrate with building architecture.

5.5. Tower

5.5.1. Design Intent:

a. Towers should have their massing designed to reduce overall bulk and to appear slender.
b. Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over-manipulated elements.
c. Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.
d. If a project has more than one tower, they should be complementary to each other and employ the same architectural design approach.
e. Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

5.6. Rooftops and Setbacks

5.6.1. General requirements:

a. Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and to be visually attractive when viewed from locations adjacent and above.
b. For rooftops to be developed as usable outdoor areas, refer to requirements specified under common open space, Section xxx.
c. All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors. All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.

5.7. Parapets, Handrails, Roof Mechanical Equipment Screening

5.7.1. Parapets and handrails: if part of an expression band or expression line, shall be finished in a distinctive manner.

5.7.2. Roof mechanical equipment: shall be screened; materials and design to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building. Enclosures for bulkheads shall not count against building height

6. STREETSCAPE

6.1. Streets and Sidewalks

6.1.1. Design Intent: the cohesiveness and variety of public open spaces and streets are key features of the Project. The combination of landscaped plazas and PARKS and landscape streets creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

(i) Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

(ii) Spacing of the street trees is critical to the overall image of the development, as their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree planting pattern.

6.1.2. Tree planting guidelines

a. It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module

for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

7. PARKING

7.1. Automobile Parking

7.1.1 Requirements for each use:

a. Commercial / Office / Retail:
   (i) At least two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings on any lot.

b. Condominiums
   (i) At least two parking spaces per each dwelling unit
   (ii) One quarter parking spaces per each dwelling unit for guest parking
   (iii) One quarter parking spaces per each dwelling unit for guest parking
   - Development is located within in a parking exempt area

c. Rental
   (i) At least one parking space for each dwelling unit of less than three habitable rooms, one and one-half parking spaces for each dwelling unit of three habitable rooms, and two parking spaces for each dwelling unit of more than three habitable rooms.

d Combination of uses:
   (i) Where there is a combination of uses of a lot, the number of parking spaces required shall be the sum of the requirements of the various uses.

7.1.2 Additional regulations:

a. Location of accessory commercial / office / retail off street spaces may be located on the same parcel as the use to which they are accessory, or on the opposing development.
   (i) (g) **Location of Parking Area**. The automobile parking spaces required by Paragraphs (b), (c), (d) and (e) hereof, shall be provided either on the same lot as the use for which they are intended to serve or on another lot not more than 750 feet distant therefrom, said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750 foot distance may be measured along said alley, walk or easement.

b. Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

c Access driveways to parking facilities will not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

d. Parking and loading access will be shared where feasible.

7.1.3. Screening

a. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and designed to look like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks.

7.2. Employee Bicycle Parking

7.2.1. Requirements for each use.

a. Commercial / Office / Retail

(i) Any portion of a building used for non-residential purposes which contains a floor area in excess of 10,000 square feet, bicycle parking spaces shall be provided at the rate of two percent of the number of automobile parking spaces required by this section for such non-residential uses; provided, however, that at least one bicycle parking space shall be provided for any such building having a floor area in excess of 10,000 square feet of non-residential use. If the calculation of the number of required spaces results in a number including a fraction, the next highest whole number shall be the number of spaces required.

b. Condominiums

(i) At least one secure bicycle parking space shall be provided for every two residential units.

c. Rental

(ii) None

7.3. Circulation

8. SERVICE AND LOADING

8.1. Requirements

a. Hotel and Commercial / Office / Retail that abut an alley

(i) Every required loading space shall be located and arranged that delivery vehicles may be driven upon or into said space from the alley. Such loading space shall have a minimum height of 14 feet and directly accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.

(ii) Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.

(iii) Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet but not more than 100,000 square feet, a minimum area of 600 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

b. Condominiums

ii) None

c. Rental
i) None

8.2. Screening

a. Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.
b. Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

8.3. Circulation

9. SIGNAGE

9.1. Guidelines

a. Refer to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

9.2. Modification to Guidelines

a. High-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted.

10. SUSTAINABILITY

10.1. LEED Certification

10.1.1. Standard of Sustainability (Mandatory for large projects)

a. Threshold: The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.
b. Requirement: The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

10.1.2. Standard of Sustainable Excellence (Voluntary for projects of any size - large and small)

a. Threshold: The Standard of Sustainable Excellence establishes an incentive program for projects that register with the USGBC's LEED® program, contract

with a LEED® AP, and can demonstrate how the project will achieve LEED® certification at a Silver or higher level.

b. Incentives. The ordinance will establish expedited service within the Department of City Planning and the Bureau of Engineering. Other incentives already in place, including those from the Department of Water and Power and the Department of Building and Safety, remain unchanged.

11. LIGHTING

11.1 Design intent: Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

11.2 Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the *grade-level setback and open PAPS*.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

11.3. Responsibility for maintenance: Building owner is responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

11.4. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner.

11.5. Lighting for areas located inside the lot line and visible from the street such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

11.6. Lighting for above-grade parking garage facilities shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

DRAFT

Design Guidelines
March 1, 2010
Revised April 8, 2010

1. INTRODUCTION

1.1. Purpose of Guidelines

1.1.1. The Design Guidelines ("Guidelines") have been prepared to regulate new development on the site with design guidelines and controls for development.

a. Establish a level of design quality and consistency for the entire development and insure design continuity will be carried through to the full implementation of the Project. The Design Guidelines establish basic site-wide design standards and criteria which serve to maintain the integrity of an overall master plan concept and protect the visual and environmental quality of the Project as a whole.

b. Permit design flexibility while establishing a vocabulary which will guide the development for the Project site.

c. Consolidate and illustrate the implications of the established practices which will govern the physical development of the two sites, defining the standards for use, bulk, parking and loading, architectural features, landscape treatment, signage, lighting, sound attenuation and sustainability.

1.2. Goals and Objectives

1.2.1. The Design Guidelines serve to reinforce the design principles which will contribute to the shape of a successful project.

1.2.2. These principles are as follows:

a. Preservation of the Capitol Records Tower and Gogerty Building.
b. Preserve public views to the Capitol Records Tower by creating *grade level setbacks*, civic plazas, on the east site adjacent to the Jazz Mural and Capitol Records Tower and west site across from the Capitol Records Tower.
c. Create civic plazas that are activated by retail, landscaped and enhance the Hollywood Walk of Fame by providing it as an urban node; creating The Hollywood Walk of Fame Plaza.
d. The reinforcement of the urban and historical importance of the intersection of Hollywood and Vine by the creation of an active street life focused on Vine Street.
e. The preservation of existing view corridor to the Hollywood hills.
f. The encouragement of street life by the creation of a new exclusive pedestrian connection between Ivar Avenue, Vine Street, and Argyle Avenue.
g. The creation of vibrant urban spaces which permit active and passive recreational facilities for both the on-site and off-site population.
h. The creation of a 24 hr community by the creation of a Thriving Mixed-Use Development.
i. ~~Insure sustainability by the creation of two development sites that offer flexibility to respond to market conditions and development phasing.~~
j. Eliminate the visual impact of the current on site parking.
k. [TRANSPORTATION – awaiting comments from CPD]
l. The establishment of a standard intended to promote architectural excellence.

DRAFT

m. Provide designs that take into account the context and make an effort to respect it and fit in visually.
n. Create architecture that seeks to be a leader in minimizing the negative environmental impact of buildings by enhancing efficiency and moderation in the use of materials, energy and development space.
o. The creation of two buildings that emphasize the vertical architecture and become a visible icon and gateway to Hollywood Boulevard from the Hollywood Freeway.

want this document to trump code?

1.3. Relationship to the Los Angeles Municipal Code

1.3.1. The Guidelines were prepared in coordination with the Los Angeles City Planning Department and approved by the City Council.

1.3.2. Wherever the Guidelines contain provisions which establish regulations that are different from or more or less restrictive than allowed in the Los Angeles Municipal Code (LAMC) the Guidelines shall prevail pursuant to the Development Agreement approved by the City Council for the Project.

Alfred when there are deviations, want guidelines to control issue w/ standards/gdelns

track entitlements separately from guidelines?

2. PROJECT BACKGROUND

2.1. Existing Site

i.d. issues that this covers trumps

2.1.1. The Project site consists of eight parcels on 4.47acres of land. The subject property occupies two distinct sites, both bounded by Yucca Street to the north and separated by Vine Street. The area bounded by Ivar Avenue, Vine Street and Yucca Street is the West Site. The area bounded by Yucca Street, Vine Street and Argyle Street is the East Site. The East Site and the West Site make up the Project Site. The Project site currently contains a mix of commercial and on grade open parking. The topography has a natural incline of approximately 13 feet from Vine Street to Argyle Avenue and 11 feet from Vine Street to Ivar Avenue. The existing sidewalk elevations will not be altered as part the Project.

2.2. Zoning Classification

2.2.1. Classification: C2-2-SN (Proposed) within the ~~Hollywood Community Redevelopment Project Area of the Community Redevelopment Agency~~ (CRA) of the City of Los Angeles.
- Currently zoned as a C4-2D-SN

Comm Plan

2.2.2. The City General Plan land use designation: Regional Center commercial.

2.2.3. FAR: 6:1 (proposed)
- FAR 3:1 under "D" development limitation
- 4.5:1 under CRA Redevelopment Plan

2.3. Transfer of Floor Area

2.3.1. Owner may transfer floor area from one site to the other, as long as the minimum and maximum building heights are maintained. Either parcel can

exceed the 6:1 FAR, as long as the FAR of the combined sites averaged together is no more than 6:1

2.4. Maximum OESF Density Per Area

2.5. Use Coordination / Use Compatibility

3. BUILDING HEIGHT AND MASSING

3.1. Street Wall

3.1.1. Definition of *street wall*: a wall or portion of a wall of a building facing a street or *a grade level setback*.

3.1.2. Design intent: required *street walls* determine the scale and character of the pedestrian environment. Articulation of the required *street wall* within the permitted ranges is required in order to create a sense of different uses, visual interest and orientation.

3.1.3. Location of a required *street wall*:

a. Parcels with a *grade level setback*: the required *street wall* shall be located minimum 5 feet from the property line.
b. Parcels or portions of parcels without a *grade level setback*: the required *street wall* shall be located on the property line.

3.1.2. Height of required *street wall* and dimension of initial setback:

a. *Street walls* shall be built to a minimum height of 30 feet and a maximum height of 150 feet above curb level except as noted in item (b) and (c) below.
b. 40% of aggregate width of required *street wall* frontage on each street can exceed maximum *street wall* height up to the maximum *tower* height.
c. 40% of aggregate width of required *street wall* frontage on a *publicly accessible private space* can exceed maximum *street wall* height up to the maximum *tower* height.

3.1.3. Amount of articulation of required *street wall*:

a. The aggregate width of required *street wall* articulation at the level of any story shall not exceed 50% of the required *street wall* above the level of the second story ceiling or 28'-0" above curb level, whichever is less, to the floor level of the penultimate floor within the required *street wall* height. Within the lesser of 2 stories or 28'-0" above curb level, recesses, balconies and bay windows shall not be permitted. Pedestrian pass-through, public plazas, entry forecourts, permitted vehicular access driveways, hotel drop-offs and loading entries and exits are permitted; steps, ramps, marquees, canopies, awnings and retail storefronts are permitted.

3.1.4. Types of permitted articulation of a required *street wall*:

DRAFT

Design Guidelines
March 1, 2010
Revised April 8, 2010

a. Recess: recesses shall be permitted to a maximum depth of 15'-0" with a 1:2 maximum depth to width ratio.

~~b.~~ Balcony: a balcony may project a minimum of 3'-0" from a required *street wall* over a *grade level setback* ~~and each balcony may have a maximum length of 12'-0".~~

~~c.~~ Bay window: a bay window may project ~~a maximum of 4'-0"~~ from a required *street wall* over a grade level setback; ~~and each may have a maximum length of 12'-0".~~

d. Expression band: an identifiable break should be provided between a building's retail floors and upper floors. This break may consist of a change in material, change in fenestration, or similar means.

3.1.5. Other permitted projections: elements which project beyond the property line from a required *street wall* shall comply with the Building Code.

a. Architectural facade elements such as expression bands, cornices, eaves, gutters, and downspouts may project from a required *street wall* over a *grade level setback* ~~by a maximum depth of 3'-0".~~ DBS - so long as setback is code required

b. Steps and ramps may project from a required *street wall* over a *grade level setback* ~~by a maximum depth of 5'-0".~~ DBS

c. Marquees, canopies and awnings

d. Retail storefronts: may project from a required street wall over a *grade level setback* by a maximum depth of 5'-0". The maximum height of these projections for each parcel shall not exceed two stories or 28'-0" above curb level, whichever is less.

needs to be a request in entitlements?

3.2. Yards

3.2.1. Commercial Use: no front, side or rear yard set backs are required

3.2.2. Residential Use:

a. Front Yard – none (proposed)
- Code requires: There shall be a front yard of not less than 15 feet; provided, however, that on key lots the minimum front yard shall be 10 feet.

b. Side Yard: Minimum 5 feet, for a building more than two stories in height, one foot shall be added to the width of such side yard for each additional story above the second story, but in no event shall a side yard of more than 16 feet in width be required.

c. Rear Yard: Minimum 15 feet, for a building more than three stories in height, one foot shall be added to the depth of such rear yard for each additional story above the third story, but such rear yard need not exceed 20 feet.

3.3. Maximum Building Height

3.3.1. Height District: No. 2

3.3.2. The total floor area contained in all the buildings on a lot in Height District No. 2 shall not exceed six times the buildable area of said lot.
- FAR 3:1 under "D" development limitation
- 4.5:1 under CRA Redevelopment Plan

DRAFT

3.3.3. Refer to Figure xx Bulk Control Plan for permitted maximum building height on each parcel.

3.3.4. The following are permitted obstructions which may penetrate the maximum building height: roof structures for the housing of elevators, stairways, tanks, ventilating fans or similar equipment required to operate and maintain the building, skylights, towers, steeples, flagpoles, wireless masts, water tanks, silos, solar energy devices, or similar structures.

- **[discuss]** LAMC SEC. 12.21.B.2: "for each foot such structure exceeds the height limit, an equal setback from the roof perimeter is provided, except that stairways, chimneys and ventilation shafts shall not be required to be set back from the roof perimeter. No portion of any roof structure as provided for above shall exceed the specified height limit by more than five feet."

[Insert] Figures for Tower Zone and Massing Diagrams

3.4. Tower Controls

3.4.1. Definition of *tower*: the portion of a building located 150 feet above curb level.

3.4.2. Maximum lot coverage of *tower*:

a. 150 – 220 feet 48%
b. 221 – 400 feet: 28%
c. 221 – 550 feet 15%
d. 221 – 585 feet 11.5%

3.4.3. Refer to 4.1.3 open space requirements for corresponding ground level open space that is determined by tower height.

3.4.4. 50% of total floor area must be located below 220 feet.

3.4.5. Tower location: a tower 220 feet or greater in height above curb level shall be located with its equal or longer dimension parallel to the north-south streets.

3.4.6. Setback and articulation of *tower* walls and crown:

a. *Towers* are not required to setback.
b. Minimum 10% of *tower* wall required to be articulated.
c. Distinctive *tower* crown and lighting permitted but not required at the highest one (1) story and rooftop mechanical equipment enclosure.

3.4.7. Types of permitted articulation of a *tower* wall:

a. Recess
b. Balcony: a balcony shall be integral to the façade and shall not create a relentless horizontal and vertical stacking pattern. They are encouraged to create a complex and varied pattern along the façade using various balcony sizes and architectural configurations.
   (i) Standard balconies may be projecting or recessed or a combination of both.
c. Bay windows

DRAFT

Design Guidelines
March 1, 2010
Revised April 8, 2010

3.4.8. Tower spacing

a. Towers should be spaced to provide privacy, natural light and air, as well as to contribute to an attractive skyline.
b. Generally, the portion of a *tower* shall be spaced at least 80 feet from all other *towers* on the same parcel, except the following which will meet code: 1) the towers are offset (staggered), 2) the largest windows in primary rooms are not facing one another, or 3) the towers are curved or angled.
c. ~~Where there is an existing adjacent tower, the distance should be measured from the wall of the existing adjacent tower to the proposed tower. Where there is no existing adjacent tower, but one could be constructed in the future, the proposed tower must be 40 feet from an interior property line and 40 feet from the alley center line shared with the potential new tower.~~

4. OPEN SPACE

4.1. Grade Level Setback

4.1.1. Definition of *grade level setback*: a continuous open space fronting the street.

4.1.2. Design intent: the purpose of a *grade level setback* is to provide a landscaped open space to preserve views of the Jazz Mural and Capitol Records and accentuate the low scale character.

4.1.3. Open space requirements:

a. Minimum ground floor open space will be 5% of total lot area of the development site for buildings up to a height of 220 feet.
b. An additional 3% of open space (total 8%) required for buildings between 221 feet and 400 feet.
c. An additional 5% (total 10%) of open space to be required for buildings between 401 feet and 550 feet
d. An additional 7% (total 12%) of open space required for buildings taller than 550 feet.

4.1.4. Location

a. East site: adjacent to the Jazz Mural and Capitol Records Tower; West site: across from the Capitol Records Tower along Vine Street.
b. Minimum depth: no horizontal dimension less than 5 feet when measured perpendicular from any point on each of the boundaries of the open space area.

4.1.5. Landscape requirements:

a. Planting requirements: Minimum 10% of *grade level setback* shall be landscaped.
b. Landscaped area(s) shall be planted with seasonally diverse plant material.
c. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
d. The minimum soil depths for planting are:

(i) Shrubs: 30"
(ii) Lawns, ground cover: 18"

e. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

~~4.1.6. Materials:~~

~~a. Raised planters shall be faced on all exposed sides with stone or masonry compatible with the building facade materials.~~
~~b. Plant material shall be selected for suitability to solar orientation, neat appearance, relationship to fenestration and seasonal diversity. The mature size of any plant shall not project more than 12" beyond the faces of the planter below a height of 10 feet above the adjacent sidewalk.~~

4.1.7. Permitted obstructions: the following are permitted obstructions which may occur in the *grade level setback*:

a. Building entries, steps, ramps, balconies, bay windows, architectural facade details, marquees, canopies, awnings, outdoor dining, and retail storefronts.

~~4.1.8. Other requirements:~~

~~a. Each planted area shall have provision for proper drainage and shall be equipped with waterproof electrical outlets and exterior water sources at a maximum interval of 50 feet or a minimum of one in each setback area.~~

4.2. Residential Open Space

4.2.1. Design intent: a common open space is intended to be a "rear yard" providing light and air to apartments on the interior of a parcel; secure, primarily passive recreational open space for resident adults and play space for children; and to be visually attractive when viewed from apartments adjacent and above.

a. Requirements:
(i) Provide at a minimum the following usable open space per dwelling unit: 100 square feet for each unit having less than three habitable rooms; 125 square feet for each unit having three habitable rooms; and 175 square feet for each unit having more than three habitable rooms.
(ii) Usable open space shall mean an area which is designed and intended to be used for active or passive recreation. Usable open space may consist of private and/or common area as further defined and regulated herein.

4.2.2. Common Open Space

a. Requirements:
(i) Be open to the sky and have no structures that project into the common open space area, except as permitted in the zoning code.
(ii) Be readily accessible to all the residents of the site.
(iii) Have a minimum area of 400 sq. ft. with no horizontal dimension less than 15 feet when measured perpendicular from any point on each of the boundaries of the open space area.

DRAFT

open space questions:

(iv) Constitute at least 50% of the total required usable open space in developments built.

(v) Common open space areas shall incorporate recreational amenities including but not limited to, swimming pools, spas, picnic tables, benches, children's play areas, ball courts, barbecue areas, sitting areas, gym and fitness center.

(vi) A minimum of 25 percent of the common open space area shall be planted with ground cover, shrubs or trees.

(i) At least one 24-inch box tree for every four dwelling units shall be provided on site and may include street trees in the parkway.

(ii) For a surface area not located directly on finished grade that is used for common open space, and located at ground level or the first habitable room level, shrubs and/or trees shall be contained within permanent planters at least 30-inches in depth, and lawn or ground cover shall be at least 12-inches in depth.

(iii) All required landscaped areas shall be equipped with an automatic irrigation system and be properly drained.

b. Location of common open space:

(i) Common open space shall be located at any story above curb level. The roof of any portion of a building used for accessory parking or for any permitted non-residential use shall be considered as common open space.

does restaurant w/seating count?

4.2.3. Private Open Space

a. Definition: a private open space area contiguous to and immediately accessible from a single dwelling unit.

b. Requirements:

(i) Contain a minimum of 50 square feet of which no more than 50 square feet per dwelling unit shall be attributable to the total required usable open space.

(ii) Have no horizontal dimension less than six feet when measured perpendicular from any point on each of the boundaries of the open space area.

(iii) Provide a minimum eight foot vertical clearance under any projection, except as provided in zoning code.

(iv) That portion of a balcony which extends or projects into a required front yard in compliance with zoning code may qualify as usable open space provided it meets each of the above specified requirements noted in items 1-3.

~~4.2.4. Access to common open space:~~

~~a. Common open space shall be directly accessible to all residents on the parcel through a lobby connecting to each elevator core. Such spaces shall be accessible to the handicapped. Ramps, elevators, corridors and doors shall be designed to accommodate wheelchairs.~~

~~b. Common open space shall be accessible only from the residential portion of the building.~~

~~c. At least 35% of each door to a common open space shall be transparent.~~

DRAFT

~~4.2.5. Permitted obstructions: the following are permitted obstructions which may occur in a common open space:~~

~~a. Terraces, balconies, bay windows, architectural facade details, accessory noncommercial greenhouses, planting boxes, steps and ramps for access by the handicapped, vents, bulkheads or other mechanical equipment, projecting not more than 5'-0";~~
~~b. Eaves, gutters, or downspouts projecting not more than 16";~~
~~c. Arbors, trellises, fences, flag poles, awnings or canopies;~~
~~d. Chimneys projecting not more than 3'-0"; and~~
~~e. Recreational equipment.~~

~~4.2.6. General requirements:~~

~~a. For every twenty (20) apartments on the parcel one fixed seat with a back shall be provided in private open space.~~
~~b. Common open spaces shall be separated from all apartments, and outdoor areas serving individual apartments, by a 4 foot high opaque fence, wall or year round screen of densely planted shrubs located at least 6 feet from a window or door of an apartment.~~
~~c. Areas with play equipment for young children may be provided. Play areas shall not be located within 20 feet of a residential unit and shall be visually and acoustically buffered from residential units and other non-planted areas.~~
~~d. Vents, bulkheads or other mechanical equipment penetrations shall be located so as not to obstruct access to and usefulness of the private open space.~~
~~e. Surface finishes of projecting structures shall be finished with materials compatible with vertical building materials.~~
~~f. No exhaust vents are permitted unless such intakes and vents are more than 10'-6" above the level of the private open space.~~

~~4.2.7. Landscape requirements:~~

~~a. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.~~
~~b. The minimum soil depths for planting are:~~
~~(i) Trees: 36"~~
~~(ii) Shrubs: 30"~~
~~(iii) Lawns, ground cover: 18"~~

~~c. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.~~
~~d. Planting requirements:~~
~~(i) For each 400 square feet of landscaped area there shall be at least one (1) major shade tree or two (2) minor trees.~~
~~(ii) The remaining landscaped area(s) shall be planted with seasonally diverse plant material appropriate for rooftops.~~
~~(iii) The landscaped area(s) shall be located such that they receive a minimum of 4 hours of direct sunlight as calculated on June 21.~~
~~(iv) The landscaped areas shall be contained by durable planters to accommodate the requirements specified in (ii) above. Planters may be designed with a coping to provide additional seating if the coping is~~

~~minimum 12" wide and does not exceed 18" in height. Planters may also be partially recessed into roof slab provided the overall requirements of (ii) above are met.~~

~~e. Furnishings:~~

~~(i) Furnishings such as seating, tables, gazebos or other shade structures are encouraged. Furnishings may be movable or fixed. If fixed, they shall be oriented to provide maximum variety in relationship to planted areas, sun and shade.~~

~~(ii) Surfacing beneath play equipment for young children shall comply with Federal safety standards and equipment shall be anchored in accordance with manufacturer's guidelines.~~

~~(iii) Provision for outdoor lighting: refer to Section xx.~~

4.3. Publicly Accessible Private Space (PAPS)

4.3.1. Definition of *publicly accessible private space (PAPS)*: a continuous through block connection, located on privately owned land.

4.3.2. Design Intent: to encourage public pedestrian circulation and other appropriate public uses on both sides along Vine Street.

4.3.3. Location and size requirements:

a. ~~15'-0" minimum width and at least 50% open to the sky shall be provided on each parcel, along the entire southern side of western parcel and northern side of eastern parcel.~~

b. The major portion of a *PAPS* is the largest area of the *PAPS* and the area of primary use. Major portions shall be generally regular in shape, contiguous to each other, easily and directly accessible from adjoining buildings and public spaces. Major portions shall occupy no less than 75 percent of the total PAPS area and shall not be less than 20'-0" wide.

c. Minor portions of *PAPS* are secondary areas that allow for additional flexibility in the shape and configuration of a *PAPS*. Minor portions shall not occupy more than 25 percent of the total area of the *PAPS*. The minor portion shall have a minimum average width of 10 feet.

d. The minor portion must be directly adjacent to the major portion.

4.3.4. Permitted obstructions:

a. *PAPS* open air minimum requirements shall be as follows:

(i)	Development with maximum building height of 150 feet:	0%
(ii)	Development with maximum building height of 220 feet:	20%
(iii)	Development with maximum building height of 400 feet:	30%
(iv)	Development with maximum building height of 550 feet:	40%
(v)	Development with maximum building height of 585 feet:	50%

b. Permitted obstructions within open air *PAPS*: any features, equipment, and appurtenances normally found in public parks and playgrounds, such as fountains and reflecting pools, waterfalls, sculptures and other works of art, arbors, trellises, benches, seats, trees, planting beds, litter receptacles, drinking fountains, and bicycle racks; open air cafes; kiosks, outdoor furniture; lights and lighting stanchions; flag poles; public telephones; temporary exhibitions;

AR0068584

balconies, bay windows; awnings, canopies and marquees; stairs, ramps and bollards. Metro station access?

4.3.5. Kiosk:

~~a.~~ Where a kiosk is provided, it shall be a one-story structure, predominantly of light materials, such as metal, glass, plastic, or fabric as approved by the Department of Buildings in conformance with the Building Code. Kiosks, including roofed areas, shall not exceed 3%of the total area of the PAPS and no one kiosk shall occupy an area of more than 250 square feet. A kiosk may be freestanding or may be attached on only one side to a wall of the building. Any area occupied by a kiosk shall be excluded from the definition of floor area [needs to be confirmed with CPD], and may be occupied by news or magazine stands, candy stands, food preparation for open air cafes, flower stands or public service/information booths. ~~Lighting and signage of kiosks shall conform to Section xx, Retail Guidelines.~~

4.3.6. Open air cafe:

a. Where an open air cafe is provided it shall be an unenclosed restaurant or eating or drinking place, which may have waiter or table service and is open to the sky except for permitted obstructions such as trees, arbors, awnings or canopies. An open air cafe shall be accessible from a minimum of two sides where there is a boundary with the remainder of the PAPS. The boundary shall be defined by planters or temporary decorative barricades. Seating may be reserved for customers. An open air cafe may occupy an aggregate area not more than 20%of the total area of the PAPS. No cooking equipment shall be installed within an open air cafe. Cooking equipment may be contained in a kiosk adjoining the open air cafe. An open air cafe qualifying as a permitted obstruction shall be excluded from the definition of floor area. ~~Lighting and signage of an open air cafe shall conform to Section xx, Retail Design Guidelines.~~

4.3.7. Service through windows:

a. Outdoor eating services or uses occupying kiosks may serve customers on PAPS through open windows.

4.3.8. Prohibition of parking spaces, loading berths, exhaust vents and building refuse storage areas:

a. No buildings refuse storage areas or refuse storage from a kiosk or open air café are permitted on any PAPS.
b. No exhaust vents are permitted on any PAPS or on any building wall of the development fronting upon the PAPS except where such vents are more than 10'-6" above the level of the PAPS.

4.3.9. Landscape requirements:

a. The landscaped portion may be designed as a single area or multiple planted areas. The minimum size of a single planted area shall be 100 square feet.
b. The minimum soil depths for planting are:

DRAFT

(i) Trees: 36"
(ii) Shrubs: 30"
(iii) Lawns, ground cover: 18"

c. Each planted area shall have provision for proper drainage, and shall be equipped with automatic drip irrigation and waterproof electrical outlets.

d. Planting requirements:
   (i) Minimum of 10% of open air PAPS shall be landscaped.
   (ii) For each 400 square feet of landscaped area there shall be at least one (l) major shade tree or two (2) minor trees.
   (iii) The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

e. Seating:
   1. There shall be a minimum of one linear foot of seating for each 500 square feet of PAPS excluding the area of an open air cafe.
      (i) One seat shall equal two linear feet
   2. Not more than 50% of the linear seating capacity may be in moveable seats which may be stored between the hours of 7 p.m. and 7 a.m. Seating shall meet the following standards:
      (i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides.
      (ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.
      (iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.
      (iv) Moveable seating or chairs, excluding seating of open air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open air cafes do not count toward meeting the seating requirements.

4.3.10. Lighting:

a. A PAPS shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade. Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

~~4.3.11. Electrical power:~~

~~a. Electrical power shall be supplied by one or more outlets furnishing a total of at least 3,000 watts of power for every 4,000 square feet, or fraction thereof, of a PAPS for maintenance equipment, special events and retail uses (kiosks, open air cafes, carts).~~

~~4.3.12. Signs:~~

~~a. A PAPS shall be treated as a street for the purpose of the applicable sign regulations. Signs are permitted only accessory to uses permitted within and adjoining the PAPS.~~

4.3.13. Mandatory allocation of frontages for permitted use: at least 40% of the total frontage of building walls of the development fronting on a PAPS shall be allocated for occupancy by permitted retail, restaurants and cultural uses. Such building frontage use requirement shall apply to both the mezzanine, if provided, and the street level. All such uses shall be directly accessible from the PAPS with an entrance required every 50' at a minimum. The remaining frontage may be occupied by other uses, vertical circulation elements and building lobbies.

all at ground

4.3.14. Maintenance:

a. Responsibility: the building owner shall be responsible for the maintenance of the PAPS including, but not limited to, the confinement of permitted obstructions, litter control, and the care and replacement of vegetation within the parcel and in the street sidewalk: area adjacent to the parcel.
b. Litter receptacles: shall be provided with a minimum capacity of one cubic foot for each 2,000 square feet of PAPS area. An additional capacity of one cubic foot of litter receptacle shall be provided for each 2,000 square feet of PAPS in connection with outdoor eating services or other uses permitted on PAPS which generate litter.

don't want to go lower

4.4. Rooftop Observation Deck

lower?

4.4.1. Buildings above 550 feet to include a public roof-top open space and viewing deck.

~~5. VIEW CORRIDOR~~

6. ARCHITECTURAL ELEMENTS

6.1. Building Materials and Color

6.1.1. Design intent: define the general design objectives for the material and color of distinct portions of the buildings and prescribe the treatment required for both residential and commercial portions of the building.

6.1.2. Guidelines:

apply w/ equivalency to all facades

a. Feature long-lived and sustainable materials. The material palette should provide variety, reinforce massing and changes in the horizontal or vertical plane.
b. Ground floors shall have a different architectural expression than upper floors and feature high quality durable materials that add scale, texture and variety.
c. Podium levels up to 150 feet ~~that include surfaces of masonry~~ will be predominantly light in color. Colors will be achieved through the inherent color of the material, rather than the application of color to the surface. Darker accent colors may be used to delineate building entrances and accents. There will be

clear contrast between the buildings surface material and the building's glazed areas.

d. The building's skin, especially for towers, should be primarily transparent; the use of darkly colored or highly reflective glass will be avoided. Glazing will have the minimum amount of reflectivity or tinting required to achieve energy efficiency standards.
e. In buildings other than curtain wall buildings, windows will be recessed, except where inappropriate to a building's architectural style.
f. To provide visual variety and depth, layer the building skin and provide a variety of textures that bear a direct relationship to the building's massing and structural elements. The skin should reinforce the integrity of the design concept and the building's structural elements, and not appear as surface pastiche.
g. Rooftop mechanical equipment: shall be screened with materials and design consistent with the building architecture; ~~see Section xx Tower crown~~.
h. Design the color palette for a building to reinforce building identity and complement changes in the horizontal or vertical plane.

6.2. Grade Level Controls

6.2.1. Design intent: street wall massing, articulation and detail, street level building entrances and storefront windows and doors, as well as the use of quality materials and decorative details, shall be used to promote pedestrian-scaled architecture along the street. Architectural features that reinforce the retail character of the ground street wall and/or help define the pedestrian environment along the sidewalk, such as canopies, awnings, and overhangs, are encouraged and should be integral to the architecture of the building.

6.2.2. Ground floor height:

a. Minimum 12'-0" height floor to ceiling.

6.2.3. Building entrances:

Comm. use storefronts

a. The primary entrance to a street level tenant that has frontage along a public street shall be provided from that street. The primary entrance to a tenant that does not have its frontage along a public street shall be provided from a courtyard, *grade level setback*, or *PAPS*. Entries shall not be higher than 4 feet above the elevation of the sidewalk at its nearest point to the entry. Where possible entries shall be marked through the use of architectural elements such as porches, gateways, entry alcoves, awnings, canopies, or portals.
b. Main building entrances should read differently from retail storefronts, restaurants and commercial entrances.
c. ~~See Section xx marquees, canopies, awnings; Section xx for signage controls, and Section xx for lighting controls.~~

6.2.4. Ground floor glazing: (CPD sending text from CRA)

a. When any building wall adjoins a street line or grade level setback, at least 25% of the total surface area of such wall between curb level and 12' above curb level or to the ceiling of the ground floor, whichever is higher, shall be transparent. Door or window openings or unglazed openings within such walls shall be considered as transparent. Such openings shall have a minimum width

of 2'-0". The lowest point of any transparency that is provided to satisfy the requirements of this section shall not be higher than 4'-0" above the curb level. Retail storefront ground floor glazing requires at least 50% transparency.

b. Any portion of such building wall, 50' or more in length, which contains no transparent elements between curb level and 12' above curb level or the ceiling of the ground floor, whichever is higher, or to its full height, shall be covered with vines or similar planting or contain art work or be treated so as to provide visual relief.

6.2.5. Arcades:

a. Arcades at grade will maintain a minimum of 10 feet clear height and will be lit with a minimum of 1.0 foot candles.

6.2.6. Service and refuse:

a. ~~All refuse, except materials to be recycled, shall be mechanically compacted in accordance with applicable law. The storage of refuse shall occur entirely within an enclosed area on the parcel and appropriate locations within the parcel shall be delineated for this purpose: at least one for residential use and one for community facility and retail uses. Developments shall store compacted refuse in an on-site container acceptable to the Department of Sanitation. Each parcel shall have a minimum of one onsite loading berth; refer to Section xx Loading. A refuse disposal room meeting ADA requirements for access shall be provided on each story that has a corridor with two (2) or more entrances to apartments. The refuse disposal room shall contain vertical chute and two containers and shelf space for the storage of recyclable materials. Each such refuse storage room and the central refuse storage and disposal room on each parcel shall be excluded from the definition of floor area.~~

b. Storage areas within the building of a size sufficient for that development to ensure that refuse is stored and loaded off-street. Refuse storage areas shall be directly and conveniently accessible to a curb cut; refer to Section xx Loading.

6.2.7. Retail storefronts:

a. Openings for storefronts, windows and doors shall comprise a minimum of 40% of the building's street level façade and be recessed where necessary.
b. Ground floor retail space will be a minimum of 20 feet deep and 12 feet clearance in height and have storefronts openings a minimum of 10 feet in height. Storefront openings shall be no wider than 100 feet and no smaller than 15 feet.
c. Security grills will be located behind glass and be at minimum 80% open.
d. Storefront glazing will be transparent.

6.3. Podium Controls

6.3.1. Design intent: provide a modern interpretation of the historical context of Hollywood by establishing different treatment from the building's base, middle and top; through the vertical articulation of the street wall façade by the use of balconies, projections, recesses, fenestration and changes in massing, color, material or other elements.

DRAFT

6.3.2. Podium height:

~~e.~~ Minimum 30'-0" to a maximum of 150 feet, ~~exclusive of the ground floor level.~~

6.3.3. Guidelines:

a. Provide an identifiable break between the building's ground floors and upper floors. This break may include a change in material, change in fenestration pattern or similar means.
b. Podium level windows shall be vertically oriented.
c. Podium levels shall be predominantly light in color.
d. Expression band shall be provided at the highest story within the podium.
e. While blank street wall façades are prohibited, an exception may be made for integration of public art or a graphic-based façade if it adds scale and interest to an otherwise bland frontage. In these cases, the façade should be a maximum of four floors high, and should have variation in its surface plane (using cut outs, insets or pop-outs). It should employ different scales of elements as viewed when seeing the entire building massing.

if bldg only 150 feet don't have podium

~~6.4. Marquees, Canopies, Awnings~~

~~6.4.1. Location by use:~~

~~a. Residential use: marquee or canopy shall be provided at the primary building entrance; canopy or awning is permitted at secondary entrances;~~
~~b. Community facility use and professional office: canopy or awning is permitted.~~
~~c. Commercial use: marquees or canopies are discouraged and shall only be permitted for office use; marquees or canopies shall be permitted for hotel use. Awnings shall be permitted for retail use.~~

~~6.4.2. Marquees:~~

~~a. 10'-0" minimum clear height and a maximum height of 20 feet shall be provided above the sidewalk. 2'-0" minimum horizontal distance from face of curb. Maximum width permitted of a marquee is 30 feet.~~

~~6.4.3. Canopies, awnings:~~

~~a. 8'-0" minimum clear height and a maximum height of 20 feet shall be provided above the sidewalk. 2'-0" minimum horizontal distance from face of curb. Maximum continuous length permitted is 15', with a minimum of 2'-0" spacing between awnings.~~
~~b. Awnings and canopies shall be fabricated of woven fabric, glass, metal or other permanent material compatible with the building architecture. Internally illuminated, vinyl awnings are not permitted.~~

6.5. Fenestration

6.5.1. Louvers, wall openings: shall be designed to integrate with building architecture.

6.6. Tower

DRAFT

6.6.1. Design Intent:

a. Towers should have their massing designed to reduce overall bulk and to appear slender.
b. Towers should be designed to achieve a simple faceted geometry and exhibit big, simple moves. They should not appear overwrought or to have over-manipulated elements.
c. Towers that emulate a more streamline modern style should provide variety through subtle details in the curtain wall, and the articulation of a human-scaled base at the street level.
d. If a project has more than one tower, they should be complementary to each other and employ the same architectural design approach.
e. Generally, buildings over 150 feet tall (the historic datum for Hollywood) should not be historicized. They are contemporary interventions in the skyline and should appear as such.

6.7. Rooftops and Setbacks

6.7.1. General requirements:

a. Rooftops and setbacks are highly visible and provide a significant amenity. They shall be landscaped with consideration for use and to be visually attractive when viewed from locations adjacent and above.
b. For rooftops to be developed as usable outdoor area, refer to requirements specified under common open space, Section xxx.
c. All other roof surfaces and setbacks shall provide surface materials which are not reflective or high contrast colors. All obtrusive features such as vents, bulkheads and cooling units shall be screened from lateral and pedestrian views.
d. ~~Rooftops and setbacks adjacent to residential units: (1) Rooftops and setbacks exceeding 50 square feet shall be finished with materials suitable for use and landscaping. (2) Paving materials shall be durable; slope of surface shall not exceed 3%. (3) Waterproof electrical outlets and exterior water source shall be provided for each residential unit or at 50' intervals if a single unit abuts a rooftop or setback greater than 50' in length.~~

6.8. Parapets, Handrails, Roof Mechanical Equipment Screening

6.8.1. Parapets and handrails: if part of an expression band or expression line, shall be finished in a distinctive manner.

6.8.2. Roof mechanical equipment: shall be screened; materials and design to be consistent with the building architecture and will utilize similar colors and materials as in other portions of the building. Enclosures for bulkheads shall not count against building height.

7. STREETSCAPE

7.1. Streets and Sidewalks

DRAFT

7.1.1. Design intent: the cohesiveness and variety of public open spaces and streets are key features of the Project. The combination of landscaped plazas and *PAPS* and landscaped streets creates diversity, and at the same time forms a single unified system. Cohesiveness shall be achieved by providing certain uniform elements such as lighting, paving, rhythmic tree plantings and continuous open spaces in a consistent palette of materials and furnishings.

Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree planting pattern.

7.1.2. Tree planting guidelines:

a. It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

~~7.1.3. New trees, planting beds, and grates will be provided along Vine Street, Ivar Avenue, Yucca Street, and Argyle Avenue. Jacaranda Mimosifiolias will be interspaced with Washingtonia Robusta palms along Vine Street. Palms will be spaced on 40 foot centers. Jacaranda Mimosifiolias will also be planted along Yucca Street frontages. Evergreen trees will be planted along Ivar and Argyle Avenues.~~

~~7.1.4. Sizable and healthy existing trees not conforming to the above will be removed and relocated on site if possible.~~

~~8. PEDESTRIAN LINKAGE~~

~~8.1. Provide through block connections on both sites along Vine Street.~~

9. PARKING

9.1. Automobile Parking

9.1.1. Requirements for each use:

a. Commercial / Office / Retail:

(i) At least two parking spaces for every one thousand square feet of combined gross floor area of commercial office, business, retail,

not a design feature needs to be in the DA instead of in TDM

DRAFT

restaurant, bar and related uses, trade schools, or research and development buildings on any lot.

b. Condominiums
   (i) At least two parking spaces per each dwelling unit
   (ii) One quarter parking spaces per each dwelling unit for guest parking
   (iii) One quarter parking spaces per each dwelling unit for guest parking
   - Development is located within in a parking congested area

c. Rental
   (i) At least one parking space for each dwelling unit of less than three habitable rooms, one and one-half parking spaces for each dwelling unit of three habitable rooms, and two parking spaces for each dwelling unit of more than three habitable rooms.

d. Combination of uses:
   (i) Where there is a combination of uses of a lot, the number of parking spaces required shall be the sum of the requirements of the various uses.

9.1.2. Additional regulations:

a. Location of accessory commercial / office / retail off-street spaces: may be located on the same parcel as the use to which they are accessory, or on the opposing development.
   - (g) **Location of Parking Area.** The automobile parking spaces required by Paragraphs (b), (c), (d) and (e) hereof, shall be provided either on the same lot as the use for which they are intended to serve or on another lot not more than 750 feet distant there from; said distance to be measured horizontally along the streets between the two lots, except that where the parking area is located adjacent to an alley, public walk or private easement which is easily usable for pedestrian travel between the parking area and the use it is to serve, the 750-foot distance may be measured along said alley, walk or easement.

b. Curb cuts shall be located no closer than 50 feet to the intersection of two streets.

c. Access driveways to parking facilities will not exceed 28 feet in width. The minimum separation between drives located along the same frontage shall be 50 feet.

d. Parking and loading access will be shared where feasible.

e. ~~The maximum floor to floor height of above grade parking shall not be greater than 9 feet except where parking is screened with dwelling units.~~

9.1.3. Screening

a. Above grade parking shall be lined with habitable floor area having a minimum depth of 20 feet along street frontages where feasible or shall be designed to blend in with the form and massing and ~~designed to look~~ like an integral part of the building. The interior of a parking structure will be designed to be screened from the view of streets and sidewalks.

we will comply with

9.2. Employee Bicycle Parking

9.2.1. Requirements for each use:

DRAFT

a. Commercial / Office / Retail:
   (i) Any portion of a building used for non-residential purposes which contains a floor area in excess of 10,000 square feet, bicycle parking spaces shall be provided at the rate of two percent of the number of automobile parking spaces required by this section for such non-residential uses; provided, however, that at least one bicycle parking space shall be provided for any such building having a floor area in excess of 10,000 square feet of non-residential use. If the calculation of the number of required spaces results in a number including a fraction, the next highest whole number shall be the number of spaces required.

b. Condominiums
   (i) At least one secure bicycle parking space shall be provided for every two residential units.

c. Rental
   (i) None

9.3. Circulation

10. SERVICE AND LOADING

10.1. Requirements

a. Hotel and Commercial / Office / Retail that abut an alley
   (i) Every required loading space shall be located and arranged that delivery vehicles may be driven upon or into said space from the alley. Such loading space shall have a minimum height of 14 feet and directly accessible through a usable door not less than three feet in width and not less than six feet six inches in height opening from the building it is to serve.
   (ii) Every required loading space shall have a minimum area of 400 square feet, a minimum width of 20 feet measured along the alley line, and a minimum depth of ten feet measured perpendicularly to the alley line.
   (iii) Loading space shall have a minimum area of 600 square feet where the gross floor area of all buildings on the lot exceeds 50,000 square feet, but not more than 100,000 square feet, a minimum area of 800 square feet where the gross floor area of all buildings is between 100,000 and 200,000 square feet, and shall be increased by an additional 200 square feet for each additional 200,000 square feet or fraction thereof of gross floor area in the building.

b. Condominiums
   (i) None

c. Rental
   (i) None

~~10.2. Location and Size~~

10.3. Screening

a. Except for the minimum ground level frontage required for access, loading shall be screened from the view of adjacent public sidewalks and streets.

DRAFT

b. Trash enclosures shall be provided and screened from the view of adjacent public sidewalks and streets. Rehabilitated trash enclosures shall be screened from the view of adjacent public sidewalks and streets.

10.4. Circulation

~~11. BICYCLE PARKING~~

12. SIGNAGE

12.1. Guidelines

a. Refer to Ordinance No. 176172: Hollywood Signage Supplemental Use District pursuant to Section 13.11 of the Los Angeles Municipal Code.

need to adopt the SUD

12.2. Modification to Guidelines

a. High-rise signs located within 24 feet from the top of the building and meeting the requirements of the Building Code shall be permitted.

~~12.3. Types~~

~~a. Retail tenants shall be allowed to install one exterior sign limited to name and logo only.~~
~~b. No pole type signage shall be used.~~
~~c. No more than one rooftop/skyline sign shall be used per building.~~
~~d. Opaque message surfaces shall be avoided.~~

~~12.4. Location~~

~~a. Retail Sign: shall be located within a permitted signage band and limited to area of 20 square feet. The total length of the sign shall not exceed 3/4 of the width of the tenant exterior wall surface and shall be equally spaced. One logo or emblem will be allowed. Interior signs shall permit an unobstructed view into tenant space.~~
~~b. Projecting Sign: shall align with major building elements. The width of projecting signs shall not exceed 4 feet. The spacing of such signs shall be no less than 20 feet with the exception that each individual retail tenant may be allowed one projecting sign not to exceed 2 feet in width.~~
~~c. Rooftop Signs: shall be setback at least 10 feet from property lines or building lines. Spacing between rooftop signs shall be at least 50 feet. Signs shall be oriented towards and parallel to Hollywood Boulevard or at corners at 45 degree angels to the Boulevard district grid.~~

~~12.5. Heights/Sizes~~

~~12.6. Illumination~~

13. SUSTAINABILITY

13.1. LEED Certification

13.1.1. Standard of Sustainability (Mandatory for large projects)

Inventory what signs in EIR as aesthetic but don't put in project description

DRAFT

a. Threshold: The Standard of Sustainability establishes a requirement for non-residential projects at or above 50,000 square feet of floor area, high-rise residential (above six stories) projects at or above 50,000 square feet of floor area, or low-rise residential (six stories or less) of 50 or more dwelling units within buildings of at least 50,000 square feet of floor area to meet the intent of the Leadership in Energy and Environmental Design® (LEED®) Certified level. The Standard also applies to existing buildings that meet the minimum thresholds described above when redevelopment construction costs exceed a valuation of 50% of the existing building's replacement cost.
b. Requirement: The project must include a LEED® Accredited Professional (LEED® AP) on the project team, and demonstrate that the project has met the intent of the US Green Building Council's (USGBC) LEED® Certified level. Formal certification by the USGBC is not required.

13.1.2. Standard of Sustainable Excellence (Voluntary for projects of any size - large and small)

a. Threshold: The Standard of Sustainable Excellence establishes an incentive program for projects that register with the USGBC's LEED® program, contract with a LEED® AP, and can demonstrate how the project will achieve LEED® certification at a Silver or higher level.
b. Incentives: The ordinance will establish expedited service within the Department of City Planning and the Bureau of Engineering. Other incentives already in place, including those from the Department of Water and Power and the Department of Building and Safety, remain unchanged.

14. LIGHTING

14.1. Design intent: lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

14.2. Supplemental lighting shall meet the following minimum requirements:

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade *level setback and open PAPS.*
b. Lighting will be operated from dusk to dawn.
c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.
d. Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.
e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

14.3. Responsibility for maintenance: building owner is responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting

DRAFT

c. The remaining landscaped area(s) shall be planted with seasonally diverse plant material.

8.3.5 Seating

a. There shall be a minimum of one linear foot of seating for each 500 square feet of *PAP* excluding the area of an open air cafe.

b. One seat shall equal 2 linear feet

c. Not more than 50% of the linear seating capacity may be in moveable seats. Seating shall meet the following standards:

(i) Seating without backs shall have a minimum depth of 16". For the benefit of handicapped persons a minimum of 20% of the required seating shall have backs at least 12" high and a minimum depth of 14". Seating 30" or more in depth shall count double provided there is access to both sides.

(ii) Seating higher than 36" and lower than 12" above the level of the adjacent walking surface shall not count toward meeting the seating requirements.

(iii) The tops of walls including but not limited to those which bound planting beds, fountains and pools may be counted as seating when they conform to the dimensional standards in subparagraphs (i) and (ii) above.

d. Moveable seating or chairs, excluding seating of open air cafes, may be credited as 30 inches of linear seating per chair. Steps and seating in open air cafes do not count toward meeting the seating requirements.

8.4 Tree Planting Guidelines

8.4.1 Purpose: [complete]

8.4.2 It is the intent to comply with the Urban Forestry Division standard guidelines regarding street tree locations and planting procedures. Regular spacing of the street trees is critical to the overall image of the Project, establishing the module for locating all of the other elements of the streetscape and certain building elements such as entrances, canopies, and utility connections.

8.4.3 Street trees play a very important role in the Project. To create a strong visual order, trees shall be planted in continuous, uniformly spaced rows along the streets. To acknowledge microclimatic variations and to avoid monoculture demise, different tree species shall be required on the designated hierarchy of street types. In all cases, the trees shall be planted in a single row on sidewalks leading to or abutting the development.

8.4.4 Spacing of the street trees is critical to the overall image of the development, so their regular spacing becomes the module for locating all of the other elements on the sidewalks such as light standards, pavement scoring patterns and curb cut zones. It is important that building elements affecting tree spacing, such as entrances, canopies, and utility connections, be coordinated at the outset to avoid conflict with the established tree planting pattern.

8.5 Lighting Standards

8.5.1 Lighting located at the perimeter of each parcel is required to supplement the street lighting. Its purpose is to improve color rendering, fill in shadows, light pedestrians' faces, articulate the building base-level facades, reinforce the residential and pedestrian character of the development and adjoining neighborhoods, increase security, and visually activate the nighttime streetscape. Lighting for this purpose shall be energy efficient, attractive, and easy to maintain.

8.5.2 Supplemental lighting shall meet the following minimum requirements

a. Supplemental sidewalk lighting for pedestrians shall be provided on all sides of the parcel and designed in conjunction with the grade level open space and open PAP.

b. Lighting will be operated from dusk to dawn.

c. Lighting will utilize a "white" light source with a color rendering index (CRI) of 65 or greater, i.e. metal halide, fluorescent, compact fluorescent, white cold cathode, white neon, or white HPS.

d. Steps and ramps will be lighted with a minimum of 1.0 foot candles on a horizontal plane.

e. Lighting approach will be consistent on each parcel with not more than 30 feet between elements.

8.5.3 Responsibility for maintenance

a. building owner is responsible for maintenance of all lighting associated with the property and for the maintenance of tenant lighting used to meet these requirements. No luminaire or lighted element which is to meet these requirements shall be out of commission for more than 10 consecutive days.

b. Additional lighting such as plant lighting, colored lighting, signage lighting, etc. will be used. The operation of additional lighting will be at the discretion of the building owner. - spotlights displays etc

8.5.4 Lighting for areas located inside the lot line and visible from the street: such as service yards, loading docks, service or garage entrances, shall be lighted with "white" light sources in attractive and/or concealed luminaires.

8.5.5 Lighting for above-grade parking garage facilities: shall utilize "white" light sources and the luminaires' brightness shall be shielded from view of the street or any residential living space. This may be accomplished through architectural screening, luminaire placement, or integral luminaire shielding. Parking garages which are entirely concealed from exterior view are exempt from this requirement.

8.6 PAP Lighting Standards

8.6.1 A *PAP* shall be illuminated throughout with an overall minimum average level of illumination of not less than one maintained foot candle (lumens per square foot) on the horizontal plane at grade.

8.6.2 Such level of illumination shall be maintained throughout the hours of darkness. Light sources shall be white light.

PREFACE

This User's Guide for the AMS/EPA Regulatory Model (AERMOD) provides user instructions for the AERMOD model. The technical description of the AERMOD algorithms is provided in a separate document (EPA, 2004a). The revised AERMOD model described in this user's guide includes the following modifications and enhancements: the PRIME building downwash algorithms based on the ISC-PRIME model, use of allocatable arrays for data storage, incorporation of EVENT processing for analyzing short-term source culpability, post-1997 PM10 processing; a non-regulatory default TOXICS option that includes optimizations for area sources and the Sampled Chronological Input Model (SCIM) option, explicit treatment of multiple-year meteorological data files and the ANNUAL average and options to specify emissions that vary by season, hour-of-day and day-of-week.

AR0068603

ACKNOWLEDGMENTS

The User's Guide for AERMOD has been prepared by Pacific Environmental Services, Inc., Research Triangle Park, North Carolina. This effort has been funded by the Environmental Protection Agency (EPA) under Contract Nos. 68D30032 and 68D30001, with Russell F. Lee as Work Assignment Manager (WAM) and under Contract No. 68D70069 with Warren D. Peters as WAM. The user instructions for AERMOD were developed in part from Volume I of the ISC3 User's Guide (EPA, 1995).

1.0 INTRODUCTION

This section provides an overall introduction to the AERMOD model and to the AERMOD user's guide. Some suggestions are offered on how various users would best benefit from using the manuals. Also provided is an overview of the model's applicability, range of options, and basic input data and hardware requirements. The input file needed to run the AERMOD model is based on an approach that uses descriptive keywords and allows for a flexible structure and format.

1.1 HOW TO USE THE AERMOD MANUALS

The AERMOD model user's guide has been designed in an attempt to meet the needs of various types of users, depending on their level of experience with the model. This section describes briefly how different types of users would benefit most from their use of the manual.

1.1.1 Novice Users

Novice users are those whose exposure to or experience with the AERMOD model has been limited. They may be new to dispersion modeling applications in general, or new to the AERMOD model and therefore unfamiliar with the keyword/parameter approach utilized for the input file. These users should review the remainder of this Introduction to gain an overall perspective of the use of AERMOD model, particularly for regulatory modeling applications. They should then concentrate their review on Section 2, which provides a brief tutorial on setting up an input file that illustrates the most commonly used options of the AERMOD model. Section 2 provides a basic description of the input file structure and explains some of the advantages of the keyword/parameter approach to specifying modeling options and inputs. As the user becomes more familiar with the operation of the model and encounters the need to use more advanced features of the model, he/she will want to review the contents of Section 3, which provides a more detailed and complete reference of the

AR0068610

various options for running the model

1.1.2 Experienced Modelers

Experienced modelers will have had considerable experience in applying the AERMOD model in a variety of situations. They should have basic familiarity with the overall goals and purposes of regulatory modeling in general, and with the scope of options available in the AERMOD model in particular. Experienced modelers who are new to the AERMOD model will benefit from first reviewing the contents of Section 2 of this volume, which will give them a basic orientation to the structure, organization and philosophy of the keyword/parameter approach used for the input runstream file. Once they have a basic grasp of the input file structure and syntax rules, they will benefit most from using Section 3 of this volume as a reference to learn the overall capabilities of the model, in order to understand the mechanics for implementing particular options. The information in Section 3 has a functional organization with detailed descriptions of each of the individual keyword options by functional pathway. Once they are familiar with most or all of the keywords, they may find the functional keyword reference provided in Appendix B useful to quickly review the proper syntax and available options/parameters for a particular keyword. They may also find the Quick Reference available at the end of the user's guide sufficient as a simple reminder of the available keywords for each pathway and to ensure the proper order of parameters for each input image.

Experienced modelers may also need to refer to the description of model formulation for AERMOD (EPA, 2009) in order to gain a more complete understanding of the technical basis for the AERMOD model.

1.1.3 Management/Decision Makers

Those involved in a management or decision-making role for dispersion modeling applications will be especially interested in the remainder of this section, which provides an

AR0068611

overview of the model, including its role in various regulatory programs, a brief description of the range of available options, and basic input data and computer hardware requirements needed to run the model. From this information they should understand the basic capabilities of the AERMOD model well enough to judge the suitability of the model for particular applications. They may also want to review the brief tutorial provided in Section 2 to learn about the nature and structure of the input runstream file, in order to better be able to review the modeling results.

1.1.4 Programmers/Systems Analysts

Programmers and systems analysts, specifically those involved with installing the AERMOD code on other computer systems or charged with maintaining the code, should review the contents of Section 4 of this document. This will give specific details on compiling and linking the code for various situations, and explain in detail the memory storage requirements and control of input and output (I/O). They may also wish to review the remainder of this Introduction and the brief tutorial in Section 2 of this volume in order to have a basic understanding of the nature and overall capabilities of the model, and to understand the basic input runstream file structure and organization.

1.2 OVERVIEW OF THE AERMOD MODEL

This section provides an overview of the AERMOD model, including a discussion of the regulatory applicability of the model, a description of the basic options available for running the model, and an explanation of the basic input data and hardware requirements needed for executing the model.

1.2.1 Regulatory Applicability

The U.S. Environmental Protection Agency (EPA) maintains a *Guideline on Air Quality Models* (hereafter, Guideline) which is published as Appendix W to 40 CFR Part 51.

AR0068612

as revised). The Guideline provides the agency's guidance on regulatory applicability of air quality dispersion models in general. In general, regulatory modeling applications should be carried out in accordance with a modeling protocol that is reviewed and approved by the appropriate agency prior to conducting the modeling. The modeling protocol should identify the specific model, modeling options and input data to be used for a particular application.

1.2.2 Basic Input Data Requirements

One of the basic inputs to AERMOD is the runstream setup file which contains the selected modeling options, as well as source location and parameter data, receptor locations, meteorological data file specifications, and output options. Another type of basic type of input data needed to run the model is the meteorological data. AERMOD requires two types of meteorological data files, that are provided by the AERMET meteorological preprocessor program (EPA, 2004b). One file consists of surface scalar parameters, and the other file consists of vertical profiles of meteorological data. These meteorological data files are described briefly later in this section, and in more detail in Sections 2 and 3. For applications involving elevated terrain effects, the receptor and terrain data will need to be processed by the AERMAP terrain preprocessing program (EPA, 2004c) before input to the AERMOD model.

1.2.3 Computer Hardware Requirements

The current version of the AERMOD model was developed on an IBM-compatible PC, and has been designed to run on PCs with an 80386 or higher central processing unit (CPU) chip, a minimum of 2 MB of RAM, a math coprocessor, and MS-DOS Version 3.2 or higher. In order to handle the input data files (runstream setup and meteorology) and the output files, it is required that the system have a hard disk drive. The amount of storage space required on the hard disk for a particular application will depend greatly on the output options selected. Some of the optional output files of concentration data can be rather large. More information on output file products is provided in Sections 2 and 3.

AR0068613

1.2.4 Overview of Available Modeling Options

The AERMOD model includes a wide range of options for modeling air quality impacts of pollution sources, making it a popular choice among the modeling community for a variety of applications. The following sections provide a brief overview of the options available in the AERMOD model.

1.2.4.1 Dispersion Options

Since the AERMOD model is specially designed to support the EPA's regulatory modeling programs, the regulatory modeling options will be the default mode of operation for the model. These options include the use of stack-tip downwash, and a routine for processing averages when calm winds or missing meteorological data occur. The model also includes non-default options for suppressing the use of stack-tip downwash, and to disable the date checking for non-sequential meteorological data files. The latter option is needed to facilitate evaluation of the model. The user can specify several short term averages to be calculated in a single run of the AERMOD model, as well as requesting the overall period (e.g. annual) averages.

1.2.4.2 Source Options

The model is capable of handling multiple sources, including point, volume, and area source types. Line sources may also be modeled as a string of volume sources or as elongated area sources. Several source groups may be specified in a single run, with the source contributions combined for each group. This is particularly useful for PSD applications where combined impacts may be needed for a subset of the modeled background sources that consume increment, while the combined impacts from all background sources (and the permitted sources) are needed to demonstrate compliance with the National Ambient Air Quality Standards (NAAQS). The model contains algorithms for modeling the effects of

AR0068614

aerodynamic downwash due to nearby buildings on point source emissions. AERMOD does include algorithms for modeling depositional effects on particulate emissions.

Source emission rates can be treated as constant throughout the modeling period, or may be varied by month, season, hour-of-day, or other optional periods of variation. These variable emission rate factors may be specified for a single source or for a group of sources. The user may also specify a separate file of hourly emission rates for some or all of the sources included in a particular model run.

4.3.2.4.3 Receptor Options.

The AERMOD model has considerable flexibility in the specification of receptor locations. The user has the capability of specifying multiple receptor networks in a single run, and may also mix Cartesian grid receptor networks and polar grid receptor networks in the same run. This is useful for applications where the user may need a coarse grid over the whole modeling domain, but a denser grid in the area of maximum expected impacts. There is also flexibility in specifying the location of the origin for polar receptors, other than the default origin at (0,0) in x,y, coordinates.

The user can input elevated receptor heights in order to model the effects of terrain above (or below) stack base, and may also specify receptor elevations above ground level to model flagpole receptors. There is no distinction in AERMOD between elevated terrain below release height and terrain above release height, as with earlier regulatory models that distinguished between simple terrain and complex terrain. For applications involving elevated terrain, the user must also input a hill height scale along with the receptor elevation. To facilitate the generation of hill height scales for AERMOD, a terrain preprocessor, called AERMAP, has been developed (EPA, 2004c).

AR0068615

3.2.4.4 Meteorology Options.

The AERMOD model utilizes a file of surface boundary layer parameters and a file of profile variables including wind speed, wind direction, and turbulence parameters. These two types of meteorological inputs are generated by the meteorological preprocessor for AERMOD, which is called AERMET (EPA, 2004b). Both of these meteorological input files are sequential ASCII files, and the model automatically recognizes the format generated by AERMET as the default format. The model will process all available meteorological data in the specified input file by default, but the user can easily specify selected days or ranges of days to process.

3.2.4.5 Output Options.

The basic types of printed output available with AERMOD are:

- Summaries of high values (highest, second highest, etc.) by receptor for each averaging period and source group combination;
- Summaries of overall maximum values (e.g., the maximum 50) for each averaging period and source group combination; and
- Tables of concurrent values summarized by receptor for each averaging period and source group combination for each day of data processed. These "raw" concentration values may also be output to unformatted (binary) files, as described below.

The tables by receptor and maximum value tables can be output for the source group values or for the individual source values, or both. In addition, when maximum values for individual sources are output, the user has the option of specifying whether the maximum source values are to be the maximum values for each source independently, or the contribution of each source to the maximum group values, or both.

In addition to the tabular printed output products described above, the AERMOD model provides options for several types of file output products. One of these options for

AR0068616

AERMOD is to output an unformatted ("binary") file of all concentration values as they are calculated. These files are often used for special postprocessing of the data. In addition to the unformatted concentration files, AERMOD provides options for two additional types of file outputs. One option is to generate a file of (X,Y) coordinates and design values (e.g., the second highest values at each receptor for a particular averaging period and source group combination) that can be easily imported into many graphics plotting packages to generate contour plots of the concentration values. Separate files can be specified for all of the averaging period and source group combinations of interest to the user.

Another output file option of the AERMOD model is to generate a file of all occurrences when a concentration value equals or exceeds a user-specified threshold. Again, separate files are generated for only those combinations of averaging period and source group that are of interest to the user. These files include the date on which the threshold violation occurred, the receptor location, and the concentration value.

AERMOD includes options for two types of output files that are designed to facilitate model evaluation. One type of file lists concentrations by rank, where only one value per date is included. This file may be used to generate Q-Q (quantile) plots of results, where values from different models and/or observed data are paired by rank. The other type of output file provides annual maximum results along with detailed information about the plume characteristics associated with the annual maximum.

1.2.4 Source Contribution Analyses

In air quality dispersion modeling applications, the user may have a need to know the contribution that a particular source makes to an overall concentration value for a group of sources. This section provides a brief introduction to how these types of source contribution (sometimes referred to as source culpability) analyses are performed using the AERMOD model. More detailed information about exercising these options is provided in Section 3.

AR0068617

The AERMOD model provides the option of specifying source groups for which the model calculates high values independently. However, users may often have to run the model a second time selecting only specific days where the high values occurred, and setting up each source in its own source group in order to obtain source contribution results. Rather than running a separate EVENT model, as was done with ISCST2 (the original precursor to the AERMOD model), the EVENT processing has been incorporated into the AERMOD model

AR0068618

2.0 GETTING STARTED - A BRIEF TUTORIAL

This section provides a brief tutorial for setting up a simple application problem with the AERMOD model, which serves as an introduction for novice users to the AERMOD model. The example illustrates the usage of the most commonly used options in the AERMOD model. A more complete description of the available options for setting up the AERMOD model is provided in Section 3.

The example problem presented in this section is a simple application of the AERMOD model to a single point source. The source is a hypothetical stack at a small isolated facility in a rural setting. Since the stack is below the Good Engineering Practice (GEP) stack height, the emissions from the source are subject to the influence of aerodynamic downwash due to the presence of nearby buildings. The tutorial leads the user through selection and specification of modeling options, specification of source parameters, definition of receptor locations, specification of the input meteorological data, and selection of output options. Since this discussion is aimed at novice users of the AERMOD model, a general description of the input file keyword/parameter approach is provided first.

2.1 DESCRIPTION OF KEYWORD/PARAMETER APPROACH

The input file for the AERMOD model makes use of a keyword/parameter approach to specifying the options and input data for running the model. The descriptive keywords and parameters that make up this input runstream file may be thought of as a command language through which the user communicates with the model what he/she wishes to accomplish for a particular model run. The keywords specify the type of option or input data being entered on each line of the input file, and the parameters following the keyword define the specific options selected or the actual input data. Some of the parameters are also input as descriptive secondary keywords.

AR0068619

The runstream file is divided into five functional "pathways." These pathways are identified by a two-character pathway ID placed at the beginning of each runstream image. The pathways and the order in which they are input to the model are as follows:

CO - for specifying overall job **CO**ntrol options;

SO - for specifying **SO**urce information;

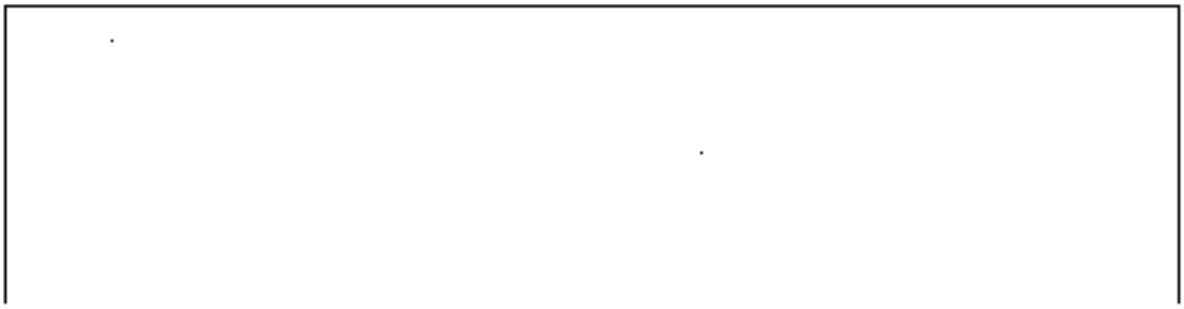
RE - for specifying **RE**ceptor information;

ME - for specifying **ME**teorology information;

EV - for specifying **EV**ent processing;

OU - for specifying **OU**tput options.

Each line of the input runstream file consists of a pathway ID, an 8-character keyword, and a parameter list. An example of a line of input from a runstream file, with its various parts identified, is shown below:



The following sections describe the rules for structuring the input runstream file, and explain some of the advantages of the keyword/parameter approach.

2.1.1 Basic Rules for Structuring Input Runstream Files

While the input runstream file has been designed to provide the user with considerable flexibility in structuring the input file, there are some basic syntax rules that need to be followed. These rules serve to maintain some consistency between input files generated by

AR0068620

different users, to simplify the job of error handling performed by the model on the input data, and to provide information to the model in the appropriate order wherever order is critical to the interpretation of the inputs. These basic rules and the various elements of the input runstream file are described in the paragraphs that follow.

One of the most basic rules is that all inputs for a particular pathway must be contiguous, i.e., all inputs for the CO pathway must come first, followed by the inputs for the SO pathway, and so on. The beginning of each pathway is identified with a "STARTING" keyword, and the ending of the pathway with the "FINISHED" keyword. Thus the first functional record of each input file must be "CO STARTING" and the last record of each input file must be "OU FINISHED." The rest of the input images will define the options and input data for a particular run.

Each record in the input runstream file is referred to as a runstream "image." These records are initially read into the model as 132-character images. The information on each input image consists of a "pathway," a "keyword," and one or more "parameters." Each of these "fields" on the runstream image must be separated from other fields by at least one blank space. To simplify the interpretation of the runstream image by the model, the runstream file must be structured with the two-character pathway in columns 1 and 2, the eight-character keyword in columns 4 through 11, followed by the parameters in columns 13 through 132, as necessary. For most keywords, the <u>order</u> of parameters following the keyword <u>is</u> important -- the exact <u>spacing</u> of the parameters <u>is not</u> important, as long as they are separated from each other by at least one blank space and do not extend beyond the 132 character limit. The example of a runstream image from the CO pathway shown above is repeated here:

AR0068621

Alphabetical characters can be input as either lower case or upper case letters. The model converts all character input to upper case letters internally, with the exception of the title fields and file names to be discussed later. Throughout this document, the convention of using upper case letters is followed. For numeric input data, it should be noted that all data are assumed to be in metric units, i.e., length units of meters, speed units of meters per second, temperature units of degrees Kelvin, and emission units of grams per second. In a few instances, the user has the option of specifying units of feet for length and the model will perform the conversion to meters. These exceptions are the input of receptor heights for elevated terrain and the specification of anemometer height, since these values are often more readily available in feet than in meters.

Certain keywords are mandatory and must be present in every runstream file, such as the MODELOPT keyword shown in the example above which identifies the modeling options. Other keywords are optional and are only needed to exercise particular options, such as the option to allow for the input of flagpole receptor heights. Some of the keywords are repeatable, such as the keywords to specify source parameters, while other keywords may only appear once. The keyword references in Section 3, Appendices A and B and the Quick Reference at the end of this volume identify each keyword as to its type, either mandatory or optional, and either repeatable or non-repeatable.

With a few exceptions that are described below, the order of keywords within each pathway is not critical. For the SO pathway, the LOCATION keyword must be specified before other keywords for a particular source, and the SRCGROUP keyword must be the last

AR0068622

keyword before SO FINISHED. For keywords on the SO pathway that accept a range of source IDs, the source parameters specified by those keywords will only be applied to the sources already defined, and will exclude any sources that are specified latter in the input file.

The PARAMETER ILEN_FLD is used to specify the maximum length of individual fields on the input runstream image, and also to declare the length of all filename and format variables. This PARAMETER is initially assigned a value of 80, and is in MODULE MAIN1 in MODULES.FOR.

2.1.2 Advantages of the Keyword Approach

The keyword approach provides some advantages over the type of input file used by other models that require formatted input of several numeric switches. One advantage is that the keywords are descriptive of the options and inputs being used for a particular run, making it easier for a reviewer to ascertain what was accomplished in a particular run by reviewing the input file. Another advantage is that the user has considerable flexibility in structuring the inputs to improve their readability and understandability, as long as they adhere to the few basic rules described above.

Some special provisions have been made to increase the flexibility to the user in structuring the input files. One provision is to allow for blank records in the input file. This allows the user to separate the pathways from each other, or to separate a group of images, such as source locations, from the other images. Another provision is for the use of "comment lines," identified by a "**" in the pathway field. Any input image that has "**" for the pathway ID will be ignored by the model. This is especially useful for labeling the columns in the source parameter input images, as illustrated in the example problem later in this section. It may also be used to "comment out" certain options for a particular run without deleting the options and associated data (e.g., elevated terrain heights) completely from the input file. Because of the descriptive nature of the keyword options and the flexibility of the

AR0068623

inputs it is generally much easier to make modifications to an existing input runstream file to obtain the desired result.

Another reason for improved "user-friendliness" is that detailed error-handling has been built into the model. The model provides descriptions of the location and nature of all of the errors encountered for a particular run. Rather than stopping execution at each occurrence of an input error, the model will read through and attempt to process all input records and report all errors encountered. If a fatal error occurs, then the model will not attempt to execute the model calculations.

2.2 REGULATORY MODELING OPTIONS

The regulatory default option is controlled from the MODELOPT keyword on the CO pathway. As its name implies, this keyword controls the selection of modeling options. It is a mandatory, non-repeatable keyword, and it is an especially important keyword for understanding and controlling the operation of the AERMOD model. Unless specified otherwise through the available keyword options, the AERMOD model implements the following default options:

- Use the elevated terrain algorithms requiring input of terrain height data.
- Use stack-tip downwash (except for building downwash cases).
- Use the calms processing routines.
- Use the missing data processing routines.
- Use a 4-hour half-life for exponential decay of SO_2 for urban sources.

The parameters used to specify options on the MODELOPT keyword are character strings, called "secondary keywords," that are descriptive of the option being selected. For example, to ensure that the regulatory default options are used for a particular run, the user would include the secondary keyword "DFAULT" on the MODELOPT input. The presence of this

AR0068624

secondary keyword tells the model to override any attempt to use a non-regulatory default option. The model will warn the user if a non-regulatory option is selected along with the DFAULT option, but will not halt processing. For regulatory modeling applications, it is strongly suggested that the DFAULT switch be set, even though the model defaults to the regulatory options without it. The MODELOPT keyword is described in more detail in the Section 4.2.2.

For any application in which a non-regulatory option is to be selected, the DFAULT switch must not be set, since it would otherwise override the non-regulatory option. The non-regulatory options are also specified by descriptive secondary keywords, for example, "NOSTD" invokes the option not to use stack-tip downwash.

2.3 MODEL STORAGE LIMITS

The AERMOD model has been designed using a dynamic storage allocation approach, where the model allocates data storage as needed based on the number of sources, receptors, source groups, and input requirements, up to the maximum amount of memory available on the computer being used.

The AERMOD model uses dynamic arrays to allocate data storage at model runtime, rather than at compile time, as done by the previous version of AERMOD. The AERMOD model preprocesses the model runstream input file to determine the data storage requirements for a particular model run, and then allocates the input data arrays before processing the setup data. Once the setup processing is completed, the model allocates storage for the result arrays. When allocating data storage, the AERMOD model traps for errors, e.g., not enough memory available to allocate. If the allocation is unsuccessful, then an error message is generated by the model, and further processing is prevented. If the CO RUNORNOT NOT option is selected, the model will still go through all array allocations so that the user can determine if sufficient memory is available to complete the run. Also, an estimate of the total

AR0068625

amount of memory needed for a particular run is printed out as part of the first page of printed output.

The parameters that are established at model runtime are as follows:

NSRC	Number of Sources
NREC	Number of Receptors
NGRP	Number of Source Groups
NAVE	Number of Short Term Averaging Periods
NVAL	Number of High Values by Receptor (RECTABLE Keyword)
NTYP	Number of Output Types (CONC currently is the only output type)
NMAX	Number of Overall Maximum Values (MAXTABLE Keyword)
NQF	Number of Variable Emission Rate Factors Per Source
NPDMAX	Number of Particle Diameter Categories Per Source
IXM	Number of X-coord (Distance) Values Per Receptor Network
IYM	Number of Y-coord (Direction) Values Per Receptor Network
NNET	Number of Cartesian and/or Polar Receptor Networks
NARC	Number of Receptor Arcs Used with EVALCART Keyword
NEVE	Number of Events for EVENT processing

In the case of NPDMAX, if no particle information is present in the input runstream, then NPDMAX is set to 1, otherwise it is set to 20. Other parameters are set to the actual numbers required for a particular model run.

There are several static array limits defined in AERMOD. These limits are controlled by PARAMETER statements in the Fortran source code. The variable name, description, and current value are defined in Section 4.2.2. If any of these static limits are changed, then AERMOD must be recompiled and linked. This process is described in Section 4.2.1.

AR0068626

2.4 SETTING UP A SIMPLE RUNSTREAM FILE

This section goes through a step-by-step description of setting up a simple application problem, illustrating the most commonly used options of the AERMOD model. The example problem is based on a simple industrial source application. The input file for AERMOD for the example problem is shown in Figure 2-1. The remainder of this section explains the various parts of the input file for the AERMOD model, and also illustrates some of the flexibility in structuring the input file.

AR0068627

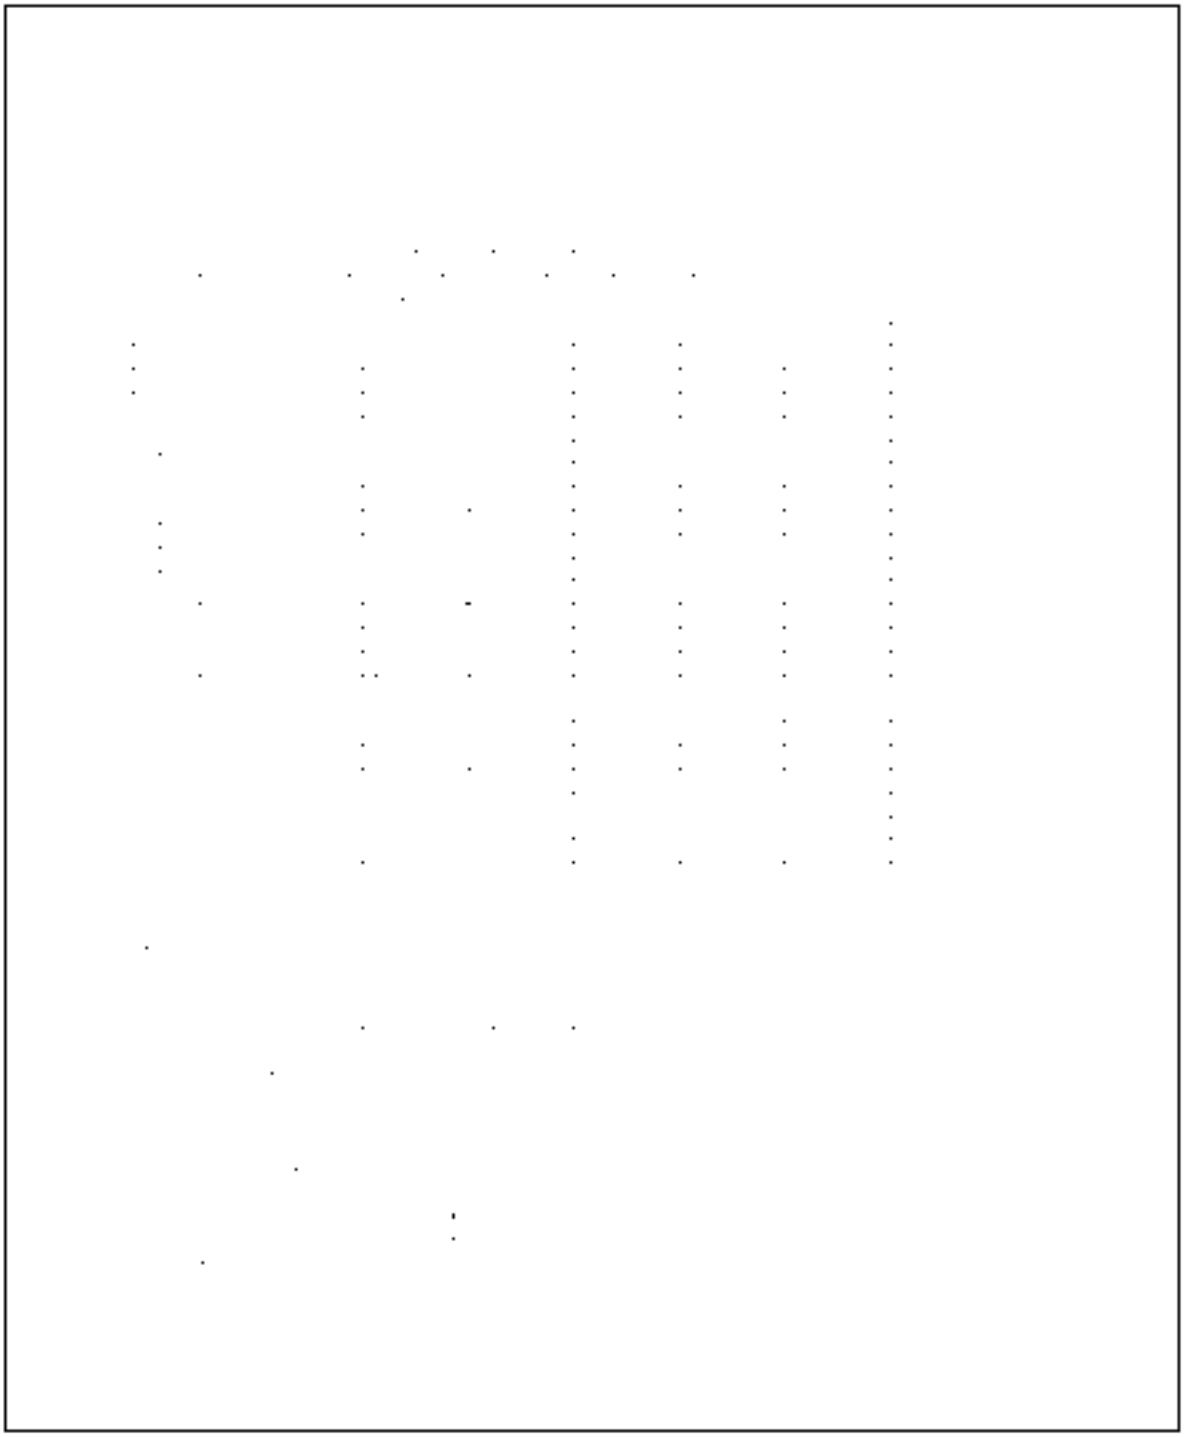


FIGURE 2-1 EXAMPLE INPUT FILE FOR AERMOD FOR SAMPLE PROBLEM

AR0068628

2.4.1 A Simple Industrial Source Application

For this simple tutorial, an application is selected involving a single point source of SO_2 that is subject to the influences of building downwash. The source consists of a 50-meter stack with a buoyant release that is adjacent to a building. We will assume that the stack is situated in flat terrain in a rural setting. A polar receptor network will be placed around the stack location to identify areas of maximum impact.

2.4.2 Selecting Modeling Options - CO Pathway

The modeling options are input to the model on the Control pathway. The mandatory keywords for the CO pathway are listed below. A complete listing of all keywords is provided in Appendix B.

STARTING -	Indicates the beginning of inputs for the pathway; this keyword is mandatory on each of the pathways.
TITLEONE -	A user-specified title line (up to 68 characters) that will appear on each page of the printed output file (an optional second title line is also available with the keyword TITLETWO).
MODELOPT	Controls the modeling options selected for a particular run through a series of secondary keywords.
AVERTIME	Identifies the averaging periods to be calculated for a particular run.
POLLUTID	Identifies the type of pollutant being modeled. At the present time, this option has no influence on the results.
RUNORNOT -	A special keyword that tells the model whether to run the full model executions or not. If the user selects not to run, then the runstream setup file will be processed and any input errors reported, but no dispersion calculations will be made.
FINISHED -	Indicates that the user is finished with the inputs for this pathway; this keyword is also mandatory on each of the other pathways.

AR0068629

The first two keywords are fairly self-explanatory. As discussed above in Section 2.2, the MODELOPT keyword on the CO pathway is pivotal to controlling the modeling options used for a particular run. For this example, we intend to use the regulatory default option, and have specified for the model to output concentration values. After the first three input records our input file will look something like this:

```
```

Note that the title parameter field does not need to be in quotations, even though it represents a single parameter. The model simply reads whatever appears in columns 13 through 80 of the TITLEONE card as the title field, without changing the lower case to upper case letters. Leading blanks are therefore significant if the user wishes to center the title within the field. Note also that the spacing and order of the secondary keywords on the MODELOPT card are not significant. A MODELOPT card that looked like this:

```
```

would have an identical result as the example above. It is suggested that the user adopt a style that is consistent and easy to read. A complete description of the available modeling options that can be specified on the MODELOPT keyword is provided in Section 4.

Since the pollutant in this example is SO_2, we will probably need to calculate average values for 3-hour and 24-hour time periods, and we also need to calculate averages for the full

AR0068630

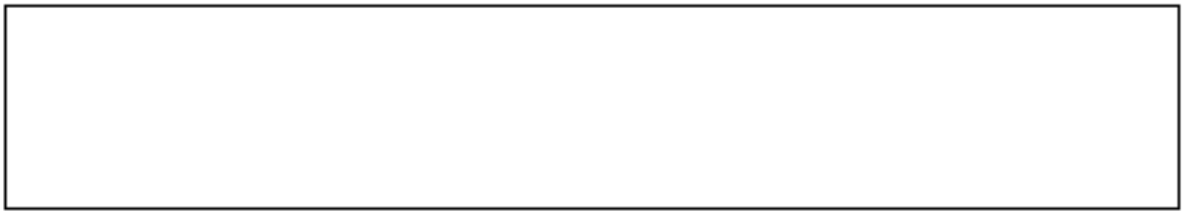
annual time period. Our runstream file might therefore look something like this after adding two more keywords:

Note again that the order of the parameters on the AVERTIME keyword is not critical, although the order of the short term averages given on the AVERTIME keyword will also be the order in which the results are presented in the output file. The order of the keywords within each pathway is also not critical in most cases, although the layout of the input runstream file may be easier to decipher if a consistent and logical order is followed. It is suggested that users follow the order in which the keywords are presented in Section 3, in Appendix B, and in the Quick Reference, unless there is a clear advantage to doing otherwise.

The only remaining mandatory keywords for the CO pathway are RUNORNOT and FINISHED. We will set the RUNORNOT switch to RUN for this example. If a user is unsure about the operation of certain options, or is setting up a complex runstream file to run for the first time, it may be desirable to set the model NOT to run, but simply to read and analyze the input file and report any errors or warning messages that are generated. Once the input file has been debugged using these descriptive error/warning messages, then the RUNORNOT switch can be set to RUN, avoiding a possible costly waste of resources generating erroneous results. Even if the model is set NOT to run, all of the inputs are summarized in the output file for the user to review.

Our complete runstream file for the CO pathway may look something like this:

AR0068631



The following set of runstream images has a more structured look, but it is equivalent to the example above

Since the pathway ID is required to begin in column 1 (see Section 2.4.8 for a discussion of this restriction), the model will assume that the previous pathway is in effect if the pathway field is left blank. The model will do the same for blank keyword fields, which will be illustrated in the next section.

In addition to these mandatory keywords on the CO pathway, the user may select optional keywords to allow the use of receptor heights above ground-level for flagpole receptors, to specify a decay coefficient or a half-life for exponential decay, and to generate an input file containing events for EVENT processing. The user also has the option of having the model periodically save the results to a file for later re-starting in the event of a power failure or other interruption of the model's execution. These options are described in more detail in Section 4 of this volume.

AR0068632

2.4.3 Specifying Source Inputs - SO Pathway

Besides the STARTING and FINISHED keywords that are mandatory for all pathways, the Source pathway has the following mandatory keywords:

LOCATION - Identifies a particular source ID and specifies the source type and location of that source.

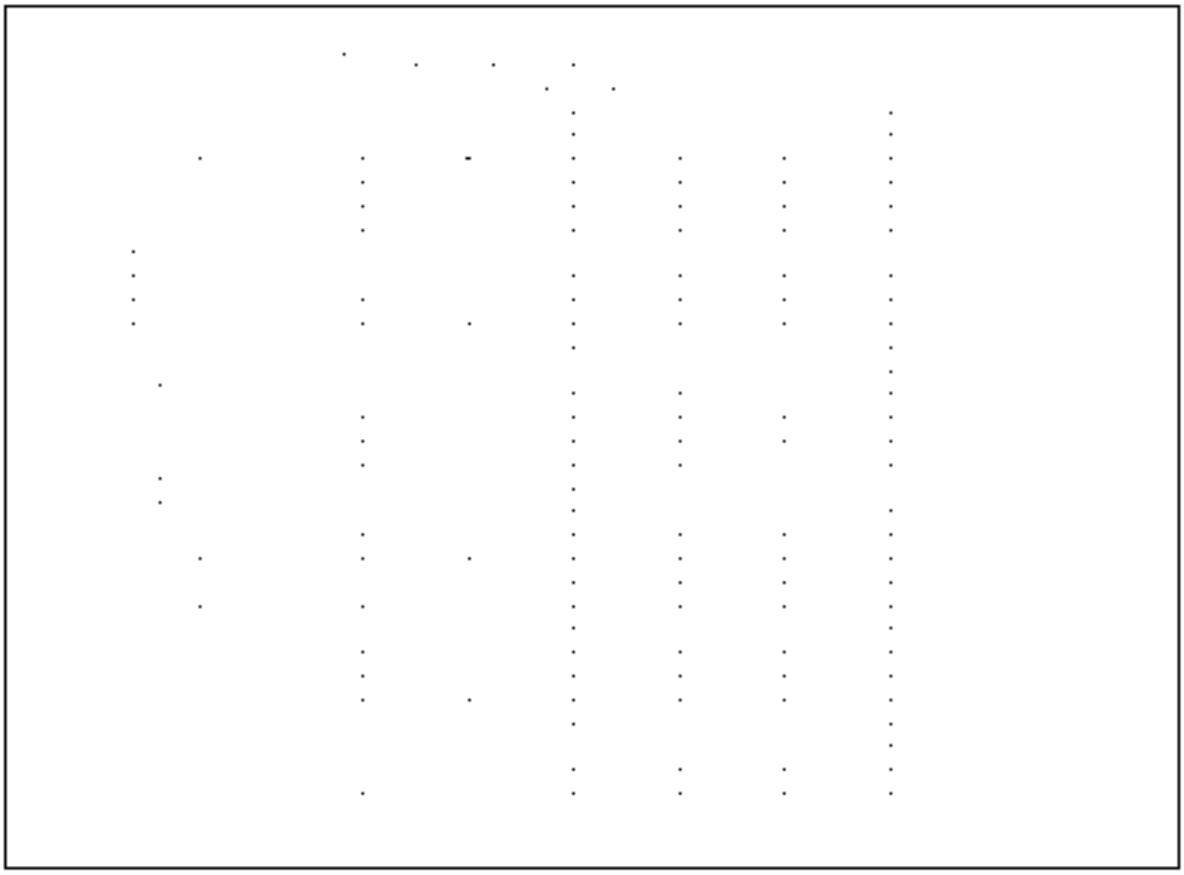
SRCPARAM - Specifies the source parameters for a particular source ID identified by a previous LOCATION card.

SRCGROUP - Specifies how sources will be grouped for calculational purposes. There is always at least one group, even though it may be the group of ALL sources and even if there is only one source.

Since the hypothetical source in our example problem is influenced by a nearby building, we also need to include the optional keywords BUILDHGT and BUILDWID in our input file.

AR0068633

The input file for the SO pathway for this example will look something like this:



There are a few things to note about these inputs. Firstly, the source ID (STACK1 in this example) is an alphanumeric parameter (up to eight characters) that identifies the inputs for different keywords with a particular source. It is crucial that the source be identified with a LOCATION card before any other keyword makes reference to that source, since this identifies the source type (POINT in this case), and therefore which parameters the model will allow. Besides POINT sources, the current version of the ISCST3 model also allows VOLUME and AREA sources to be specified. Since the effects of elevated terrain are included in this analysis, it is important to specify the source base elevation above mean sea level (MSL) on the LOCATION card. For this example, the source base elevation is 0.0 meters MSL.

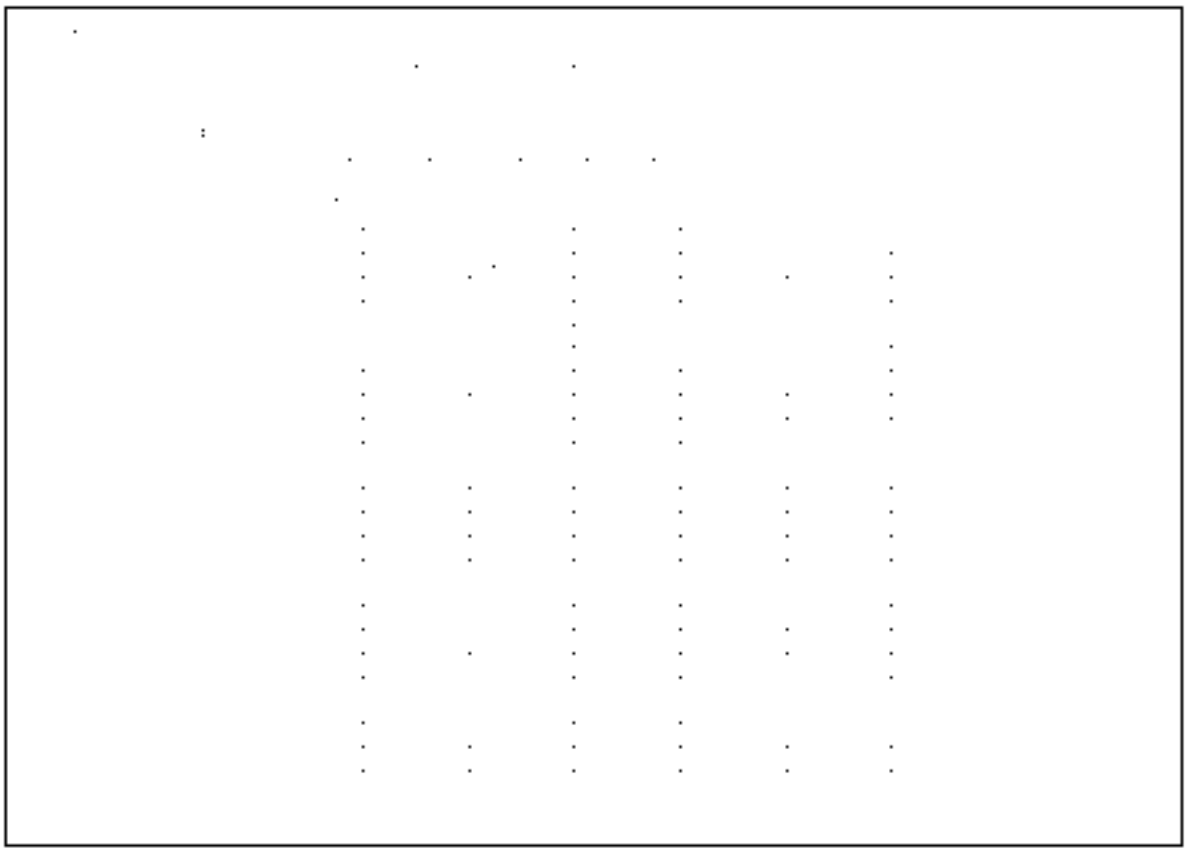
AR00668634

Another thing to note is that since the model uses direction specific building dimensions for all sources with downwash, there are 36 building heights and 36 building widths entered on the appropriate keywords, one value for each 10 degree sector beginning with the 10 degree flow vector (direction toward which the wind is blowing), and continuing clockwise. Since the user could not fit all 36 values on a single record, the pathway, keyword and source ID were repeated as many times as were necessary. In this case there were 6 values given on each of 6 lines for each of the building dimensions. There could have been fewer or more lines as long as exactly 36 values were entered before starting with a new keyword. Since all of the building heights were the same across the sectors (fairly realistic for the height but not for widths, unless the structure was circular), there is a short cut available for specifying numeric input in the runstream files for the model. The user can specify "repeat values" by entering a field such as "36*50.0" as a parameter for the BUILDHGT keyword. The model will interpret this as "36 separate entries, each with a value of 50.0," and store the values in the appropriate arrays within the model. Since the model must identify this as a single parameter field, there must not be any spaces between the repeat value and the value to be repeated.

The final keyword before finishing the SO pathway must be the SRCGROUP keyword. In this example, since there is only one source, we have taken advantage of a short cut provided by the model by specifying a source group ID (which may be up to eight characters) of ALL. Whenever this card appears in an input file, it will generate a source group with a source-group ID of ALL, consisting of all sources defined for that run. The sources do not have to be explicitly identified. In a run involving multiple sources, the user may specify multiple source groups by repeating the SRCGROUP keyword. The use of the SRCGROUP card is explained in more detail in Section 3.

AR0068635

Using some of the formatting options discussed above, the SO pathway for our example may look like this, with the same result as above:



This version of the SO pathway inputs illustrates the use of the comment card to label the stack parameters on the SRCPARAM card, i.e., QS for emission rate (g/s), HS for stack height (m), TS for stack exit temperature (K), VS for exit velocity (m/s), and DS for stack diameter (m). A complete description of the source parameter card, with a list of parameters for each source type, is provided in Section 3.3 and in Appendix B.

Other optional inputs that may be entered on the SO pathway include specifying variable emission rate factors for sources whose emissions vary as a function of month, season, hour-of-day, or season and hour-of-day (see Section 3.3.4 for more details). The

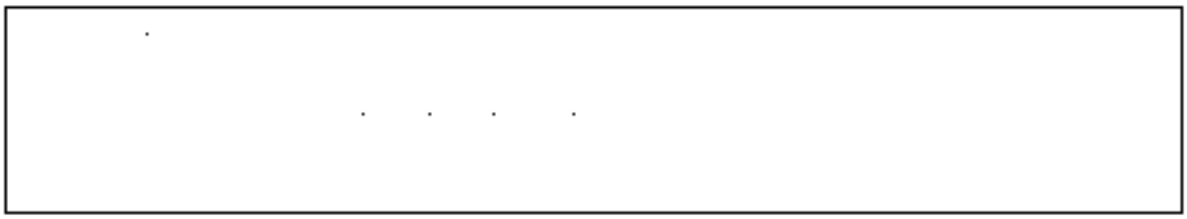
AR0068636

number of factors entered depends on the option selected, and factors may be input for single sources or for a range of sources.

2.4.4 Specifying a Receptor Network - RE Pathway

As mentioned above, this example will illustrate the use of a single polar receptor network centered on the stack location. Other options available on the RE receptor pathway include specifying a Cartesian grid receptor network, and specifying discrete receptor locations in either a polar or a Cartesian system. These other options are described in more detail in Section 3.4.

The RE pathway for this example will look like this:



Looking at the example for the RE pathway, the first thing to note about these inputs is that there is a new set of keywords, including something that looks like a STARting and ENDing. In fact the GRIDPOLR keyword can be thought of as a "sub-pathway," in that all of the information for a particular polar network must be in contiguous records, and that the starting and ending of the sub-pathway are identified. The order of secondary keywords within the sub-pathway is not critical, similar to the main pathways. Each card must be identified with a network ID (up to eight alphanumeric characters), in this case it's "POLR1". Multiple networks may be specified in a single model run. The model waits until the END secondary keyword is encountered to set the variables, which may include terrain heights for receptors on elevated terrain or flagpole receptor heights if those options are being exercised.

AR0068637

by the user. The use of these optional secondary keywords is described in detail in Section 3.4

For this example, the ORIG secondary keyword specifies the location of the origin for the polar network being defined as being the location of the source STACK1. The origin can also be specified as X and Y-coordinates. The ORIG keyword is optional, and the model will default to an origin of (0.0, 0.0) if it is omitted. The DIST keyword identifies the distances along each direction radial at which the receptors will be located. In this case there are four distances. More distances could be added by adding values to that input card or by including a continuation card with the DIST keyword, if needed. The GDIR keyword specifies that the model will Generate DIRection radials for the network, in this case there will be 36 directions, beginning with the 10 degree flow vector and incrementing every 10 degrees clockwise. The user may elect to define Discrete DIRection radials instead by using the DDIR keyword in place of the GDIR keyword

2.4.5 Specifying the Meteorological Input - ME Pathway

The MEteorology pathway has the following four mandatory keywords (besides STARTING and FINISHED, of course)

SURFILE - Specifies the filename and format for the input surface meteorological data file

PROFILE - Specifies the filename and format for the input profile meteorological data file

SURFDATA - Specifies information about the surface meteorological data which will be used in the modeling

UAIRDATA - Specifies information about the upper air meteorological data which will be used in the modeling

PROFBASE - Specifies the base elevation above MSL for the potential temperature profile

AR0068638

For the purposes of this example we will assume that the meteorological data files are for Albany, NY and that an on-site location called Hudson has also been used. We will also assume that the surface and profile data files were generated by the AERMET preprocessor, and are in the default format for AERMOD. The filename of the surface file is AERMET2.SFC and it consist of four days of data for Albany/Hudson from March 1988. The filename of the profile file is AERMET2.PFL. The data files used in this example correspond with the on-site example files used for the AERMET preprocessor program. The runstream images for the METeorology pathway would look something like this:

The first parameters on the SURFFILE and PROFFILE keywords are the filenames for the surface and profile data file, respectively, which can be entered as a full DOS pathname, including the drive specification and subdirectories, up to a total of 80 characters (with the maximum number of characters controlled by the FILE_FILD PARAMETER located in MODULE MAIN1 - see Section 2.1.3). Since there is no second parameter, the model will assume the default ASCII format for the data files. The format of the surface and profile data files is described in Appendix D.

The next two mandatory inputs identify the location and data period of the input meteorological data. A separate keyword is used for the surface meteorological data and for the upper air (mixing height) data. The parameters on these cards are the station number (e.g. WBAN number for NWS stations), the data period (years), and a station name. In order to identify potential errors in the model inputs, the model compares the station number from the runstream input file with values provided in the first record of the surface meteorology file, and issues warning messages if there are any mismatches. The user may also optionally input

AR0068639

the (X,Y) coordinates for the location of the station(s), although these values are not currently used by the model. In this case, we have also included the optional SITEDATA keyword to identify the location for the on-site meteorological data that were preprocessed by AERMET.

The final mandatory keyword is PROFBASE, which is used to specify the base elevation (above MSL) for the potential temperature profile generated by AERMOD for use in the plume rise calculations. This should correspond to the base elevation for the main meteorological tower, which in this example is specified as 0.0 meters and is the same as the source base elevation.

Other optional keywords available on the ME pathway provide the user with options to specify selected days to process from the meteorological data file and a wind direction rotation correction term. These optional inputs are described in more detail in Section 3.5.

2.4.6 Selecting Output Options - OU Pathway

All of the keywords on the Output pathway are optional, although the model will warn the user if no printed outputs are requested and will halt processing if no outputs (printed results or file outputs) are selected. The user has considerable flexibility to select only the outputs that are needed for a particular application. The printed table keywords are:

RECTABLE - Specifies the selection of high value by receptor table output options

MAXTABLE - Specifies the selection of overall maximum value table output options

DAYTABLE - Specifies the selection of printed results (by receptor) for each day of data processed (this option can produce very large files and should be used with care)

The RECTABLE keyword provides the highest, second-highest and third-highest values by receptor. The MAXTABLE keyword provides the overall maximum 50 table. For both of these keywords, the user has additional flexibility to specify for which short term averaging periods the outputs are selected. For the MAXTABLE keyword the user can also

AR0068640

specify the number of overall maximum values to summarize for each averaging period selected, up to a maximum number controlled by a parameter in the computer code. For this example problem we will select the highest and second-highest values by receptor, and the maximum 50 values for all averaging periods. These OU pathway inputs will look something like this:

To simplify the input for users who request the same printed table output options for all averaging periods, these keywords recognize the secondary keyword "ALL AVE" as the first parameter for that purpose. In order to obtain the overall maximum 10 values for the 24-hour averages only, then the OU pathway images would look like this:

It should also be noted that these output table options apply only to the short-term averaging periods, such as the 3-hour and 24-hour averages used in our example. If the user has selected that PERIOD averages be calculated (on the CO AVERTIME keyword), then the output file will automatically include a table of period averages summarized by receptor (the RECTABLE option does not apply since there is only one period value for each receptor). In addition, the printed output file will include tables summarizing the highest values for each averaging period and source group.

Other options on the OU pathway include several keywords to produce output files for specialized purposes, such as generating contour plots of high values, identifying occurrences

AR0068641

of violations of a particular threshold value (e.g., a NAAQS), and for postprocessing of the raw concentration data. These options are described in detail in Section 3.7.

The complete input runstream file for this simple example is shown in Figure 2-2. Note that a consistent style has been used for formatting and structuring the file in order to improve its readability. This input file is comparable to the version shown earlier in Figure 2-1, which used a somewhat different style.

AR0068642

AR0068643

2.4.7 Using the Error Message File to Debug the Input Runstream File

The previous sections in this tutorial have lead through the step-by-step construction of a sample runstream input file for AERMOD. This simple example problem illustrated the usage of the most commonly used options of the AERMOD model. However, many real-time applications of the model will be much more complex than this example, perhaps involving multiple sources and source groups, multiple receptor networks, the addition of discrete receptor locations, and/or elevated terrain heights. Since humans are prone to make errors from time to time, an effort has been made to develop detailed error handling capabilities for the AERMOD model.

The error handling capabilities of the AERMOD model are designed to accomplish two things for the user. First, the model should read through the complete input file and report all occurrences of errors or suspect entries before stopping, rather than stopping on the first instance (and every instance thereafter) of an error in the input file. Second, the model should provide error and warning messages that are detailed and descriptive enough that they will help the user in his/her effort to debug the input file. The remainder of this section provides a brief introduction to the use of the model's error handling capabilities. Appendix C of this volume provides more details about the error handling provided by the AERMOD model, including a listing and explanation of all error and other types of messages generated by the model.

The AERMOD model generates messages during the processing of the input data and during the execution of model calculations. These messages inform the user about a range of possible conditions including:

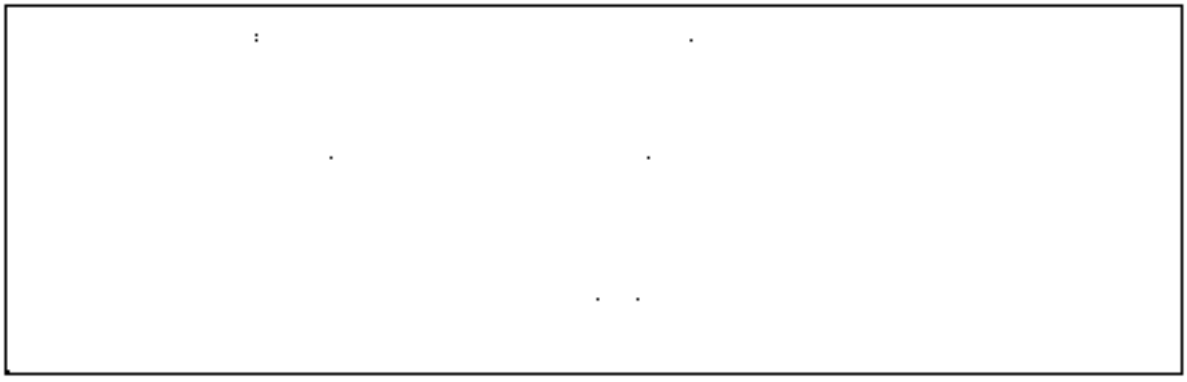
- Errors that will halt any further processing, except to identify additional error conditions,
- Warnings that do not halt processing but indicate possible errors or suspect conditions, and

AR0068644

- Informational messages that may be of interest to the user but have no direct bearing on the validity of the results

As the model encounters a condition for which a message is generated, the model writes the message to a temporary storage file. At the completion of the setup processing for a run, and at the completion of the model calculations, the model rereads the message file and generates a summary of the messages which is included in the main printed output file. If the processing of the model setup information indicates no errors or warnings, and the user has selected the option to RUN the model calculations on the CO RUNORNOT card, then the model will simply write a statement to the print file that the model setup was completed successfully. Otherwise, the model will report a summary of the messages encountered. The summary of model setup messages that would be generated for the example problem if the option NOT to run was chosen is shown in Figure 2-4. This summary table reports the total number of occurrences for each of the message types, and lists the detailed message for any fatal errors or warning messages that were generated. In this case, since there were no errors or suspicious conditions in the setup file, there are no error or warning messages listed.

An example of the warning message that would have been generated had we left out the card on the RE pathway that specifies the origin of the polar receptor network is shown below.



AR0068645

Since this is a warning message, it would have appeared at the end of the message summary table in the output file, but it would not have halted processing of the data. The last item on the message line, "Hints," may include such information as the keyword or parameter name causing the error, the source ID, group ID or (as in this case) the network ID involved, or perhaps the date variable identifying when the message occurred during the processing of the meteorological data, such as an informational message identifying the occurrence of a calm wind.

For new users and for particularly complex applications, it is strongly recommended that the model first be run with the RUNORNOT keyword (on the CO pathway) set NOT to run. In this way, the user can determine if the model is being setup properly by the runstream file before committing the resources to perform a complete run. The user should make a point of examining any warning messages carefully to be sure that the model is operating as expected for their application, since these messages will not halt processing by the model. In most cases, the detailed messages will provide enough information for the user to determine the location and nature of any errors in the runstream setup file. If the intent of the message is not immediately clear, then the user should refer to the more detailed descriptions provided in Appendix C for the particular error code generated.

In deciphering the error and warning messages, the line number provided as part of the message may be particularly helpful in locating the error within the input file. However, if it is an error of omission that is caught by the error checking performed at the completion of inputs for a pathway, then the line number will correspond to the last record for that pathway. The user may need to examine all of the messages carefully before locating the error or errors, especially since a single occurrence of certain types of errors may lead to other error conditions being identified later in the input file which do not really constitute errors in themselves. An example of this is provided in Figure 2-4, which shows some inputs for the SO pathway where the building dimension keywords have been typed incorrectly, and the associated list of error messages. Since continuation cards were being used for the building width inputs, and the keyword was entered incorrectly on the first line, the subsequent records

AR0068646

were also taken by the model to be invalid keyword inputs. While the error messages are the same for these records, the message originates from a different part of the model (SUBROUTINE SOCARD) for the records with the blank keyword.

Since the detailed error and warning messages are listed in the output file as part of the message summary table, there will generally not be a need for the user to examine the contents of the detailed message file. For this reason, the default operation of the model is to write the messages that are generated by a particular run to a temporary file that is deleted when the run is completed. If the user wishes to examine the complete list of detailed messages for all to post, there is an optional keyword available on the CO pathway for that purpose. The ERRORFIL keyword, which is described in detail in Section 3.2.7, allows the user to save the complete list of detailed messages to a user-specified filename.

AR0068648

2.4.8 Running the Model and Reviewing the Results

Now that we have a complete and error-free runstream input file, we are ready to run the model and then review the results. The PC-executable file available on the SCRAM website opens the runstream input and printed output files explicitly within the model using internally specified filenames of AERMOD.INP and AERMOD.OUT, respectively. The model can be executed from the command prompt by simply typing the name AERMOD, as follows:

C:>AERMOD

The "c-prompt" of DOS has been represented by the characters "C:>", but may appear different on different machines. The important points are that the AERMOD.EXE file either be in the directory from which you are attempting to run the model, or in a directory that is included on the DOS PATH command when the system is "booted up". The runstream input file (AERMOD.INP) must also be located in the directory from which the model is being executed. The model can also be executed by double clicking on the executable file from Windows Explorer.

As mentioned above, the SCRAM PC-executable file for AERMOD opens the input and output files explicitly. One reason for this is to allow for the model to write an update on the status of processing to the PC terminal screen. For the AERMOD model, the model first indicates that setup information is being processed and then gives the Julian day currently being processed. If no status message is seen then the model did not load into memory properly. If the model stops after completing the setup processing, then either the RUNORNOT option was set NOT to run. If a fatal error is encountered during the setup processing, then a message to that effect will be written to the screen and model execution will be stopped. Another reason for not sending the printed output to the default output device (i.e., to the screen or redirected to a file), is so that any DOS error messages will be visible on the screen and not be written to the printed file. One such message might be that

AR0068649

there is insufficient memory available to run the program. Handling of DOS error messages may require some knowledge of DOS, unless the meaning of the message is obvious.

The order of contents and organization of the main output file for the AERMOD model is presented in Figure 2-5.

Echo of Input Runstream Images

  - RECTABLE Keyword
- Overall Maximum Short Term Average Results for Each Source Group (If Applicable)
  - MAXTABLE Keyword

Summary Tables of High Values for Each Averaging Period and Source Group (Always provided if PERIOD averages or the RECTABLE keyword are used)

Summary of Complete Model Execution Messages

FIGURE 2-5 ORGANIZATION OF AERMOD MODEL OUTPUT FILE

AR0068650

Each page of the output file, except for the echo of the input file images, is labeled with the model name and version number, user-specified title(s), page number, and, for the PC version of the model, the date and time of the particular run. Also included as part of the header information for each page is a one-line summary of the modeling options used for that particular run. The modeling options are listed as the secondary keywords used to control the options, such as DEPLETE, CONC, etc. (Details about the date/time routines and other PC-specific features of the computer code are discussed in Section 4.0.)

Since the complete input file is normally echoed back as part of the output file, and since processing of the inputs stops when the OU FINISHED card is reached, the run can be duplicated by simply specifying the output filename as the input runstream file. Alternatively, the input records could be "cut and pasted" from the output file to a separate file using a text editor.

By default, the model will echo each line of the input runstream file to the printed output file. This provides a convenient record of the inputs as originally read into the model, without any rounding of numerical values that may appear in the input summary tables. As noted above, it also means that the output file can be used as an input file to the model to reproduce a particular application. However, for some applications, the length of the input runstream file may be too cumbersome to include the entire set of inputs at the beginning of each output file. This may happen, for example, if a large number of sources are being defined or if a large number of discrete receptor locations are used. For this reason, the user is provided with the option to "turn off" the echoing of the input file at any point within the runstream file. This is accomplished by entering the keywords "NO ECHO" in the first two fields anywhere within the runstream file. In other words, place NO in the pathway field, followed by a space and then ECHO. None of the input runstream images after the NO ECHO will be echoed to the output file. Thus, a user may choose to place NO ECHO after the Control pathway in order to keep the control options echoed, but suppress echoing the rest of the input file.

AR0068651

The details of the message summary tables were discussed in the previous section. A portion of the summary of modeling option inputs is shown in Figure 2-6 for the simple example described in this section. The summary of source parameter input data includes separate tables for each source type, rather than combining all sources onto a single table. In this way the column headings are specific to the source type.

Figure 2-7 presents an example of the results output for the second highest values by receptor for our sample problem. These values are the second highest 3-hour averages at each receptor location. The number in parentheses following each concentration value is the date corresponding to each value. The date is given as an eight digit integer variable that includes the year (2-digits), month, day, and hour corresponding to the end of the averaging period.

For each of the different types of model result tables, the controlling keyword is identified in Figure 2-8 at the end of the description. All of the outputs of the same type (e.g. high values by receptor, are printed together, and the order of tables loops through all source groups for a particular averaging period, and then loops through all averaging periods. The summary tables of high values at the end of the model results follow the same order of loops. An example of the summary tables for our sample problem is shown in Figure 2-8. The summaries for all averaging periods have been combined onto a single figure, but would appear on separate pages of the actual output file.

2.5 MODIFYING AN EXISTING RUNSTREAM FILE

As noted earlier, one of the advantages of the keyword/parameter approach and the flexible format adopted for the input runstream file is that it will be easier for the user to make modifications to the runstream file and obtain the desired result. This section briefly illustrates some examples of how a runstream file can be modified. It is assumed that the reader is familiar with the operation of and basic editing commands for a text editor (i.e., a program that edits ASCII files), and is familiar with the previous sections of this tutorial.

2.5.1 Modifying Modeling Options

Depending on the type of analysis being performed, the user may need to modify the modeling options and run the model again. Because of the descriptive nature of the keywords and the secondary keywords used to control the modeling options, this can easily be done with the new runstream file, and usually without having to refer back to the user's guide each time a modification is attempted.

2.5.2 Adding or Modifying a Source or Source Group

Modifying the input file to add a source or a source group, or to add a source to a source group, is as simple as just adding it. There is no need to specify the total number of sources in the run, which would then have to be changed if more sources were added. The same applies to the number of groups, or the number of sources per group. If the user attempts to input more than the total number of sources or groups allowed for a particular run, an error message will be generated to that effect. Also, modifying a source group to delete a source is as easy as just deleting it from the input card, without having to change any other inputs.

Another way of "deleting" a source or a group from an input file is to place a "**" in the pathway field of the card or cards which define the source or group to "comment out" those inputs. This approach, which was discussed above in Section 2.1.2, has the advantage of leaving the input data for the source or group in the input file for possible later use. It doesn't matter

AR0068656

whether the "*" is entered with the text editor in "insert" mode, in which case the other inputs of that line are moved over, or if it is in "overtype" mode, which would replace the pathway ID that was already there.

2.5.3 Adding or Modifying a Receptor Network

As with source data, adding to or modifying the receptor information in the AERMOD model is relatively straight forward. The problem of having to make several changes to accomplish one small modification, such as adding a distance to a polar receptor network, has been avoided in the new model. All that the user needs to do is to add the new distance on the appropriate input card, which is easily identifiable because of the use of descriptive keywords. The model checks to ensure that the user does not attempt to specify more than the maximum number of receptors for a particular run, and generates an appropriate message if too many are input.

2.5.4 Modifying Output Options

Modifying the output options involves many of the same principles that are described above. In addition, all of the output options are structured in a way that allows the user to select options for specific averaging periods, so that the user may find it useful to copy a record or group of records set up for one averaging period and simply change the averaging period parameter. The other important short cut that is available for the printed table output options is to use the secondary keyword ALL AVE to indicate that the option applies to all averaging periods that are calculated. In this way, there will be no need to change the output options if a new averaging period is added to a run or if one is deleted.

AR0068657

3.0 DETAILED KEYWORD REFERENCE

This section of the AERMOD User's Guide provides a detailed reference for all of the input keyword options for the AERMOD model. The information provided in this section is more complete and detailed than the information provided in the Brief Tutorial in Section 2. Since this section is intended to meet the needs of experienced modelers who may need to understand completely how particular options are implemented in the model, the information for each keyword should stand on its own. This section assumes that the reader has a basic understanding of the keyword/parameter approach used by the model for specification of input options and data. Novice users should first review the contents of Section 2 in order to obtain that understanding.

3.1 OVERVIEW

The information in this section is organized by function, i.e., the keywords are grouped by pathway, and are in a logical order based on their function within the model. The order of keywords presented here is the same as the order used in the functional keyword reference in Appendix B, and the Quick Reference section at the end of the volume. The syntax for each keyword is provided, and the keyword type is specified - either mandatory or optional and either repeatable or non-repeatable. Unless noted otherwise, there are no special requirements for the order of keywords within each pathway, although the order in which the keywords are presented here and in Appendix B is recommended. Any keyword which has special requirements for its order within the pathway is so noted following the syntax and type description.

The syntax descriptions in the following sections use certain conventions. Parameters that are in all capital letters and underlined in the syntax description are secondary keywords that are to be entered as indicated for that keyword. Other parameters are given descriptive names to convey the meaning of the parameter, and are listed with an initial capital letter. Many of the parameter names used correspond to variable names used in the computer code of the model. Parentheses around a parameter indicate that the parameter is optional for that keyword. The default that is taken when an optional parameter is left blank is explained in the discussion for that keyword.

AR0068658

3.2 CONTROL PATHWAY INPUTS AND OPTIONS

The COntrol pathway contains the keywords that provide the overall control of the model run. These include the dispersion options, averaging time options, terrain height options, and others that are described below. The CO pathway must be the first pathway in the runstream input file.

3.2.1 Title Information

There are two keywords that allow the user to specify up to two lines of title information that will appear on each page of the main output file from the model. The first keyword, TITLEONE, is mandatory, while the second keyword, TITLETWO, is optional. The syntax and type for the keywords are summarized below.

Syntax:	
Type:	

The parameters Title1 and Title2 are character parameters of length 68, which are read as a single field from columns 13 to 80 of the input record. The title information is taken as it appears in the runstream file without any conversion of lower case to upper case letters. If the TITLETWO keyword is not included in the runstream file, then the second line of the title in the output file will appear blank.

3.2.2 Dispersion Options

The dispersion options are controlled by the MODELOPT keyword of the CO pathway. The syntax, type, and order of the MODELOPT keyword are summarized below.

Syntax:	
Type:	

AR0068659

where the secondary keyword parameters are described below (the order and spacing of these parameters is not critical).

DEFAULT - Specifies that the regulatory default options will be used.

CONC - Specifies that concentration values will be calculated (note that deposition algorithms have not been implemented in AERMOD yet).

FLAT - Specifies that the non-default option of assuming flat terrain will be used.

NOSTD - Specifies that the non-default option of no stack-tip downwash will be used.

NOCHKD - Specifies that the non-default option of suspending date checking will be used for non-sequential meteorological data files.

NOWARN - Specifies that the option of suppressing the detailed listing of warning messages in the main output file will be used (the number of warning messages is still reported, and warning messages are still included in the error file controlled by the CO ERRORFIL card described in Section 3.2.14).

SCREEN - Specifies that the non-default option for running AERMOD in a screening mode will be used.

TOXICS Specifies use of air toxics option(s), including SCIM and area source optimizations, and

SCIM - Sampled Chronological Input Model - used only with the ANNUAL average option to reduce runtime by sampling meteorology at a user-specified regular interval. SCIM sampling parameters must be specified on the MI pathway.

The regulatory default option in AERMOD includes the use of stack-tip downwash, incorporates the effects of elevated terrain, and includes the calms and missing data processing routines. The regulatory default option in AERMOD also forces the use of a 4-hour half life when modeling SO2 in an urban source, and does not allow for exponential decay for other applications.

The missing data processing routines that are included in the AERMOD model allow the model to handle missing meteorological data in the processing of short term averages. The model

AR0068660

treats missing meteorological data in the same way as the calms processing routine, i.e., it sets the concentration values to zero for that hour, and calculates the short term averages according to EPA's calms policy, as set forth in the Guideline. Calms and missing values are tracked separately for the purpose of flagging the short term averages. An average that includes a calm hour is flagged with a 'c', an average that includes a missing hour is flagged with an 'm', and an average that includes both calm and missing hours is flagged with a 'b'. If the number of hours of missing meteorological data exceeds 10 percent of the total number of hours for a given model run, a cautionary message is written to the main output file, and the user is referred to Section 5.3.2 of "Meteorological Monitoring Guidance for Regulatory Modeling Applications" (EPA, 2000).

The screening mode of AERMOD, which is controlled by the SCREEN keyword on the MODELOPT card, forces the model calculations to represent values for the plume centerline, regardless of the source-receptor-wind direction orientation. This option is included in AERMOD to facilitate the use of the model with a Windows based AERMOD Screening Model interface (not yet developed) to estimate worst case impacts. Its use outside of that context is not recommended. Since the screening model is designed to be used with a non-sequential meteorological data file, representing a matrix of conditions, the SCREEN option also forces the use of the NOCHKD option described above, even if NOCHKD is not included on the MODELOPT card. The SCREEN option also restricts the averaging period options to 1-hour averages only on the AVERTIME card (see Section 3.2.3).

The AERMOD model includes the Sampled Chronological Input Model (SCIM) option for air toxics applications. In order to utilize this option, the user must include the TOXICS and SCIM keywords together on the CO MODELOPT card. Since the TOXICS option is a non-regulatory default option, the DEFAULT keyword should not be included on the MODELOPT card. If the DEFAULT keyword is present on the MODELOPT card, the DEFAULT option will override the TOXICS option if it is present, and any other enhancements dependent on the TOXICS option. The SCIM approach associated with the TOXICS option is described below.

AR0068661

When the TOXICS option is specified, the area source integration routine is optimized to reduce model runtime. This is accomplished by incorporation of a three-tiered approach using the Romberg numerical integration, a 2-point Gaussian Quadrature routine for numerical integration, or a point source approximation based on the location of the receptor relative to the source. In the regulatory default mode the Romberg numerical integration is utilized for all receptors.

If the non-default TOXICS option is specified, the user may also use the SCIM option to reduce model runtime. The SCIM option can only be used with the ANNUAL average option, and is primarily applicable to multi-year model simulations. The approach used by the SCIM option is to sample the meteorological data at a user-specified regular interval to approximate the long-term (i.e., ANNUAL) average impacts. Studies have shown that the uncertainty in modeled results introduced by use of the SCIM option is generally lower for area sources than for point sources.

When only the regular sampling is selected, hourly concentrations are calculated in the normal fashion for each sampled hour. The annual average concentration is then simply calculated by dividing the cumulative concentration for the sampled hours by the number of hours sampled (arithmetic average), i.e.,

$$C = \sum C_N / N_S$$

where

C = Calculated concentration

$\sum C_N$ = Cumulatibe impacts for the sampled hours

N_S = Number of sampled hours

To use the SCIM option, the user must include the SCIM and TOXICS keywords on the CO MODELOPT card, and also specify the SCIM sampling parameters on the ME SCIMBYHR card. The format and syntax of the ME SCIMBYHR keyword are described in Section 3.5.7.

3.2.3 Averaging Time Options

The averaging periods for AERMOD are selected using the AVERTIME keyword. The syntax and type of the AVERTIME keyword are summarized below:

AR0068662

Syntax:	
Type:	

where the parameters Time1 ... Time8 refer to the user-specified short term averaging periods of 1, 2, 3, 4, 6, 8, 12, or 24 hours, the secondary keyword MONTH refers to monthly averages (for calendar months), and the secondary keyword PERIOD refers to the average for the entire data period. Any of the short term averaging periods listed above may be selected for a given run, as long as the total data storage needed by the model does not exceed the available computer memory. Since the monthly averages are treated as short term averages, the user can select appropriate output options, such as the second highest values by receptor, on the OU pathway.

The location of the PERIOD keyword in the parameter list is not critical. The order of the short term averaging periods (including MONTH) is also not critical, although it does control the order of the averaging period result tables in the main output file. Generally, it is recommended that the short term averaging periods be input in increasing order, unless there is a clear advantage in doing otherwise.

3.2.4 Urban Modeling Option

The AERMOD model allows the user to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions. The user defines the input parameters for the urban area with the URBANOPT keyword on the CO pathway, and then identifies which sources are to be modeled with urban effects using the URBANSRC keyword on the SO pathway (see Section 3.3.4). The syntax and type of the URBANOPT keyword are summarized below:

Syntax:	
Type:	

where the UrbPop parameter specifies the population of the urban area, the optional UrbName parameter may be used to identify the name of the urban area, and the optional UrbRoughness

AR0068663

parameter may be used to specify the urban surface roughness length. Note the UrbName must be specified if the user wants to specify the urban roughness length. A default value of 1.0 meter will be used for the urban roughness length if the UrbRoughness parameter is omitted.

3.2.5 Specifying the Pollutant Type

The POLLUTID keyword is used to identify the type of pollutant being modeled for a particular run. The syntax, type, and order of the POLLUTID keyword are summarized below:

Syntax:	
Type:	

where the Pollut parameter may be name of up to eight characters. Examples include SO2, NOX, CO, PM10, TSP, and OTHER. The only choice that currently has any impact on the results is the selection of PM10 (or PM-10) with the multi-year option for generating the high-sixth-high in five years. Otherwise, the pollutant ID currently has no effect on the calculations made in AERMOD.

3.2.6 Modeling With Exponential Decay

The model provides the option to use exponential decay of the pollutant being modeled. Two keywords are available for this purpose, the HALFLIFE and DCAYCOEF keywords. The syntax, type, and order of these keywords are summarized below:

Syntax:	
Type:	

where the Halflf parameter is used to specify the half life for exponential decay in seconds, and the parameter Decay is used to specify the decay coefficient in units of s^{-1}. The relationship between these parameters is: DECAY = 0.693/HALFLIFE

AR0068664

Only one of these keywords may be specified in a given run. If more than one is encountered, a non-fatal warning message is generated and the first specification is used in the modeling.

3.2.7 Flagpole Receptor Height Option

The FLAGPOLE keyword specifies that receptor heights above local ground level (i.e. flagpole receptors) are allowed on the Receptor pathway. The FLAGPOLE keyword may also be used to specify a default flagpole receptor height other than 0.0 meters. The syntax and type of the FLAGPOLE keyword are summarized below.

Syntax:	
Type:	

where Flagdf is an optional parameter to specify a default flagpole receptor height. If no parameter is provided, then a default flagpole receptor height of 0.0 meters is used. Any flagpole receptor heights that are entered on the Receptor pathway will override the default value, but are ignored if the FLAGPOLE keyword is not present on the Control pathway, and a non-fatal warning message is generated.

3.2.8 To Run or Not to Run - That is the Question

Because of the improved error handling and the "defensive programming" that has been employed in the design of the AERMOD model, it is intended that the model will read through all of the inputs in the runstream file regardless of any errors or warnings that may be encountered. If a fatal error occurs in processing of the runstream information, then further model calculations will be aborted. Otherwise, the model will attempt to run. Because of the great many options available in the AERMOD model, and the potential for wasted resources if a large run is performed with some incorrect input data, the RUNORNOT keyword has been included on the Control pathway to allow the user to specify whether to RUN the model and perform all of the

AR0068665

calculations, or NOT to run and only process the input runstream data and summarize the setup information. The syntax and type of the RUNORNOT keyword are summarized below:

Syntax:	— —
Type:	

3.2.9 Generating an Input File for EVENT Processing

The AERMOD model contains the EVENTFIL keyword on the CO pathway to control whether or not the AERMOD model will generate an input file for EVENT processing. The syntax and type of the EVENTFIL keyword are summarized below:

Syntax:	
Type:	

where the optional Evfile parameter specifies the name of the EVENT input file to be generated (the maximum length of the file name is set by the FLEN_FILE parameter in MODULE MAIN1), and the optional parameter, Evopt, specifies the level of detail to be used in the EVENT output file. Valid inputs for the Evopt parameter are the secondary keywords of SOCONT and DETAIL (see the EVENTOUT keyword on the OUtput pathway, Section 3.7.2.1). The default filename used if no parameters are specified is EVENTS.INP, and the default for the level of detail is DETAIL. If only one parameter is present, then it is taken to be the Evfile, and the default will be used for Evopt.

The primary difference between routine AERMOD and EVENT processing is in the treatment of source group contributions. The AERMOD model treats the source groups independently. EVENT processing is designed to provide source contributions to particular events, such as the design concentrations determined from AERMOD, or user-specified events. The user may specify the "events" to process using the EVent pathway, which lists specific combinations of receptor location, source group, and averaging period. By specifying the EVENTFIL keyword, an input runstream file will be generated that can be used directly for

AR0068666

EVENT processing. The events included in the generated EVENT processing input file are the design concentrations defined by the RECTABLE keyword and the threshold violations identified by the MAXIFILE keyword on the CO pathway.

3.2.10 The Model Re-start Capability

The AERMOD model has an optional capability to store intermediate results into an unformatted file, so that the model run can be continued later in case of a power failure or a user interrupt. This re-start option is controlled by the SAVEFILE and INITFILE keywords on the CO pathway. The syntax and type of these keywords are summarized below.

Syntax:
Type:

The SAVEFILE keyword instructs the model to save the intermediate results to a file, and controls the save options. All three parameters for this keyword are optional. If the user specifies only the Savfil parameter, then the intermediate results are saved to the same file (and overwritten) each time. If the user specifies both the Savfil and the Savfil2 parameters, then the model alternates between the two files for storing intermediate results. The latter approach requires additional disk space to handle two storage files. However, selecting two files avoids the potential problem that the power failure or interrupt might occur while the temporary file is open and the intermediate results are being copied to it. In such a case, the temporary results file would be lost.

The optional Daycnt parameter allows the user to specify the number of days between successive dumps. The default is to dump values at the end of each day, i.e., Daycnt = 1. For larger modeling runs, where the SAVEFILE option is most useful, the additional execution time required to implement this option is very small, compared to the total runtime. To be most effective, it is recommended that results be saved at least every 5 days.

AR0068667

If no parameters are specified for the SAVEFILE keyword, then the model will store intermediate results at the end of each day using a default filename of TMP.FIL.

The INITFILE keyword works in conjunction with the SAVEFILE keyword, and instructs the model to initialize the results arrays from a previously saved file. The optional parameter, Initfil, identifies the unformatted file of intermediate results to use for initializing the model. If no Initfil parameter is specified, then the model assumes the default filename of TMP.FIL. If the file doesn't exist or if there are any errors encountered in opening the file, then a fatal error message is generated and processing is halted.

Note: It is important to note that if both the SAVEFILE and INITFILE keywords are used in a the same model run, then different filenames must be specified for the Savfil and Initfil parameters. Otherwise, the model will encounter an error in opening the files, and further processing will be halted.

3.2.11 Post-1997 PM_{10} Processing

A new NAAQS for modeling PM_{10} was promulgated in July 1997. This guidance utilizes the expected second high value of the 24-hour NAAQS replaced by a 3-year average of the 99th percentile value of the frequency distribution and a 3-year average of the annual mean. Since the Guideline on Air Quality Modeling precludes the use of a 3-year data set, a policy was established that uses unbiased estimates of the 3-year averages, utilizing all meteorological data (both single and multiple years of data) available. An unbiased estimate of the 99th percentile is the fourth highest concentration, if one year of meteorological data are input to the model, or the multi-year average of the fourth highest concentrations, if more than one year of meteorological data are input to the model. Similarly, an unbiased estimate of the 3-year average annual mean is simply the annual mean, if only one year of meteorological data are input to the model, or the multi-year average annual mean if multiple years of meteorological data are used. Analogously to the original NAAQS situation, the entire area is in compliance when the highest fourth high (or highest average fourth high) and the highest annual mean (or the highest average annual mean) are less than or equal to the NAAQS.

AR0068668

AERMOD will process the 24-hour and annual averages for PM_{10} according to the new NAAQS if the pollutant ID specified on the CO POLLUTID card is PM10 or PM-10, and the CO MULTYEAR card is not present. In this case, the model will compute an average of the fourth highest concentrations at each receptor across the number of years of meteorological data being processed. For a single year of data, the model will report the fourth highest concentration at each receptor. For a five year period of data, the model will report the average of the five fourth-highest values at each receptor. Also, for multiple year data files, the annual average will first be calculated for each individual year of data, and the average of these across the number of years will be calculated. This processing of the annual average across multiple years may give slightly different results than the PERIOD average across the same time period, due to differences in the number of calms from year to year. In order to accommodate this difference, the new PM_{10} NAAQS makes use of the ANNUAL average keyword for specifying the long-term average.

Users should be aware of the following restrictions which are applied to the new PM_{10} NAAQS processing:

1. The averaging periods are limited to the 24-hour and ANNUAL averages. Use of the PERIOD average or a short term average other than 24-hour will result in a fatal error message being generated.

2. Only the FOURTH (or 4TH) highest value may be requested on the RECTABLE card for 24-hour averages. Specifying another high value on the RECTABLE card will result in a fatal error message being generated.

3. The model will only process complete years of meteorological data, although there is no restriction on the start date for the data. If less than one complete year of data is processed, a fatal error message will be generated. If additional meteorological data remains after the end of the last complete year of data, the remaining data will be ignored, and a non-fatal warning message will be generated specifying the number of hours ignored.

AR0068669

4. The MULTYEAR card cannot be used with the new PM_{10} NAAQS. Multiple year analyses should be accomplished by including the multiple years of meteorology in a single data file.

5. Since the 24-hour average design values for post-1997 PM_{10} analyses may consist of averages over a multi-year period, they are incompatible with the EVENT processor. If the MAXIFILE option is used to output 24-hour average threshold violations, these may be used with the EVENT processor. Therefore, if the EVENTFIL option is used without the MAXIFILE option for post-1997 PM_{10} analyses, a non-fatal warning message will be generated, and the EVENTFIL option will be ignored.

3.2.12 Pre-1997 PM_{10} Processing

AERMOD may still be used to perform PM_{10} analyses according to the pre-1997 NAAQS. This may be accomplished as before by use of the MULTYEAR card on the CO pathway, except that the syntax for this keyword has been changed slightly. The syntax and type are now as follows:

Syntax:	
Type:	

where H61H is a new secondary keyword that identifies this as a pre-1997 analysis, the Savfil parameter specifies the filename for saving the results arrays at the end of each year of processing, and the Initfil parameter specifies the filename to use for initializing the results arrays at the beginning of the current year. The Initfil parameter is optional, and should be left blank for the first year in the multi-year series of runs. A non-fatal warning message will be generated if the MULTYEAR card is used for pre-1997 NAAQS analyses.

AR0068670

3.2.13 Debugging Output Option

The DEBUGOPT keyword on the CO pathway allows the user to request detailed files of intermediate calculation results for debugging purposes. The syntax and type of the DEBUGOPT keyword are summarized below:

Syntax:	——— ———
Type:	

where the MODEL and METEOR secondary keywords specify the type of debug information to be provided, and the DbgFil and DbmFil parameters specify the names of the detailed message files. This option allows for two types of debug output files. The MODEL secondary keyword specifies that intermediate calculations related to the model results for each source and receptor, e.g., dispersion parameters, plume heights, etc., are to be output. The METEOR secondary keyword specifies that the gridded profiles of meteorological variables for each hour of data are to be output. Use the DEBUGOPT keyword with **CAUTION** - it can produce very large files! The METEOR profiles are printed to a separate file from the MODEL information. The filenames for each type of output are optional, and if provided must immediately follow the appropriate secondary keyword. The default filenames used if none are specified by the user are MODEL.DBG and METEOR.DBG. The model will overwrite these files, without warning, if they already exist.

3.2.14 Detailed Error Listing File

The ERRORFIL keyword on the CO pathway allows the user to request a detailed listing file of all the messages generated by the model. This includes the error and warning messages that are listed as part of the message summaries provided in the main output file, and also any informational messages (such as occurrences of calm winds) and quality assurance messages that are generated. The syntax and type of the ERRORFIL keyword are summarized below:

AR0068671

Syntax:	
Type:	

where the Errfil parameter is the name of the detailed message file. If the optional Errfil parameter is left blank, then the model will use a default filename of ERRORS.LST. A complete description of the error and other types of messages generated by the model is provided in Appendix C.

3.3 SOURCE PATHWAY INPUTS AND OPTIONS

The **SO**urce pathway contains the keywords that define the source information for a particular model run. The model currently handles three source types, identified as point, volume or area sources. The input parameters vary depending on the source type. For point sources, the user can also identify building dimensions for nearby structure that cause aerodynamic downwash influences on the source. The user can also identify groups of sources for which the model will combine the results.

The LOCATION keyword, which identifies the source type and location, must be the first card entered for each source. The only other requirement for order of the keywords is that the SRCGROUP keyword must be the last keyword before the SOFINISHED card. The user may group all of the LOCATION cards together, then group the source parameter cards together, or they may want to group all input cards for a particular source together. All sources are given a source ID by the user, which is used to link the source parameter inputs to the correct source or sources. The source ID can be any alphanumeric string of up to eight characters.

As noted in Section 2.3, the number of sources is allocated dynamically at the time AERMOD is run. This value, in concert with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

AR0068672

3.3.1 Identifying Source Types and Locations

The LOCATION keyword is used to identify the source type and the location of each source to be modeled. The LOCATION card must be the first card entered for each source since it identifies the source type, and dictates which parameters are needed and/or accepted. The syntax, type and order of the LOCATION keyword are summarized below:

Syntax:	
Type:	
Order:	

where the Srcid parameter is the alphanumeric source ID defined by the user (up to eight characters), Srctyp is the source type, which is identified by one of the secondary keywords - POINT, VOLUME, AREA, AREAPOLY, or AREACIRC - and Xs, Ys, and Zs are the x, y, and z coordinates of the source location in meters. All three of the area source types use the same numerical integration algorithm for estimating impacts from area sources, and are merely different options for specifying the shape of the area source. The AREA source keyword may be used to specify a rectangular-shaped area source with arbitrary orientation, the AREAPOLY source keyword may be used to specify an area source as an irregularly-shaped polygon of up to 20 sides; and the AREACIRC source keyword may be used to specify a circular-shaped area source (modeled as an equal-area polygon of 20 sides). Note that the source elevation, Zs, is an optional parameter. If the default option to include elevated terrain effects is used and the source elevation is omitted, a warning message will be generated and the source elevation will be given a value of 0.0. The source elevation is not used by the model if the non-default FLAT terrain option is used. While the default units of Zs are meters, the user may also specify source elevations to be in feet by adding the SO ELEVUNIT FEET card immediately following the SO STARTING card. The x (west-east) and y (north-south) coordinates are for the center of the source for POINT, VOLUME, and AREACIRC sources, and are for one of the vertices of the source for AREA and AREAPOLY sources. The source coordinates may be input as Universal Transverse Mercator (UTM) coordinates, or may be referenced to a user-defined origin.

AR0068673

Certain types of line sources can be handled in AERMOD using either a string of volume sources, or as an elongated area source. The volume source algorithms are most applicable to line sources with some initial plume depth, such as conveyor belts and rail lines. Section 1.2.2 of the ISC Model User's Guide - Volume II (EPA, 1995) provides technical information on how to model a line source with multiple volume sources. The use of the AERMOD area source algorithm for elongated rectangles would be most applicable to near ground level line sources, such as a viaduct.

The source ID entered on the LOCATION card identifies that source for the remainder of the SO pathway inputs. Since the model accepts alphanumeric strings of up to eight characters for the source ID, the sources can be identified with descriptive names, such as STACK1, STACK2, BOILER3, SLAGPILE, etc. This may also be useful if line sources are being modeled as multiple volume or areas, as discussed above. Since they are part of the same physical source, they can be given names that will identify them as being related, such as LINE1A, LINE1B, LINE1C, etc.

3.3.2 Specifying Source Release Parameters

The main source parameters are input on the SRCPARAM card, which is a mandatory keyword for each source being modeled. Since the input parameters vary depending on the source type, the different source types handled by the AERMOD model are discussed separately.

3.3.2.1 POINT Source Inputs

The AERMOD POINT source algorithms are used to model releases from stacks and isolated vents, as well as other kinds of sources. The syntax, type and order for the SRCPARAM card for POINT sources are summarized below:

AR0068674

Syntax:	
Type:	
Order:	

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

Premis - point emission rate in g/s,

Stkhgt - release height above ground in meters,

Stktmp - stack gas exit temperature in degrees K,

Stkvel - stack gas exit velocity in m/s, and

Stkdia - stack inside diameter in meters

An example of a valid SRC PARAM input card for a point source is given below:

where the source ID is STACK1, the emission rate is 16.71 g/s, the release height is 35.0 m, the exit temperature is 444.8 K, the exit velocity is 22.7 m/s, and the inside stack diameter is 2.74 m. All of the parameters must be present on the input card.

If a value of 0.0 is input for the exit temperature, AERMOD will adjust the exit temperature for each hour to match the ambient temperature. This option allows the user to model a plume that is released at ambient temperature. The user may also model a plume with an exit temperature that exceeds the ambient temperature by a fixed amount by entering a negative value for exit temperature equal in magnitude to the temperature difference. The model will add the absolute value of a negative exit temperature to the ambient temperature for each hour to obtain the exit temperature used in computing the buoyancy flux of the plume. The AERMOD model does not include algorithms to model plumes that are released at temperatures below ambient temperature. Such releases should be modeled with a dense gas model.

AR0068675

Since the AERMOD model uses direction-specific building dimensions for all sources subject to building downwash, there are no building parameters entered on the SRCPARAM card. Building dimensions are entered on the BUILDHGT, BUILDWID, BUILDLEN, XBADJ, and YBADJ cards described above in Section 3.4.3.

3.4.2.2 VOLUME Source Inputs

The AERMOD VOLUME source algorithms are used to model releases from a variety of industrial sources, such as building roof monitors, multiple vents, and conveyor belts. The syntax, type and order for the SRCPARAM card for VOLUME sources are summarized below:

Syntax:	
Type:	
Order:	

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

Vlemis - volume emission rate in g/s,

Relhgt - release height (center of volume) above ground, in meters,

Syinit - initial lateral dimension of the volume in meters, and

Szinit - initial vertical dimension of the volume in meters.

The following table, which is explained in more detail in Section 1.2.2 of the ISC Model User's Guide - Volume II, summarizes the suggested procedures to be used for estimating the initial lateral and vertical dimensions for various types of volume and line sources.

AR0068676

TABLE 3-1

SUMMARY OF SUGGESTED PROCEDURES FOR ESTIMATING

INITIAL LATERAL DIMENSIONS σ_{y_0} AND

INITIAL VERTICAL DIMENSIONS σ_{z_0} FOR VOLUME AND LINE SOURCES

Type of Source		Procedure for Obtaining Initial Dimension
(a) Initial Lateral Dimensions (σ_{y_0})		
Single Volume Source	σ_{y_0}	length of side divided by 4.3
Line Source Represented by Adjacent Volume Sources (see Figure 1-8(a) in EPA, 1995)	σ_{y_0}	length of side divided by 2.15
Line Source Represented by Separated Volume Sources (see Figure 1-8(b) in EPA, 1995)	σ_{y_0}	center to center distance divided by 2.15
(b) Initial Vertical Dimensions (σ_{z_0})		
Surface-Based Source (h_s = 0)	σ_{z_0}	vertical dimension of source divided by 2.15
Elevated Source (h_s > 0) on or Adjacent to a Building	σ_{z_0}	building height divided by 2.15
Elevated Source (h_s > 0) not on or Adjacent to a Building	σ_{z_0}	vertical dimension of source divided by 4.3

3.3.2.3 AREA Source Inputs

The AERMOD area source algorithm is used to model low level or ground level releases with no plume rise (e.g., storage piles, slag dumps, and lagoons). The AERMOD model uses a numerical integration approach for modeling impacts from area sources. When the TOXICS option is specified, the area source integration routine is optimized to reduce model runtime. This is accomplished by incorporation of a three-tiered approach using the Romberg numerical integration, a 2-point Gaussian Quadrature routine for numerical integration, or a point source approximation based on the location of the receptor relative to the source. In the regulatory default mode the Romberg numerical integration is utilized for all receptors.

AR0068677

The AERMOD model includes three options for specifying the shape of an area source the AREA source type may be used to specify rectangular areas that may also have a rotation angle specified relative to a north-south orientation, the AREAPOLY source type may be used to specify an area source as an irregularly-shaped polygon of up to 20 sides; and the AREACIRC source keyword may be used to specify a circular-shaped area source (modeled as an equal-area polygon of 20 sides). The source parameter inputs for each of the area source types is described below.

AREA Source Type

The rotation angle for rectangular AREA sources is specified relative to the vertex used to define the source location on the SO LOCATION card (e.g., the southwest corner). The syntax, type and order for the SRCPARAM card for AREA sources are summarized below:

Syntax:
Type:
Order:

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

Artemis - area emission rate in g/(s-m^2).

Relhgt - release height above ground in meters.

Xinit - length of X side of the area (in the east-west direction if Angle is 0 degrees) in meters.

Yinit - length of Y side of the area (in the north-south direction if Angle is 0 degrees) in meters (optional).

Angle - orientation angle for the rectangular area in degrees from North, measured positive in the clockwise direction (optional), and

Szinit - initial vertical dimension of the area source plume in meters (optional).

AR0068678

It should be noted that the emission rate for the area source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source.

If the optional Yinit parameter is omitted, then the model assumes that the area is a square, i.e., Yinit = Xinit. If the optional Angle parameter is omitted, then the model assumes that the area is oriented in the north-south and east-west directions, i.e., Angle = 0.0. If the Angle parameter is input, and the value does not equal 0.0, then the model will rotate the area clockwise around the vertex defined on the SOURCE card for this source. Figure 3-1 illustrates the relationship between the Xinit, Yinit, and Angle parameters and the source location, (Xs,Ys), for a rotated rectangle. The Xinit dimension is measured from the side of the area that is counterclockwise along the perimeter from the vertex defined by (Xs,Ys), while the Yinit dimension is measured from the side of the area that is clockwise from (Xs,Ys). The Angle parameter is measured as the orientation, relative to North, of the side that is clockwise from (Xs,Ys), i.e., the side with length Yinit. The Angle parameter may be positive (for clockwise rotation) or negative (for counterclockwise rotation), and a warning message is generated if the absolute value of Angle is greater than 180 degrees. The selection of the vertex to use for the source location is not critical, as long as the relationship described above for the Xinit, Yinit, and Angle parameters is maintained.

AR0068679

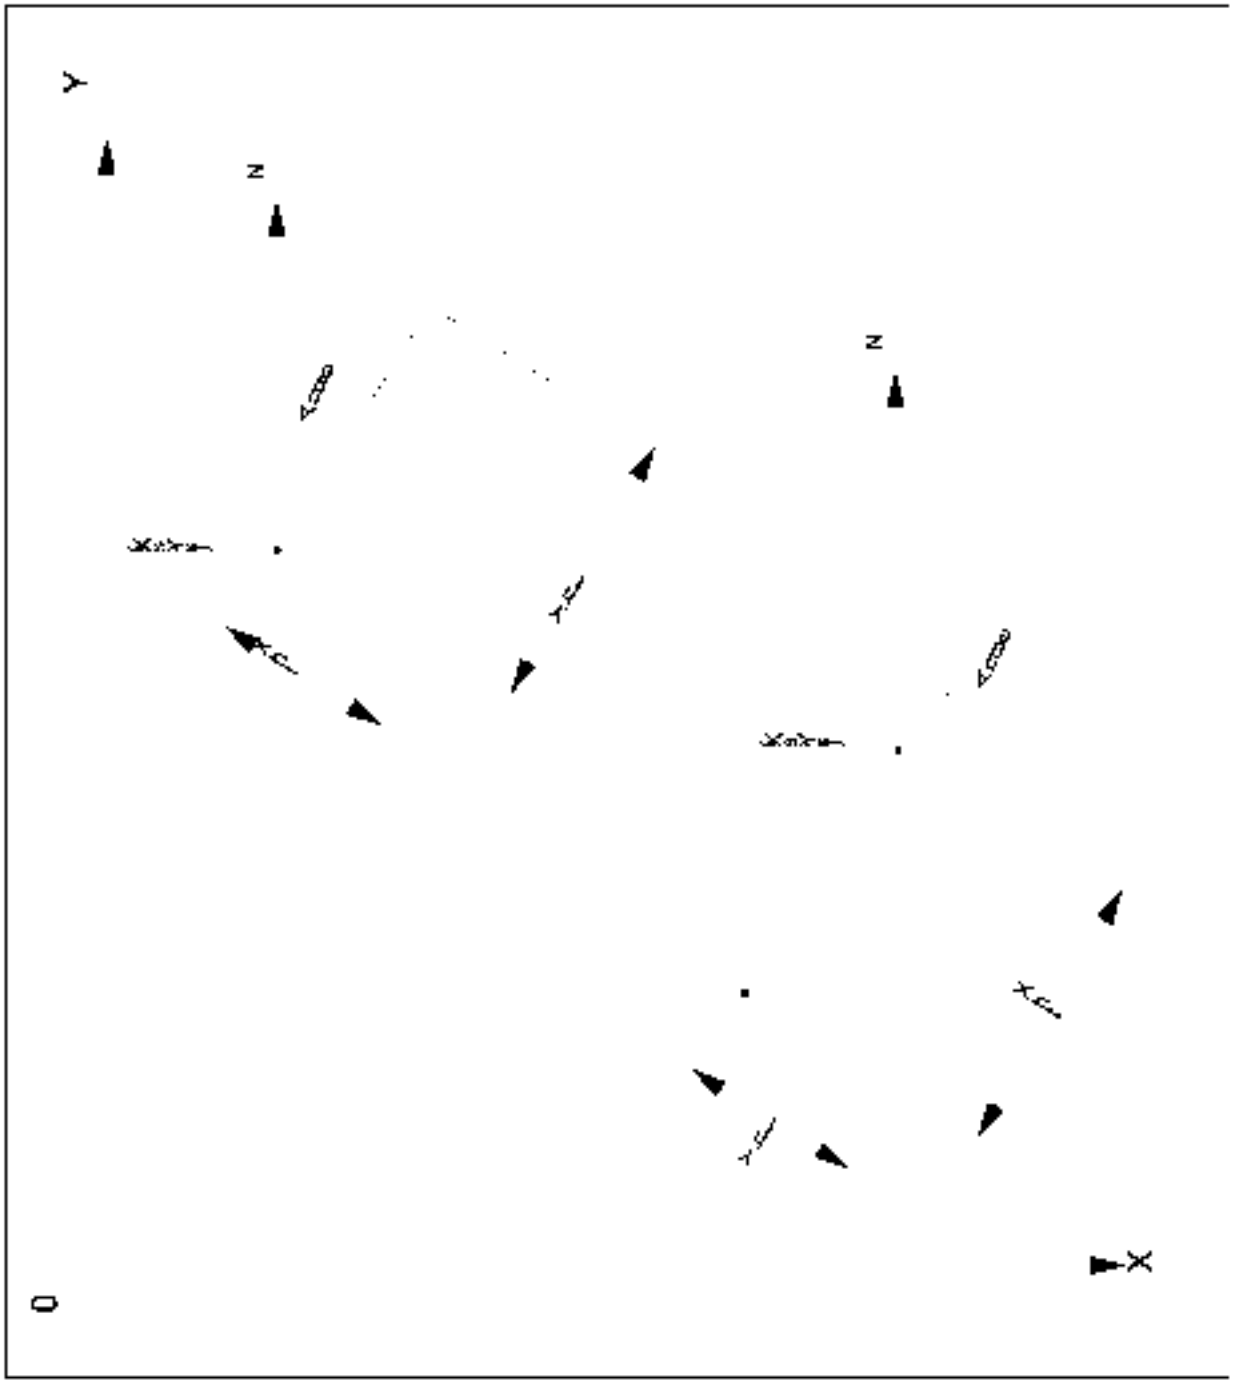

FIGURE 3-1 RELATIONSHIP OF AREA SOURCE PARAMETERS FOR ROTATED RECTANGLE

AR0068680

By making the Yinit and Angle parameters optional, the area source input data for the previous versions of the ISC2 model can be used with the AERMOD model. The aspect ratio (i.e., length-width) for area sources should generally be less than about 10 to 1. If this is exceeded, then the model will generate a non-fatal warning message, and the user should consider subdividing the area to achieve a 10 to 1 aspect ratio (or less) for all subareas.

The optional Szinit parameter may be used to specify an initial vertical dimension to the area source plume, similar to the use of the Szinit parameter for volume sources. This parameter may be important when the area source algorithm is used to model mechanically generated emission sources, such as mobile sources. In these cases, the emissions may be turbulently mixed near the source by the process that is generating the emissions, and therefore occupy some initial depth. For more passive area source emissions, such as evaporation or wind erosion, the Szinit parameter may be omitted, which is equivalent to using an initial sigma-z of zero.

An example of a valid SRCPARAM input card for a rectangular area source is given below:

```
. . . .
```

where the source ID is SLAGPILE, the emission rate is 0.0025 g/(s-m^2), the release height is 5.0 m, the X-dimension is 50.0 m, the Y-dimension is 100.0 m, and the orientation angle is 30.0 degrees clockwise from North.

Since the numerical integration algorithm can handle elongated areas with aspect ratios of up to 10 to 1, the AERMOD area source algorithm may be useful for modeling certain types of line sources. There are no restrictions on the placement of receptors relative to area sources for the AERMOD model. Receptors may be placed within the area and at the edge of an area. The AERMOD model will integrate over the portion of the area that is upwind of the receptor. However, since the numerical integration is not performed for portions of the area that are closer than 1.0 meter upwind of the receptor, caution should be used when placing receptors within or

AR0068681

adjacent to areas that are less than a few meters wide. More technical information about the application of the AERMOD area source algorithm is provided in Sections 1.2.3 and 2.2.3 of the ISC Model User's Guide - Volume II (EPA, 1995).

AREAPOLY Source Type

The AREAPOLY source type may be used to specify an area source as an arbitrarily-shaped polygon of between 3 and 20 sides (the number of sides allowed may be increased by modifying the NVMAX parameter in MODULE MAIN1). This source type option provides the user with considerable flexibility for specifying the shape of an area source. The syntax, type and order for the SRCPARAM card for AREAPOLY sources are summarized below.

Syntax:
Type:
Order:

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

Arerris - area emission rate in g/(s-m^2),

Relhgt - release height above ground in meters,

Nverts - number of vertices (or sides) of the area source polygon,

Szinit - initial vertical dimension of the area source plume in meters (optional).

As with AREA sources, the emission rate for the source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source. The number of vertices (or sides) used to define the area source polygon may vary between 3 and 20. The locations of the vertices are specified by use of the AREAVERT keyword, which applies only to AREAPOLY sources. The syntax, type and order for the AREAVERT keyword used for AREAPOLY sources are summarized below.

AR0068682

Syntax:	
Type:	
Order:	

where the Xv(i) and Yv(i) are the x-coordinate and y-coordinate values of the vertices of the area source polygon. There must by Nverts pairs of coordinates for the area source, where Nverts is the number of vertices specified for that source on the SRCPARAM card. The first vertex, Xv(1) and Yv(1), must also match the coordinates given for the source location on the LOCATION card, Xs and Ys. The remaining vertices may be defined in either a clockwise or counter-clockwise order from the point used for defining the source location.

Since the numerical integration algorithm can handle elongated areas with aspect ratios of up to 10 to 1, the AERMOD area source algorithm may be useful for modeling certain types of line sources. There are no restrictions on the placement of receptors relative to area sources for the AERMOD model. Receptors may be placed within the area and at the edge of an area. The AERMOD model will integrate over the portion of the area that is upwind of the receptor. However, since the numerical integration is not performed for portions of the area that are closer than 1.0 meter upwind of the receptor, caution should be used when placing receptors within or adjacent to areas that are less than a few meters wide.

AREACIRC Source Type

The AREACIRC source type may be used to specify an area source as a circular shape. The model will automatically generate a regular polygon of up to 20 sides to approximate the circular area source. The polygon will have the same area as that specified for the circle. The syntax, type and order for the SRCPARAM card for AREACIRC sources are summarized below:

Syntax:	
Type:	
Order:	

AR0068683

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source, and the other parameters are as follows:

Arsrris - area emission rate in g/(s-m^2),

Rellgt - release height above ground in meters,

Radius - radius of the circular area in meters,

Nverts - number of vertices (or sides) of the area source polygon (optional, 20 sides will be used if omitted),

Szinit - initial vertical dimension of the area source plume in meters (optional)

As with AREA sources, the emission rate for the source is an emission rate per unit area, which is different from the point and volume source emission rates, which are total emissions for the source.

3.4.3 Specifying Building Downwash Information

As noted above, the AERMOD model include algorithms to model the effects of buildings downwash on emissions from nearby or adjacent point sources. The building downwash algorithms do not apply to volume or area sources. For a technical description of the building downwash algorithms in AERMOD, the user is referred to Schulman, et al. (2000). The AERMOD model uses direction specific information for all building downwash cases.

There are five keywords that are used to specify building downwash information: BUILDHGT, BUILDWID, BUILDLEN, XBADJ, YBADJ. The syntax, type and order for the BUILDHGT keyword, used to input direction specific building heights, are summarized below:

Syntax:
Type:
Order:

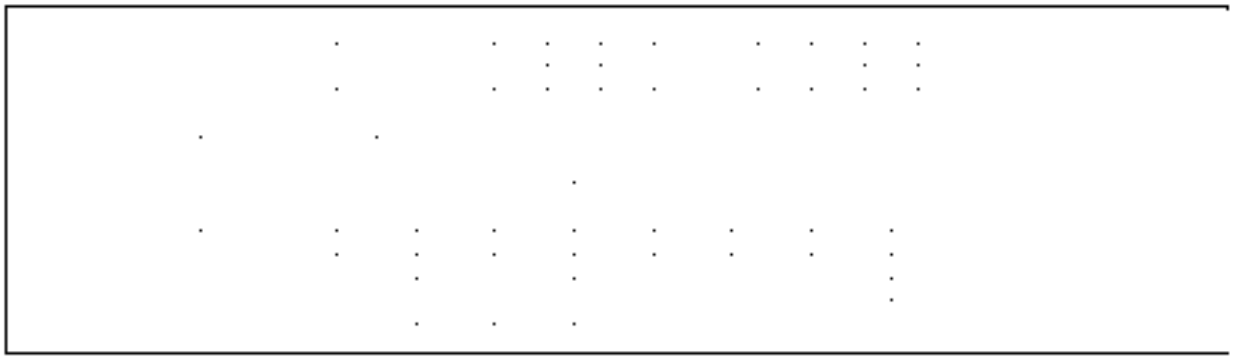
AR0068684

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source. The user also has the option of specifying a range of sources (the Srcrng parameter) for which the building heights apply, instead of identifying a single source. This is accomplished by two source ID character strings separated by a dash, e.g., STACK1-STACK10. Since the model reads the source range as a single input field there must not be any spaces between the source IDs. The model then places the building heights that follow (the Dsbh() parameter) into the appropriate arrays for all Srcid's that fall within that range, including STACK1 and STACK10.

When comparing a source ID to the range limits for a Srcrng parameter, the model separates the source IDs into three parts: an initial alphabetical part, a numerical part, and then the remainder of the string. Each part is then compared to the corresponding parts of the source range, and all three parts must satisfy the respective ranges in order for the source ID to be included. If there is no numeric part, then the ID consists of only one alphabetical part. If the ID begins with a numeric character, then the initial alphabetical part defaults to a single 'blank'. If there is no trailing alphabetical part, then the third part also defaults to a single blank part. If the trailing part consists of more than one alphabetical or numeric field, it is all lumped into one character field. For example, the source ID 'STACK2' consists of the parts 'STACK' plus '2' plus a single trailing blank, ' '. By comparing the separate parts of the source IDs, it can be seen that STACK2 falls between the range 'STACK1-STACK10'. For a three-part example, it can also be seen that VENT1B falls within the range of VENT1A-VENT1C. However, VENT2 does not fall within the range of VENT1A to VENT1B, since the third part of VENT2 is a single blank, which does not fall within the range of A to C. This is because a blank character will precede a normal alphabetical character. Normally, the source ranges will work as one would intuitively expect for simple source names. Most importantly, for names that are made up entirely of numeric characters, the source ranges will be based simply on the relative numerical values. The user is strongly encouraged to check the summary of model inputs to ensure that the source ranges were interpreted as expected, and also to avoid using complex source names in ranges, such as AA1B2C-AB3A3C. Since the order of keywords within the SO pathway is quite flexible, it is also important to note that the building heights will only be applied to those sources that have been defined previously in the input file.

AR0068685

Following the Srcid or the Srcrng parameter, the user inputs 36 direction-specific building heights (Dsbh parameter) in meters, beginning with the 10 degree flow vector (wind blowing toward 10 degrees from north), and incrementing by 10 degrees in a clockwise direction. Some examples of building height inputs are presented below:



The first example illustrates the use of repeat cards if more than one card is needed to input all of the values. The values are processed in the order in which they appear in the input file, and are identified as being repeat cards by repeating the Srcid parameter. The first and second examples produce identical results within the model. The second one illustrates the use of a repeat value that can simplify numerical input in some cases. The field "36*3.0" is interpreted by the model as "repeat the value 3.0 a total of 36 times." This is also used in the third example where the building height is constant for directions of 10 degrees through 330 degrees, and then is set to 0.0 (e.g. the stack may be outside the region of downwash influence) for directions 340 through 360. The third example also uses a source range rather than a single source ID. The last example illustrates building heights which vary by direction, and shows that the number of values on each card need not be the same. For improved readability of the input file, the user may want to put the numerical inputs into "columns," but there are no special rules regarding the spacing of the parameters on this keyword.

The BUILDWID keyword is used to input direction-specific building widths for downwash analyses. The syntax for this keyword, which is very similar to the BUILDHGT keyword, is summarized below, along with the type and order information.

AR0068686

Syntax:	
Type:	
Order:	

For a description of the Srcid and Srcng parameters, and for a discussion and examples of the numeric input options, refer to the **BUILDHGT** keyword above. The Dsbw(n) parameter contains the 36 direction-specific building widths. The directions proceed in a clockwise direction, beginning with the 10 degree flow vector.

The BUILDLEN keyword is used to input direction-specific along-flow building lengths for downwash analyses. Figure 3-2 shows the relationship of the projected building to this dimension. The syntax for this keyword, which is very similar to the BUILDHGT keyword, is summarized below, along with the type and order information.

Syntax:	
Type:	
Order:	

For a description of the Srcid and Srcng parameters, and for a discussion and examples of the numeric input options, refer to the **BUILDHGT** keyword above. The Dsbl(n) parameter contains the 36 direction-specific building lengths. The directions proceed in a clockwise direction, beginning with the 10 degree flow vector.

AR0068687

Figure 3-2 shows the relationship of the projected building to these distances.

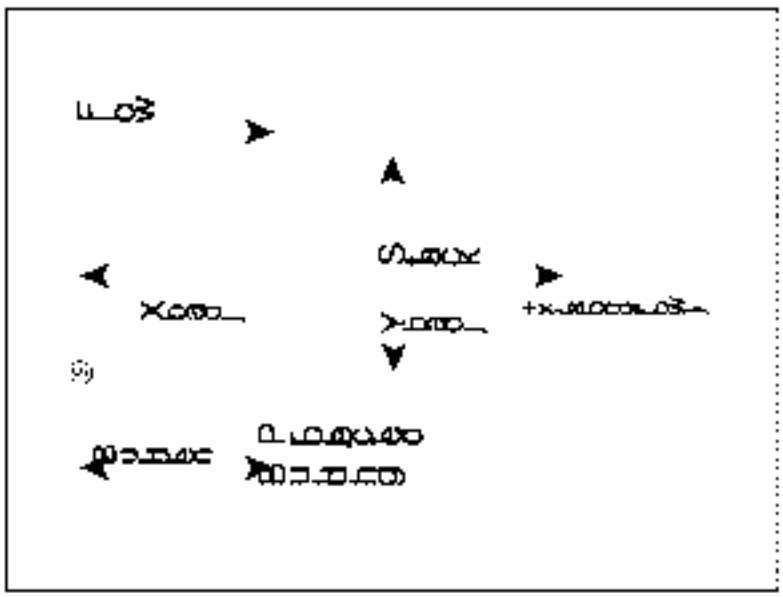


FIGURE 3-2 SCHEMATIC DIAGRAM IDENTIFYING NEW BUILDING DATA FOR PRIME DOWNWASH

The XBADJ and YBADJ keywords are used to input direction-specific along-flow and across-flow distances from the stack to the center of the upwind face of the projected building, respectively. Figure 3-2 shows the relationship of the projected building to these distances. The syntax for these keywords, which is very similar to the BUILDHGT keyword, are summarized below, along with the type and order information.

AR0068688

Syntax:	
Type:	
Order:	

Syntax:	
Type:	
Order:	

For a description of the Srcid and Srcrng parameters, refer to the BUILDHGT keyword above. The Xbadj(i) parameter contains the 36 direction-specific along-flow distances from the stack to the center of the upwind face and the Ybadj(i) parameter contains the 36 direction-specific across-flow distances from the stack to the center of the upwind face. The directions proceed in a clockwise direction, beginning with the 10 degree flow vector.

3.4.4 Specifying Urban Sources

As discussed in Section 3.2.4, the AERMOD model allows the user to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions. The user specifies the parameters for the urban area on the CO URBANOPT card (see Section 3.2.4), and identifies which sources are to be modeled with urban effects using the SO URBANSRC card. If a source is not included on the URBANSRC card, it will be modeled without the urban effects. The syntax, type and order for the URBANSRC keyword are summarized below:

Syntax:	
Type:	
Order:	

where the Srcid's and Srcrng's are the individual source IDs and/or source ranges that are to be modeled with urban effects. Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.4.3), are input as two source IDs separated by a dash, e.g.,

AR0068689

STACK1-STACK10. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to define the urban sources, then additional cards may be input.

3.3.5 Using Variable Emission Rates

The AERMOD model provide the option of specifying variable emission rate factors for individual sources or for groups of sources. The factors may vary on different time scales, such as by season, hour-of-day, etc. The EMISFACT keyword provides the user the option of specifying variable emission rate factors for sources modeled by the AERMOD model. The syntax, type and order of this keyword are summarized below:

Syntax:
Type: **Order:**

where the Srcid parameter is the same source ID that was entered on the LOCATION card for a particular source. The user also has the option of using the Srcrng parameter for specifying a range of sources for which the emission rate factors apply, instead of identifying a single source. This is accomplished by two source ID character strings separated by a dash, e.g., SRCID1-SRCID10. The use of the Srcrng parameter is explained in more detail in Section 3.3.3 above for the BUILDHGT keyword.

The parameter Qflag is the variable emission rate flag, and is one of the following secondary keywords:

SEASON - emission rates vary seasonally (n=4).

MONTH - emission rates vary monthly (n=12).

HRODDY - emission rates vary by hour-of-day (n=24).

WSPEED - emission rates vary by wind speed (n=6).

AR0068690

SEASHR	emission rates vary by season and hour of day (nf = 96),
SHRDOW	emission rates vary by season, hour of day, and day of week (M-F, Sat, Sun; nf = 288), and
SHRDOW7	emission rates vary by season, hour-of-day, and the seven days of the week (M,Tu,W,Th,F,Sat,Sun) (nf = 672)

The Qfac array is the array of factors, where the number of factors is shown above for each Qflag option. The seasons are defined in the following order: Winter (Dec., Jan., Feb.), Spring (Mar., Apr., May), Summer (Jun., Jul., Aug.), and Fall (Sep., Oct., Nov.). The wind speed categories used with the WSPEED option may be defined using the MF-WINDCATS keyword. If the WINDCATS keyword is not used, the default wind speed categories are defined by the upper bound of the first five categories as follows (the sixth category is assumed to have no upper bound): 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The EMISFACT card may be repeated as many times as necessary to input all of the factors, and repeat values may be used for the numerical inputs. An example of each of these options is presented below, with column headers to indicate the order in which values are to be to input.

AR0068691

AR0068692

3.3.6 Adjusting the Emission Rate Units for Output

The default emission rate units for the AERMOD model are grams per second for point and volume sources, and grams per second per square meter for area sources. By default, the model converts these input units to output units of micrograms per cubic meter for concentration calculations. This is accomplished by applying a default emission rate unit factor of 1.0E+06 for concentration.

The EMISUNIT keyword on the SO pathway allows the user to specify a different unit conversion factor, and to specify the appropriate label for the output units for either concentration calculations. The syntax and type of the EMISUNIT keyword are summarized below:

Syntax:
Type:

where the parameter Emsfac is the emission rate unit factor, Emslbl is the label for the emission units (up to 40 characters), and Conlbl is the output unit label (up to 40 characters) for concentration calculations. For example, to produce output concentrations in milligrams per cubic meter, assuming input units of grams per sec, the following card could be input:

since there are 1,000 milligrams per gram. The emission rate unit factor applies to all sources for a given run. Since the model uses one or more spaces to separate different fields on the input runstream images, it is important that there not be any spaces within the label fields on this card. Thus, instead of entering 'GRAMS PER SECOND' for the emission label, a label of 'GRAMS/SECOND', or 'GRAMS-PER-SECOND' or an equivalent variation should be used.

AR0068693

3.3.7 Specifying Variables for Settling, Removal and Deposition Calculations

The current version of the AERMOD model does not include algorithms to handle the gravitational settling and removal by dry deposition of particulates.

3.3.8 Specifying Variables for Precipitation Scavenging and Wet Deposition Calculations

The current version of the AERMOD model does not include algorithms to handle the scavenging and removal by wet deposition (i.e., precipitation scavenging) of gases and particulates.

3.3.9 Specifying an Hourly Emission Rate File

The source (SO) pathway includes an option for inputting hourly emission rates for the AERMOD model, controlled by the HOUREMIS keyword. AERMOD currently allows for a single hourly emission file to be used with each model run. The syntax, type and order for this keyword are summarized below:

Syntax:
Type:
Order:

where the Hr-fil parameter specifies the filename (up to 40 characters) for the hourly emission file, and Srcid or Srcrng identify the source or sources for which hourly emission rates are included. Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.3.3L) are input as two source IDs separated by a dash, e.g., STACK1-STACK10. The user may include more than one HOUREMIS card in a runstream file, if needed to specify additional sources, but there can be only one hourly emissions file, and therefore the filename must be the same on all HOUREMIS cards.

AR0068694

The format of each record of the hourly emissions file includes a pathway and keyword (SO HOUREMIS), followed by the Year, Month, Day, Hour, Source ID, and emission rate (in the appropriate units). For point sources, the stack gas exit temperature (K), and stack gas exit velocity (m/s) are also specified. The hourly emissions file is processed using the same routines used to process the mainstream input file; therefore each of the parameters must be separated by at least one space, but otherwise the format is flexible. It is also not necessary to include the SO HOUREMIS on each line, as long as the parameters (Year, Month, etc.) do not begin before column 13.

The data in the hourly emission file must include the exact same dates as are included in the meteorological input files, and the source IDs must correspond to the source IDs defined on the SO LOCATION cards and be in the same order. Multiple records are required to define the emissions for one hour if more than one source is referenced. The model will check for a date mismatch between the hourly emissions file and the meteorological data, and also for a source ID mismatch. However, it is not necessary to process the entire hourly emissions file on each model run, i.e., the correct emissions data will be read if the ME DAYRANGE or the ME STARTEND cards (see Section 3.5.4) are used, as long as all the dates (including those that are processed and those that are skipped) match the meteorological data files. An example of several lines from an hourly emissions file for two point sources is provided below:

```
.          .          .
.          .          .
.          .
.          .
.          .          . .
.          .          . .
.          .          .
.          .          .
```

The model will use the stack release height and stack inside diameter defined on the SO SRCPARAM card, but will use the emission rate, exit temperature and exit velocity from the hourly emission file. If the emission rate, exit temperature and exit velocity are not included for a particular hour, i.e., any or all of those fields are blank, the model will interpret emissions data for

AR0068695

that hour as missing and will set the parameters to zero. Since the emission rate will be zero, there will be no calculations made for that hour and that source.

3.4.10 Including Source Data From an External File

The user has the option of including source data from an external file by using the INCLUDED keyword on the source (SO) pathway. An SO INCLUDED card may be placed anywhere within the source pathway, after the STARTING card and before the FINISHED card (i.e., the SO STARTING and SO FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the runstream file. The syntax and type of the INCLUDED keyword are summarized below:

Syntax:
Type:

where the Incfil parameter is a character field of up to 40 characters that identifies the filename for the included file. The contents of the included file must be valid runstream images for the source pathway. If an error is generated during processing of the included file, the error message will report the line number of the included file (see Appendix C). If more than one INCLUDED file is specified for the source pathway, the user will first need to determine which file the error occurred in. If the starting column of the main runstream input file is shifted from column 1 (see Section 2.4.8), then the runstream images in the included file must be offset by the same amount.

3.3.11 Using Source Groups

The AERMOD model allows the user to group contributions from particular sources together. Several source groups may be setup in a single run, and they may, for example, be used to model impacts from the source being permitted, the group of increment consuming PSD sources, and the group of all sources for comparison to a NAAQS in a single run. There is always at least one source group in a run, which may consist of all sources, so the SRCGROUP keyword

AR0068696

has been made mandatory in the AERMOD model. The syntax, type and order of the SRCGROUP keyword are summarized below:

Syntax:	
Type:	
Order:	

where the Grpid parameter is an alphanumeric string of up to eight characters that identifies the group name. The Srcid's and Srcrng's are the individual source IDs and/or source ranges that make up the group of sources. Source ranges, which are described in more detail in the description of the BUILDHGT keyword (Section 3.3.5), are input as two source IDs separated by a dash, e.g., STACK1-STACK16. Individual source IDs and source ranges may be used on the same card. If more than one input card is needed to define the sources for a particular group, then additional cards may be input, repeating the pathway, keyword and group ID.

A special group ID has been reserved for use in specifying the group of all sources. When Grpid = ALL, the model will automatically setup a source group called ALL that includes all sources modeled for that particular run. If desired, the user can setup a group of all sources with a different group ID by explicitly specifying all sources on the input card(s).

As noted in Section 2.3, the number of source groups is allocated dynamically at the time AERMOD is run. This value, in concert with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

As discussed in Sections 1.2.4.b and 3.3.9, it is sometimes important for a user to know the contribution of a particular source to the total result for a group. These source contribution analyses are facilitated for short term averages by the use the EVENT processing capabilities in the AERMOD model. EVENT processing uses the same source groups that are identified by AERMOD (when the input file is generated using the COEVENTFIL option), but the model is structured in a way that it retains individual source results for particular events. Refer to the sections noted above for a more complete description of EVENT processing and its uses.

AR0068697

3.4 RECEPTOR PATHWAY INPUTS AND OPTIONS

The **RE**ceptor pathway contains keywords that define the receptor information for a particular model run. The RE pathway contains keywords that allow the user to define Cartesian grid receptor networks and/or polar grid receptor networks, with either uniform or non-uniform grid spacing, as well as discrete receptor locations referenced to a Cartesian or a polar system. As noted in Section 2.3, the number of receptors and receptor networks are allocated dynamically at the time AERMOD is run. This value, in combination with the other dynamically allocated arrays and input requirements, is limited only by the amount of available memory.

All of the receptor options in AERMOD allow the user to input terrain elevations and hill height scales for each receptor, both of which are needed when applying AERMOD in an elevated terrain situation. To facilitate the generation of hill height scales for AERMOD, a terrain preprocessor, called AERMAP, has been developed (EPA, 2004e). The AERMAP terrain preprocessor, which uses U.S. Geological Survey (USGS) Digital Elevation Model (DEM) data as an input, may also be used to generate the terrain elevations for the receptor locations. The AERMAP program generates an output file that contains the receptor pathway data for AERMOD in the format described below. This file may either be cut and pasted into the AERMOD runstream file, or may be included as an external file using the RECEPTOR INCLUDED card (see Section 3.4.4).

The default units for receptor elevations for the AERMOD model are in meters, however, the user may specify receptor elevations to be in units of feet by adding the RE ELEVUNIT FEET card immediately after the RE STARTING card. Since the AERMAP terrain preprocessor outputs elevations in meters and includes the RE ELEVUNIT METERS card as the first record, the AERMAP data must be placed at the beginning of the receptor pathway.

3.4.1 Defining Networks of Gridded Receptors

Two types of receptor networks are allowed by the AERMOD model. A Cartesian grid network, defined through the GRIDCART keyword, includes an array of points identified by their

AR0068698

x (east-west) and y (north-south) coordinates. A polar network, defined by the GRIDPOLR keyword, is an array of points identified by direction and distance from a user-defined origin. Each of these keywords has a series of secondary keywords associated with it that are used to define the network, including any receptor elevations for elevated terrain and flagpole receptor heights. The GRIDCART and GRIDPOLR keywords can be thought of as "sub-pathways," since their secondary keywords include a STArt and an END card to define the start and end of inputs for a particular network.

3.4.1.1 Cartesian Grid Receptor Networks

Cartesian grid receptor networks are defined by use of the GRIDCART keyword. The GRIDCART keyword may be thought of as a "sub-pathway" in that there are a series of secondary keywords that are used to define the start and the end of the inputs for a particular network, and to select the options for defining the receptor locations that make up the network. The syntax and type of the GRIDCART keyword are summarized below:

Syntax:	—
	—
	—
	—
Type:	

AR0068699

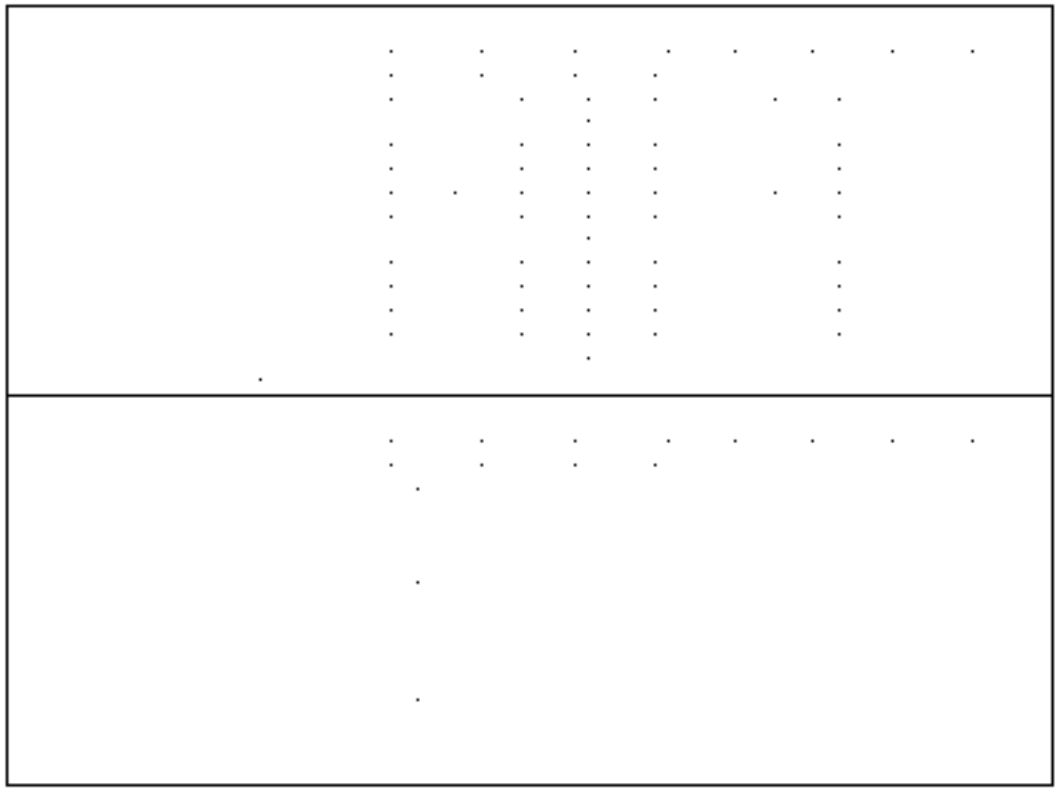
where the parameters are defined as follows:

The ELEV, HILL, and FLAGr keywords are optional inputs, and are only needed if elevated terrain or flagpole receptor heights are to be used. If elevated terrain is being used, then both the ELEV and HILL inputs are needed for each receptor. If the ELEV and HILL keywords are used and the model is being run with the flat terrain option (see Section 3.2.2), then the elevated terrain height inputs will be ignored by the model, and a non-fatal warning message will be generated. If the elevated terrain option is selected, and no elevated terrain heights are entered,

AR00068700

the elevations will default to 0.0 meters, and warning messages will also be generated. The model handles flagpole receptor height inputs in a similar manner.

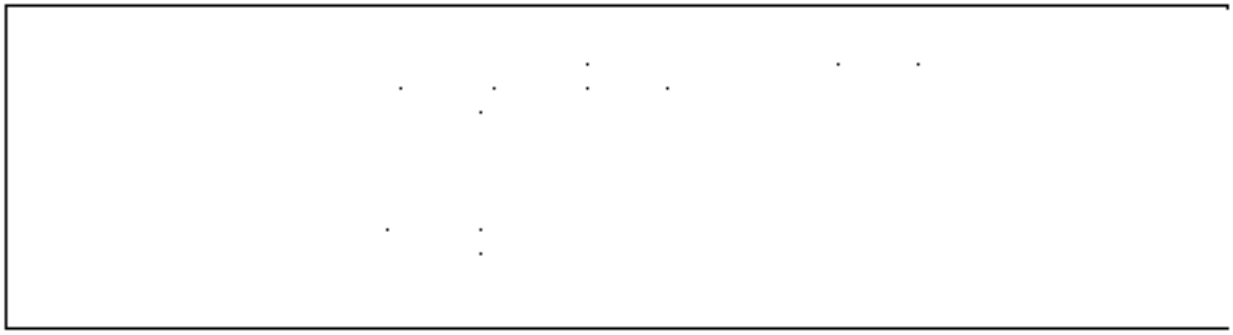
The order of cards within the GRIDCART subpathway is not important, as long as all inputs for a particular network are contiguous and start with the STA secondary keyword and end with the END secondary keyword. It is not even required that all ELEV cards be contiguous, although the input file will be more readable if a logical order is followed. The network ID is also not required to appear on each upstream image (except for the STA card). The model will assume the previous ID if none is entered, similar to the use of continuation cards for pathway and keywords. Thus, the following two examples produce the same 8 X 4 Cartesian grid network:



The Row parameter on the ELEV, HILL, and FLAG inputs may be entered as either the row number (i.e., 1, 2, etc.) or as the actual y-coordinate value, e.g., -500., -250., etc. in the example above. The model sorts the inputs using Row as the index, so the result is the same. The

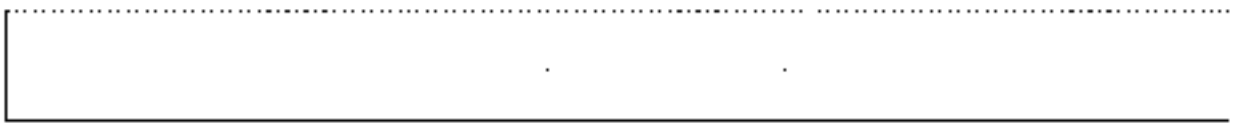
AR00068701

above example could therefore be entered as follows, with the same result:



Of course, one must use either the row number or x-coordinate value consistently within each network to have the desired result.

The following simple example illustrates the use of the XYINC secondary keyword to generate a uniformly spaced Cartesian grid network. The resulting grid is 11 x 11, with a uniform spacing of 1 kilometer (1000 meters), and is centered on the origin (0, 0). No elevated terrain heights or flagpole receptor heights are included in this example.



AR0068702

3.4.1.2 Polar Grid Receptor Networks

Polar receptor networks are defined by use of the GRIDPOLR keyword. The GRIDPOLR keyword may also be thought of as a "sub-pathway," in that there are a series of secondary keywords that are used to define the start and the end of the inputs for a particular network, and to select the options for defining the receptor locations that make up the network. The syntax and type of the GRIDPOLR keyword are summarized below.

Syntax:	—
	—
	. .
	. . . .
	—
	—
	— .
	. .
	—
Type:	

AR0068703

where the parameters are defined as follows:

The ORIG secondary keyword is optional for the GRIDPOLR inputs. If omitted, the model assumes a default origin of (0.0, 0.0) in x,y coordinates. The ELEV, HILL, and FLAG keywords are also optional inputs, and are only needed if elevated terrain or flagpole receptor heights are to be used. If elevated terrain is being used, then both the ELEV and HILL inputs are needed for each receptor. If the ELEV and HILL keywords are used and the model is being run with the flat terrain option (see Section 3.2.2), then the elevated terrain height inputs will be ignored by the model, and a non-fatal warning message will be generated. If the elevated terrain

AR00068704

option is selected, and no elevated terrain heights are entered, the elevations will default to 0.0 meters, and warning messages will also be generated. The model handles flagpole receptor height inputs in a similar manner.

As with the GRIDCART keyword described above, the order of cards within the GRIDPOLR subpathway is not important, as long as all inputs for a particular network are contiguous and start with the SEA secondary keyword and end with the END secondary keyword. It is not even required that all ELEV cards be contiguous, although the input file will be more readable if a logical order is followed. The network ID is also not required to appear on each runstream image (except for the SEA card). The model will assume the previous ID if none is entered, similar to the use of continuation cards for pathway and keywords.

The following example of the GRIDPOLR keyword generates a receptor network consisting of 180 receptor points on five concentric distance rings centered on an assumed default origin of (0,0). The receptor locations are placed along 36 equal spaced radials, beginning with 10 degrees and incrementing by 10. degrees in a clockwise fashion.

```
. . . . . .
```

Another example is provided illustrating the use of a non-zero origin, discrete direction radials and the specification of elevated terrain and flagpole receptor heights.

```
      .
      .
      .     .     .     .
      .     .
   .  .  .  .  .  .
.  .  .  .  .  .  .
.  .  .  .  .  .  .
         .
      .  .  .
.     .  .  .  .  .
.  .  .  .  .  .  .
      .  .  .
         .
         .  .
.  .  .  .  .  .
```

AR0068705

The user has the option of specifying the radial number (e.g. 1, 2, 3, etc.) on the ELEV, HILL, and FLAG inputs, or the actual direction associated with each radial.

For purposes of model calculations, all receptor locations, including those specified as polar, are stored in the model arrays as x, y and z coordinates and flagpole heights. For the purposes of reporting the results by receptor in the main print file, the tables are labeled with the polar inputs, i.e., directions and distances.

3.4.2 Using Multiple Receptor Networks

For some modeling applications, the user may need a fairly coarsely spaced network covering a large area to identify the area of significant impacts for a plant, and a denser network covering a smaller area to identify the maximum impacts. To accommodate this modeling need, the AERMOD model allows the user to specify multiple receptor networks in a single model run. The user can define either Cartesian grid networks or polar networks, or both. With the use of the ORIG option in the GRIDPOLR keyword, the user can easily place a receptor network centered on the facility being permitted, and also place a network centered on another background source known to be a significant contributor to high concentrations. Alternatively, the polar network may be centered on a receptor location of special concern, such as a nearby Class I area.

As noted in the introduction to this section (3.4), the model dynamically allocates array storage based on the number of receptors and receptor networks when the AERMOD model is run, up to the maximum amount of memory available on the computer.

3.4.3 Specifying Discrete Receptor Locations

In addition to the receptor networks defined by the GRIDCART and GRIDPOLR keywords described above, the user may also specify discrete receptor points for modeling impacts at specific locations of interest. This may be used to model critical receptors, such as the locations of schools or houses, nearby Class I areas, or locations identified as having high concentrations by previous modeling analyses. The discrete receptors may be input as either

AR0068706

Cartesian x,y points (DISCCART keyword) or as polar distance and direction coordinates (DISCPOLR keyword). Both types of receptors may be identified in a single run. In addition, for discrete polar receptor points the user specifies the source whose location is used as the origin for the receptor.

3.4.3.1 Discrete Cartesian Receptors

Discrete Cartesian receptors are defined by use of the DISCCART keyword. The syntax and type of this keyword are summarized below.

Syntax:	
Type:	

where the Xcoord and Ycoord parameters are the x-coordinate and y-coordinate (m), respectively, for the receptor location. The Zelev parameter is an optional terrain elevation (m) and Zhill is a corresponding hill height scale for the receptor for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms, and are referenced to the same reference elevation (e.g., mean sea level) used for source elevations. The Zflag parameter is the optional receptor height above ground (m) for modeling flagpole receptors. All of the parameters are in units of meters, except for Zelev and Zhill, which default to meters but may be specified in feet by use of the RE ELEVUNIT keyword.

If neither the elevated terrain option (Section 3.2.2) nor the flagpole receptor height option (Section 3.2.7) are used, then the optional parameters are ignored if present. If only the elevated terrain height option is used (no flagpoles), then the third parameter (the field after the Ycoord) is read as the Zelev parameter. If only the flagpole receptor height option is used (no elevated terrain), then the third parameter is read as the Zflag parameter. If both options are used, then the parameters are read in the order indicated for the syntax above. If the optional parameters are left blank, then default values will be used. The default value for Zelev is 0.0, and the default value for Zflag is defined by the COFLAGPOLE card (see Section 3.2.7). Note: If both the elevated terrain and flagpole receptor height options are used, then the third parameter will always be used

AR0068707

as Zelev, and it is not possible to use a default value for Zelev while entering a specific value for the Zflag parameter.

3.1.3.2 Discrete Polar Receptors

Discrete polar receptors are defined by use of the DISCPOLR keyword. The syntax and type of this keyword are summarized below.

Syntax:	
Type:	

where the Srcid is the alphanumeric source identification for one of the sources defined in the SO pathway which will be used to define the origin for the polar receptor location. The Dist and Direct parameters are the distance in meters and direction in degrees for the discrete receptor location. Degrees are measured clockwise from north. The Zelev parameter is an optional terrain elevation for the receptor and Zhill is the corresponding hill top elevation (m) for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms, and are referenced to the same reference elevation (e.g., mean sea level) used for source elevations. The units of Zelev and Zhill are in meters, unless specified as feet by the RECEIVUNIT keyword. The Zflag parameter is the optional receptor height above ground (meters) for modeling flagpole receptors.

If neither the elevated terrain option (Section 3.2.2) nor the flagpole receptor height option (Section 3.2.7) are used, then the optional parameters are ignored if present. If only the elevated terrain height option is used (no flagpoles), then the third parameter (the field after the Ycoord) is read as the Zelev parameter. If only the flagpole receptor height option is used (no elevated terrain), then the third parameter is read as the ZFlag parameter. If both options are used, then the parameters are read in the order indicated for the syntax above. If the optional parameters are left blank, then default values will be used. The default value for Zelev is 0.0, and the default value for ZFlag is defined by the COFLAGPOLE card (see Section 3.2.7). Note: If both the elevated terrain and flagpole receptor height options are used, then fourth parameter will always be used as

AR0068708

Zelev, and it is not possible to use a default value for Zelev while entering a specific value for the Zflag parameter.

3.4.3.3 Discrete Cartesian Receptors for EVALFILE Output

The EVALCART keyword is used to define discrete Cartesian receptor locations, similar to the DISCCART keyword, but it also allows for grouping of receptors, e.g., along arcs. It is designed to be used with the EVALFILE option, described later for the output pathway, which outputs are maxima values to a separate file for evaluation purposes. The EVALCART keyword can be used without the use of the EVALFILE option, in which case the receptor groupings are ignored. The syntax and type for the modified EVALCART keyword are summarized below:

Syntax:	
Type:	

where the Xcoord and Ycoord parameters are the x-coordinate and y-coordinate (m), respectively, for the receptor location. The Zelev parameter is the terrain elevation (m) for the receptor and Zhill is the corresponding hill top elevation (m) for use in elevated terrain modeling. Both the Zelev and Zhill parameters must be specified for use with the elevated terrain algorithms, and are referenced to the same reference elevation (e.g., mean sea level) used for source elevations. The Zflag parameter is the receptor height above ground (m) for modeling flagpole receptors. All of the parameters are in units of meters, except for Zelev and Zhill, which default to meters but may be specified in feet by use of the RELEVUNIT keyword. The Arcid parameter is the receptor grouping identification, which may be up to eight characters long, and may be used to group receptors by arc. The Name parameter is an optional name field that may be included to further identify a particular receptor location. The Name parameter is ignored by the model. Unlike the DISCCART keyword, all of the parameters (except for the Name) must be present on each card with the EVALCART keyword. The terrain height and flagpole height inputs are ignored if the appropriate options are not specified on the CO TERRHGT and CO FLAGPOLE cards.

AR0068709

3.4.4 Including Receptor Data From an External File

The user has the option of including receptor data from an external file by using the INCLUDED keyword on the receptor pathway. An RE INCLUDED card may be placed anywhere within the source pathway, after the STARTING card and before the FINISHED card (i.e., the RE STARTING and RE FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the runstream file. The syntax and type of the INCLUDED keyword are summarized below:

Syntax:	
Type:	

where the Incfil parameter is a character field of up to 40 characters that identifies the filename for the included file. The contents of the included file must be valid runstream images for the receptor pathway. If an error is generated during processing of the included file, the error message will report the line number of the included file (see Appendix C). If more than one INCLUDED file is specified for the receptor pathway, the user will first need to determine which file the error occurred in. If the starting column of the main runstream input file is shifted from column 1 (see Section 2.4.8), then the runstream images in the included file must be offset by the same amount. The INCLUDED option allows the user to include receptor data that have been generated by the AERMOD Terrain Preprocessor, AERMAP, in the runstream file without having to cut and paste the AERMAP output file. Since AERMAP generates terrain elevations in meters and includes the RE ELEVUNIT METERS card as the first record, an AERMAP file must be INCLUDED at the beginning of the receptor pathway, immediately following the RE STARTING card. If more than one AERMAP output file is INCLUDED on the receptor pathway, the RE ELEVUNIT METERS card must be deleted from all but the first one.

3.5 METEOROLOGY PATHWAY INPUTS AND OPTIONS

The **ME**teorology pathway contains keywords that define the input meteorological data for a particular model run.

AR0068710

3.5.1 Specifying the Input Data Files and Formats

The AERMOD model uses hourly meteorological data from separate surface and profile data files as one of the basic model inputs. These input meteorological data filenames for AERMOD are identified by the SURFFILE and PROFFILE keywords on the ME pathway. The syntax and type of these keywords are summarized below:

Syntax:
Type:

where the Srstfil and Profil parameters are character fields of up to 40 characters that identify the filenames for the input meteorological data files. For running the model on an IBM compatible PC, the filename parameters may include the complete DOS pathname for the file, or will assume the current directory if only the filename is given. The optional Format parameter specifies the format of the meteorological data files. The default formats for the surface and profile data files corresponds with the format of the files generated by the AERMET meteorological preprocessor program. The user also has the option of specifying the Fortran read format for each of these files. The contents of the meteorological data files are described below, and the file formats are documented in Appendix D.

The surface meteorological data file consists of a header record containing information on the meteorological station locations, and one record for each hour of data. These data are delimited by at least one space between each element, i.e., the data may be read as free format. The contents of the surface file are as follows:

Year
Month (1 - 12)
Day (1 - 31)
Julian day (1 - 366)
Hour (1 - 24)
Sensible heat flux (W m^{-2})
Surface friction velocity, u_* (m s^{-1})
Convective velocity scale, w_* (m s^{-1})

AR0068711

Vertical potential temperature gradient in the 500 m layer above the planetary boundary layer
Height of the convectively generated boundary layer (m)
Height of the mechanically-generated boundary layer (m)
Monin-Obukhov length, L, (m)
Surface roughness length, z_o (m)
Bowen ratio
Albedo
Wind speed (ms^{-1}) used in the computations
Wind direction (degrees) corresponding to the wind speed above
Height at which the wind above was measured (m)
Temperature (K) used in the computations
Height at which the temperature above was measured (m)

The sensible heat flux, Bowen ratio and albedo are not used by the AERMOD model, but are passed through by AERMET for information purposes only.

The profile meteorological data file consists of one or more records for each hour of data. As with the surface data file, the data are delimited by at least one space between each element and may be read as Fortran free format. The contents of the profile meteorological data file are as follows:

Year
Month (1 - 12)
Day (1 -31)
Hour (1 - 24)
Measurement height (m)
Top flag 1, if this is the last (highest) level for this hour,
0, otherwise
Wind direction for the current level (degrees)
Wind speed for the current level (ms^{-1})
Temperature at the current level (K)
Standard deviation of the wind direction, σ_θ (degrees)
Standard deviation of the vertical wind speed, σ_w (ms^{-1})

The data in this file include the on-site meteorological data that are processed by AERMET. Since AERMET was designed to be able to perform dispersion parameter calculations with NWS data only, i.e., no on-site data, the profile data may consist of a one-level "profile" based on the NWS winds and temperature.

AR0068712

3.5.2 Specifying Station Information

Three keywords are used to specify information about the meteorological stations. SURFDATA for the surface meteorological station, UAIRDATA for the upper air station, and the optional SITEDATA for any on-site meteorological data that may be used. The syntax and type of these keywords are summarized below:

Syntax:	
Syntax:	
Syntax:	
Type:	

where Stanum is the station number, e.g. the 5-digit WBAN number for NWS stations, Year is the year of data being processed (either 2- or 4-digits), Name is an optional character field (up to 40 characters with no blanks) specifying the name of the station, and Xcoord and Ycoord are optional parameters for specifying the x and y coordinates for the location of the stations. At the present time, the station locations are not utilized in the model. Therefore, no units are specified for Xcoord and Ycoord at this time, although meters are suggested in order to be consistent with the source and receptor coordinates. The AERMOD model compares the station numbers input using these keywords with the numbers included in the header record of the surface meteorological data file, and issues non-fatal warning messages if there are any mismatches.

3.5.3 Specifying the Base Elevation for Potential Temperature Profile

The AERMOD model generates a gridded vertical profile of potential temperatures for use in the plume rise calculations. Since potential temperature is dependent on the elevation above mean sea level (MSL), the user must define the base elevation for the profile with the PROFBASE keyword. The syntax and type for the PROFBASE keyword are summarized below:

AR0068713

Syntax:	
Type:	

where the BaseElev parameter specifies the base elevation above MSL for the potential temperature profile, and the optional Units parameter specifies the units of BaseElev. Valid inputs of Units are the secondary keywords METERS or FEET. The default units for BaseElev are in meters if Units is left blank. The base elevation should correspond with the base elevation of the primary meteorological tower.

3.5.4 Specifying a Data Period to Process

There are two keywords that allow the user to specify particular days or ranges of days to process from the sequential meteorological file input for the AERMOD model. The STARTEND keyword controls which period within the meteorological data file is read by the model, while the DAYRANGE keyword controls which days or ranges of days (of those that are read) for the model to process. The default for the model is to read the entire meteorological data file (up to a full year) and to process all days within that period.

The syntax and type for the STARTEND keyword are summarized below.

Syntax:	
Type:	

where the Styr, Smon, Sday parameters specify the year, month and day of the first record to be read (e.g., 87 01 31 for January 31, 1987), and the parameters Eyr, Emon, Eday specify the year, month and day of the last record to be read. The Shr and Ehr are optional parameters that may be used to specify the start and end hours for the data period to be read. If either Shr or Ehr is to be specified, then both must be specified. Any records in the data file that occur before the start date are ignored, as are any records in the data file that occur after the end date. In fact, once the end date has been reached, the model does not read any more data from the meteorological file. If Shr and Ehr are not specified, then processing begins with hour 1 of

AR0068714

the start date, and ends with hour 24 of the end date, unless specific days are selected by the DAYRANGE card described below.

Any PERIOD averages calculated by the model will apply only to the period of data actually processed. Therefore, if someone wanted to calculate a six-month average, they could select PERIOD averages on the CO-AVERTIME card, and then specify the period as follows:

for the period January 1, 1987 through June 30, 1987.

The syntax and type for the DAYRANGE keyword are summarized below.

Syntax:	
Type:	

where the Range parameters specify particular days or ranges of days to process. The days may be specified as individual days (e.g. 1 2 3 4 5) or as a range of days (e.g. 1-5). The user also has the option of specifying Julian day numbers, from 1 to 365 (366 for leap years), or specifying month and day (e.g., 1-31 for January 31). Any combination of these may also be used. For example the following card will tell the model to process the days from January 1 (Julian day 1) through January 31 (Day 31):

The DAYRANGE keyword is also repeatable, so that as many cards as needed may be included in the MI: pathway.

AR0068715

As with the STARTEND keyword, any PERIOD averages calculated by the model will apply only to the period of data actually processed. If the STARTEND keyword is also used, then only those days selected on the DAYRANGE cards that fall within the period from the start date to the end date will be processed. Thus, if the ME pathway included the following two cards

then no data would be processed, since the days 1 through 31 fall outside the period 2/1 to 12-31

3.3.3 Correcting Wind Direction Alignment Problems

The WDROTATE keyword allows the user to correct the input meteorological data for wind direction alignment problems. All input wind directions or flow vectors are rotated by a user-specified amount. Since the model results at particular receptor locations are often quite sensitive to the transport wind direction, this optional keyword should be used only with extreme caution and with clear justification.

The syntax and type of this keyword are summarized below.

Syntax:	
Type:	

where the Rotang parameter specifies the angle in degrees to rotate the input wind direction measurements. The value of Rotang is subtracted from the wind direction measurements. It may be used to correct for known (and documented) calibration errors, or to adjust for the alignment of a valley if the meteorological station is located in a valley with a different alignment than the source location.

AR0068716

3.5.6 Specifying Wind Speed Categories

Variable emission rate factors may be input to the model that vary by wind speed category. The model uses six wind speed categories, and these are defined by the upper bound wind speed for the first five categories (the sixth category is assumed to have no upper bound). The default values for the wind speed categories are as follows: 1.54, 3.09, 5.14, 8.23, and 10.8 m/s. The syntax and type of the WINDCATS keyword, which may be used to specify different category boundaries, are summarized below.

Syntax:	
Type:	

where the Ws1 through Ws5 parameters are the upper bound wind speeds of the first through fifth categories in meters per second. The upper bound values are inclusive, i.e., a wind speed equal to the value of Ws1 will be placed in the first wind speed category.

3.5.7 Specifying SCIM Parameters

The SCIM parameters on the SCIMBYHR card specify the starting hour and sampling interval for the regular sample and an optional file name. The syntax and type of the SCIMBYHR keyword are summarized below.

Syntax:	
Type:	

where the NRegStart and NRegInt parameters specify the first hour to be sampled and the sampling interval, respectively, when performing the regular sampling. The NWetStart and NWetInt parameters are used to specify the first wet hour (i.e., with non-zero precipitation) and the wet sampling interval for wet sampling. However, since the AERMOD model currently does not include wet deposition algorithms, the wet sampling option is not operational, and the user should enter a value of zero (0) for both NWetStart and NWetInt. Optionally, the user can create

AR0068717

output files containing the surface and profile meteorological data for the sampled hours by specifying the SfcFilnam and PflFilnam parameters. These output files are in the same format used in the summary of the first 24 hours of data included in the main output file.

In order to use the SCIM option, the user must specify the non-DEFAULT TOXICS option on the CO MODELOPT card, and also specify SCIM on the MODELOPT card. Although the MP SCIMBYHR is an optional card, it is required when using the SCIM option. NRegStart is required to have a value from 1 through 24, i.e., the first sampled hour must be on the first day in the meteorological data file. There are no restrictions for NRegInt, however, NRegInt would generally be greater than 1. For example, NRegInt could be based on the formula (24n + 1), where "n" is the number of days to skip between samples, in order to ensure a regular diurnal cycle to the sampled hours (e.g., 25 or 49).

3.6 EVENT PATHWAY INPUTS AND OPTIONS

EVENT processing is specifically designed to facilitate analysis of source contributions to specific events for short term averages (less than or equal to 24 hours). These events may be design concentrations generated by the AERMOD model, occurrences of violations of an air quality standard, or user-specified events. These events are input to the AERMOD model through the EVent pathway. Each event is defined by an averaging period and specific data period, a source group, and a receptor location. Since the locations are only of interest in combination with particular averaging and data periods, the REceptor pathway is not used with EVENT processing.

There are two keywords that are used to define the events on the EV pathway. The EVENTPER keyword defines the averaging period, data period and source group, while the EVENTLOC keyword defines the receptor location for the event. Each event is also given an alphanumeric name that links the two input cards for that event.

AR0068718

The syntax and type of the EVENTPER and EVENTLOC keywords are summarized below.

Syntax:	
Syntax:	
Type:	

where the parameters are as follows:

Evname - event name (an alphanumeric string of up to 8 characters).

Aveper - averaging period for the event (e.g. 1, 3, 8, 24 hr).

Grpid - source group ID for the event (must be defined on SO pathway).

Date - date for the event, input as an eight digit integer for the ending hour of the data period (YYYYMMDDHH), e.g. 84030324 defines a data period ending at hour 24 on March 3, 1984. The length of the period corresponds to Aveper.

XR - X-coordinate (m) for the event location, referenced to a Cartesian coordinate system.

YR - Y-coordinate (m) for the event location, referenced to a Cartesian coordinate system.

RNG - distance range (m) for the event location, referenced to a polar coordinate system with an origin of (0., 0.).

DIR - radial direction (deg.) for the event location, referenced to a polar coordinate system with an origin of (0., 0.).

Zelev - optional terrain elevation for the event location (m).

Zflag - optional receptor height above ground (flagpole receptor) for the event location (m).

Each event is defined by the two input cards EVENTPER and EVENTLOC, and these inputs are linked by the event name, which must be unique among the events being processed in a given run. There is no particular requirement for the order of cards on the EV pathway. Note that the

AR0068719

location for the event may be specified by either Cartesian coordinates or by polar coordinates. However, the polar coordinates must be relative to an origin of (0,0).

3.6.1 Using Events Generated by the AERMOD Model

The AERMOD model has an option (CO EVENTFIL, described in Section 3.2.9) to generate an input file for the AERMOD EVENT processing. When this option is used, the AERMOD model copies relevant inputs from the AERMOD runstream input file to the Event processing input file, and generates the inputs for the EVent pathway from the results of the modeling run. These events are the design concentrations identified by the OU RECTABLE keyword (see Section 3.8.1.1), such as the highest and high-second-high 24-hour averages, etc., and any threshold violations identified by the OU MAXTFILE keyword (see Section 3.8.1.2). The inputs generated by the AERMOD model correspond to the syntax described above for the EVENTPER and EVENTLOC keywords. The locations for events generated by the AERMOD model are always provided as Cartesian coordinates.

To easily identify the events generated by the AERMOD model, and to provide a mechanism for the AERMOD model to manage the events generated from the model run, a naming convention is used for the EVNAME parameter. The following examples illustrate the event names used by the AERMOD model:

H1H01001 - High-first-high 1-hour average for source group number 1

H2H24003 - High-second-high 24-hour average for source group number 3

TH03H010 - Threshold violation number 10 for 3-hour averages

TH24H019 - Threshold violation number 19 for 24-hour averages

The high value design concentrations are listed first in the EVENT processing input file, followed by the threshold violations (grouped by averaging period). To make it easier for the user to review the EVENT processing input file generated by the AERMOD model, and determine which events are of most concern, the actual concentration value associated with the event is included as

AR0068720

the last field on the EVENTPER card. This field is ignored by the AERMOD model, and is included only for informational purposes. The user should be aware that the same event may appear in the AERMOD model input file as both a design value and as a threshold violation, depending on the options selected and the actual results. Since the model processes the events by date sequence and outputs the results for each event as it is processed, the order of events in the output file will generally not follow the order of events in the input file, unless all of the events were generated by the MAXIFILE option.

3.6.2 Specifying Discrete Events

The user can specify discrete events by entering the EVENTPER and EVENTLOC cards as described above. The averaging period and source group selected for the event must be among those specified on the CO AVERTIME and SO SRCGROUP cards. If the EVENT processing input file was generated by the AERMOD model, the user may include additional events for those averaging periods and source groups used in the original AERMOD model run. They may also add averaging periods or define new source groups in the Event processing input file in order to define additional events.

3.6.3 Including Event Data From an External File

The user has the option of including event data from an external file by using the INCLUDED keyword on the source EVT pathway. An EV INCLUDED card may be placed anywhere within the event pathway, after the STARTING card and before the FINISHED card (i.e., the EV STARTING and EV FINISHED cards cannot be included in the external file). The data in the included file will be processed as though it were part of the runstream file. The syntax and type of the INCLUDED keyword are summarized below:

Syntax:	
Type:	

AR0068721

where the Infil parameter is a character field of up to 40 characters that identifies the filename for the included file. The contents of the included file must be valid runstream images for the event pathway. If an error is generated during processing of the included file, the error message will report the line number of the included file (see Appendix C). If more than one INCLUDED file is specified for the event pathway, the user will first need to determine which file the error occurred in. If the starting column of the main runstream input file is shifted from column 1 (see Section 2.4.8), then the runstream images in the included file must be offset by the same amount.

3.7 OUTPUT PATHWAY INPUTS AND OPTIONS

The OUTPUT pathway contains keywords that define the output options for the model runs. The AERMOD model has three keywords that control different types of tabular output for the main output file of the model, and seven keywords that control separate output file options for specialized purposes. The user may select any combination of output option for a particular application.

3.7.1 Selecting Options for Tabular Printed Outputs.

The three tabular printed output options are controlled by the following keywords:

RECTABLE - Controls output option for high value summary tables by receptor

MAXTABLE - Controls output option for overall maximum value summary tables; and

DAYTABLE Controls output option for tables of concurrent values summarized by receptor for each day processed

The keywords are described in more detail in the order listed above.

The syntax and type for the RECTABLE keyword are summarized below:

AR0068722

Syntax:	____ _____ ... ____ ____ ____ ... ____
Type:	

where the Aveper parameter is the short term averaging period (e.g. 1, 3, 8 or 24 hr or MONTH) for which the receptor table is selected, and the secondary keywords, FIRST, SECOND, etc., indicate which high values are to be summarized by receptor for that averaging period. The RECTABLE card may be repeated for each averaging period. For cases where the user wants the same RECTABLE options for all short term averaging periods being modeled, the input may be simplified by entering the secondary keyword ALLAVE for the Aveper parameter. The following example will select summaries of the highest, second highest and third highest values by receptor for all averaging periods.

The model will also recognize a range of high values on the RECTABLE input card, and therefore the following card will have the effect:

The output file will include tables for only the high values selected. Tables for all source groups for a particular averaging period are grouped together, and the averaging periods are output in the order that they appear the CO AVERTIME card. For each averaging period and source group combination, the tables of high values for the receptor networks (if any) are printed first, followed by any discrete Cartesian receptors, and any discrete polar receptors.

If the CO EVENTFIL keyword has been used to generate an input file for EVENT processing, then the design values identified by the RECTABLE options, e.g., the high-second-high 24-hour average, are included in the events that are defined in the EVENT processing input file.

AR0068723

The syntax and type for the MAXTABLE keyword are summarized below:

Syntax:
Type:

where the Aveper parameter is the short term averaging period (e.g. 1, 3, 8 or 24 hr or MONTH) for which the receptor table is selected, and the Maxnum parameter specifies the number of overall maximum values to be summarized for each averaging period. The MAXTABLE card may be repeated for each averaging period. As with the RECTABLE keyword, for cases where the user wants the same MAXTABLE options for all short term averaging periods being modeled, the input may be simplified by entering the secondary keyword ALLAVE for the Aveper parameter. The following example will select the maximum 50 table for all averaging periods:

A separate maximum overall value table is produced for each source group. The maximum value tables follow the RECTABLE outputs in the main print file. All source group tables for a particular averaging period are grouped together, and the averaging periods are output in the order that they appear on the CO AVERTIME card.

The syntax and type for the DAYTABLE keyword are summarized below:

Syntax:
Type:

where the Avperm parameters are the short term averaging periods (e.g. 1, 3, 8 or 24 hr or MONTH) for which the daily tables are selected. The DAYTABLE card is non-repeatable, but as with the RECTABLE and MAXTABLE keywords, for cases where the user wants daily tables for all short term averaging periods being modeled, the input may be simplified by entering the

AR0068724

secondary keyword ALLAVE for the first parameter. The following example will select the daily tables for all averaging periods.

For each averaging period for which the DAYTABLE option is selected, the model will print the concurrent averages for all receptors for each day of data processed. The receptor networks (if any) are printed first, followed by any discrete Cartesian receptors, and any discrete polar receptors. Results for each source group are output. For example, if 1, 3, and 24-hour averages are calculated, and the OU DAYTABLE ALLAVE option is used, then for the first day of data processed, there will be 24 sets of tables of hourly averages (one for each hour in the day), eight sets of 3-hour averages (one for each 3-hour period in the day), and one set of 24-hour averages. The averages are printed as they are calculated by the model, but for hours where more than one averaging period is calculated (e.g., hour 24 is the end of an hourly average, a 3-hour average, and a 24-hour average), the order in which the averages are output will follow the order used on the OU AVERTIME card. Note: This option can produce very large output files, especially when used with a full year of data and very short period averages, such 1-hour and 3-hour. It should therefore be used with CAUTION.

3.7.2 Selecting Options for Special Purpose Output Files.

The AERMOD model provides options for seven types of output files for specialized purposes. These options are controlled by the following keywords:

MAXIFILE - Produces file with occurrences of violations of user-specified threshold value.

POSTFILE - Produces file of concurrent (raw) results at each receptor suitable for post-processing.

PLOTFILE - Produces file of design values that can be imported into graphics software for plotting contours.

AR0068725

TOXXFILE	Produces unformatted files of raw results above a threshold value with a special structure for use with the TOXX model component of TOXST.
RANKFILE -	Produces file of output values by rank for use in Q-Q (quantile) plots.
EVALFILE -	Produces file of output values, including arc-maximum normalized concentrations suitable for model evaluation studies and
SEASONHR -	Produces file of output values by season and hour-of-day

The keywords are described in more detail in the order listed above.

The syntax and type for the MAXIFILE keyword are summarized below.

Syntax:	
Type:	

where the Aveper parameter is the short term averaging period (e.g. 3, 8, 24 for 3, 8 and 24-hour averages, or MONTH for monthly averages) and Grpid is the source group ID for which the MAXIFILE option is selected. The Thresh parameter is the user-specified threshold value and Filnam is the name of the file where the MAXIFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 26-100, inclusive. By specifying the same filename and unit for more than one MAXIFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 5.7.2).

The MAXIFILE card may be repeated for each combination of averaging period and source group, and a different filename should be used for each file. The resulting maximum value file will include several header records identifying the averaging period, source group and the threshold value for that file, and a listing of every occurrence where the result for that averaging period-source group equals or exceeds the threshold value. Each of these records includes the averaging period, source group ID, date for the threshold violation (ending hour of the averaging

AR0068726

period, the x, y, z and flagpole receptor height for the receptor location where the violation occurred, and the concentration value.

Each of the threshold violations, except for monthly averages, identify events that may be modeled for source contribution information with EVENT processing by selecting the CO EVENTFIL option (see Sections 3.2.9 and 3.8). Each of the threshold violations is included as an event on the EV pathway, and is given a name of the form TTIxxyyyy, where xx is the averaging period, and yyyy is the violation number for that averaging period. For example, an event name of TTD-0019 identifies the 19th threshold violation for 24-hour averages. Monthly average threshold violations are included in the file specified on the MAXFILE card, but are not included in the EVENT processing input file since the AERMOD model currently handles only averaging periods of up to 24 hours.

The following examples illustrate the use of the MAXIFILE option:

```
                                .
                              .   .
                             .     .
                                .
```

where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. The FILNAM parameter may be up to 40 characters in length. It should also be noted that only one MAXIFILE card may be used for each averaging period/source group combination. Note: The MAXIFILE option may produce very large files for runs involving a large number of receptors if a significant percentage of the results exceed the threshold value.

The syntax and type for the POSTFILE keyword are summarized below:

AR0068727

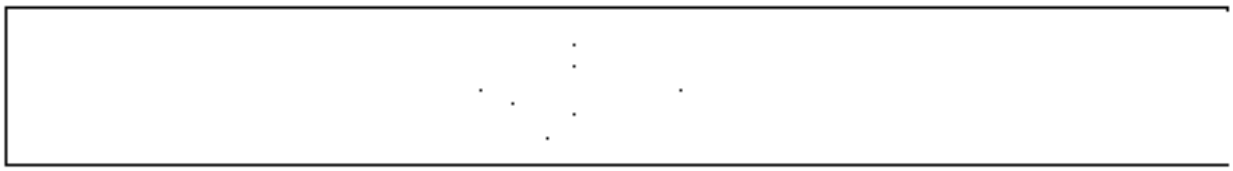
Syntax:	
Type:	

where the Aveper parameter is the averaging period (e.g. 1, 8, 24 for 1, 8 and 24-hour averages, MONTH for monthly averages, PERIOD for period averages, or ANNUAL for annual averages) and Grpid is the source group ID for which the POSTFILE option is selected. The Format parameter specifies the format of the POSTFILE output, and may either be the secondary keyword UNFORM for unformatted concentration files, or the secondary keyword PLOT to obtain formatted files of receptor locations (x- and y-coordinates) and concentrations suitable for plotting contours of concurrent values. The Filnam parameter is the name of the file where the POSTFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 20-100, inclusive. By specifying the same filename and unit for more than one POSTFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 3.8.2).

The POSTFILE card may be repeated for each combination of averaging period and source group, and a different filename should be used for each file. If UNFORM is specified for the Format parameter, then the resulting unformatted file includes a constant-length record for each of the selected averaging periods calculated during the model run. The first variable of each record is an integer variable (4 bytes) containing the ending date (YYMMDDHH) for the averages on that record. The second variable for each record is an integer variable (4 bytes) for the number of hours in the averaging period. The third variable for each record is a character variable of length eight containing the source group ID. The remaining variables of each record contain the calculated average concentration values for all receptors, in the order in which they were defined in the input runstream.

AR0068728

The following examples illustrate the use of the POSTFILE option:



where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. The Filnam parameter may be up to 40 characters in length. The use of separate files for each averaging period/source group combination allows the user flexibility to select only those results that are needed for post-processing for a particular run, and also makes the resulting unformatted files manageable. Note: The POSTFILE option can produce very large files, and should be used with some caution. For a file of hourly values for a full year (8760 records) and 400 receptors, the resulting file will use about 14 megabytes of disk space. To estimate the size of the file (in bytes), use the following equation:

File Size (bytes) = (No. of Hours/Yr / (No. of Hours/Ave)) * No. of Receptors * 4

Divide the result by 1000 to estimate the number of kilobytes (KB) and divide by 1,0E6 to estimate the number of megabytes (MB).

The syntax and type for the PLOTFILE keyword are summarized below:

Syntax:
Type:

where the Aveper parameter is the averaging period (e.g. 3, 8, 24 for 3, 8 and 24-hour averages, MONTH for monthly averages, PERIOD for period averages, or ANNUAL for annual averages), Grpid is the source group ID for which the PLOTFILE option is selected, and Hivalu specifies which short term high values are to be output (FIRST for the first highest at each receptor, SECOND for the second highest at each receptor, etc.). Note that the Hivalu parameter is not

AR0068729

specified for PERIOD or ANNUAL averages, since there is only one period or annual average for each receptor. The Filnam parameter is the name of the file where the PLOTFILE results are to be written. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 26-100, inclusive. By specifying the same filename and unit for more than one PLOTFILE card, results for different source groups and/or averaging periods may be combined into a single file. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 3.8.2).

The PLOTFILE card may be repeated for each combination of averaging period, source group, and high value, and a different filename should be used for each file. The resulting formatted file includes several records with header information identifying the averaging period, source group and high value number of the results, and then a record for each receptor which contains the x and y coordinates for the receptor location, the appropriate high value at that location, and the averaging period, source group and high value number. The data are written to the file in the order of x-coord, y-coord, concentration so that the file can easily be imported into a graphics package designed to generate contour plots. Many such programs will read the PLOTFILEs directly without any modification, ignoring the header records, and produce the desired plots.

The following examples illustrate the use of the PLOTFILE option:

```
                                .
                                .
                              .
                            . .
                          .                 .
                              .
                            .
```

where the 3-hour example illustrates the use of a DOS pathname for the PC, and the last example illustrates the use of monthly averages. As illustrated by the second and third examples, the high

AR0068730

value parameter may also be input as secondary keywords using the standard abbreviations of 1ST, 2ND, 3RD, . . . 10TH. The Filnam parameter may be up to 40 characters in length. The use of separate files for each averaging period, source group, high value combination allows the user flexibility to select only those results that are needed for plotting from a particular run.

The syntax and type for the TOXXFILE keyword are summarized below:

Syntax:	
Type:	

where the Aveper parameter is the short term averaging period (e.g. 1, 3, 8, 24 for 1, 3, 8 and 24-hour averages, or MONTH for monthly averages) for which the TOXXFILE option has been selected. The Cutoff (threshold) parameter is the user-specified threshold cutoff value in g/m^3, and Filnam is the name of the file where the TOXXFILE results are to be written. It is important to note that the units of the Cutoff parameter are g/m^3, regardless of the input and output units selected with the SO EMISUNIT card. The optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 26-100, inclusive. If the Funit parameter is omitted, then the model will dynamically allocate a unique file unit for this file (see Section 5.8.2). While the TOXXFILE option may be specified for any of the short term averaging periods that are identified on the CO AVERTIME card for a particular run, a non-fatal warning message will be generated if other than 1-hour averages are specified. This is because the TOXST model currently supports only 1-hour averages.

The TOXXFILE card may be repeated for each averaging period, but a different filename should be used for each file since the structure of the output file generated by the TOXXFILE option does not allow for a clear way to distinguish between results for different averaging periods. The resulting output file for the AERMOD model is an unformatted file with several header records identifying the title, averaging period, receptor information, and the threshold value for that file, followed by records listing every occurrence where the result for any source group for that averaging period equals or exceeds the threshold value. When one of the source

AR00068731

groups exceeds the threshold value, the results for all source groups for that averaging period and receptor location are output. Each concentration that is output through the TOXXFILE option is paired with an integer ID variable that identifies the averaging period (hour number of the year), the source group number, and the receptor number corresponding to that value. The concentration values and corresponding ID variables are stored in buffer arrays, and the arrays are then written to the unformatted output file when full. The size of the arrays is controlled by the NPAIR PARAMETER defined in MODULE MAIN1 and is initially set at 100. At the end of the modeling run, any values remaining in the buffer arrays are written to the file, padded on the right with zeroes. The structure of the output file generated by the TOXXFILE option is described in more detail in Section 3.8.2 and in Appendix D. When using the TOXXFILE option, the user will normally place a single source in each source group. The user should refer to the user's guide for TOXST for further instructions on the application of the TOXXFILE option of the AERMOD model.

The following examples illustrate the use of the TOXXFILE option:

:

The Filnam parameter may be up to 40 characters in length. It should be noted that only one TOXXFILE card may be used for each averaging period. Note: The TOXXFILE option may produce very large files for runs involving a large number of receptors if a significant percentage of the results exceed the threshold value.

The RANKFILE keyword outputs values by rank for use in Q-Q (quantile) plots. The MAXTABLE option must be specified first in order to use the RANKFILE option for a particular averaging period. However, the RANKFILE output differs from the results in the MAXTABLE output in that duplicate date/hour occurrences are removed. The syntax and type for the RANKFILE keyword are summarized below:

AR0068732

Syntax:
Type:

where the Aveper parameter is the averaging period (e.g., 3, 8, 24 for 3, 8, and 24-hour averages, or MONTH for monthly averages), and Hinum is the number of high values to be ranked. The RANKFILE keyword cannot be used with PERIOD averages. As noted above, the MAXTABLE option must be specified first for the particular Aveper, and the Hinum parameter on the RANKFILE card must be less than or equal to the Maxnum parameter on the corresponding MAXTABLE card. Since duplicate dates are removed from the RANKFILE output, the output file may contain less than the number of requested high values. The NMAX parameter, which controls the maximum number of values that can be stored, has been set initially to 400. The Filnam parameter is the name of the file (up to 40 characters) where the RANKFILE results are to be written. The optional Hunit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 20-100, inclusive. By specifying the same filename and unit for more than one RANKFILE card, results for different averaging periods may be combined into a single file. If the Hunit parameter is omitted, the model will dynamically allocate a unique file unit for this file according to the following formula:

IRKUNT = 100 + IAVE

where IRKUNT is the Fortran unit number and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card).

The EVALFILE option is specifically designed for use in generating residuals for model evaluation studies. The EVALFILE output consists of the arc-maximum normalized concentration values for each hour of meteorology and for each source specified. The arc groupings of the receptors must be specified using the RE EVALCART keyword described above. The syntax and type for the EVALFILE keyword are summarized below:

AR0068733

Syntax:	
Type:	

where the Srcid parameter is the source ID for which EVMLFILE results are requested, the Filnam parameter is the name of the file (up to 40 characters) where the EVALFILE results are to be written, and the optional Funit parameter allows the user the option of specifying the Fortran logical file unit for the output file. The user-specified file unit must be in the range of 26-100, inclusive. By specifying the same filename and unit for more than one EVALFILE card, results for different sources may be combined into a single file. If the Funit parameter is omitted, the model will dynamically allocate a unique file unit for this file according to the following formula.

IFLUNT = 400 + ISRC*5

where IFLUNT is the Fortran unit number and ISRC is the source number (the order of the source as specified on the SO pathway).

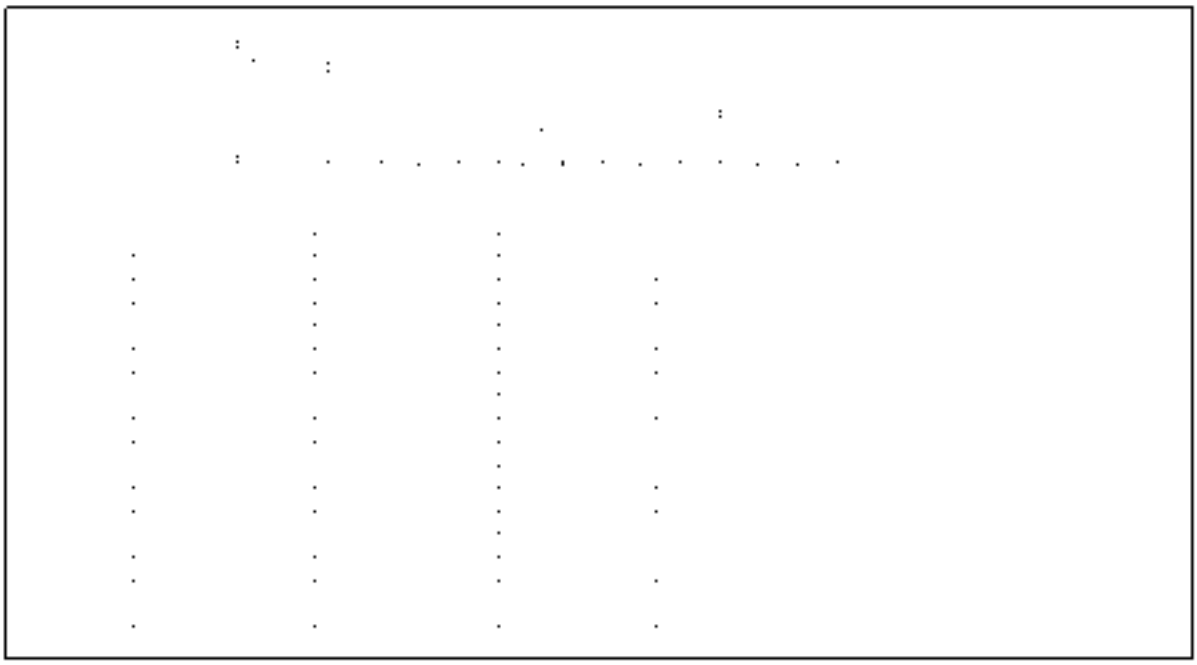
For each hour of meteorological data processed and for each receptor grouping (e.g., arc), the EVMLFILE option outputs five records containing the source ID, date, arc ID, arc-maximum normalized concentration (χ/Q), emission rate, and other plume dispersion and meteorological variables associated with the arc-maximum. Since the EVALFILE option looks at receptor groupings, it must be used in conjunction with the EVALCART keyword described above for the RE pathway, and a fatal error is generated if no receptor groups are identified.

The SEASONHR option is used to output a file containing the average results by season and hour-of-day. To select this option, the user must include the SEASONHR keyword on the OU pathway. The syntax, type, and order for the SEASONHR keyword are summarized below.

Syntax:	
Type:	

AR00068734

where the GroupID parameter specifies the source group to be output. FileName specifies the name of the output file, and the optional FileUnit parameter specifies an optional file unit and must be in the range 26-100, inclusive. If FileUnit is left blank, then the model will dynamically assign a file unit based on the formula 302 + IGRP*10, where IGRP is the group index number. A sample from a SEASONHR output file is shown below.



The NHRS column in the output file contains the number of non-calm and non-missing hours used to calculate the season-by-hour-of-day averages. The SEAS column is the season index, and is 1 for winter, 2 for spring, 3 for summer and 4 for fall. The records loop through hour-of-day first, and then through the seasons.

AR0068735

3.7.3 EVENT Processing Options

EVENT processing in the AERMOD model is designed specifically to perform source contribution analyses for short term average (less than or equal to 24-hour) events. The events may either be generated by the AERMOD model, or they may be user-specified events, or both. Because of this rather narrow focus of applications, the output options are limited to a single keyword. The EVENTOUT keyword controls the level of detail in the source contribution output from the EVENT mode. The syntax and type of the EVENTOUT keyword are summarized below:

Syntax:	——— ———
Type:	

where the SOCONT secondary keyword specifies the option to produce only the source contribution information in the output file, and the DETAIL secondary keyword specifies the option to produce more detailed summaries in the output file. The SOCONT option provides the average concentration (or total deposition) value (i.e., the contribution) from each source for the period corresponding to the event for the source group. The basic source contribution information is also provided with the DETAIL option. In addition, the DETAIL option provides the hourly average concentration (or total deposition) values for each source for every hour in the averaging period, and a summary of the hourly meteorological data for the event period. In general, the DETAIL option produces a larger output file than the SOCONT file, especially if there are a large number of sources. There is no default setting for the EVENTOUT options.

3.8 CONTROLLING INPUT AND OUTPUT FILES

This section describes the various input and output files used by the AERMOD model, and discusses control of input and output (I/O) on the IBM compatible PC environment. Much of this discussion also applies to operating the model in other environments.

AR0068736

3.8.1 Description of AERMOD Input Files

The two basic types of input files needed to run all of the AERMOD model are the input runstream file containing the modeling options, source data and receptor data, and the two input meteorological data files. Each of these is discussed below, as well as a special file that may be used to initialize the AERMOD model with intermediate results from a previous run.

3.8.1.1 Input Runstream File.

The input runstream file contains the user-specified options for running the various AERMOD model (called AERMOD INP), includes the source parameter data and source group information, defines the receptor locations, specifies the location and parameters regarding the meteorological data, and specifies the output options. Details regarding the keywords and parameters used in the input runstream file are provided in Section 5, and Appendix B.

For the PC-executable version of the model available on the SCRAM website, the runstream file is explicitly opened by the model using a Fortran OPEN statement, and the integer variable, INUNIT, specifies the unit number for the file. The variable INUNIT is initialized to a value of 7 in a DATA statement in MODULE MAIN1 and is therefore available to all of the necessary subroutines.

3.8.1.2 Meteorological Data Files.

The input meteorological data is read into the AERMOD model from two separate data files, one corresponding to surface (scalar) parameters, and the other corresponding to multi-level profiles of data. The meteorological data filenames and formats are specified within the input runstream file using the ME SURFFILE and PROFFILE keywords. The AERMOD model accepts meteorological data that has been preprocessed by the AERMET meteorological preprocessor program (EPA, 2004b). The data are read from formatted ASCII files of hourly sequential records.

AR0068737

The meteorological data files are explicitly opened by the model using Fortran OPEN statements, and the integer variables MFUNIT for the surface/scalar file and MPUNIT for the profile file are used to specify the unit numbers for the files. The variable MFUNIT is initialized to a value of 19 and MPUNIT is initialized to a value of 20 in a DATA statement in MODULE MAIN1, and are therefore available to all of the necessary subroutines.

3.8.1.3 Initialization File for Model Re-start

The AERMOD model has an optional capability to store intermediate results to an unformatted (sometimes called binary) file for later re-starting of the model in the event of a power failure or user interrupt. This unformatted file may therefore be used as an input file to initialize the model. This option is controlled by the SAVEFILE (saves intermediate results to a file) and the INITFILE (initialize result arrays from a previously saved file) keywords on the CO pathway.

When initializing the model for the re-start option, the user specifies the name of the unformatted results file on the INITFILE keyword. The default filename used if no parameter is provided is INIT.FIL. The initialization file is explicitly opened by the AERMOD model, and the integer variable, IRSUNT, specifies the unit number for the file. The variable IRSUNT is initialized to a value of 15 in a DATA statement in MODULE MAIN1, and is therefore available to all of the necessary subroutines.

3.8.2 Description of AERMOD Output Files

The AERMOD model produce a variety of output files, including the main print file of model results, an unformatted file of intermediate results for later re-start of the model (AERMOD only), and several output data files for specialized purposes. These files are described in detail below.

AR0068738

3.8.2.1 Output Print File

The AERMOD model produces a main output print file of model results called AERMOD.OUT. The contents and organization of this file were shown in Figure 2-5. This file includes an echo of the input runstream images at the beginning of the file (up until a NO ECHO input is encountered). A summary of runstream setup messages and a summary of the inputs follow the echo of inputs. The input summary includes a summary of modeling options, source data, receptor data, and meteorological data, following the same order as the pathways in the runstream file. If model calculations are performed, then the model results are summarized next. The content and order of the model result summaries depend on the output options selected and on the particular model being run. Following the detailed model results are summary tables of the high values for each averaging period and source group. The final portion of the main output print file is the summary of messages for the complete model run.

For the PC-executable version of the model available on the SCRAM website, the main print output file is explicitly opened by the model using a Fortran OPEN statement, and the integer variable, IOUNIT, specifies the unit number for the file. The variable IOUNIT is initialized to a value of 8 in a DATA statement in MODULE MAIN1, and is therefore available to all of the necessary subroutines.

By opening the printed output file explicitly, the outputs are not automatically formatted for the printer. This formatting is accomplished using the CARRIAGECONTROL specifier in the OPEN statement for the output file.

3.8.2.2 Detailed Error Message File

The user may select an option for the model to save a separate file of detailed error and other messages, through use of the CO ERRORFIL keyword. The format and syntax of these messages is described in Appendix C. The order of messages within the file is the order in which they were generated by the model. The file includes all types of messages that were generated.

AR0068739

The error message file is explicitly opened by the model using a Fortran OPEN statement, and the integer variable, IERUNT, specifies the unit number for the file. The variable IERUNT is initialized to a value of 10 in a DATA statement in MODULE MAIN1, and is therefore available to all of the necessary subroutines.

3.8.2.3 Intermediate Results File for Model Re-start.

The AERMOD model has an optional capability to store intermediate results to an unformatted (sometimes called binary) file for later re-starting of the model in the event of a power failure or user interrupt. This unformatted file may therefore be used as an input file to initialize the model. This option is controlled by the SAVEFILE (saves intermediate results to a file) and the INITFILE (initialize result arrays from a previously saved file) keywords on the CO pathway.

When saving the intermediate results for the re-start option, the user specifies the name of the unformatted results file on the SAVEFILE keyword. The user has the option of specifying a single filename, two filenames (for alternate saves), or specifying no filename. The default filename used if no parameter is provided is TMP.FIL. If a single file is used, then the intermediate results file is overwritten on each successive dump, with the chance that the file will be lost if the interrupt occurs during the time that the file is opened. If two filenames are provided, then the model also saves to the second file on alternate dumps, so that the next most recent dump will always be available. The main save file is explicitly opened by the AERMOD model, and the integer variable, IDPUNT, specifies the unit number for the file. The variable IDPUNT is initialized to a value of 12 in a BLOCK DATA subprogram of the model. If a second save file is used, then it is also opened explicitly, and the integer variable IDPUN2, initialized to a value of 14, specifies the unit number.

AR0068740

3.8.2.4 Maximum Value/Threshold File

The user may select an option for the AERMOD model to generate a file or files of concentration values exceeding a user-specified threshold. The OU MAXIFILE keyword controls this option. The user may select separate files for each averaging period and source group combination for which a list of threshold violations may be needed. Each file includes several records with header information identifying the averaging period, source group and threshold value, and then a record for every occurrence where the result for that averaging period/source group equals or exceeds the threshold value. Each of these records includes the averaging period, source group ID, date for the threshold violation (ending hour of the averaging period), the x, y, z and flagpole receptor height for the receptor location where the violation occurred, and the concentration value.

The structure of the threshold violation file is described in more detail in Appendix D. Each of the files selected by the user is opened explicitly by the model as an formatted file. The filenames are provided on the input runstream image. The user may specify the file unit on the MAXIFILE card through the optional FUNIT parameter. User-specified units must be greater than or equal to 26 and are recommended to be less than or equal to 100. If no file unit is specified, then the file unit is determined internally according to the following formula:

$$IMXUNT = 200 + IGRP*10 + IAVE$$

where IMXUNT is the Fortran unit number, IGRP is the source group number (the order in which the group is defined in the runstream file), and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula will not cause any conflict with other file units used by the model for up to 9 source groups and up to 9 short term averaging periods.

3.8.2.5 Sequential Results File for Postprocessing

The user may select an option for the AERMOD model to generate a file or files of

AR0068741

concentration values suitable for postprocessing. The OU POSTFILE keyword controls this option. The user may select separate files for each averaging period and source group combination for which postprocessing may be needed. For each file requested, the user has the option of specifying whether to use unformatted files suitable for postprocessing or to use a plot format which could allow for importing the concentration files into a graphics package for plotting. For the unformatted file option, each file consists of sequential unformatted records of values at each receptor location for every averaging period calculated. For the plot file format option, each file consists of formatted records listing the x-coordinate, y-coordinate and concurrent concentration values for each receptor and for all averaging periods calculated. For certain applications, these files may become quite large, and should only be used when needed, especially when using the plot format.

The structure of both types of postprocessing file is described in more detail in Appendix D. Each of the postprocessing files selected by the user is opened explicitly by the model as either an unformatted or a formatted file, depending on the option selected. The filenames are provided on the input runstream image. The user may specify the file unit on the POSTFILE card through the optional FUNIT parameter. User-specified units must be greater than or equal to 20, and are recommended to be less than or equal to 100. If no file unit is specified, then the file unit is determined internally according to the following formulas.

IPSUNT = 200 + IGRP*10 + IAVE for short term averages
IAPUNT = 300 + IGRP*10 + 5 for PERIOD averages

where IPSUNT and IAPUNT are the Fortran unit numbers, IGRP is the source group number (the order in which the group is defined in the runstream file), and IAVE is the averaging period number (the order of the averaging period as specified on the AVERTIME card). This formula will not cause any conflict with other file units used by the model for up to 9 source groups and up to 9 short term averaging periods.

AR0068742

3.8.2.6 High Value Summary File for Plotting

The user may select an option for the AERMOD model to generate a file or files of the highest concentration values at each receptor suitable for importing into a graphics package in order to generate contour plots. The OU PLOTFILE keyword controls this option. The user may select separate files for each averaging period, source group and high value combination for which a plot file may be needed. Each file includes several records with header information identifying the averaging period, source group and high value number of the results, and then a record for each receptor which contains the x and y coordinates for the receptor location, the appropriate high value at that location, and the averaging period, source group and high value number.

The structure of the plot file is described in more detail in Appendix D. Each of the plot files selected by the user is opened explicitly by the model as an formatted file. The filenames are provided on the input runstream image. The user may specify the file unit on the PLOTFILE card through the optional FUNIT parameter. User specified units must be greater than or equal to 26, and are recommended to be less than or equal to 100. If no file unit is specified, then the file unit is determined internally according to the following formulas:

IPLUNT = (IVAL - 3)*100 + IGRP*10 + IAVE for short term averages
IPPUNT = 300 + IGRP*10 for PERIOD averages

where IPLUNT and IPPUNT are the Fortran unit numbers, IVAL is the high value number (1 for FIRST highest, 2 for SECOND highest, etc.), IGRP is the source group number (the order in which the groups is defined in the runstream file), and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula will not cause any conflict with other file units used by the model for up to 9 source groups and up to 9 short term averaging periods.

AR0068743

3.8.2.7 TOXX Model Input Files

The user may select an option for the AERMOD model to generate an unformatted file or files of concentration values exceeding a user-specified threshold for use with the TOXX model component of TOXST. The OU TOXXFILE keyword controls this option. The user may select separate files for each averaging period for which a threshold violation file may be needed. Each file includes several records with header information identifying the title, averaging period, threshold value, and receptor network information, and then records including every occurrence where the result of any source group for that averaging period equals or exceeds the threshold value. Records are also output that identify the averaging period (hour number of the year), source group number and receptor number corresponding to the concentration values.

The structure of the threshold exceedance file for use with the TOXX model component of TOXST is described in more detail in Appendix D. Each of the files selected by the user is opened explicitly by the model as an unformatted file. The filenames are provided on the input runstream image. The user may specify the file unit on the TOXXFILE card through the optional Funit parameter. User-specified units must be greater than or equal to 26, and are recommended to be less than or equal to 100. If no file unit is specified, then the file unit is determined internally according to the following formula:

$$ITXUNT = 300 + IAVE$$

where ITXUNT is the Fortran unit number, and IAVE is the averaging period number (the order of the averaging period as specified on the CO AVERTIME card). This formula will not cause any conflict with other file units used by the model for up to 4 short term averaging periods.

The user may also select an option for the AERMOD model to generate an output for use with the RISK model component of TOXST. The OU TOXXFILE keyword also controls this option. The user can specify a separate TOXXFILE for each long term averaging period and source group combination. The TOXXFILE option may also be used for PERIOD averages with

AR0068744

the AERMOD model. The structure of the TOXXFILE output for AERMOD is very similar to the long term PLOTFILE output, except that results are output for each individual source in the specified source group. The structure of the long term TOXXFILE is described in more detail in Appendix D. Each of the files selected by the user is opened explicitly by the model as a formatted file. The filenames are provided on the input runstream image. The user may specify the file unit on the TOXXFILE card through the optional Furit parameter. User-specified units must be greater than or equal to 26, and are recommended to be less than or equal to 100. If no file unit is specified, then the file unit is determined internally according to the following formulas:

ITXUNT = 500 + IAVE*20 + IGRP for long term averages
IPXUNT = 700 + IGRP*10 for PERIOD averages

where ITXUNT and IPXUNT are the Fortran unit numbers, IAVE is the averaging period number (in the order of months, seasons or quarters, and annual), and IGRP is the source group number (in the order in which the groups are defined in the SO pathway). This formula will not cause any conflict with other file units used by the model for up to 9 source groups.

3.5.3 Control of File Inputs and Outputs (I/O)

3.5.3.1 Control of I/O on PCs.

The main input runstream file and the main output print file are specified internally by AERMOD as AERMOD.INP and AERMOD.OUT, respectively. Therefore, a standard command line to execute the AERMOD model might look something like this:

C:>AERMOD

where the "DOS prompt" has been given as "C:>", but may look different on different systems, or may include a subdirectory specification. The output file generated by the DOS version

AR0068745

includes page feeds that are written directly to the file as part of the header for each page, rather than using the Fortran carriage control of '1'. This is accomplished by including a compiler-specific parameter to set CARRIAGECONTROL = 'Fortran' on the OPEN statement for the output file.

3.8.1.2 Controlling I/O on Other Computer Systems

Since the main input runstream file and the main output print file are specified internally by AERMOD, control of I/O on other computer systems will be the same, with the possible exception of the compiler-specific option to set CARRIAGECONTROL = 'Fortran' on the OPEN statement for the output file.

APPENDIX A. ALPHABETICAL KEYWORD REFERENCE

This appendix provides an alphabetical listing of a l of the keywords used by the AERMOD model. Each keyword is identified as to the pathway for which it applies, the keyword type (either mandatory or optional, and either repeatable or non-repeatable), and with a brief description of the function of the keyword. For a more complete description of the keywords, including a list of associated parameters, refer to the Detailed Keyword Reference in Section 3 or the Functional Keyword/Parameter Reference in Appendix B

AR0068748

Keyword	Path	Type	Keyword Description
AREAVERT	SO	M - R	Specifies location of vertices for an AREAPOLY source type (mandatory if AREAPOLY source is used)
AVERTIME	CO	M - N	Averaging time(s) to process (up to NAVE short term plus PERIOD or ANNUAL averages)
BUILDHGT	SO	O - R	Building height values for each wind sector
BUILDWID	SO	O - R	Building width values for each wind sector
DAYRANGE	ME	O - R	Specifies days or ranges of days to process (default is to process all data read in)
DAYTABLE	OU	O - N	Option to provide summaries for each averaging period for each day processed
DCAYCOEF	CO	O - N	Optional decay coefficient for exponential decay
DEBUGOPT	CO	O - N	Option to generate detailed result and meteorology files for debugging purposes
DISCCART	RE	O - R	Defines the discretely placed receptor locations referenced to a Cartesian system
DISCPOLR	RE	O - R	Defines the discretely placed receptor locations referenced to a polar system
ELEVUNIT	SO RE	O - N O - N	Defines input units for receptor elevations (RE path), or source elevations (SO path) (defaults to meters)
EMISFACT	SO	O - R	Optional input for variable emission rate factors
EMISUNIT	SO	O - N	Optional conversion factors for emission units and concentration units

Type: M - Mandatory N - Non-repeatable
O - Optional R - Repeatable

AR0068749

Keyword	Path	Type	Keyword Description
ERRORFIL	CO	O - N	Option to generate detailed error listing file (error file is mandatory for CO RUNORNOT NOT case)
EVALCART	RE	O - R	Defines discretely placed receptor locations referenced to a Cartesian system, grouped by arc for use with the EVALFILE output option
EVALFILE	OU	O - R	Option to output file of normalized arc maxima for model evaluation studies
EVENTFIL	CO	O - N	Specifies whether to generate an input file for EVENT model
EVENTLOC	EV	M - R	Describes receptor location for an event
EVENTOUT	OU	M - N	Specifies the level of output information provided by the EVENT model
EVENTPER	EV	M - R	Describes data and averaging period for an event
FINISHED	ALL	M - N	Identifies the end of inputs for a particular pathway
FLAGPOLE	CO	O - N	Specifies whether to accept receptor heights above local terrain (m) for use with flagpole receptors, and allows for a default flagpole height to be specified
GRIDCART	RE	O - R	Defines a Cartesian grid receptor network
GRIDPOLR	RE	O - R	Defines a polar receptor network
HALFLIFE	CO	O - N	Optional half-life used for exponential decay
HOUREMIS	SO	O - R	Option for specifying hourly emission rates in a separate file
INCLUDED	SO, RE	O - R	Option to include input data from a separate file in the runstream for the SO and/or RE pathways
INITFILE	CO	O - N	Option to initialize model from file of intermediate results generated by SAVEFILE option
LOCATION	SO	M - R	Identifies coordinates for particular source location

AR0068750

Keyword	Path	Type	Keyword Description
MAXFILE	OU	O - R	Option to list events exceeding a threshold value to File (if CO EVENT FILE option is used, these events are included in the input file generated for the EVENT model)
MAXTABLE	OU	O - R	Option to summarize the overall maximum values
MODELOPT	CO	M - N	Job control and dispersion options
MULTYEAR	CO	O - N	Specifies that run is part of a multi-year run, e.g., for PM-10 HiVol in five years
PLOTFILE	OU	O - R	Option to write certain results to a storage file suitable for input to plotting routines
POLLUTID	CO	M - N	Identifies pollutant being modeled
POSTFILE	OU	O - R	Option to write results to a mass storage file for postprocessing
PROFBASE	ME	M - N	Specifies the base elevation (above MSL) for the potential temperature profile
PROFFILE	ME	M - N	Describes input profile meteorological data file
RANKFILE	OU	O - R	Option to produce output file of ranked values for Q-Q plots

AR0068751

Keyword	Path	Type	Keyword Description
RECTABLE	OU	O - R	Option to output value(s) by receptor
RUNORNOT	CO	M - N	Identifies whether to run model or process setup information only
SAVEFILE	CO	O - N	Option to store intermediate results for later restart of the model after user or system interrupt
SCIMBYHR	ME	O - N	Specifies sampling parameters for the SCIM option
SITEDATA	ME	O - N	Describes on-site meteorological station
SRCGROUP	SO	M - R	Identification of source groups
SRCPARAM	SO	M - R	Identifies source parameters for a particular source
STARTEND	ME	O - N	Specifies start and end dates to be read from input meteorological data file (default is to read entire file)
STARTING	ALL	M - N	Identifies the start of inputs for a particular pathway
SURFDATA	ME	M - N	Surface meteorological station
SURFFILE	ME	M - N	Describes input surface meteorological data file
TITLEONE	CO	M - N	First line of title for output
TITLETWO	CO	O - N	Optional second line of output title
TOXXFILE	OU	O - R	Creates output file formatted for use with TOXX model component of TOXST
UAIRDATA	ME	M - N	Upper air meteorological station
WDROTATE	ME	O - N	Wind direction rotation adjustment
WINDCATS	ME	O - N	Upper bound of wind speed categories

AR0068752

APPENDIX B. FUNCTIONAL KEYWORD/PARAMETER REFERENCE

This appendix provides a functional reference for the keywords and parameters used by the input runstream files for the AERMOD model. The keywords are organized by functional pathway, and within each pathway the order of the keywords is based on the function of the keyword within the model. The pathways used by the model are as follows, in the order in which they appear in the runstream file and in the tables that follow:

CO - for specifying overall job **CO**ntrol options;
SO - for specifying **SO**urce information;
RE - for specifying **RE**ceptor information;
ME - for specifying **ME**teorology information and options;
EV - for specifying **EV**ent information and options;
OU - for specifying **OU**tput options.

The pathways and keywords are presented in the same order as in the Detailed Keyword Reference in Section 5, and in the Quick Reference at the end of the manual.

Two types of tables are provided for each pathway. The first table lists all of the keywords for that pathway, identifies each keyword as to its type (either mandatory or optional and either repeatable or non-repeatable), and provides a brief description of the function of the keyword. The second type of table, which takes up more than one page for most pathways, presents the parameters for each keyword, in the order in which they should appear in the runstream file where order is important, and describes each parameter in detail.

The following convention is used for identifying the different types of input parameters. Parameters corresponding to secondary keywords which should be input "as is" are listed on the tables with all capital letters and are underlined. Other parameter names are given with an initial capital letter and are not input "as is." In all cases, the parameter names are intended to be descriptive of the input variable being represented, and they often correspond to the Fortran variable names used in the model code. Parentheses around a parameter indicate that the parameter is optional for that keyword. The default that is taken when an optional parameter is left blank is explained in the discussion for that parameter.

APPENDIX C EXPLANATION OF ERROR MESSAGE CODES

C.1 INTRODUCTION

The AERMOD input runstream is checked to identify parameters that are missing or potentially in error, and the input source and meteorological data are checked and flagged for possible erroneous values.

The AERMOD model uses a "defensive programming" approach to eliminate as much as possible of the user's work in debugging the input runstream file. Also, a great deal of effort has been made to eliminate the possibility of run time errors, such as "divide by zero," and to point out questionable input data. Error messages are reported to the user in two ways. A summary of messages is provided in the main output result file, and the user can also request a detailed message listing file.

Message Summary. Whether the user selects a detailed error listing file or not, the AERMOD model output a summary of messages within the output result file. This message table gives the number of messages of each type, together with a detailed list of all the fatal errors and warning messages. During setup processing, if no errors or warnings are generated, then the model simply reports to the user that "SETUP Finishes Successfully."

Detailed Message Listing File. The AERMOD model provide the option of saving a detailed list of all messages generated by the model to a separate output file. The user can select this option by specifying the keyword "ERRORFIL" followed by a filename inside the CONTROL pathway. For example, the following statements will save all the error messages to an ASCII text file named "errormsg.out":

```
CO STARTING
   ERRORFIL  errormsg.out
CO FINISHED
```

AR0068774

C.2 THE OUTPUT MESSAGE SUMMARY

There are two message summaries provided in the standard output file of the AFRMOD model. The first one is located after the echo of input upstream file images and before the input data summary. This summary will take one of two forms, depending on whether any fatal error or non-fatal warning messages were generated, and also depending on whether the option to RUN or NOT to run was selected on the CO RUNORNOT card. If there are no errors or warnings generated during the setup processing, and the RUN option was selected, then the model simply reports that "SETUP Finishes Successfully." If any fatal errors or warning messages were generated during the setup processing, or if the option NOT to run was selected, then a more detailed summary is provided. This summary provides a message count for each type of message, and a detailed listing of each fatal error and warning message generated. The second message summary table is located at the very end of the standard output result file, and it sums up the messages generated by the complete model run - both setup processing and run-time processing.

An example of a setup processing message summary is shown in Figure C-1

AR0068775

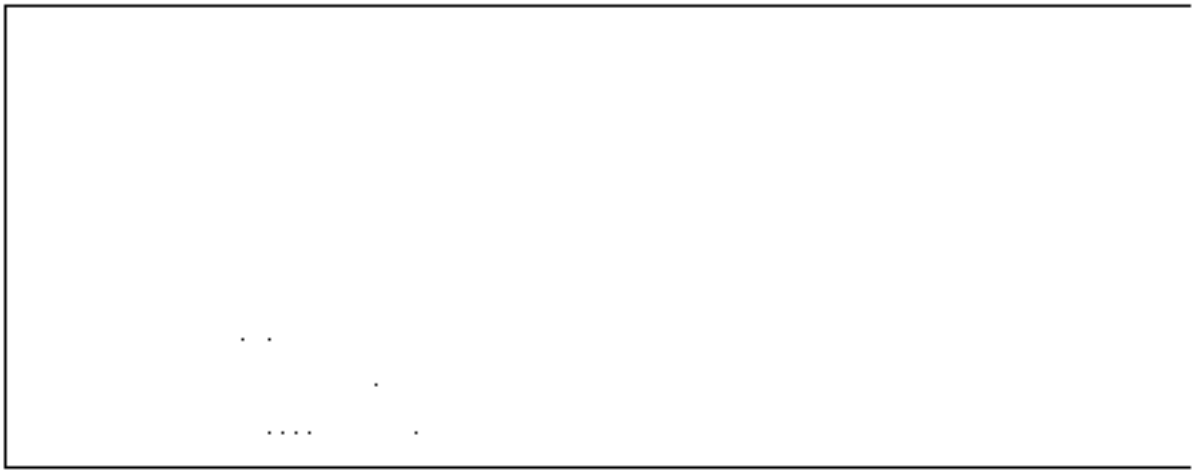

FIGURE C-1. EXAMPLE OF AN AERMOD MESSAGE SUMMARY

C.3 DESCRIPTION OF THE MESSAGE LAYOUT

Three types of messages can be produced by the model during the processing of input runstream images and during model calculations. These are described briefly below:

- Errors that will halt any further processing, except to identify additional error conditions (type E);
- Warnings that do not halt processing but indicate possible errors or suspect conditions (type W); and
- Informational messages that may be of interest to the user but have no direct bearing on the validity of the results (type I).

The messages have a consistent structure which contains the pathway ID, indicating which pathway the messages are generated from; the message type followed by a three-digit message number; the line number of the input runstream image file for setup messages (or the meteorology hour number for runtime messages); the name of the module (e.g. the subroutine name) from which the message is generated; a detailed message corresponding to the message code; and an 8-character simple hint to help the user spot the possible source of the problem.

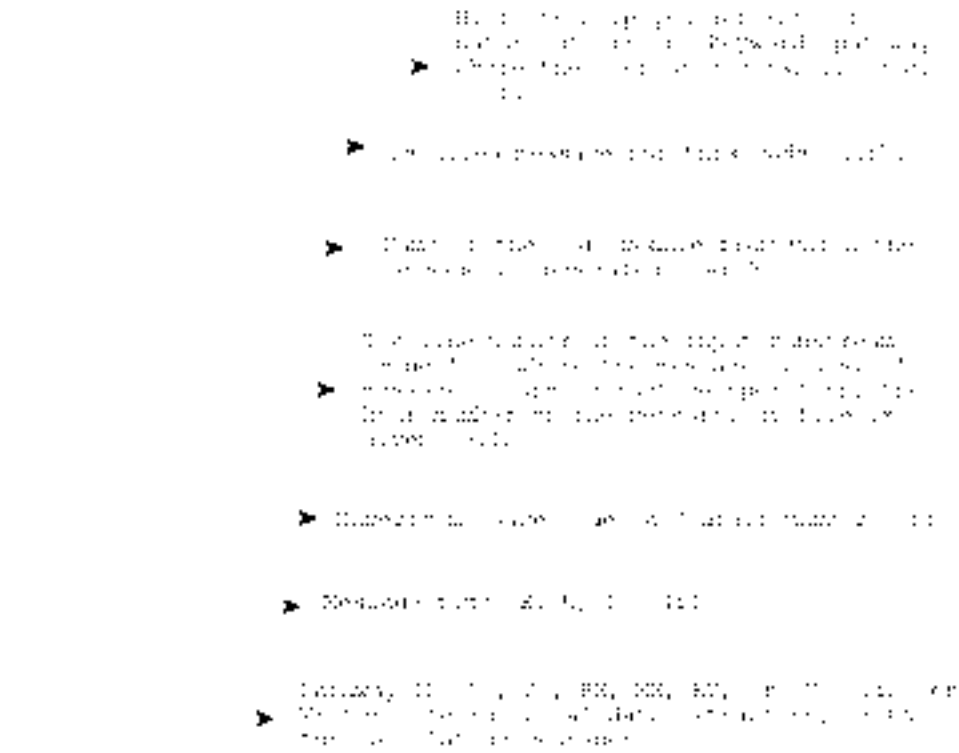
AR0068776

The following is an example of a detailed message generated from the CO pathway

```
:
```

The message syntax is explained in more detail below (values in parentheses give the column numbers within the message line for each element)

```
FW
```



If an error occurs during processing of an included file (either SO INCLUDED or RE INCLUDED), the line number will represent the line number of the included file. The line number of the runstream file is saved before processing the included data, and then restored when processing returns to the main runstream file.

AR0068777

The three message types are identified with the letters F (for errors), W (for warnings), and I (for informational messages). The 3-digit message codes are grouped into general categories corresponding to the different stages of the processing. These categories are

100 - 199 Input Runstream Image Structure Processing
200 - 299 Parameter Setup Processing
300 - 399 Data and Quality Assurance Processing
400 - 499 Run Time Message Processing
500 - 599 Input/Output Message Processing

A detailed description of each of the message codes currently used in the model is provided in the next section

C.4 DETAILED DESCRIPTION OF THE ERROR/MESSAGE CODES

INPUT RUNSTREAM IMAGE STRUCTURE PROCESSING, 100-199

This type of message indicates problems with the basic syntax and/or structure of the input runstream image. Typical messages include errors like "Missing mandatory keyword" "Illegal Keyword", , etc. If a fatal error of this kind is detected in a runstream image, a fatal error message is written to the message file and any attempt to process data is prohibited, although the remainder of the runstream file is examined for other possible errors. If a warning occurs, data may still be processed, although the inputs should be checked carefully to be sure that the condition causing the warning does not indicate an error.

100 **Invalid Pathway Specified.** The pathway ID should be a 2 character string. It should be one of the following: CO for control pathway, SO for source pathway, RE for receptor pathway (or EV for event pathway for EVENT processing), ME for meteorology data setting pathway, and OU for output format pathway. Its position is normally confined to columns 1 and 2 (1:2) of the input runstream file. However, the model does allow for a shift of the entire input runstream file of up to 3 columns. If the inputs are shifted, then all input records must be shifted by the same amount. The invalid pathway is repeated at the end of the message

AR0068778

105 Invalid Keyword Specified. The keyword ID should be an 8 character string. Its position is normally confined to columns 4 to 11 (4-11) of the input runstream file. However, the model does allow for a shift of the entire input runstream file of up to 3 columns. If the inputs are shifted, then all input records must be shifted by the same amount. There should be a space between keyword ID and any other data fields. For a list of valid keywords, refer to Appendix A or Appendix B. The invalid keyword is repeated at the end of the message.

110 Keyword is Not Valid for This Pathway. The input keyword is a valid 8-character string, but it is not valid for the particular pathway. Refer to Appendix A, Appendix B or Section 3 for the correct usage of the keyword. The invalid keyword is repeated at the end of the message.

115 Starting and Finishing Statements do not match. Only One STARTING and one FINISHED statement, respectively, is allowed at the very beginning and the very end of each pathway block. Check the position and frequency to make sure the input runstream file meets the format requirement. The pathway during which the error occurs is included at the end of the message.

120 Pathway is Out of Sequence. The pathways are not input in the correct order. The correct order is CO, SO, RE, ME, and OU for the AERMOD and AERMOD model and CO, SO, ME, EV, and OU for EVENT processing. The offending pathway is given as a hint.

125 Missing FINISHED Statement - Runstream file is incomplete. One or more FINISHED statements are missing. A 5-digit status variable is given as a hint. Each digit corresponds to a pathway in the appropriate order, and is a '1' if the pathway is complete and a '0' if the FINISHED is missing. For example, a status of '10111' indicates that the SO pathway was missing a FINISHED statement. Normally such an error will generate additional messages as well.

130 Missing Mandatory Keyword. To run the model, certain mandatory keywords must present in the input runstream file. For a list of mandatory keywords, see Appendix A or Appendix B. For more detailed information on keyword setup, see the description of message code 105. The missing keyword is included with the message.

135 Duplicate Non-repeatable Keyword Encountered. More than one instance of a non-repeatable keyword is encountered. For a list of non-repeatable keywords, see Appendix A or Appendix B. The repeated keyword is included with the message.

140 Invalid Placement of Keyword. A keyword has been placed out of the acceptable order, or a STARTING or FINISHED keyword has been placed in an INCLUDED file. The order for most keywords is not critical, but the relative order of a few keywords is important for the proper interpretation of the input data. The keyword reference in Section 3 identifies any requirements for the order of keywords. The keyword that was improperly placed is included with the message.

AR0068779

145 Conflicting Options: MULTYEAR and Re Start Option. The multiple year option for processing PM-10 values makes use of the re-start routines in the model with some slight changes to handle the period averages from year to year. As a result, the MULTYEAR keyword cannot be specified with either the SAVEFILE or INITFILE keywords.

150 Conflicting Options: MULTYEAR for Wrong Pollutant. The multiple year option is provided specifically for the processing of PM-10 values to obtain the "high-sixth-high in five years" design value. Its treatment of the high short term values for multiple year periods is not consistent with existing air quality standards for other pollutants. To use the MULTYEAR option, the user must specify a pollutant type (on the CO POLLUTID card) of PM-10, PM10, or OTHER.

152 ELEVUNIT card must be first for this pathway. The ELEVUNIT card must be the first non-commented card after STARTING when used on the SO or RE pathway. This requirement is made in order to simplify reviewing upstream files to determine the elevation units used for sources and receptors.

154 Conflicting Options: SCIM option cannot be used with the specified option: causing a fatal error.

155 Conflicting Decay Keyword. The ISCMOD model allows for the user to specify the rate of exponential decay either in terms of the half-life (HALFLIFE keyword) or the decay coefficient (DCAYCOEF keyword). If both keywords are specified, then only the first one will be used, and inputs for the second one will be ignored.

156 Option ignored - not valid with SCIM. The specified option is not valid with the SCIM option and is ignored. This is not a fatal error.

157 Wet SCIM option is not operational yet and the input is ignored. Since the model does not include wet deposition algorithms yet, the wet SCIM option is not operational.

158 Wet SCIM option is not operational yet and the input is ignored. Since the model does not include wet deposition algorithms yet, the wet SCIM option is not operational.

160 Duplicate ORIG Secondary Keyword for GRIDPOLR. Only one origin card may be specified for each grid of polar receptors. The network ID for the effected grid is included with the message.

170 Invalid Secondary Key for Receptor GRID. The network ID for the effected grid is included with this message. Refer to Appendix B for the correct syntax of secondary keywords.

175 Missing Secondary Keyword END for Receptor Grid. The END secondary keyword is required for each grid of receptors input by the user (keywords GRIDCART and

AR0068780

GRIDPOLAR). It signals the end of inputs and triggers the processing of data for that particular network.

180 Conflicting Secondary Keyword for Receptor Grid. Two incompatible secondary keywords have been input for the same grid of receptors, e.g. GDDR and DDDR for the keyword GRIDPOLAR, where GDDR specifies to generate directions with uniform spacing, and DDDR specifies that discrete non-uniform directions are being specified.

185 Missing Receptor Keywords - No Receptors Specified. Since none of the RE pathway keywords are mandatory, a separate error check is made to determine if any of the RE keywords are specified. At least one of the following keywords must be present: GRIDCART, GRIDPOLR, DISCCART, DISCPOLR, or EVALCART.

190 No Keywords for OU Pathway and No PERIOD or ANNUAL Averages. All of the OU pathway keywords are optional, and in fact the model will run if no keywords are specified on the OU pathway as long as PERIOD or ANNUAL averages are being calculated. However, if there are no OU keywords and no PERIOD or ANNUAL averages, then there will be no output generated by the model, and this fatal error message will be generated.

195 Incompatible Option Used With SAVEFILE or INITFILE. Either a non-fatal message to warn the user that DAYTABLE results will be overwritten if the model run is re-started, or a fatal error message generated if the TOXXFILE option is selected with either the SAVEFILE or INITFILE options.

197 Post-1997 PM_{10} processing option without the MAXIFILE option is incompatible with the EVENTFIL option. Threshold violations generated through the MAXIFILE option are the only events that are compatible with post-1997 PM_{10} processing for EVENT processing.

198 The non-default TOXICS option is required in order to use the specified option, such as the SCIM option.

PARAMETER SETUP PROCESSING, 200-299

This type of message indicates problems with processing of the parameter fields for the runstream images. Some messages are specific to certain keywords, while others indicate general problems, such as an invalid numeric data field. If a fatal error of this kind is detected in a runstream image, a fatal error message is written to the message file and any attempt to process data is prohibited, although the remainder of the runstream file is examined for other

AR0068781

possible errors. If a warning occurs, data may still be processed, although the inputs should be checked carefully to be sure that the condition causing the warning does not indicate an error.

200 Missing Parameter(s). No options were selected for the indicated keyword. Check Appendix B for the list of parameters for the keyword in question.

201 Not Enough Parameters Specified For The Keyword. Check if there are any missing parameters following the indicated keyword. See Appendix B for the required keyword parameters.

202 Too Many Parameters Specified For The Keyword. Refer to Appendix B or Section 3 for the list of acceptable parameters.

203 Invalid Parameter Specified. The inputs for a particular parameter are not valid for some reason. Refer to Appendix B or Section 3. The invalid parameter is included with the message.

204 Option Parameters Conflict. Forced by Default to. Some parameters under the indicated keyword conflict with the other model parameters setting. Refer to Appendix B or Section 3 for the correct parameter usage. The default setting is specified with the message.

205 No Option Parameter Setting. Forced by Default to. No setting was specified for a particular parameter. Refer to Appendix B or Section 3 for the correct parameter usage. The default setting is specified with the message.

206 Regulatory DEAULT Specified With Non-default Option. The DEAULT option on the CO MODELOPT card always overrides the specified non-default option, and a warning message is generated.

207 No Parameters Specified. Default Values Used For. The keyword for which no parameters are specified is included with the message. Refer to Appendix B or Section 3 for a discussion of the default condition.

208 Illegal Numerical Field Encountered. The model may have encountered a non-numerical character for a numerical input, or the numerical value may exceed the limit on the size of the exponent, which could potentially cause an underflow or an overflow error.

209 Negative Value Appears For A Non-negative Variable. The effected variable name is provided with the message.

210 Number of Short Term Averages Exceeds Maximum. The user has specified more short term averages on the CO AVERTIM card than the model array limits allow.

AR0068782

This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NAVE variable. While the model still performs this test, this message should never occur.

211 Duplicate Parameter(s) Specified for Keyword. A duplicate parameter or set of parameters has been specified for the indicated keyword. For example, if more than one POSTFILE keyword is included for the same averaging period and source group then this error message will be generated.

212 END Encountered Without (X,Y) Points Properly Set. This error occurs during setting up the grid of receptors for a Cartesian Network. This message may occur for example if X-coordinate points have been specified without any Y-coordinate points for a particular network ID.

213 ELEV Inputs Inconsistent With Option. Input Ignored. This happens when the user inputs elevated terrain heights for receptors when the FLAT option is specified. The input terrain heights are ignored and the model proceeds with FLAT terrain modeling.

214 ELEV Inputs Inconsistent With Option. Defaults Used. This happens when the user does not input elevated terrain heights for receptors when the default option of incorporating elevated terrain effects is used. The model assumes that the missing terrain heights are at 0.0 meters for those receptors and proceeds with ELEV terrain modeling.

215 FLAG Inputs Inconsistent With Option. Input Ignored. This happens when the user inputs receptor heights above ground for flagpole receptors when the FLAGPOLE keyword option has not been specified. The input flagpole heights are ignored in the model calculations.

216 FLAG Inputs Inconsistent With Option. Defaults Used. This happens when the user does not input receptor heights above ground for flagpole receptors when the FLAGPOLE keyword option has been specified. The model assumes that the missing flagpole heights are equal to the default value specified on the CO FLAGPOLE card. If no default height is specified on the FLAGPOLE card, then a default of 0.0 meters is assumed.

217 More Than One Delimiter In A Field. For example, 12-34 is an illegal input data item for the DAYRANGE card, and STACK1--STACK20 is an illegal specification for a range of sources.

218 Number of (X,Y) Points Not Match With Number Of ELEV Or FLAG. Check the number of elevated terrain heights or flagpole receptor heights for the gridded network associated with the indicated line number in the runstream file.

219 Number Of Receptors Specified Exceeds Maximum. The user has specified more receptors on the RE pathway than the model array limits allow. This array limit is

AR0068783

dynamically allocated at model runtime based on model inputs, and is stored in the NREC variable. While the model still performs this test, this message should never occur.

220 Missing Origin (Use Default = 0,0) In GRIDPOLR. This is a non-fatal warning message to indicate that the ORIG secondary keyword has not been specified for a particular grid of polar receptors. The model will assume a default origin of (X=0, Y=0).

221 Missing Distance Setting In Polar Network. No distances have been provided (secondary keyword DIST) for the specified grid of polar receptors.

222 Missing Degree Or Distance Setting In Polar Network. Missing a secondary keyword for the specified grid of polar receptors.

223 Missing Distance or Degree Field. No data fields have been specified for the indicated secondary keyword.

224 Number of Receptor Networks Exceeds Maximum. The user has specified more receptor networks of gridded receptors on the RE pathway than the model array limits allow. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NNET variable. While the model still performs this test, this message should never occur.

225 Number of X-Coords Specified Exceeds Maximum. The user has specified more X-coordinate values for a particular grid of receptors than the model array limits allow. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the IXM variable. While the model still performs this test, this message should never occur.

226 Number of Y-Coords Specified Exceeds Maximum. The user has specified more Y-coordinate values for a particular grid of receptors than the model array limits allow. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the IYM variable. While the model still performs this test, this message should never occur.

227 No Receptors Were Defined on the RE Pathway. Either through lack of inputs or through errors on the inputs, no receptors have been defined.

228 Default(s) Used for Missing Parameters on Keyword. Either an elevated terrain height or a flagpole receptor height or both are missing for a discrete receptor location. Default value(s) will be used for the missing parameter(s).

229 Too Many Parameters - Inputs Ignored on Keyword. Either an elevated terrain height or a flagpole receptor height or both are provided when the corresponding option has not been specified. The unneeded inputs are ignored.

AR0068784

231 Too Many Numerical Values Specified - Too many values have been specified for the type of input indicated

232 Number Of Specified Sources Exceeds Maximum - The user has specified more sources than the model array limits allow. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NSRC variable. While the model still performs this test, this message should never occur

233 Building Dimensions Specified for a Non-POINT Source - Building dimensions can only be specified for a POINT source, since the VOLUME and AREA source algorithms do not include building downwash

234 Too Many Sectors Input - For example, the user may have input too many building heights or widths for a particular source

235 Number of Source Groups Specified Exceeds Maximum - The user has specified more source groups than the model array limits allow. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NGRP variable. While the model still performs this test, this message should never occur

236 Not Enough BUILDHGTs Specified for a Source ID - There should be 36 building heights

237 Not Enough BUILDWIDs Specified for a Source ID. There should be 36 building widths.

239 Not Enough QFACTs Specified for a Source ID - The number of variable emission rate factors specified for a particular source is less than the model expects based on the variable emission rate flag. Check the EMISFACT keyword on the SO pathway in Appendix B of Section 3 for the appropriate number.

241 Not Enough BUILDLENs Specified for a Source ID - There should be 36 building lengths specified

246 Not Enough XBADJs Specified for a Source ID. There should be 36 along-flow distances from the stack to the center of the upwind face of building specified

247 Not Enough YBADJs Specified for a Source ID - There should be 36 across-flow distances from the stack to the center of the upwind face of building specified

248 No Sources Were Defined on the SO Pathway - There must be at least one LOCATION card and one SRCPARAM card to define at least one source on the SO pathway. Either no cards were input or there were errors on the inputs

250 Duplicate XPNTDIST or YPNTDIR Specified for GRID - One of the grid inputs, either an X-coordinate, Y-coordinate, polar distance range or polar direction, has been

AR0068785

specified more than once for the same grid of receptors. This generates a non-fatal warning message.

252 Duplicate Receptor Network ID Specified. A network ID for a grid of receptors (GRIDCART or GRIDPOLR keyword) has been used for more that one network.

254 Number of Receptor Arcs Exceeds Maximum. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NARC variable. While the model still performs this test, this message should never occur.

256 EVALFILE Option Used Without EVALCART Receptors. The EVALFILE output option provides model results designed for model evaluation purposes based on receptors grouped by arc. Such receptors must be identified using the EVALCART keyword. If EVALFILE is selected without any EVALCART receptors, this fatal error message will be generated.

260 Number of Emission Factors Exceeds Maximum. The user has selected an option for variable emission rate factors that exceeds the array storage limit for emission rate factors. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NQF variable. While the model still performs this test, this message should never occur.

262 First Vertex Does Not Match LOCATION for AREAPOLY Source. The coordinates of the first vertex defined for an AREAPOLY source must match the source location coordinates provided on the SO LOCATION card.

264 Too Many Vertices Specified for an AREAPOLY Source. The number of vertices specified on the AREAVERT cards must match the number given on the SRCPARAM card for that source.

265 Not Enough Vertices Specified for an AREAPOLY Source. The number of vertices specified on the AREAVERT cards must match the number given on the SRCPARAM card for that source.

270 Number of High Values Specified Exceeds Maximum. The user has selected a high short term value on the OU RECTABLE card that exceeds the array storage limit for high values by receptor. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NVAL variable. While the model still performs this test, this message should never occur.

280 Number of Maximum Values Specified Exceeds Maximum. The user has selected a value for the number of overall maximum values on the OU MAXTABLE card that exceeds the array storage limit for overall maximum values. This array limit is dynamically allocated at model runtime based on model inputs, and is stored in the NMAX variable. While the model still performs this test, this message should never occur.

AR0068786

294 PERIOD and ANNUAL averages are both selected on the AVERTIME card. The user can only specify one long-term averaging option, either PERIOD or ANNUAL average.

295 Invalid Averaging Period Specified for the SCREEN Mode. The SCREEN mode of AERMOD can only be used with 1-hour averages

298 Error Allocating Storage for Setup Arrays. An error occurred while allocating storage for the setup arrays, indicating that there is insufficient memory available on the computer for the model to run. Try closing other applications and/or reducing the size of the run. An estimate of memory requirements is provided on the first page of the output file

299 Error Allocating Storage for Result Arrays. An error occurred while allocating storage for the result arrays, indicating that there is insufficient memory available on the computer for the model to run. Try closing other applications and/or reducing the size of the run. An estimate of memory requirements is provided on the first page of the output file

SETUP DATA AND QUALITY ASSURANCE PROCESSING, 300-399

This type of message indicates problems with the actual values of the parameter data on the input runstream image. The basic structure and syntax of the input card is correct, but one or more of the inputs is invalid or suspicious. These messages include quality assurance checks on various model inputs. Typical messages will tell the consistency of parameters and data for the setup and run of the model. If a fatal error of this kind is detected in a runstream image, a fatal error message is written to the message file and any attempt to process data is prohibited. If a warning occurs, data may or may not be processed, depending on the processing requirements specified within the run stream input data.

300 Specified Source ID Has Not Been Defined Yet. The message indicates that the user attempts to use a source ID on a keyword before defining this source ID on a SO LOCATION card. It could indicate an error in specifying the source ID, an omission of a LOCATION card, or an error in the order of inputs

310 Attempt to Define Duplicate LOCATION Card for Source. There can be only one LOCATION card for each source ID specified. The source ID is included with the message

AR0068787

313 Attempt to Define Duplicate EVENTPER Card for the specified EVENT. There can be only one EVENTPER card for each EVENT specified. The EVENT name is included with the message.

315 Attempt to Define Duplicate SRCPARAM Card for Source. There can be only one SRCPARAM card for each source ID specified. The source ID is included with the message.

319 No Sources Included in the Specified Source Group. This is a non-fatal warning message indicating that a source group has been defined that does not include any sources. The source group ID is provided.

320 Source Parameter May Be Out-of-Range for Parameter. The value of one of the source parameters may be either too large or too small. The name of the parameter is provided with the message. Use the line number provided to locate the card in question.

325 Negative Exit Velocity (Set 1.0E-5) for Source ID. The exit velocity for the specified source ID was input as a negative value. Since the model currently cannot handle sources with downward momentum, the exit velocity is set to a very small value (1.0E-5 m/s) and modeling proceeds. This non-fatal message is generated to warn the user that the input may be in error.

330 Mass Fraction Parameters Do Not Sum to 1.0 (within +/- 2 percent) for a particular source.

332 Mass Fraction Parameter Out-of-Range for a particular source. Must be between 0.0 and 1.0, inclusive.

334 Particle Density Out-of-Range for a particular source. Must be greater than 0.0.

340 Possible error in the PROFBASE input. The value input as the base elevation (above MSL) for the potential temperature file is less than zero.

342 Source ID Mismatch in the Hourly Emissions File. The source ID read from the hourly emissions file does not match what is expected based on the SO HOURFMS card. A source ID and/or date may be out of order or missing in the hourly emissions file. The source ID read from the file is provided with the error message.

344 Hourly Emission Rate is Zero. The emission rate read from the hourly emission file is zero for the specified date. This is written as an informational message, and does not halt processing of the data.

350 Julian Day Out Of Range. This error occurs if the Julian Day selected is less than zero or greater than 366. Check ME setups to ensure the Julian Day selection.

AR0068788

352 Missing Field on MULTYEAR Card for Pre-1997 PM10. When using the MULTYEAR card for pre-1997 PM10 processing, the keyword 'HIGH' must be specified.

353 MULTYEAR Card for PM10 Processing Applies Only for Pre-1997 Applications. Use High-Fourth-High for Post-1997 PM10 Processing.

354 High-Fourth-High Only Required for Post-1997 PM10 Processing with the RFCTABLE Card.

360 2-digit Year Specified. Valid for the range 1950-2049. Four-digit years are valid for the entire range of Gregorian dates, but two digit years are accepted.

363 24-Hr and ANNUAL Averages Only are Allowed for Post-1997 PM10 Processing on the AVERTIME Card.

365 Year Input is Greater than 2147. A four-digit year greater than 2147 has been input to the model, which will cause an integer overflow.

370 Invalid Date, 2/29 for a Non-Leap Year. The year has been identified as a non-leap year, and a date of 2/29 (February 29) has been specified on the DAYRANGE card. Check the year and/or the date specification.

380 This Input Variable is Out-of-Range. The indicated value may be too large or too small. Use the line number to locate the card in question, and check the variable for a possible error.

381 Latitude in the Surface File is Not Valid. The latitude is read from the header record of the surface/scalar meteorological data file. If the value is not within the valid range of 0 to 90 degrees, then this error message is generated.

382 Error Decoding Latitude in the Surface File. The latitude is read from the header record of the surface/scalar meteorological data file. An error occurred trying to decode the latitude indicating a potential problem with the surface file.

385 Averaging period does not equal 1-hour averages for the TOXXFILE option for the AERMOD model. The AERMOD model will generate TOXXFILE outputs for other averaging periods, but the TOXX model component of TOXST currently supports only the 1-hour averages. This is a non-fatal warning message.

390 Averaging period specified on the EVENTPER card for EVENT processing must be less than or equal to 24.

391 Aspect ratio (length/width) of an area source is greater than 20. The area source algorithm in the AERMOD model allows for specifying area sources as elongated rectangles, however, if the aspect ratio exceeds 10 a warning message will be printed.

AR0068789

eat. The user should subdivide the area so that each subarea has an aspect ratio of less than 10.

392 Error Decoding Latitude. The latitude is read from the header record of the surface/scalar meteorological data file. The value of the latitude should be followed by an 'N' or an 'S' for the northern or southern hemispheres. If the value cannot be decoded properly, then this error message is generated.

395 Met Data Error: Incompatible Version of AERMET. Based on the version date given in the header record of the surface meteorological data file, the meteorological data were generated by an older, incompatible version of AERMET.

396 Met Data Generated by Older Version of AERMET. Based on the version date given in the header record of the surface meteorological data file, the meteorological data were generated by an older version of AERMET. The data may be compatible with the current version of AERMOD, but should be updated with the current version of AERMET.

RUNTIME MESSAGE PROCESSING, 400-499

This type of message is generated during the model run. Setup processing has been completed successfully, and the message is generated during the performance of model calculations. Typical messages will tell the information and error during the model run. If a fatal error of this kind is detected during model execution, a fatal error message is written to the message file and any further processing of the data is prohibited. The rest of the meteorological data file will be read and quality assurance checked to identify additional errors. If a warning occurs, data may or may not be processed, depending on the processing requirements specified within the run stream input data.

405 The Value of PHEE Exceeds 1.0. If the value of PHEE, the fraction of the plume material below Heff, is greater than 1.0, then this informational message is generated. The value of PHEE is then set to 1.0 for the specified date.

406 Increase NVMAX for complex AREAPOLY source. The number of vertices for an AREAPOLY source exceeds the value of NVMAX, initially set to 20.

410 Flow Vector Out-of-Range. The flow vector must be between 0 and 360 degrees, inclusive. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

AR0068790

413 Number of Threshold Violation Events > 9999 for the Specified Averaging Period. This will result in duplicate event names being written to the EVENT.REC file. The duplicate events will have to be segregated before running the model in the EVENT processing mode.

420 Wind Speed Out-of-Range. The wind speed value may be either too large or too small. An error is generated if the speed is less than 0.0, and a warning is generated if the speed is greater than 30.0 m/s. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

430 Ambient Temperature Data Out-of-Range. The ambient temperature value may be either too large or too small. A warning is generated if the temperature is less than 220.0 K or greater than 330 K. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

432 Surface Friction Velocity Out-of-Range. The surface friction velocity may by too large. A warning is generated if the surface friction velocity is greater than 1.5 m/s. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

438 Surface Roughness Length Out-of-Range. A warning is generated if the surface friction velocity is less than 0.001 meters, and the value is set to 0.001 meters to avoid a divide by zero. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

448 Convective Velocity Scale Out-of-Range. The convective velocity scale may by too large. A warning is generated if the convective velocity scale is greater than 3.0 m/s. The date of occurrence is provided with the message (in the form of year, month, day, hour as YYMMDDHH).

460 Calm Hour Identified in Meteorology Data File. This message is generated if a calm hour is identified, and provides the date of occurrence (in the form of year, month, day, hour as YYMMDDHH). A calm hour is identified by a reference wind speed of 0.0 m/s in the surface meteorological data file.

450 Error in Meteorology File - Record Out of Sequence. There is an error in the sequence of the hourly meteorological data file. The message also provides the date of occurrence (in the form of year, month, day, hour as YYMMDDHH).

455 Date/Time Mismatch on Hourly Emission File. There is mismatch in the date/time field between the meteorological data file and the hourly emission file. The message also provides the date of the occurrence from the surface/scalar file (in the form of year, month, day, hour as YYMMDDHH).

456 Date/Time Mismatch on Scalar and Profile Data. There is mismatch in the date/time field between the surface/scalar and the profile meteorological data files. The message

AR0068791

also provides the date of the occurrence from the surface/scalar file (in the form of year, month, day, hour as YYMMDDHH)

460 Missing Hour Identified in Meteorology Data File. At least one of the meteorological variables is missing or invalid for the hour specified (in the form of year, month, day, hour as YYMMDDHH). If the missing data processing option is not used, then this message will be generated and any further calculations with the data will be aborted. The model will continue to read through the meteorological data file and check the data.

465 Number of Profile Levels Exceeds the Maximum. The profile meteorological data file includes more than the maximum number of levels, specified by the MXPLVL PARAMETER in MODULE MAIN1. The value of MXPLVL is provided with the message.

470 Mixing Height Value is Less Than or Equal to 0.0. This is an informational message that may indicate an error in the meteorological data file. The message includes the hour of occurrence (in the form of year, month, day, hour as YYMMDDHH).

475 The Reference Height is Higher than 200 m. The reference height is read from the surface/scalar meteorological data file. This warning message is generated if the reference height is higher than 200 meters. Since data for the reference height are used in surface layer similarity profiles, the reference height should be within the surface layer (between about 7 and 100 times the surface roughness length).

480 Less Than 1 Year Found for ANNUAL Averages. The input meteorological data file consists of less than a full year of data. The ANNUAL average requires that a full year of data or multiple years be available.

485 Data Remaining After End of Year. The ANNUAL average requires full years of input data (not necessarily calendar years), and there are data remaining after the end of the year. The number of hours remaining is specified.

487 User-specified Start Date on STARTEND card is Earlier Than Start Date of Data File with the ANNUAL average or post 1997 PM10 processing option.

INPUT/OUTPUT MESSAGE PROCESSING, 500-599

This type of message is generated during the model input and output. Typical messages will tell the type of I/O operation (e.g., opening, reading or writing to a file), and the type of file. If a fatal error of this kind is detected in a runstream image, a fatal error message is written to the message file and any attempt to process data is prohibited. If a warning occurs,

AR0068792

data may or may not be processed, depending on the processing requirements specified within the run stream input data.

500 Fatal Error Occurs During Opening of the Data File. The file specified can not be opened properly. This may be the runstream file itself, the meteorological data file, or one of the special purpose output files. This may happen when the file called is not in the specified path, or an illegal filename is specified. If no errors are found in the filename specification, then this message may also indicate that there is not enough memory available to run the program, since opening a file causes a buffer to be opened which takes up additional memory in RAM. For the special purpose output files, the hint field includes character string identifying the type of file and the file unit number, e.g., 'PLOTFILE:12'.

510 Fatal Error Occurs During Reading of the File. File is missing, incorrect file type, or illegal data field encountered. Check the indicated file for possible problems. As with error number 500, this message may also indicate that there is not enough memory available to run the program if no other source of the problem can be identified.

520 Fatal Error Occurs During Writing to the File. Similar to message 510, except that it occurs during a write operation.

540 CAUTION: Met Station ID Mismatch with SURFFILE for SURFDATA, UAIRDATA or SITEDATA. The surface, upper air, or optional on-site station ID numbers specified on the ME pathway do not agree with the values on the first record of the surface meteorological data file. This is a non-fatal warning message, but the input data should be checked carefully to ensure that the correct data file has been used.

549 No RECTABLE/MAXTABLE/DAYTABLE for Averaging Period. No printed output options selected for a particular averaging period. This is a non-fatal warning condition for the TERRAIN model.

550 File Unit/Name Conflict for the Output Option. This error indicates that a problem exists with the filename and file unit specification for one of the special purpose output files. The associated keyword is provided as a hint. The same filename may have been used for more than one file unit, or vice versa.

560 User Specified File Unit Less Than or Equal to 25 for OU Keyword. A file unit of less than or equal to 25 has been specified for the indicated special purpose output files. This is a fatal error condition. File units of less than or equal to 25 are reserved for system files. Specify a unit number in the range of 26 to 100.

565 Possible conflict With Dynamically Allocated FUNIT. A file unit specified for the indicated special purpose output files is in the range 1-100, and may therefore conflict

AR0068793

with file units dynamically allocated for special purpose files by the model. This is typically a non-fatal warning condition

570 Problem Reading Temporary Event File for Event - The AERMOD model stores high value events in a temporary file that is used to create the input file for EVENT processing, if requested, and also to store the high values for the summary tables at the end of the printed output file. A problem has been encountered reading this file possibly because the concentration value was too large and overflowed the fixed format field of F14.5

580 End-of-File Reached Trying to Read a Data File - The AERMOD model has encountered an end-of-file trying the read the indicated file. This may appear when trying to "re-start" a model run with the CO INITFILE card if there is an error with the initialization file. Check the data file for the correct filename

AR00068794

APPENDIX D. DESCRIPTION OF FILE FORMATS

D.1 AERMET METEOROLOGICAL DATA

Two files are produced for input to the AERMOD dispersion model by the AERMET meteorological preprocessor. The surface OUTPUT contains observed and calculated surface variables, one record per hour. The PROFILE file contains the observations made at each level of an on-site tower, or the one level observations taken from NWS data, one record per level per hour. The contents and format of each of these files is described below.

SURFACE OUTPUT

Header record

READ(1) *latitude, longitude, UA identifier, SF identifier, OS identifier, Version*

FORMAT (2(2X,A8),8X,' UA ID: ',A8,' SF ID: ',A8,' OS ID: ',A8,
8X,'VERSION: ',I5)

where *latitude* latitude specified in Stage 3 of AERMET

longitude longitude specified in Stage 3 of AERMET

UA identifier station identifier for upper air data, usually the WBAN number used to extract the data from an archive data set

SF identifier station identifier for hourly surface observations, usually the WBAN number used in extracting the data

OS identifier on-site identifier

Version version date of AERMET used to generate file

Data records

READ(1) *year, month, day, jday, hour, H, u*$_*$, *w*$_*$, *THETA*, Z_o, Z_{ref}, L, z_i, B, r, BV, $W_{sz_{ref}}$, *temp*, z_{ref}

FORMAT (3(I2,1X), I3,1X, I2,1X, F6.1,1X, 2(F6.3,1X), F5.0,1X, F8.1,1X, F5.2,1X, 2(F6.2,1X), F7.2,1X, F5.0, 3(1X,F6.2))

where *jday* Julian date

AR0068795

H	sensible heat flux ($W \cdot m^{-2}$)
u_*	surface friction velocity (m/s)
w_*	convective velocity scale (m/s)
$dTdz$	vertical potential temperature gradient in the 500 m layer above PBL
z_i	height of convectively-generated boundary layer (m)
z_{im}	height of mechanically-generated boundary layer (m)
L	Monin-Obukhov length (m)
z_o	surface roughness length (m)
Bo	Bowen ratio
r	Albedo
WS	wind speed ($m \cdot s^{-1}$)
WD	wind direction (degrees)
z_{ref}	reference height for WS and WD (m)
temp	temperature (K)
z_{ref}	reference height for *temp* (m)

The sensible heat flux, Bowen ratio and albedo are not used by AERMOD, but are passed through by AERMET for information purposes only.

PROFILE

READ( ) *year, month, day, hour, height, top,* WD*nn*, WS*nn*, TT*nn*, SA*nn*, SW*nn*

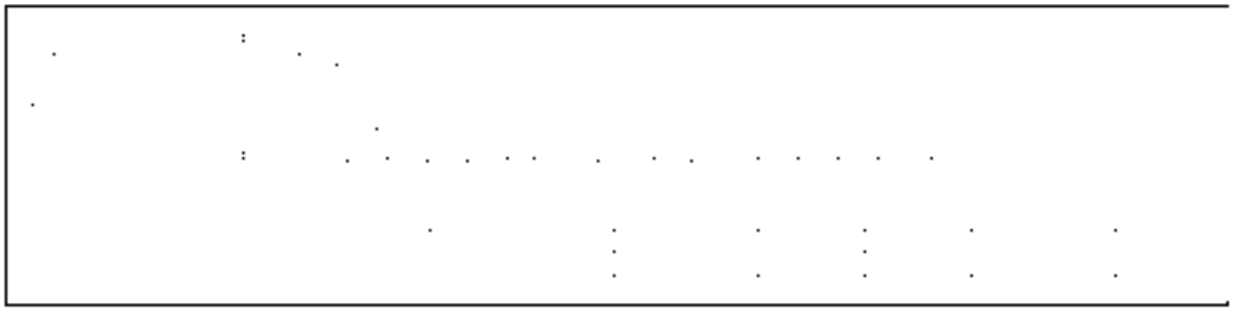
FORMAT (4I2,1X, F6.1,1X, I1,1X, F5.0,1X, F7.2,1X, F7.1, 1X,F6.1, 1X,F7.2)

where	*height*	measurement height (m)
	top	1 if this is the last (highest) level for this *hour*, or 0 otherwise
	WD*nn*	wind direction at the current level (degrees)
	WS*nn*	wind speed at the current level (m/s)
	TT*nn*	temperature at the current level (° C)
	SA*nn*	σ_θ (degrees)
	SW*nn*	σ_w ($m \cdot s^{-1}$)

AR0068796

D.2 THRESHOLD VIOLATION FILES (MAXIFILE OPTION)

The OU MAXIFILE card for the AERMOD model allows the user the option to generate a file or files of threshold violations for specific source group and averaging period combinations. The file consists of several header records, each identified with an asterisk (*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, and the threshold value. Any value equal to or exceeding the threshold value will be included in the file. The header also includes the format used for writing the data records and column headers for the variables included in the file. The variables provided on each data record include the averaging period, the source group ID, the date (YYMMDDHH) for the end of averaging period, the X and Y coordinates of the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, and the concentration value that violated the threshold. The following example from a threshold file identifies the contents of the MAXIFILE:



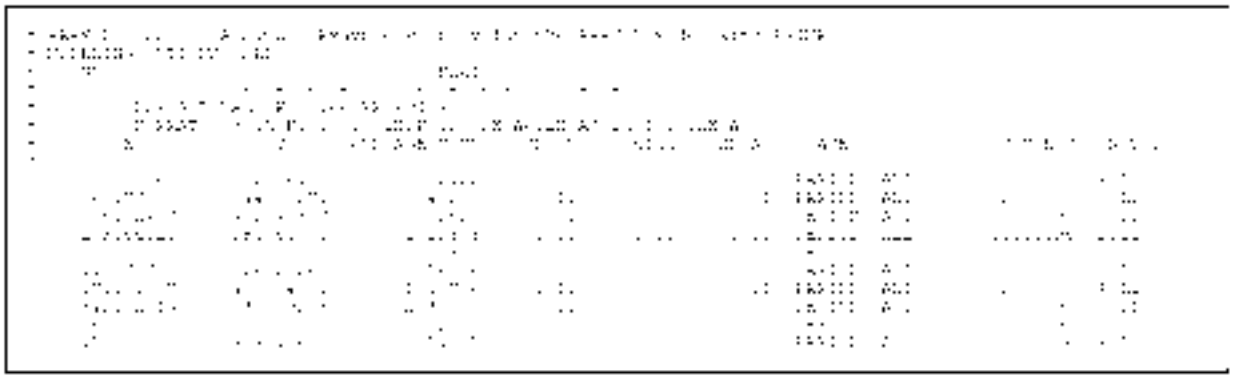
D.3 POSTPROCESSOR FILES (POSTFILE OPTION)

The OU POSTFILE card for the AERMOD model allows the user the option of creating output files of concurrent concentration values suitable for postprocessing. The model offers two options for the type of file generated - one is an unformatted file, and the other is a formatted file of X, Y, CONC values suitable for inputting to plotting programs.

AR0068797

The unformatted POSTFILE option generates a separate unformatted data record of concurrent values for each averaging period and source group specified. The averaging period and source group combinations may be written to separate files, or combined into a single file. Each record begins with the date variable for the end of the averaging period (an integer variable of the form YYMMDDHH), the averaging period (e.g., an integer value of 3 for 3-hour averages), and the source group ID (eight characters). Following these three header variables, the record includes the concentration values for each receptor location, in the order in which the receptors are defined on the RE pathway. The results are output to the unformatted file or files as they are calculated by the model.

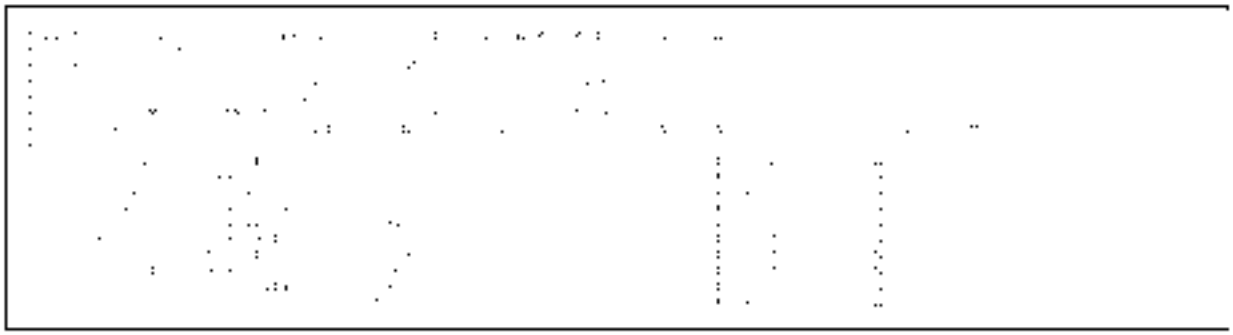
The formatted plot file option for the POSTFILE keyword includes several lines of header information, each identified with an asterisk (*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, and the number of receptors included. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for that location, receptor terrain elevation, hill height scale, flagpole receptor height, the averaging period, the source group ID, and the either the date variable for the end of the averaging period (in the form of YYMMDDHH) for short term averages or the number of hours in the period for PERIOD averages. The following example from a formatted postprocessor file for PERIOD averages identifies the contents of the POSTFILE:



AR0068798

D.4 HIGH VALUE RESULTS FOR PLOTTING (PLOTFILE OPTION)

The OU PLOTFILE card for the AERMOD model allows the user the option of creating output files of highest concentration values suitable for importing into graphics software to generate contour plots. The formatted plot files generated by the PLOTFILE include several lines of header information, each identified with an asterisk (*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period and source group included in the file, the high value (e.g. 2ND highest) included for plotting, and the number of receptors included. The header also includes the format used for writing the data records and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the concentration value for that location, receptor terrain elevation, hill height scale, flagpole receptor height, averaging period, the source group ID, and either the high value included for short term averages or the number of hours in the period for PERIOD averages. For short term averages, the PLOTFILE also includes the date variable for the end of the averaging period (in the form of YYMMDDHH). The PERIOD average PLOTFILE uses the same format for the data records as the PERIOD average formatted POSTFILE shown in the previous section. The following example from a plot file for high second highest 24-hour averages identifies the contents of the PLOTFILE:



The PLOTFILE output also includes a flag (**) identifying the receptor with the highest concentration. For short term averages, the flag precedes the date field. For period averages, the

AR0068799

flag precedes the field with the number of hours in the period.

D.5 TOXX MODEL INPUT FILES (TOXXFILE OPTION)

The OU TOXXFILE card for the AERMOD model allows the user the option to generate an unformatted file or files of threshold violations for a specific averaging period for use with the TOXX model component of TOXST. The file consists of three header records, including the first line of the title information for the run, the number of source groups, receptors and averaging periods, information on the type of receptor network, and the threshold cutoff value. Following the header records are pairs of records identifying the specific averaging period, source group and receptor location and corresponding concentration value for the values exceeding the user-specified threshold. If any source group exceeds the threshold for a given averaging period and receptor location, then the concentrations for all source groups are output for that period and receptor. The structure of the unformatted file for the AERMOD model TOXXFILE option is described below.

Record	=	Description
1		Title (80 characters)
2		IYEAR, NUMGRP, NUMREC, NUMPER, ITAB, NXTOX, NYTOX, IDUM1, IDUM2, IDUM3
3		CUTOFF, RDUM1, . . ., RDUM9

where TITLE: First line of title (80 characters)
IYEAR Year of simulation
NUMGRP No. of source groups
NUMREC Total no. of receptors
NUMPER No. of averaging periods (e.g., number of hours in the year)
ITAB 1 for polar grid, 2 for Cartesian grid, 0 for discrete receptors or mixed grids
NXTOX No. of x-coordinates (or distances) in receptor network
NYTOX No. of y-coordinates (or directions) in receptor network
IDUM1, IDUM2, IDUM3 dummy integer variables, arbitrarily set equal to zero
CUTOFF User-specified threshold for outputting results (g/m^3)
RDUM1, . . ., RDUM9 Dummy real variables (nine) arbitrarily set equal to zero

Following the header records, the file consists of pairs of records including an ID variable

AR0068800

identifying the data period, source group number and receptor number, and the corresponding concentration values. The number of values included in each record is controlled by the NPAIR PARAMETER, which is initially set at 100 in MODULE.MAIN1. The identification variable is determined as follows:

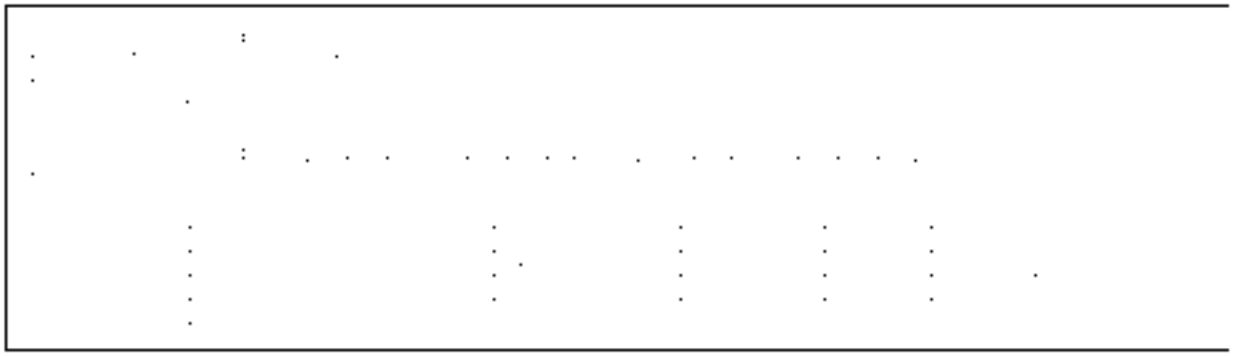
IDCONC = IPER*10000 + IGRP*1000 + IREC

where IPER = the year number for the year corresponding to the concentration value
IGRP = the source group number (the order in which the group was defined on the SO pathway)
IREC = the receptor number (the order in which the receptor was defined on the RE pathway)

D.6 MAXIMUM VALUES BY RANK (RANKFILE OPTION)

The OU RANKFILE card for the AERMOD model allows the user the option of creating output files of the maximum concentration values by rank, suitable for generating Q-Q or quantile plots. The data contained in the RANKFILE output is based on the MAXTABLE arrays, except that only one occurrence per data period is included. The formatted data files generated by the RANKFILE include several lines of header information, each identified with an asterisk (*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the averaging period included in the file, and the number of ranked values included. The header also includes the format used for writing the data records, and column headers for the variables included in the file. The variables provided on each data record include the rank, concentration value, X and Y coordinates of the receptor location, receptor terrain elevation, hill height scale, flagpole receptor height, and the source group ID. Each RANKFILE includes results for all of the source groups for a particular averaging period. Since the RANKFILE only include one occurrence per data period, the file may not include the number of ranked values requested, especially for evaluation data bases of limited duration. The following example identifies the contents of the RANKFILE:

AR0068801



D.7 ARC-MAXIMUM VALUES FOR EVALUATION (EVALFILE OPTION)

The OU EVALFILE card for the AERMOD model allows the user the option of creating output files of the arc-maximum concentration values for individual sources suitable for use in model evaluation studies. The data contained in the EVALFILE output is based on the maximum value along arcs of receptors, identified using the RE EVALCART card. Receptors may be grouped on arcs based on their distance from the source, or other logical grouping. The formatted EVALFILE output includes five records of information for each selected source and each hour of meteorological data. The information provided is as follows:

Record 1
- Source ID (eight characters)
- Date variable (YYMMDDHH)
- Arc ID (eight characters)
- Arc maximum χ/Q
- Emission rate for arc maximum (including unit conversions)
- Crosswind integrated concentration based on true centerline concentration
- Normalized non-dimensional crosswind integrated concentration

Record 2
- Downwind distance corresponding to arc maximum (m)
- Effective wind speed corresponding to arc maximum (m/s)
- Effective σ_v corresponding to arc maximum (m/s)
- Effective σ_w corresponding to arc maximum (m/s)
- σ_z corresponding to arc maximum (m)
- Effective plume height corresponding to arc maximum (m)

Record 3
- Monin-Obukhov length for current hour (m)
- Mixing height for current hour (m)
- Surface friction velocity for current hour (m/s)
- Convective velocity scale for current hour if unstable (m/s), or σ_v for current hour if stable (m)

AR0068802

Buoyancy flux for current hour (m^4/s^3)
Momentum flux for current hour (m^4/s^2)

Record 4 Bowen ratio for current hour
Plume penetration factor for current hour
Centerline χ/Q for direct plume
Centerline χ/Q for indirect plume
Centerline χ/Q for penetrated plume
Nondimensional downwind distance

Record 5 Plume height/mixing height ratio
Non-dimensional buoyancy flux
Source release height (m)
Arc centerline χ/Q
Developmental option settings place holder (string of 10 zeroes)
Flow vector for current hour (degrees)
Effective height for stable plume collections (m)

The following Fortran WRITE and FORMAT statements are used to write the results to the EVALFILE output

```
      WRITE(IFILE,9000) SRCID,SCAVDP,NUMDAT,AVGTIM,
     &                  ARCDIS(I),CHI(I),CHIDP(I),
     &                  CHIPEN(I),PCOF(I),PENDIS(I),
     &                  SYSTEP,ITEST,(DUMMY(I),I=1,10),
     &                  FLOW(I),TI,PLUHT,FSTAR,FS,FM,
     &                  BOWEN,DUM,(DUMMY(I),I=1,2),(DUMMY(I),I=1,2),
     &                  XNDIS,HSTAR,FSTAR,ZELEVREC,ARCDIS(I),
     &                  DFV,HSTACK(I)

9000  FORMAT(2X,A8,2X,A8,2X,A8,2X,A8,I10,2X,A8,
     &       4(2X,1PE12.5),2X,A8,2X,1PE12.5,
     &       4(2X,1PE12.5),2X,A8,2X,1PE12.5,
     &       2X,A8,2X,A8,2X,A8,2X,1PE12.5,
     &       2X,A8,2X,A8,2X,A8,2X,1PE12.5)
```

D.8 RESULTS BY SEASON AND HOUR-OF-DAY (SEASONHR OPTION)

The SEASONHR option is used to output a file containing the average results by season and hour-of-day. The formatted data files generated by the SEASONHR option include several lines of header information, each identified with an asterisk (*) in column one. The header information includes the model name and version number, the first line of the title information for the run, the list of modeling option keywords applicable to the results, the source group included in the file, and the number of receptors. The header also includes the format used for writing the

AR0068803

data records, and column headers for the variables included in the file. The variables provided on each data record include the X and Y coordinates of the receptor location, the average concentration value, receptor terrain elevation, hill height scale, flagpole receptor height, source group ID, number of non-calm and non-missing hours used to calculate the season-by-hour-of-day averages (the NHRS column), season index (the SEAS column with 1 for winter, 2 for spring, 3 for summer, and 4 for fall), and the hour-of-day for the concentration value. A sample from a SEASONHR output file is shown below.

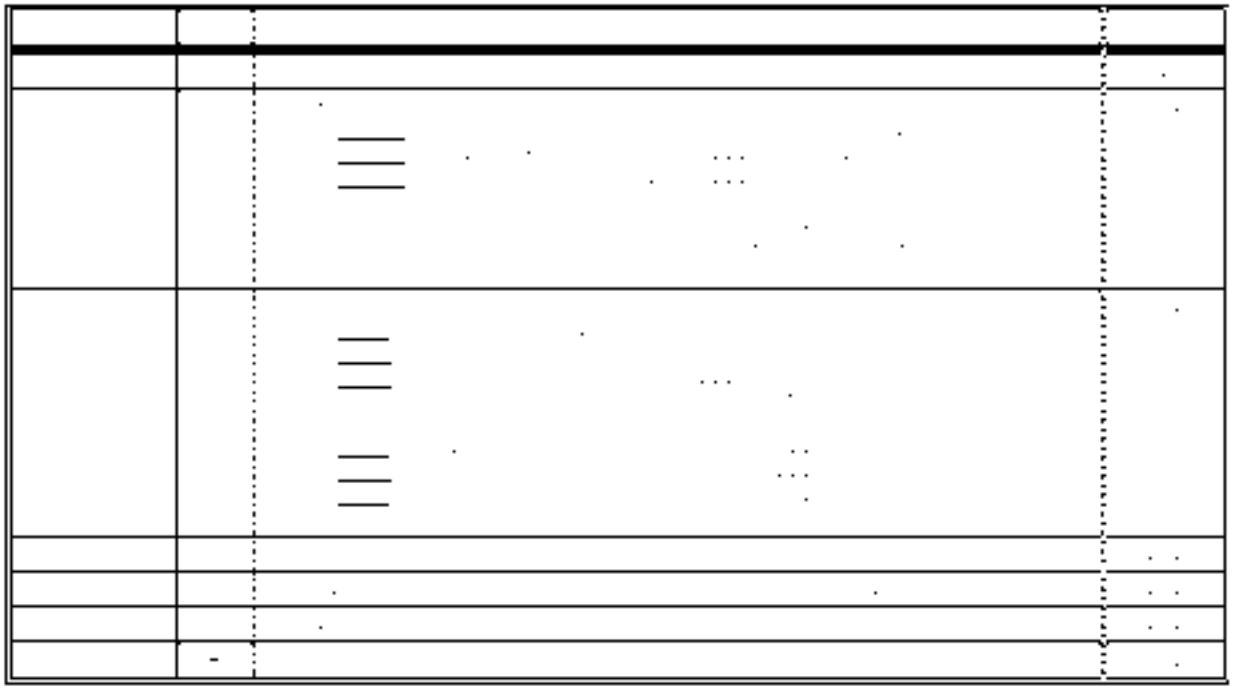
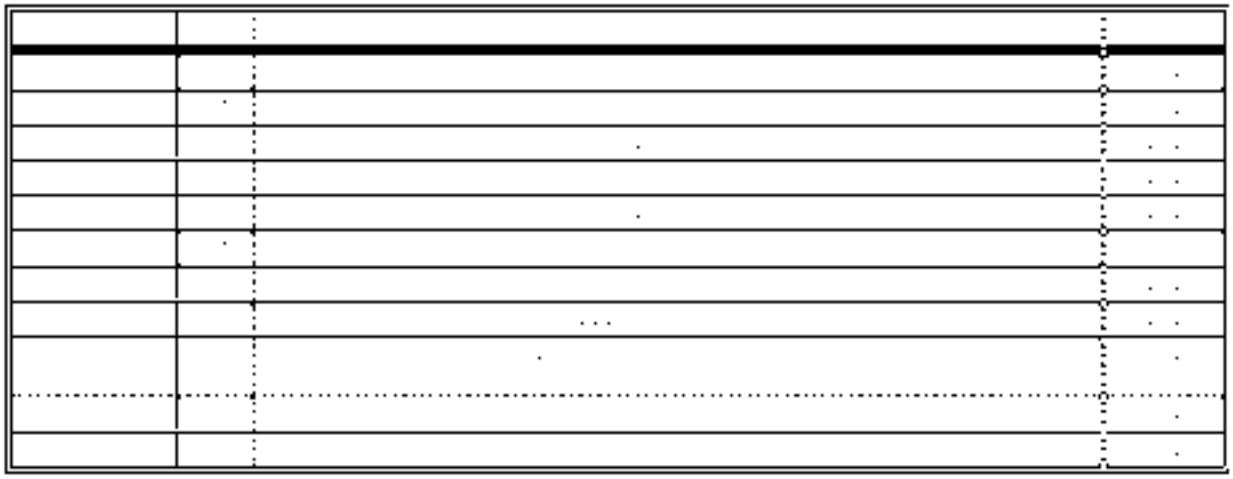
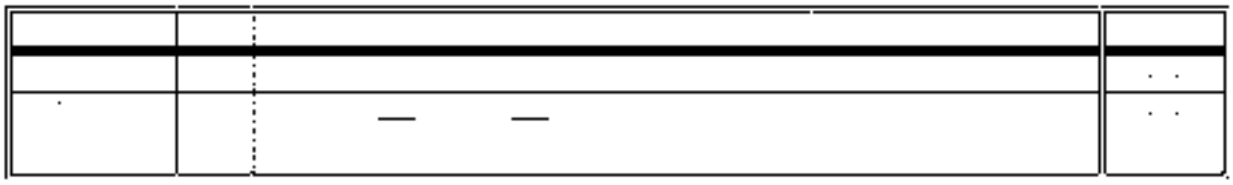
APPENDIX E.

QUICK REFERENCE FOR AERMOD

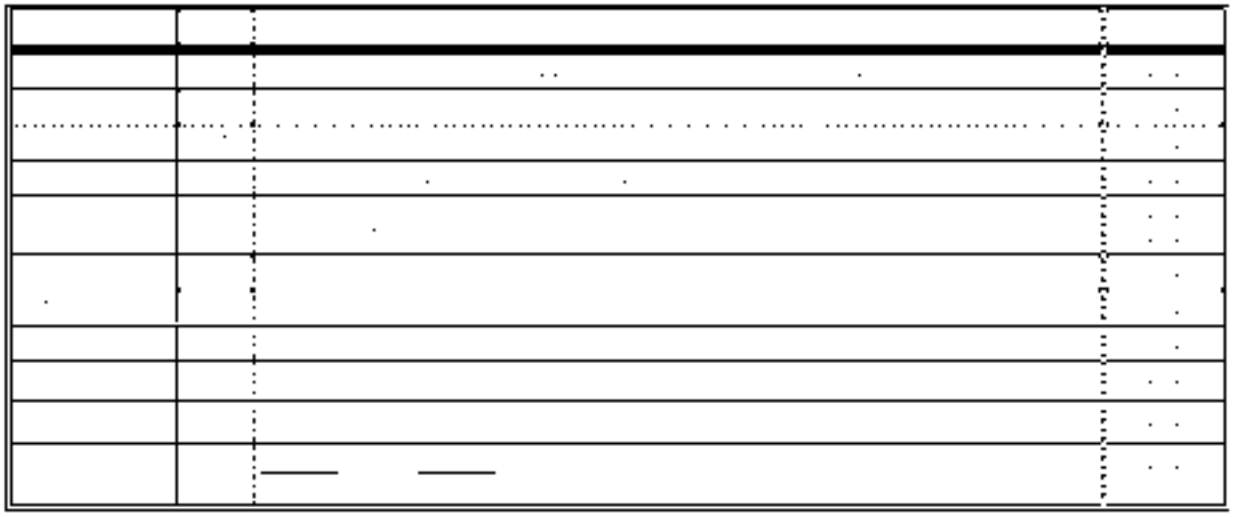
AR0068805







AR0068806



AR0068807

GLOSSARY

AERMAP -- AMS/EPA Regulatory Model (AERMOD) Terrain Preprocessor

AERMET -- AMS/EPA Regulatory Model (AERMOD) Meteorological Preprocessor.

AERMOD -- AMS/EPA Regulatory Model

ASCII -- American Standard Code for Information Interchange, a standard set of codes used by computers and communication devices. Sometimes used to refer to files containing only such standard codes without any application-specific codes such as might be present in a document file from a word processor program.

CD-144 Format -- Card Deck-144 data format available from NCDC for National Weather Service surface observations commonly used for dispersion models. Each record represents an 80-column "card image"

CO -- **CO**ntrol, the 2-character pathway ID for input runstream images used to specify overall job control options

CO Pathway -- Collective term for the group of input runstream images used to specify the overall job control options, including files, dispersion options, terrain options, etc

Directory -- A logical subdivision of a disk used to organize files stored on a disk

Dispersion Model -- A group of related mathematical algorithms used to estimate (model) the dispersion of pollutants in the atmosphere due to transport by the mean (average) wind and small-scale turbulence

DOS -- Disk Operating System. Software that manages applications software and provides an interface between applications and the system hardware components, such as the disk drive, terminal, and keyboard

Echo of Inputs -- By default, the AERMOD model will echo the input runstream images, character by character, into the main printed output file. This serves as a record of the inputs as originally entered by the user, without any rounding of the numerical values. The echoing can be suppressed with the NO ECHO option

EOF -- End-of-File.

EPA -- U. S. Environmental Protection Agency

Error message -- A message written by the model to the error-message file whenever an error is encountered that will inhibit data processing

AR0068808

Error Message File -- A file used for storage of messages written by the model.

EV -- EVent, the 2-character pathway ID for input runstream images used to specify event inputs for the Short Term EVENT model

EV Pathway -- Collective term for the group of input runstream images used to specify the event periods and locations for the Short Term EVENT model

EVENT Processing -- An option in the AERMOD model specifically designed to provide source contribution (culpability) information for specific events of interest, e.g., design values or threshold violations

Extended Memory -- Additional memory on 80386 and 80486 PCs that allows programs to address memory beyond the 640 KB limit of DOS. Special software is required to utilize this extra memory

Fatal Error -- Any error which inhibits further processing of data by the model. Model continues to read input images to check for errors during setup, and will continue to read input meteorological data during calculation phase

Flow Vector -- The direction towards which the wind is blowing

GMT -- Greenwich Mean Time, the time at the 0° meridian.

Informational Message -- Any message written to the error/message file that may be of interest to the user, but which have no direct bearing on the validity of the results and do not affect processing

Input Image -- User supplied input, read through the default input device, controlling the model options and data input. A single card or record from the input runstream file. Each input image consists of a pathway ID (may be blank indicating a continuation of the previous pathway), a keyword (may also be blank for continuation of a keyword), and possibly one or more parameter fields

Input Runstream File -- The basic input file to the AERMOD model controlling the modeling options, source data, receptor locations, meteorological data file specifications, and output options. Consists of a series of input images grouped into functional pathways.

Julian Day -- The number of the day in the year, i.e., Julian Day = 1 for January 1 and 365 (or 366 for leap years) for December 31

KB -- Kilobyte, 1000 bytes, a unit of storage on a disk

Keyword -- The 8-character codes that follow immediately after the pathway ID in the input run stream data

AR0068809

LST Local Standard Time

Math Co processor A computer chip used to speed up floating point arithmetic in a personal computer

MB -- Megabyte, one million bytes, a unit of storage on a disk

ME -- **ME**teorology, the 2-character pathway ID for input runstream images used to specify meteorological data options

MF Pathway -- Collective term for the group of input runstream images used to specify the input meteorological data file and other meteorological variables, including the period to process from the meteorological file for the AERMOD model.

Meteorological Data File -- Any file containing meteorological data, whether it be mixing heights, surface observations or on-site data

Missing Value -- Alphanumeric character(s) that represent breaks in the temporal or spatial record of an atmospheric variable

Mixing Height -- The depth through which atmospheric pollutants are typically mixed by dispersive processes

NCDC -- National Climatic Data Center, the federal agency responsible for distribution of the National Weather Service upper air, mixing height and surface observation data

NO ECHO -- Option to suppress echoing of the runstream input images to the main printed output file

NWS -- National Weather Service.

On-site Data -- Data collected from a meteorological measurement program operated in the vicinity of the site to be modeled in the dispersion analysis

OU -- **OU**tput, the 2-character pathway ID for input runstream images used to specify output options

OU Pathway -- Collective term for the group of input runstream images used to specify the output options for a particular run

Overlay -- One or more subprograms that reside on disk and are loaded into memory only when needed

Pasquill Stability Categories -- A classification of the dispersive capacity of the atmosphere, originally defined using surface wind speed, solar insolation (daytime) and cloudiness

AR0068810

(nighttime). They have since been reinterpreted using various other meteorological variables.

Pathway -- One of the six major functional divisions in the input runstream file for the AERMOD model. These are **CO**ntrol, **SO**urce, **RE**ceptor, **ME**teorology, **EV**ent, and **OU**tput (see these entries in this section for a description).

PC -- Personal Computer, a wide ranging class of computers designed for personal use, typically small enough to fit on a desktop.

Quality Assessment -- Judgment of the quality of the data.

Quality Assessment Check -- Determining if the reported value of a variable is reasonable (see also Range Check).

Quality Assessment Message -- Message written to the error/message file when a data value is determined to be suspect.

Quality Assessment Violation -- Occurrences when data values are determined to be suspect (see also Range Check Violation).

RAM -- Random Access Memory on a personal computer.

RAMMET -- Meteorological processor program used for regulatory applications capable of processing twice-daily mixing heights (TD-9689 format) and hourly surface weather observations (CD-144 format) for use in dispersion models such as AERMOD, CRSTER, MPTER and RAM.

Range Check -- Determining if a variable falls within predefined upper and lower bounds.

Range Check Violation -- Determination that the value of a variable is outside range defined by upper and lower bound values (see also Quality Assessment Violation).

RE -- **RE**ceptor, the 2-character pathway ID for input runstream images used to specify receptor locations.

RE Pathway -- Collective term for the group of input runstream images used to specify the receptor locations for a particular run.

Regulatory Applications -- Dispersion modeling involving regulatory decision-making as described in the Guideline on Air Quality Models, which is published as Appendix W of 40 CFR Part 51 (as revised).

Regulatory Model -- A dispersion model that has been approved for use by the regulatory offices of the EPA, specifically one that is included in Appendix A of the Guideline on Air Quality Models, (as revised), such as the AERMOD model.

AR0068811

Runstream File -- Collectively, all input images required to process input options and input data for the AERMOD model

SCRAM -- Support Center for Regulatory Air Models - part of EPA's website on the internet, used by EPA for disseminating air quality dispersion models, modeling guidance, and related information

Secondary Keyword -- A descriptive alphabetical keyword used as a parameter for one of the main runstream keywords to specify a particular option

SO -- **SO**urce, the 2 character pathway ID for input runstream images used to specify input source parameters and source groups

SO Pathway -- Collective term for the group of input runstream images used to specify the source input parameters and source group information

Station Identification -- An integer or character string used to uniquely identify a station or site as provided in the upper air (TD-5600 and TD-6201), mixing height (TD-9689), and surface weather (CD-144 and TD-3280) data formats available from NCDC. There are no standard station numbers for on-site data or data image screening data, and the user may include any integer string.

Subdirectory -- A directory below the root, or highest level, directory or another subdirectory, used for organization of files on a storage medium such as a PC hard disk

Surface Weather Observations -- A collection of atmospheric data on the state of the atmosphere as observed from the earth's surface. In the U.S. the National Weather Service collect these data on a regular basis at selected locations

Surface Roughness Length -- Height at which the wind speed extrapolated from a near-surface wind speed profile becomes zero

Syntax -- The order, structure and arrangement of the inputs that make of the input runstream file, specifically, the rules governing the placement of the various input elements including pathway IDs, keywords, and parameters.

TD-1440 Format -- A format available from NCDC for summarizing NWS surface observations in an 80-column format; the CD-144 format is a subset of this format. This format has been superseded by the TD-3280 format

TD-3280 Format -- The current format available from NCDC for summarizing NWS surface weather observations in an elemental structure, i.e., observations of a single atmospheric variable are grouped together for a designated period of time

TD-5600 Format -- A format available from NCDC for reporting NWS upper air sounding data. This format has been superseded by the TD-6201 format

AR0068812

TD-6201 Format -- The current format available from NCDC for reporting NWS upper air data. The file structure is essentially the same as the TD-5600 format except that there is more quality assurance information

TD-9689 Format -- The format available from NCDC for mixing heights estimated from morning upper air temperature and pressure data and hourly surface observations of temperature

Unformatted File -- A file written without the use of a FORTRAN FORMAT statement, sometimes referred to as a binary file

Upper Air Data (or soundings) -- Meteorological data obtained from balloon-borne instrumentation that provides information on pressure, temperature, humidity, and wind away from the surface of the earth

Vertical Potential Temperature Gradient -- The change of potential temperature with height, used in modeling the plume rise through a stable layer, and indicates the strength of the stable temperature inversion. A positive value means that potential temperature increases with height above ground and indicates a stable atmosphere.

Warning Message -- A message written by the model to the error message file whenever a problem arises that may reflect an erroneous condition, but does not inhibit further processing

15. SUPPLEMENTARY NOTES

16. ABSTRACT: This User's Guide for the AMS/EPA Regulatory Model (AERMOD) provides user instructions for the AERMOD model. The technical description of the AERMOD algorithms is provided in a separate document. The revised AERMOD model described in this user's guide includes the following modifications and enhancements: the PRIME building downwash algorithms based on the ISC-PRIME model, use of allocatable arrays for data storage, incorporation of EVENT processing for analyzing short-term source culpability, post-1997 PM10 processing, a non-regulatory default TOXICS option that includes optimizations for area sources and the Sampled Chronological Input Model (SCIM) option, explicit treatment of multiple-year meteorological data files and the ANNUAL average, and options to specify emissions that vary by season, hour of day and day of week.

APPENDIX "A"

Trip Generation Table

For purposes of this Table the floor area shall be the square footage confined by the outside surface of the exterior walls of a building, except for the square footage devoted to vehicle parking, necessary interior driveways and ramps.

LAND USE	P.M. PEAK TRIPS PER HOUR
Automobile Uses:	
*Car Wash	110.0 per car wash
*Gas Station	3.6 per pump
*Repair/Service	6.0 per service stall
Car rental/Used car sales	1.0 per 1,000 sq. ft. of lot size
New car sales	4.6 per 1,000 sq. ft. of floor area
Banking Uses	
*Walk-in Bank	16.7 per 1,000 sq. ft. of floor area
*With Drive-through	25.3 per 1,000 sq. ft. of floor area
*Savings & Loan	5.3 per 1,000 sq. ft. of floor area
*With Drive-through	6.8 per 1,000 sq. ft. of floor area
Shopping Center	
*Less than 30,000 sq. ft.	14.6 per 1,000 sq. ft. of floor area
30,000 sq. ft. or more	The trips per p.m. peak hour shall be determined by the following formula:

(-0.001A + (323.5/A) + 3.9) per 1,000 sq. ft. of floor area; Where A = Floor Area/1,000

Hospitals:	
General	1.2 per bed
Convalescent	0.2 per bed
Lodging:	
Hotel, Motel, or Apartment Hotel	0.7 per guest room
*Multi-Story Apartments, Condominiums, Townhomes or Single-Family Housing	0.7 per dwelling unit

*LOCAL SERVING USES

AR0068816

Retail Uses:	
*Supermarket	6.8 per 1,000 sq. ft. of floor area
*Convenience Market	46.7 per 1,000 sq. ft. of floor area
*Specialty Retail (Free standing retail not in a shopping center excluding high Trip generating land uses)	5.0 per 1,000 sq. ft. of floor area
*Furniture Store (More than 30,000 sq. ft.)	0.4 per 1,000 sq. ft. of floor area
*Other Commercial (High Trip generating land uses such as video stores, bakeries, yogurt shops, etc.)	9.6 per 1,000 sq. ft. of floor area
*Entertainment Theater	0.15 per seat
Discount Stores (More than 50,000 sq. ft.)	6.1 per 1,000 sq. ft. of floor area
Industrial:	
Industrial Park	1.0 per 1,000 sq. ft. of floor area
Manufacturing	0.8 per 1,000 sq. ft. of floor area
Warehousing (50,000 sq. ft. or more)	1.6 per 1,000 sq. ft. of floor area
*Storage (Less than 50,000 sq. ft.)	0.3 per 1,000 sq. ft. of floor area
Airport Facilities, other than Passenger Terminals, such as maintenance or cargo facilities	0.8 per 1,000 sq. ft. of floor area
Mini-Warehouse (Less than 30,000 sq. ft.)	0.3 per 1,000 sq. ft. of floor area
Science Research & Development	0.9 per 1,000 sq. ft. of floor area

*LOCAL SERVING USES

AR0068817

Offices:	
Commercial Office under 100,000 sq. ft.	2.6 per 1,000 sq. ft. of floor area
Commercial Office 100,000 sq. ft. or more	2.0 per 1,000 sq. ft. of floor area
Government Office	2.9 per 1,000 sq. ft. of floor area
Medical Office	3.9 per 1,000 sq. ft. of floor area
Parking Lot - Commercial:	0.0 Trips
Restaurants:	
*Low Turnover	6.1 per 1,000 sq. ft. of floor area
*High Turnover	10.5 per 1,000 sq. ft. of floor area
*Fast Food (A restaurant immediately adjacent to an automobile parking area, where patrons are served at a counter or a drive-through)	31.6 per 1,000 sq. ft. of floor area
***Child Care/Nursery**	12.3 per 1,000 sq. ft. of floor area
Health Club	3.6 per 1,000 sq. ft. of floor area

Dear Mr. Wulkan:

Millennium Hollywood Project – Request for Wastewater Service Information

This is in response to your September 8, 2011 letter requesting wastewater service information for the proposed project. The Bureau of Sanitation, Wastewater Engineering Services Division (WESD), has conducted a preliminary evaluation of the potential impacts to the wastewater system for the proposed project.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Existing			
Capital Records Complex	150 GPD/1000 SQ.FT	114,303 SQ.FT	(17,145)
Proposed			
Office	150 GPD/1000 SQ.FT	115,542 SQ.FT	17,331
Capital Records Complex	150 GPD/1000 SQ.FT	114,303 SQ.FT	17,145
Commercial Retail	80 GPD/1000 SQ.FT	115,000 SQ.FT	9,200
Food and Beverage	300 GPD/1000 SQ.FT	28,750 SQ.FT	8,625
Fitness/Sports Club	250 GPD/1000 SQ.FT	92,000 SQ.FT	23,000
Residential: Hotel	130 GPD/DU	200 DU	26,000
Residential: Studio/1-BR	120 GPD/DU	166 DU	19,920
Residential: 2-BR	160 GPD/DU	314 DU	50,240
Residential: 3-BR	200 GPD/DU	12 DU	2,400
Total			**156,716**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes an existing 8-inch line on Argyle Ave, an 8-inch line on Vine St, and a 12-inch line on Yucca St. The sewage from the existing lines 8-inch lines on Argyle Ave and Vine St join at the intersection of Sunset Blvd and Vine St before discharging into a 33-inch line on Vine St. The sewage from the existing 12-inch line on Yucca St feeds into a 21-inch line on Cole Ave before splitting and discharging into a 27-inch line on Willoughby Ave and 20-inch line on Melrose Ave. Figure 1 shows the details of the sewer system within the vicinity of the project.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
8	Argyle Ave	30	931,513 GPD
8	Vine St	48	725,182 GPD
12	Yucca St	14	676,120 GPD
33	Vine St	24	21.11 MGD
21	Cole Ave	11	5.46 MGD
27	Willoughby Ave	20	6.16 MGD
20	Melrose Ave	32	1.56 MGD

* No gauging available

Based on the estimated flows, it appears the existing sewer system with the exception of the one on Argyle Ave might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Treatment Plant, which has sufficient capacity for the project.

If you have any questions, please call Kwasi Berko of my staff at (323) 342-1562.

Sincerely,

Ali Poosti, Acting Division Manager
Wastewater Engineering Services Division
Bureau of Sanitation

CalRecycle

Waste Characterization

Service Sector: Estimated Solid Waste Generation and Disposal Rates

NOTE: More recent estimates for waste disposal, diversion, and generation rates are available for a limited number of business groups. These can be found in Table 2 of CalRecycle's *2006 Waste Disposal and Generation Studies for Selected Industry Groups*.

The data on this page is not official CalRecycle data; please read our disclaimer and background information.

Also see listings for Commercial / Industrial / Institutional / Residential establishments.

Waste Generation Source	Gen Rate	Units of Measure	Source Date	Source	Notes
Golf course	0.5	lb/golfer/day	Apr 1992	Stevenson Ranch Draft Environmental Impact Report (EIR) (Phase IV), LA County	EIR cites source as Ultrasystems
Hotel	2	lb/room/day	Apr 1992	Stevenson Ranch Draft EIR (Phase IV), LA County	EIR cites source as Ultrasystems
Hotel/motel	4	lb/room/day	Dec. 1991	Draft EIR for North Hills Development (Santa Clarita)	EIR cites City of LA Bureau of Solid Waste, 1989, as source; assumes 750 SF/room
Hotel/motel	2	lb/room/day	May 1997	Guide to Solid Waste and Recycling Plans for Development Projects (Santa Barbara County Public Works Department)	Cites SWANA Tech. Bull. 85-6, Recovery Sciences, 1987; and Matrix Mgmt Group, "Best Management Practices Analysis for Solid Waste"
Motel	3.6	lb/room/day	Apr 1993	Draft EIR for South Gate Commercial Corridors Redevelopment Project	Cites City of LA Dept. of City Planning document "EIR Manual for Private Projects" as source
Other services*	3.12	lb/100 sq ft/day	May 1997	Guide to Solid Waste and Recycling Plans for Development Projects (Santa Barbara County Public Works Department)	Cites SWANA Tech. Bull. 85-6, Recovery Sciences, 1987; and Matrix Mgmt Group, "Best Management Practices Analysis for Solid Waste"
Restaurant	1	lb/seat/day	Apr 1992	Stevenson Ranch DEIR (Phase IV), LA County	EIR cites source as Ultrasystems; assumes 50% of restaurant is seating and 16 SF/seat
Restaurant	0.005	lb/sq ft/day	Dec 1991	Draft EIR for North Hills Development (Santa Clarita)	EIR cites City of LA Bureau of Solid Waste, 1989, as source
Restaurant (fast food)	7	lb/employee/day	May 1997	Guide to Solid Waste and Recycling Plans for Development Projects (Santa Barbara County Public Works Department)	Cites SWANA Tech. Bull. 85-6, Recovery Sciences, 1987; and Matrix Mgmt Group, "Best Management Practices Analysis for Solid Waste"

* Includes museums, art galleries, theaters, recreational services, health clubs, repair services

CalRecycle does not officially endorse any of the waste generation rates in the preceding table, and cannot validate their accuracy. However, they may be useful in providing a general level of information for planning purposes.

The table contains information extracted from various sources, which are cited. Please note that several of the documents listed were developed by city or county planning or environmental departments. Your city or county planning or environmental agency may be a source of information for a local project.

FOREWORD

At present more than half of the water supply of the South Coastal area of Southern California is furnished by water from the ground water basins of the area. In general, the drafts on the ground water basins exceed the supply thereto, resulting in overdraft conditions that are expressed by the alarming decline of ground water levels. The lowered ground water levels result in higher costs of pumping, increased problems of maintaining proper salt balance, and in some basins, sea water or connate brine intrusion which threatens destruction of the utilization of the ground water basin.

The serious nature of this continuing and increasing overdraft of the ground water supply led many local water agencies and water users associations to request that detailed information on geology, hydrology, and basin operation be provided to assist them in overcoming or at least alleviating this dangerous condition. As a result of these requests, many by way of formal resolutions, the Southern District of the Department of Water Resources formulated a comprehensive program for an investigation of the planned utilization of the major ground water basins of Southern California.

The general objective of the basic program is to formulate a coordinated plan of operation that will permit the maximum utilization of these ground water basins in conserving the local water supply and in storing and distributing imported water. To attain this objective the work program for each basin investigation is divided into three phases: geology, hydrology, and operation and management. The first two phases provide the basic information required to develop a plan for coordinated ground water basin operation and will be detailed in interim reports as the studies are completed in each ground water basin. The final report on the planned utilization of

AR0068835

each ground water basin will summarize the information contained in the interim reports and present and compare the alternative plans for coordinated operation of the ground water basin.

The Legislature provided funds during the 1959 General Session to initiate this program. The first ground water basins to be investigated underlie the Coastal Plain of Los Angeles County. The first phase of this investigation, the geologic study, has been completed and is presented in detail in this report.

ADDRESS REPLY TO
P. O. BOX 388 SACRAMENTO
1120 N STREET HICKORY 5-

STATE OF CALIFORNIA

Department of Water Resources

SACRAMENTO

June 14, 1961

The Honorable Edmund G. Brown, Governor, and
Members of the Legislature of the
State of California

Gentlemen:

I have the honor to transmit herewith Appendix A, "Ground Water Geology", a portion of Bulletin No. 104, entitled "Planned Utilization of the Ground Water Basins of the Coastal Plain of Los Angeles County".

This appendix presents data and conclusions on the extent, thickness, and lithology of the aquifers comprising the ground water basins of the Coastal Plain of Los Angeles County. It also describes the connections between the different aquifers, the areas where recharge to the aquifers are possible from the ground surface, and the effects of structural features on the movement of water through the basins. Geologic studies of this nature are required for proper operation of the ground water basins and for adequate planning and design of facilities for utilization of imported water.

Sincerely yours,

William E. Warne

Director

AR0068846

ACKNOWLEDGMENTS

Valuable assistance and data used in this investigation were contributed by agencies of the Federal Government and of the State of California, by cities, counties, public districts, and by private companies and individuals. This cooperation is gratefully acknowledged.

Special mention is made of the helpful cooperation of the following:

California Department of Public Works, Division of Highways

California Department of Natural Resources, Division of Mines and Division of Oil and Gas

Long Beach State College

Los Angeles County Engineers Office, Water Works Districts

Los Angeles County Flood Control District

Los Angeles Museum of History, Science, and Art; especially Theodore Downs, Curator of Vertebrate Paleontology and George P. Kanakoff, Curator of Invertebrate Paleontology

AR0068848

CHAPTER I. INTRODUCTION

This report describes the geology of the water-bearing sediments and formations of the Coastal Plain of Los Angeles County, California. The information it contains will be used to support studies of the hydrology, water quality, and operational characteristics of the ground water basins in the area. The material presented includes a description of the geologic history of the area, the composition and extent of the aquifers of the coastal plain, the areas where recharge to the aquifers from the ground surface could occur, the geologic structure affecting the occurrence and movement of ground water through the area, and finally, a description of the individual ground water basins which comprise the coastal plain.

Description of Area

The area covered in this report is shown on Plate 1, entitled "General Geology and Location of Area of Investigation". In Los Angeles and Orange Counties there is a large coastal plain which extends inland from the Pacific Ocean. The ground water basins underlying this coastal plain are complex and the area is large; therefore, in order to adequately meet the objectives of this investigation within a reasonable period of time, the area was somewhat arbitrarily divided along the Los Angeles-Orange County line. This report considers only the northern portion of the coastal plain, that within Los Angeles County. The geology of the southern portion of the coastal plain within Orange County will be developed and reported upon subsequently.

The area of investigation is then the Coastal Plain of Los Angeles County. It is bounded by the Santa Monica Mountains on the north, the low-lying Elysian, Repetto, Merced, and Puente Hills on the northeast, the

AR0068849

Los Angeles-Orange County line on the southeast, and the Pacific Ocean on the south and west. This 480 square mile portion of the coastal plain slopes gently from the bordering highlands on the north and northeast toward the ocean. The locations of these features are shown on Plate 2, entitled "Physiographic Features and Ground Water Basins".

Three main stream channels, the Los Angeles River, San Gabriel River, and Rio Hondo flow into the area from the interior valleys. The Los Angeles River drains the San Fernando Valley and flows southward across the coastal plain to discharge into the Pacific Ocean at San Pedro Bay. The San Gabriel River and Rio Hondo drain the San Gabriel Valley. The Rio Hondo flows southwesterly across the coastal plain and joines the Los Angeles River about midway in its journey across the coastal plain. The San Gabriel River flows southerly across the coastal plain and discharges into the Pacific Ocean about six miles southeast of the mouth of the Los Angeles River.

Authorization for Investigation

The Legislature, by Chapter 832, Statutes of 1929, directed that exploration and investigation be conducted to further a coordinated plan for the conservation, development, and utilization of the water resources of California. As a result of this legislation and pursuant to authorization contained in Sections 225 and 226 of the Water Code, a continuing hydrologic investigation of the Southern California area has been carried on. The work generally included, among other specific objectives, compilation of hydrologic data for use in a full scale investigation when needed and feasible.

Limited work on the investigation of the geology of the Coastal Plain of Los Angeles County was initiated in 1955 and carried on to the

AR0068850

extent funds were available in the following years. During the 1959 session of the Legislature, responsible local agencies in Los Angeles County were instrumental in obtaining a $150,000 augmentation of the Department's 1959-60 budget to finance an intensive investigation of the ground water basins of Southern California. With these funds, it has been possible to finish this study of the geology of the area and concurrently carry forward hydrologic and operational studies which will lead to completion of plans for operation of the ground water complex underlying coastal Los Angeles County.

Previous Investigations

Because of the coordinated efforts of both oil company and academic geologists to unravel the complex structures involved in the oil fields within the Coastal Plain of Los Angeles County, the geologic history of the deeper and older consolidated sediments is better known than that of the shallower water-bearing materials. The younger shallower sediments have been studied where interest in ground water occurrence and movement has developed. Publications reporting those studies utilized in this investigation are listed in the bibliography.

W. C. Mendenhall of the United States Geological Survey first made a broad survey of wells and geology in the Upper Santa Ana Valley and the coastal plain in 1905. As ground water problems became apparent, interest in the younger alluvial deposits gained impetus and further geologic investigations were conducted.

In 1934, Bulletin No. 45, "South Coastal Basin Investigation, Geology and Ground Water Storage Capacity of Valley Fill", was published by the California Department of Public Works, Division of Water Resources. The fragmentary geologic work, both published and unpublished, which existed

AR0068851

up to that time was reviewed, and original field and laboratory studies of the water-bearing sediments of the area were made.

After publication of Bulletin No. 45, relatively little work was accomplished on the water-bearing materials until the United States Geological Survey began an investigation which culminated in a series of open-file reports in the 1945-48 period. Some of these reports have been published in recent years. Both the published and unpublished Geological Survey reports are listed in the bibliography.

A report was prepared on an investigation of the West Coast Basin by the California Division of Water Resources, acting as Referee that was entitled "Report of Referee, California Water Service Company versus City of Compton, et al . . .", included considerable detailed geologic work in the West Coast Basin. This work was adopted, with minor modifications, for the purposes of this investigation.

Bulletin No. 170, "Geology of Southern California", published in 1954 by the California Department of Natural Resources, Division of Mines, contains many maps and articles on the geology of the coastal plain. One of the geologic contributions included in this bulletin is the "Geology of the Los Angeles Basin", by A. O. Woodford, J. E. Schoellhamer, J. G. Vedder, and R. F. Yerkes.

Scope of Report

The studies leading to this report began in 1955. At that time, it was planned to investigate only the area in and near Whittier Narrows. Field location of wells, both new and old, began in 1955 and continued sporadically in 1956. Interest in the geology of the coastal plain increased as the formation of the Central and West Basin Water Replenishment District

AR0068852

was discussed and initiated. By 1957 it had become apparent that geologic studies would have to include a larger portion of the coastal plain than was originally planned, in order to make the geologic picture complete. Consequently, the geologic studies have included all of the Coastal Plain of Los Angeles County, with particular emphasis on the Central Basin.

Previous detailed data accumulated for the West Coast Basin reference study was utilized to the maximum extent. In addition, about 200 drillers logs and electric logs of oil wells, 3,500 water well drillers logs, and 20 electric logs of water wells were used in this study. Additional information was obtained from records of test holes and seismic work of various agencies and companies. The results of over 40 transmissibility tests made during this study and during the West Coast Basin reference study were used. (See Table C, Attachment 2). Outcrops of important water-bearing formations were visited in the field and descriptions of temporary excavations visited by department personnel were carefully studied. Paleontological data were used where possible to aid in correlation of subsurface strata. In all areas, ground water levels and water quality data were used to the extent available in checking the validity of these correlations.

Approximately 50 geologic sections were compiled from the logs of water and oil wells. Fifteen of these are shown on plates included with this report. The cross sections are oriented in north-south and east-west directions, since this follows the prevailing highway net and more wells are found adjacent to major thoroughfares. This also made it convenient to form a grid in order to trace aquifers across the coastal plain. Wells were used wherever possible for matching the cross sections at the points of intersection.

AR0068853

This report contains six chapters in addition to this introduction. Chapter II, "Geologic History", relates the succession of geologic events for which evidence is present in the area of investigation. The chapter begins with the oldest known events and ends with Recent and presently active events. The third chapter, "Physiography", describes the land forms of the area of investigation. These land forms, or physiographic features, are the result of erosion combined with such transporting agents as water, gravity, and wind acting over a long period of time upon the sediments and rocks comprising the surface of the area. The present drainage system and the water-bearing quality of the physiographic features are discussed in this chapter.

Chapter IV, "Stratigraphy", describes the sediments and rocks now present in the coastal plain and the aquifers and aquicludes that have been identified in these sediments. The lithology of the more permeable Recent and Pleistocene sediments is discussed from the surface downward in some detail. The older underlying sediments and rocks, which are generally nonwater-bearing, are more briefly dealt with.

The fifth chapter, "Geologic Structure", is concerned with the structural features in the coastal plain and their relation to ground water movement. The structural features include anticlines, synclines, domes, and faults.

Chapter VI, "Description of Ground Water Basins", identifies the boundaries of the ground water basins contained within the coastal plain and takes up, basin by basin, the extent, thickness, and lithology of the aquifers and aquicludes within each. The connections between the different aquifers, the areas where recharge to the aquifers is possible from the

AR0068854

ground surface, and the effects of structural features on the movement of ground water through the basins is also discussed.

The last chapter, "Concluding Remarks", presents a brief statement on the value of the data contained in this report, and recommendations on possible expansion of the data-collection activities.

AR0068855

CHAPTER II. GEOLOGIC HISTORY

The geologic history of the coastal plain of Los Angeles County is exceedingly complex. Part of the area under study, the Santa Monica Mountains, is included in the Transverse Range geomorphic province, while the rest of the area is in the Peninsular Range province. Each of these two major geomorphic provinces has its own history of development and only large scale earth movements has affected both provinces simultaneously.

The physiography, structure, stratigraphy, and paleontology of an area must be carefully considered in any geologic history, and each subject is complex in its own way. The physiography or development of land forms and their relations to one another, are the product of periods of deformation, deposition of sediments, sea level changes, and erosional patterns. As for structure, pre-Pleistocene geologic structures are not always oriented in the same direction as structures formed since the Pleistocene began. The complex stratigraphy of the area has been further complicated by authors who have assigned different names to the same formation found in separate localities. Finally, paleontological data, in many cases essential to the proper identification of formations, are often lacking in critical areas, especially in sediments of Pleistocene age.

Succeeding sections of this chapter discuss the geologic history of the area of investigation and the broader scale regional geologic events which have played a role in that history. Some of the general features of the area of investigation and the surrounding region are shown on Plate 1, entitled "General Geology and Location of Area of Investigation". For the purposes of the discussion, four major periods are treated: pre-Miocene, Miocene-Pliocene, Pleistocene, and Recent. The geologic history as presented in this chapter is of a general nature, leaving much of the more detailed

AR0068856

historical relationships of the various formations to be discussed in succeeding chapters. The time divisions employed in discussing geologic events is that employed in most standard geologic publications and is illustrated on Plates 3A and 3B, entitled "Areal Geology". These plates also delineate the detailed areal geology compiled from various sources for this investigation.

Pre-Miocene History

Sediments deposited during the Triassic period are found in the Santa Monica Mountains and other areas of Southern California. Rocks similar in lithology to Jurassic rocks in other parts of California have been identified in the offshore islands, on the Palos Verdes Hills, on the San Pedro shelf in San Pedro Bay, and in Orange County, suggesting relatively widespread deposition of materials in Jurassic time. These Triassic and possibly Jurassic sediments were metamorphosed as a result of rock deformation and intrusions of igneous rocks, perhaps in Jurassic time, and certainly in Cretaceous time. The early history of the region is summarized by E. S. Larsen, Jr. et al in United States Geological Survey Bulletin 1070-B, "Lead-Alpha Ages of the Mesozic Batholiths of Western North America", (1958), a portion of which is as follows:

> "In southern California, the succession of events bearing on the age of the batholith is deposition of fossiliferous Triassic rocks, folding and mild metamorphism during the Triassic, deposition of volcanic rocks and associated sediments of possible Jurassic age, folding and metamorphism of all these rocks, intrusion of the batholith, erosion to a mature surface, deposition of gravels, followed by deposition of fossiliferous Upper Cretaceous sediments (Larsen, 1948). The batholithic rocks are thus certainly younger than the Triassic rocks and older than the Upper Cretaceous sediments. On the basis of regional evidence Larsen (1948) considered them to be early Late Cretaceous."

AR0068857

The Southern California batholith was intruded over a period of about nine million years ranging from 105 to 114 million years ago. This batholithic intrusion emplaced the granite and granodiorite which now underlie two large areas within the coastal plain. One of these is the "high", or upthrown block, underlying the Torrance Plain and the Palos Verdes Hills, and the other is the downdropped block beneath the Downey Plain; these features are shown on Plate 2 entitled "Physiographic Features and Ground Water Basins". The position of the basement rock has been verified in some areas by deep oil wells. The boundary between these two blocks is a fault system which lies beneath the Newport-Inglewood belt of hills.

Sediments of Early Cretaceous age have not been identified within the coastal plain. Lead-alpha dating of the granitic rock underlying the coastal plain indicates that this rock was probably being emplaced at that time and therefore that period was probably one of uplift and erosion. Portions of the Downey Plain, however, are believed to be underlain by Cretaceous sediments that were laid down upon the irregular surface of the crystalline basement. In the Torrance Plain, Cretaceous sediments are missing. Upper Cretaceous continental sediments, although not identified in the deeper parts of the coastal plain within Los Angeles County, were deposited unconformably on older formations in the Santa Monica and Santa Ana Mountains. In the Santa Monica Mountains an unconformity at the top of these basal continental Upper Cretaceous rocks indicates that some tilting occurred prior to the deposition of the overlying marine Upper Cretaceous sediments.

After minor structural deformation and erosion, marine sediments of Paleocene and Eocene age were deposited where the Santa Monica Mountains and the Santa Ana Mountains are now found, and probably on the coastal plain. During these two epochs, the area west of the Newport-Inglewood uplift was

AR0068858

probably a physiographic "high" (Corey, 1954). After another period of deformation and erosion, continental sediments of Oligocene age were deposited in some areas. These continental beds indicate that at least part of the region was above sea level in Oligocene time. Geographic distribution of the highlands and the shorelines at that time are only vaguely known.

Miocene and Pliocene History

Deposition of marine sediments resumed in early Miocene time, accompanied by intrusion and extrusion of as much as 4,000 feet of basaltic material. An orogeny or series of orogenic movements during mid-Miocene time caused differential depression of the existing early Miocene features and further encroachment of the sea. The main embayment affecting the Los Angeles area, known as the Capistrano embayment (Reed, 1943), extended in a northwesterly direction across Orange County to the vicinity of Los Angeles. The landward end of this embayment has been referred to in geological literature as the Los Angeles Basin. The embayment served as a catchment area for materials being eroded from surrounding highlands. It reached a maximum size during middle and upper Miocene time. As sediments collected in the downwarped basin, areas around the margins were uplifted, exposing more material to weathering and erosional processes. Thus the elevation of the source areas controlled the rate of deposition.

Emery (1960) states that the series of ocean basins now found off Coastal Southern California also originated in the Miocene epoch. As the Los Angeles Basin filled with sediments, the excess material overflowed into adjacent, nearshore basins. As these nearshore basins filled, the sediments spilled into basins farther from shore. This process of filling and overtopping continues within the present offshore basins.

AR0068859

Repeated unconformities in the sediments around the margins of the basin are primarily the result of the tectonic activity which accompanied the great downwarping of the basin and the rising of the adjacent highlands. By late Miocene or early Pliocene time the depth of the ocean embayment reached approximately 4,000 to 6,000 feet. Sediments approaching 5,000 feet in thickness were deposited during early Pliocene time. The shoreline extended to the east at least as far as Pomona and north as far as the San Gabriel Mountains. All features now on the coastal plain, including the Newport-Inglewood uplift, were probably minor subsea features, if indeed they existed at all. During late Pliocene time the downwarped Los Angeles basin became shallower and more limited in extent as it filled with another 3,500 feet of sediments. By the end of the Pliocene epoch the coastal plain had undergone repeated cycles of erosion and deposition accompanied by folding and faulting of the pre-existing sediments.

To summarize the geological events up to the end of Pliocene time: The Southern California batholith was emplaced during the Jurassic-Cretaceous epochs followed by further deposition and differential earth movements. During mid-Miocene time continued earth movement formed the embayment which contains the present coastal plain and raised the adjacent highlands. From mid-Miocene time until the end of Pliocene time the basin became shallower as it filled with sediments.

Sediments deposited during these early periods are for the most part nonwater-bearing. However, in some areas, potable water is present in the Pliocene sediments and in the older rocks.

Pleistocene History

The Pleistocene epoch is generally considered to have begun approximately 1,000,000 years ago. Major glaciation occurred at least four times during this epoch and caused fluctuations in sea level of at least 400 feet. The geologic events of Pleistocene time are illustrated on Plate 4, entitled "Generalized Pleistocene Chronology, Coastal Plain of Los Angeles County". The interpretation of events shown on Plate 4 were based on data collected during the course of this investigation, and time unit and sea level changes are modified from previous work by Hinds (1952), Fairbridge (1958), Hopkins (1959), Flint (1957), and others.

The shoreline during early Pleistocene time extended along the south side of the Santa Monica Mountains, and probably across the San Gabriel Valley, north of the area now occupied by the Elysian, Repetto, Merced and Puente Hills. These hills were offshore features in the process of emerging from the sea. From here, the sea apparently extended in a southeasterly direction along the southwestern edge of the Santa Ana Mountains.

Depth of the water in the Whittier Narrows area, according to microfossil data, exceeded 500 feet. Location of the old shoreline in the vicinity of the present Elysian, Repetto, Merced, and Puente Hills is based on marine fossils found in lower Pleistocene deposits in the vicinities of Whittier and Los Angeles Narrows. The Palos Verdes Hills were also covered by the ocean during early Pleistocene time. As time progressed, all these areas were elevated above sea level. Such larger physiographic features as the Santa Monica Mountains, San Gabriel Mountains, and the Santa Ana Mountains in Orange County probably existed at least as subsea features

AR0068861

since early Miocene time. During Pliocene and Pleistocene time these mountains were being uplifted to their present elevations.

Uplift, accompanied by erosion, was relatively rapid in some areas but slow in others. Meanwhile the downdropped areas continued to subside and the Coastal Plain of Los Angeles County was filled with more than 1,300 feet of sediments in early Pleistocene time. These sediments constitute the San Pedro formation. The Newport-Inglewood uplift is the only geologic feature on the coastal plain which may have occasionally risen above the surrounding flat-lying areas.

A very important unconformity separates lower and upper Pleistocene sediments throughout most of the California Coast Ranges. The orogeny suggested by this unconformity has been called the "Pasadena" or "Coast Range" disturbance (Reed, 1943b, p. 118). This hiatus, as shown on Plate 4, also referred to as the mid-Pleistocene orogeny, separates sediments which are of early and late Pleistocene age. The available evidence suggests, however, that several disturbances took place during the Pleistocene epoch and that the time of the unconformity could vary from area to area as erosion took place with each new uplift.

In spite of the relatively short span of geologic time involved, the rate of deformation in the coastal plain is adequate, if assumed continuous, to have formed most of the present features since the beginning of Pleistocene time. The assumption that tectonic activity has been continuous from the Pleistocene to the present time is supported by two pieces of geologic evidence. First, upper Pleistocene marine terraces are found on the Palos Verdes and Elysian Hills and on the Santa Monica Mountains at elevations varying from 200 feet to 1,000 feet above the present sea level. Equivalent terraces elsewhere are probably buried beneath the coastal plain

AR0068862

or have been removed by erosion. Secondly, differential tilting and deformation of Pleistocene and Recent aquifers has occurred, and changes in drainage patterns, wind gaps, and other features may have been caused in part by tilting or by uplift.

At the beginning of late Pleistocene time the Santa Monica Mountains, the Elysian Hills, Repetto Hills, Merced Hills, and the Puente Hills apparently were not as high above sea level nor as rugged as they are at the present time. They did, however, form the ocean shoreline of late Pleistocene time.

Marine fossils in upper Pleistocene sediments near the cities of Santa Monica, Beverly Hills and Los Angeles indicate that at one time the ocean extended inland across the La Brea Plain. Physiographic features similar to those of the La Brea Plain are found in the Montebello Plain. Together, they suggest that an upper Pleistocene shoreline existed near the south edge of the Repetto and Merced Hills. No certain evidence has been found that upper Pleistocene marine sediments were deposited in the vicinity of the Coyote Hills, although one late Pleistocene marine fossil locality has been reported (Hoskins, 1954). The lack of upper Pleistocene marine terraces and the continental nature of the Pleistocene deposits within the inland valleys led Eckis (Calif. D.W.R., 1934) to infer that late Pleistocene seas never extended inland beyond the present margins of the coastal plain.

Throughout late Pleistocene time sediments were being deposited primarily in the downfolded areas of the coastal plain and, probably simultaneously, were being deformed to some extent along such uplifts as the Palos Verdes Hills, Repetto Hills, Puente Hills, and possibly the Santa

AR0068863

Monica Mountains. These late Pleistocene sediments are named the Lakewood formation in this report. The period during which they were being deposited is illustrated on Plate 4. The Newport-Inglewood belt of hills may have existed as a line of very low hills in late Pleistocene time. These hills were undergoing continuous folding and faulting, but in general, deposition seems to have been the predominant process during this time. Outcrops clearly indicate that the basal portion of these upper Pleistocene deposits have been tilted as much as eleven degrees near areas of uplift, and have been downwarped beneath the present surface of the Downey Plain.

Although the western portion of the coastal plain was below sea level during at least part of late Pleistocene time, the nature of the upper Pleistocene deposits indicates that the shoreline apparently fluctuated and the resulting deposits are extremely complex.

World-wide changes of sea level during Pleistocene time caused the oceans to withdraw several times from the coastal plain. This was combined with intermediate periods of advance of the ocean onto the land. These recessions and advances occurred independently of the land movements. Plate 4 shows diagrammatically the possible fluctuations of sea level in Pleistocene and Recent times with suggested dates for each fluctuation. Withdrawals of the ocean caused erosion, and a rise in sea level caused deposition. That both of these conditions occurred at least once in late Pleistocene time is clearly seen in the stratigraphic sequences in the coastal plain. At least one deposit of marine sand (which now comprises the Gage aquifer) was exposed as the sea level fell, probably during the Illinoian glacial stage. A channel was eroded into these deposits by a river, or rivers, entering the coastal plain through the Los Angeles or Whittier Narrows or both. The resultant channel formed by these streams

AR0068864

extended, not toward Dominguez Gap as does the present Los Angeles River, but westerly toward Gardena and Redondo Beach. This channel was backfilled, with coarse river gravels that form the present Gardena aquifer, as sea level rose because of the melting of the Illinoian stage glaciers.

As sea level continued to rise (probably during the beginning of the Sangamon interglacial period), portions of the Gardena aquifer inland from Lynwood were removed by wave action, and what remained was then covered by marine sands, silts, and clays. These new sand deposits cannot now be differentiated from the lower sands, and together they form the Gage aquifer.

All evidence of the stream which flowed through the Gardena and Redondo Beach areas, as well as the Gage aquifer, was eventually covered by deposition of shallow marine silts, clays and some sands. In the El Segundo Sand Hills these deposits (exposed in deep cuts in 1957 and 1958) consisted of beach sands. These beach sands extended across what is now Ballona Gap onto Ocean Park Plain where they were partly interfingered with later upper Pleistocene alluvial fans deposited by streams emanating from the Santa Monica Mountains. Erosion has subsequently removed the dunes and underlying materials from Ballona Gap. Further inland, alluvial material was being deposited concurrently by the major stream systems. Since deposition of the Gage and Gardena aquifers and the overlying fine-grained sediments, they have all been slightly folded and cut by minor faults along the Newport-Inglewood uplift.

During the last lowering of sea level, at the beginning of the Wisconsin glacial stage, it appears that the beach sands along the El Segundo-Redondo Beach area were exposed to the winds and blown inland to form the present El Segundo Sand Hills and part of the Ocean Park Plain. As sea level fell and the sea retreated, the Los Angeles and San Gabriel River
