Selection of cities for these case studies was based on several criteria. A study city needed to have a climate that experienced freezing temperatures and received precipitation (snow and ice) that warranted removal methods, including snowplowing and salting. The APS units employed by the city needed to be pushbutton-integrated devices. A study city needed to have multiple APS installations, not just an isolated occurrence. Since one of the goals was to find out the long term effect of cold weather on the devices, cities with longer histories of APS use were preferred over those with shorter histories.

The research team used their knowledge of APS installation locations to draw up a list of cities that would be potential study sites. To add to this list, the team contacted distributors for the various manufacturers to learn of cities with APS installations. Of the 36 contact attempts made, two cities were selected for site visits. Another city provided written feedback but was not visited. Other cities were excluded due to lack of appropriate APS devices, short histories with devices (1 year or less), lack of sufficiently cold weather, and failure to establish contact with the appropriate individuals.

The two cities that were visited were Halifax, Nova Scotia and Waukesha, Wisconsin. These cities primarily use Novax and Polara equipment, respectively. Pushbutton-integrated APS have been in service in these cities for 1-2 years. Cities with long maintenance histories are difficult to find, due to the fact that pushbutton-integrated APS models have not been on the market for long. The city of Ann Arbor, Michigan provided written feedback but was not visited by the research team. Their APS devices, which had been in service for 5 years, had been sent to the manufacturer due to malfunction and it was unknown when they would be reinstalled at the intersections.

HALIFAX, NOVA SCOTIA

History and Background

Halifax has been using overhead-mounted Novax APS since 1998. Pushbutton-integrated units (Novax Vibrawalk) were introduced in 2003 and are now in operation at five intersections. The APS units were installed in response to requests from the Canadian National Institute for the

AR0072292

Blind (CNIB). All installations were retrofits to an existing signal and were performed by a contracted party.

Process and Procedure

Requests for APS installations come from the CNIB. They typically provide the city with a list of intersections where they would like APS installations. The city reviews the list and selects intersections for APS installations based on design of the intersection and available funding. If the intersection is suitable for pushbutton-integrated units, they install Novax Vibrawalks in addition to the overhead speaker APS units. Factors that affect the decision for pushbuttons include suitability of pole location and availability of wiring.

Funding

APS in Halifax were funded by the capital budget in a specified fund for pedestrian safety issues. There was also a federal 50-50 funding match in 2004 for APS installations.

APS Type and Features

Novax DS2000 Audible Pedestrian Signal for overhead speaker units

Novax Vibrawalk for pushbutton

APS features (pushbutton-integrated device installations):

- Locator tone
- Vibrotactile WALK indication
- Extended button press – when button is held for 3 seconds, the audible cuckoo will sound at the next WALK phase. Otherwise there will be no audible indication of the WALK phase.

Installation Issues

The APS unit is mounted on top of the pedestrian head and faces across the street. A typical configuration for a crossing in Halifax involves two APS units, one at each end of the crossing. The volume is set up so that the sound only reaches ¾ the way across the street. This enables the user to detect the second unit part way across the street and guide them in the proper direction. Setups with only one APS per crossing generated numerous noise complaints as the volume has to be higher to be heard across the street.

Most units are attached to aluminum poles but some locations have wooden poles, as shown in Figure 5-1. The APS units on wooden poles are clamped to the signal arm or pedestrian head. To access the pushbuttons, ½-inch PVC conduit is strapped to the wooden pole and an LB or liquid tight flex pipe provides access to the bottom of the pushbutton.

Figure 5-1. APS mounted on wooden pole.

The overhead speakers are typically mounted to the pedestrian signal head. Plastic (polycarbonate) signal heads gave problems with breaking when the APS speakers were mounted into them. Strong winds would push on the speaker and crack off the thin plastic of the signal head into which the speaker was mounted. In these cases, the speaker was mounted on the pole or

AR0072293

some other metal or wood surface, as shown in Figure 5-2. Pedestrian signal heads made of aluminum did not have this issue. In areas with less of a problem with strong winds, this may not be a concern.

Availability of wiring at the pole is an important issue. If sufficient wiring is installed with the signal, installing an APS later is much easier. Pulling wire later can become prohibitively expensive.

Figure 5-2. APS overhead speaker mounted on signal head support arm.

Maintenance

The city handles the maintenance of the devices. The APS overhead speakers generally will start having problems at the 5-year mark. They usually last from 5 to 10 years. Damage is usually due to salt and moisture. The Vibrawalk devices have not shown any problems during the two years they have been in service. Halifax engineers have also noted that moisture and insects can cause pushbuttons to short out, thereby causing the APS to activate every cycle.

Cold Weather Issues

Snow is a constant problem in the Halifax climate. Snow banks can prevent access to the pushbuttons when not cleared properly. For intersections where pushbuttons are used, pole placement becomes an important issue so that the all pedestrians can reach the button. Poles with pushbuttons located to the immediate left or right of the crosswalk give a better chance of being reached by pedestrians and having the snow cleared properly. Halifax uses mini-plows for clearing sidewalks. They anticipate that this could be a problem with stub poles (i.e., knocking them over), so the use of stub poles is generally avoided.

Being near to the ocean, moisture and salt in the air is a problem for Halifax, as is salt on the roads for de-icing. Current Novax APS units (overhead-mounted speakers) last about five years before problems arise. There have been no problems or failures with the Vibrawalks yet.

Other issues are caused by freezing temperatures. Pulling additional wire for a retrofit installation cannot be done in the winter due to ice in the wire conduits. Extreme cold can cause some signals cabinets to fail and thus the APS to fail.

Evaluation

The initial installations of non-pushbutton-integrated APS installations were configured to give the audible WALK cuckoo at every cycle. The city received complaints about noise, especially in the summer months when people had their windows open. Due to concerns about noise, these units were set up to be off (give no audible indication) from 11:00 pm to 6:00 am. Pushbutton-integrated installations, however, can be accessed 24 hours per day, but the audible

AR0072294

indication is given only when the button is held for three seconds. No feedback was reported on the pushbutton-integrated devices.

WAUKESHA, WISCONSIN

History and Background

Waukesha has been using pushbutton-integrated APS with speech messages since 2002. Prior to that, they used overhead speaker units which gave a chirp or chirps but were not activated by pushbutton. There are approximately 84 Polara Navigator units in service in Waukesha, most of which were installed during summer 2004. The move to pushbutton-integrated devices was motivated by requests from the local blind community, the Sight Loss Network, who introduced the city to the speech message capability of the Polara Navigator.

Process and Procedure

The initial APS installations were performed in one large campaign in the summer of 2004. These installations were scattered about town, but mainly focused on center city intersections. There is another installation campaign planned that will involve approximately 100 units. This will focus on installing devices at the rest of the center city intersections and moving outwards from there. It is also current Waukesha policy that any new signal installation will be accompanied by an APS installation.

Funding

APS in Waukesha are currently fully funded by Waukesha County Community Development Block Grant Program up to a specified amount per year. This funding includes time and materials.

APS Type and Features

Polara Navigator for pushbutton-integrated devices (the model type mainly in use) has four wires for installation and a separate control board that is configured remotely.

APS features:

- Pushbutton locator tone
- Vibrotactile WALK indication
- Extended button press
- Speech WALK indication
- Pushbutton information message by extended button press

AR0072295

Installation Issues

Installation of the devices is done by the city. If a signal to be retrofitted already has pushbuttons, this greatly facilitates APS installation. Even in these cases, however, the four-wire models still necessitate the pulling of extra wire.

Most of the signal poles are steel and accommodate the APS devices fairly easily. They try to have two poles per corner for every intersection. Sometimes stub poles are necessary if the signal poles are not close enough to the crosswalk. In one case, a lamp post was used successfully as a mount for an APS unit (*see Figure 5-3*), since aesthetics of the area placed restrictions on the number of poles that could be installed.

All but one of the existing APS installations were retrofits. However, all new signals in the future will have APS devices installed at the time of the signal installation.

Figure 5-3. APS mounted on lamp post.

Maintenance

There have been no maintenance issues for the APS units in their one year of service.

Cold Weather Issues

There were no significant issues related to APS units in cold weather during their one year of service. Previous pushbuttons (non-APS) had an estimated life of 10 years. The problems were mainly corrosion at the wire connections due to salt and moisture.

Waukesha uses mini-plows for removing snow from sidewalks. The manager of city snow plowing has expressed concern that stub poles may be damaged by these plows.

Evaluation

Devices in residential areas initially drew noise complaints. The city had been leaving the sound settings as the factory default. Once the volume was reduced, there were no complaints.

AR0072296

ANN ARBOR, MICHIGAN

History and Background

Ann Arbor has been using pushbutton-integrated APS since 2001. Five Polara Navigators were installed that year and none have been added since.

Process and Procedure

APS units are installed on the basis of recommendations from the Ann Arbor Commission on Disability Issues.

Funding

Approval for APS funding comes through the City Council. The money is budgeted from the Major Street Fund, which is a transportation fund. Currently, $50,000 is designated for the purchase, installation and maintenance of five APS.

APS Type and Features

Polara Navigator (pushbutton-integrated unit)

APS features:

- Pushbutton locator tone
- Extended button press
- Speech WALK indication
- Pushbutton information message by extended button press

Installation Issues

All APS installations were retrofits to existing signals. All poles were steel poles, and existing wiring was sufficient to accommodate APS installation. Some units are installed on pedestrian signal poles and some are mounted on the vertical pole of a signal mast arm.

Maintenance

Many of the APS units began to malfunction in 2004 and the city sent them back to the manufacturer. The problem was observed to be rusting of the devices.

Vandalism was an issue. There were several instances where the unit was knocked off the pole. The attachment bolts were replaced with bigger diameter bolts.

Cold Weather Issues

Little direct effect was seen from cold weather conditions. However, the use of salt may have contributed to rust that was experienced. The city engineers do not believe that the winter conditions contributed much to the signal operation.

Evaluation

There were several complaints about the noise of the locator tones, especially in the summer when people keep windows open. The locator tone sound was lowered in response.

AR0072297

When there were two APS units on a single pole, the locator tone for one was switched off to control noise.

To explain how the APS devices work, the city publicized the devices through a newspaper article and local cable broadcast.

CHAPTER 6
ENGINEERING EVALUATION

INTRODUCTION

The engineering evaluation was conducted to acquire feedback on the physical installation, operation, and maintenance of APS devices in the two cities where the primary experiments were conducted – Tucson, Arizona and Charlotte, North Carolina. This section comprises the notes made by the city staffers on the installation of the APS and subsequent monitoring of the operation and maintenance performance. The information in this chapter may be helpful to engineers and signal technicians who have not worked with APS before. It covers the installation process for both cities as well as approximately one year of post-installation observation for the Charlotte sites and one and a half years of post-installation observation for the Tucson sites.

As with any technology, the design of APS is an ever-evolving field. Manufacturers of APS are constantly updating their products to address usability and design concerns. This engineering evaluation presents issues that were known at the time of this report and should be understood in that context.

INSTALLATION

Instructions

- Instructions provided by the manufacturer were generally very good and helpful for installers who had not previously dealt with APS. Manufacturers and their representatives were also very helpful in answering questions and making personal visits to the sites to solve installation problems.

Mounting

- In some cases, installers were able to use some or all of the pre-drilled mounting holes in the APS pushbutton unit. In cases where this was not possible, new holes had to be drilled.

Wiring

- Some APS types required four wires at the pushbutton; others required only two. If four wires were not available at locations where they were needed, extra wire needed to be pulled, making the installation more difficult.
- Some APS types had a central control board in the cabinet, others had individual control boards in the pushbutton or in the corresponding pedestrian signal head.
- Some APS types required wiring between the pushbutton unit and the pedestrian signal head. This added another level of difficulty to the installation. Sometimes this extra wire was not included from the manufacturer, or the included wire was not long enough.
- One APS type required the installation of a terminal block into each pedestrian signal head for the termination of wires.

AR0072300

Setup

- Setting up the timing on units that use remote controllers (specialized remote control or PDA with special software) was fairly easy and user-friendly. Other types of APS required the setup to be done inside the pushbutton or overhead unit, which was more difficult.
- One of the devices required a specialized screwdriver, which was sent later.

Volume adjustment

- For APS types that used remote control, adjusting the volume of the APS was fairly easy.
- However, some APS types required that the volume adjustment be done on the control board in the overhead pedestrian signal, which was much more difficult. This process required the installer to turn a volume adjustment screw while on top of a ladder, then climb down to evaluate the volume at street level. This proved to be a time-consuming process.
- The volume on most APS had to be adjusted after installation. The default settings from the manufacturer were typically too loud or too volume (silent).
- Upon activation, one installation had a locator tone that was extremely loud. The solution from the manufacturer's representative was to muffle the sound by placing foam inside the speaker unit.

OPERATION AND MAINTENANCE

Observed failures

- No response to ambient sound
- Weak or no vibration
- Malfunction of audible message or tone
- Delay between onset of walk interval and start of speech message
- Failure due to wire shorting to the vibrator cover/pushbutton.
- Mechanical failure of pushbutton magnetic switch
- Failure of control board
- Faulty pot driver

Weather

- The pushbutton of some units operated intermittently since water possibly sensitive to temperature

Damage

- One device was damaged by a turning vehicle but continued functioning.
- One unit was knocked off the pole.

Several of the directional arrow indicators came unglued and are missing

AR0072301

CHAPTER 7
RECOMMENDED GUIDELINES

INTRODUCTION

The best approach to installing APS would be to ensure that all installations are standardized, i.e., have the same features and placed at the same locations on every corner of every intersection. This approach should still the ultimate goal. Unfortunately, increasing complexity in intersection geometry and signalization make a "one size fits all" approach to specifying APS features and installation difficult in the U.S. In particular, variations in pushbutton location, variations in location and direction of slope of curb ramps, the presence of islands and medians, the presence of very wide, sometimes skewed crossings, and the presence of yield-controlled right-turn lanes, mean that the use of the same features on all APS will result in some crossings that have adequate information for most users, but others that have insufficient information for many users, and still others that are made more dangerous by the installation of APS whose volume is not properly adjusted. Engineering judgment is needed at APS installations to determine the appropriate features for the APS and the best location for the installation. The recommendations included in this chapter are intended to provide practitioners with the information needed to choose the most appropriate APS features and make sound installation decisions.

Guidelines suggested in this chapter are supported by the results of two experiments conducted as part of this project. Research was conducted to determine what features of pushbutton-integrated APS best promote safe and independent street crossings by pedestrians who are blind. This research was conducted in Tucson, Arizona and Charlotte, North Carolina and is reported in full in Chapter 3. In addition, research was conducted to examine the effect of pushbutton location on the accuracy and speed of determining which crosswalk at a corner has the WALK signal. The research also examined the effect of type of WALK indication on accuracy and speed of determining which crosswalk had the WALK signal. This research involved groups of participants with varying levels of visual impairment and varying types of cognitive impairment. All significant results were for the group whose participants were totally blind; however the findings for all other groups were consistently in the same direction. This research was conducted in Portland, Oregon and is reported in full in Chapter 3.

Fortunately, all the pushbutton-integrated APS currently marketed in the U.S. have most of the features mentioned below as either standard or optional features. Often it is a simple matter of programming the APS to add, cancel, or change a feature. APS installed with default settings at all crossings do not always provide accessible and usable information to all pedestrians who are blind or who have low vision. Selection of features necessary at a particular crossing requires engineering judgment, and some circumstances may require input from an orientation and mobility specialist and any individual who had requested installation of an APS at that crossing. While primary features are recommended on all APS, not all crossings at an intersection will need secondary features. For example, audible beaconing may be needed for the major street crossing, but unnecessary for the minor street crossing.

AR0072302

In countries such as Australia and Sweden, where the relationship between the crosswalk and the pushbutton is tightly controlled, and the curb ramp always slopes in the direction of the crosswalk, standard APS features and standard installation guidelines are very workable. This is not always the case in the U.S. The following sections on features and on installation guidelines will take into account the varied device and installation needs at crossings having different geometries and different signalization schemes.

FEATURES OF PUSHBUTTON-INTEGRATED APS

This section is divided into primary features and secondary features. Primary APS features are those that, on the basis of psychophysical research as well as subjective data, should be included in all pushbutton-integrated APS, regardless of intersection geometry or signalization. Secondary features are those that have been shown to facilitate crossings by some pedestrians who are blind, but which may 1) not be indicated for use at all intersections, 2) not be desired or needed by all pedestrians who are blind or who have low vision, or 3) have limited research support.

Primary APS features

Pushbutton Locator Tone

It is recommended that a pushbutton-integrated APS be required to have pushbutton locator tones that sound at one second intervals during flashing and steady DON'T WALK intervals, as described in *MUTCD* 4E.09. No particular tone is recommended. Pushbutton locator tones are intended to notify pedestrians who are approaching a crosswalk of the need to press a button to get a WALK indication (and pedestrian timing); they also help users locate pushbuttons.

The strongest support for these recommendations is from two types of subjective data (see *Chapter 5*). First, participants were asked, following each crossing for which they used the pushbutton, how they located the pushbutton. This was an open-ended question, permitting multiple responses. Participants said they used the pushbutton locator tone on most trials, regardless of device (Tucson 95%, Charlotte 85%). Furthermore, when asked following each trial on which they had specific familiarization and experience with the four APS devices, to rate their agreement with the statement "The locator tone helped me find the pushbutton," mean responses for each device in each city were all in the positive direction.

It is not possible to clearly measure the effect of locator tones on finding the pushbutton. In the condition in which participants had no information about the crossing other than that it would have an APS, and they did not know that the APS would be of the pushbutton-integrated type and may have been completely unfamiliar with this type of APS, participants searched for the pushbutton on very few trials. When they had general or specific information on the pushbutton-integrated APS, knew that there were pushbuttons at each crossing, and knew that each pushbutton had a locator tone, participants searched for pushbuttons on 98% of trials across both cities, suggesting that the locator tone was helpful in locating the pushbutton.

Among the four APS installed for this research, there were three different tones used as locator tones: one was a click tone, and one was an 880 Hz electronic tone, and two were a bright beep tone, all repeating at once per second. All APS across both cities received an approximately equal number of positive and negative comments, and no particular APS locator tone resulted in

AR0072303

a higher percentage of participants finding the pushbutton. Participants said, after most trials, that they used the locator tone to help find the pushbuttons, regardless of the nature of the locator tone.

Pushbutton Style

It is recommended that the APS have a clearly defined pushbutton that is tactually identifiable. Psychophysical tests provided no direct evidence of performance differences attributable to pushbutton style. However, style of the pushbutton was frequently mentioned when participants were asked what they liked most and least regarding each APS. The two APS having two-inch diameter rounded buttons "that pushed" drew a number of positive comments to an open-ended question (*see Chapter 3*). It should be noted that APS with mechanical pushbuttons (providing the desired mental feedback) may be more susceptible to vandalism than those with electronic (pressure-sensitive) pushbuttons.

Incorrect evidence for difficulty in finding the two pushbuttons that were atypical, the flat-panel pushbutton, and the flat recessed circular pushbutton, is found in the latency to find and push the correct pushbutton. In the condition in which participants only had a general description of APS features, the two unusual pushbuttons took significantly longer to locate and push than the two buttons that were typical. The time included both the time to find the pole and the device and the time to locate and use the button on the device. However, when participants had specific information about and experience with the various pushbuttons, all differences in latency disappeared.

Tactile Arrow

It is recommended that tactile arrows be required on all pushbutton-integrated APS as indications of which crosswalk is controlled by which pushbutton. Tactile arrows are typically also used as an aid to alignment, however most users are unable to align with precision to tactile arrows. Style of arrow, within the range of the four APS tested, did not consistently make a difference. Therefore there is no recommendation for a specific type of arrow or location of the arrow, particularly since the *Draft Guidelines* include some specifications of arrow size and shape.

Results of subjective research (*see Chapter 3*) confirm that the tactile arrow is an important feature for helping APS users know which crosswalk is associated with a pushbutton. All mean ratings were positive for the question "The tactile arrow helped me know which pushbutton was for the correct street."

The performance measure that best indicates how effective the tactile arrows were at conveying which street was controlled by a pushbutton is the number of trials on which participants looked at the arrow on the incorrect pushbutton and correctly rejected it. In Tucson, although participants looked at the arrow on the incorrect pushbutton on 28 of 160 trials when general or specific information was provided, they correctly rejected the incorrect pushbutton on 100% of those trials. Participants in Charlotte looked at the arrow on the incorrect pushbutton on 63 of 160 trials, and rejected the incorrect pushbutton on 65% of these trials. The difference between cities was probably due to the different levels of participant skill in independent travel, observed by researchers as inefficient or ineffective strategies for some tasks. Participants in Charlotte were more successful in rejecting the incorrect pushbutton when they had specific information about the APS they were to encounter.

AR0072304

An additional subjective measure of the effectiveness of tactile arrows in communicating which crosswalk was controlled by a pushbutton was the ratings of agreement with the statement "I was sure I pushed the button for the street I wanted to cross." Participants responded positively to the statement on 90% of trials when they just had general information, and on 90% of trials when they had specific information. The increase in confidence, as well as in performance, following specific information was probably due to the brief training participants received interpreting arrow direction during their specific familiarization with demonstration devices.

Thus, the inclusion of a tactile arrow on APS quite successfully conveys which crosswalk is controlled by which pushbutton when users are accustomed to using arrows and understand their meaning. The arrow is also highly regarded for identifying which crosswalk is controlled by which pushbutton.

There were no significant differences attributable to style of arrow, with regard to correct rejection of the incorrect pushbutton. There were also no subjective differences related to the style of the arrow.

A different use of a tactile arrow is for aligning for crossing. However, mean ratings for the statement "The tactile arrow helped me align for crossing" were negative for all devices in Tucson, and slightly positive in Charlotte, showing no clear pattern of support for use of tactile arrows for this purpose. The data for alignment showed no differences attributable to style of arrow.

Precise alignment of tactile arrows with direction of travel on the associated crosswalk is nonetheless essential, because researchers observed that, at many crossings in Tucson and Charlotte, participants who used the arrow not only used it to confirm that the pushbutton was for the street they wanted to cross, but also used it as well as they could to align for crossing that street.

Actuation Indication

It is recommended that an audible actuation indication be required on pushbutton integrated APS. This may be either a tone or a speech message. There is no support for specifying the nature of the actuation indication at this time.

The only data on the usefulness of the audible actuation indication is ratings of agreement with the statement "The tone or message was helpful in letting me know the button had been activated." Mean ratings were quite positive, ranging from 3.58 to 4.58 in Tucson and 4.28 to 4.61 in Charlotte, indicating a strong desire for an audible actuation indication (*see Chapter 3*). There were no meaningful differences in ratings attributable to differences in actuation indications in either city. However, the indication message "Wait" received a number of positive comments on the open-ended question regarding most and least liked features. It received no negative comments.

Audible WALK Indication

The recommended WALK indication is a rapid tick signal, a signal that differs markedly from the locator tone in its repetition rate, and should be on for the duration of the walk interval except where the pedestrian signal rests in WALK, in which case it may be limited to approximately seven seconds. The WALK indication should repeat at ten times per second, while

AR0072305

the locator tone repeats at once per second. However, accuracy in understanding which crossing is being signaled is dependent on excellent location of APS (*see below*) or which two APS at one corner are located on individual poles and spaced apart as described in *MUTCD 4E.09*.

In retrofit situations where it is necessary to place two APS on the same pole or closer than is recommended, the WALK indication should be a speech message with the following format: "Oakdale walk sign is on to cross Oakdale." The message should repeat for the duration of the walk interval (except where the pedestrian signal rests in WALK), and should be used in conjunction with a pushbutton information message.

Prompt initiation of crossing in response to the WALK indication contributes to the likelihood that crossings will be completed before steady DON'T WALK, so the choice of WALK indication should be one which promotes fast starting to cross. Equally important is accuracy in understanding which crossing is being signaled. A fast start across the wrong street can be deadly. It is therefore even more important that the WALK indication result in accurate understanding of which crossing has the WALK signal. Research in this project addressed both of these issues, and concluded that the rapid tick WALK indication provides for both the fastest starts and the most accurate judgment regarding which crossing has the WALK signal—provided that the APS is located optimally. (*See General Installation Guidelines below.*)

There are three fundamental types of walk indications that are in use on pushbutton-integrated APS currently in use in the U.S.: cuckoo/chirp signals, rapid tick signals, and speech messages. All were included both in the research in Charlotte and Tucson (Chapter 3) and in research in Portland (Chapter 4). In Portland, all three kinds of indications were produced by the same APS. (The indications were switched by a hand-held controller during the course of the experiment.) Because there were no other device differences in Portland, the results are free from confounds with other device characteristics.

In Portland, both the location of pushbutton-integrated APS and APS WALK indications were explored. Cuckoo/rapid tick and rapid tick signals only were compared where two pushbuttons were located on two different poles at a corner, separated by approximately ten feet. Cuckoo/rapid tick and speech messages were compared where two pushbuttons were located on the same pole. Participants performed two tasks in preparation for crossings (but did not make crossings independently). They located the pushbutton to cross the perpendicular street, and they indicated when the WALK signal came on for that street. Measures that are meaningful in the context of specifying a WALK indication are speed and accuracy in indicating when the correct WALK indication appeared.

There were significant differences in response time and accuracy attributable to the nature of the WALK. The rapid tick used on the two-pole corners produced the fastest and most accurate responses to the WALK indication. When two pushbuttons were on the same pole, the fastest responses were to cuckoo/rapid tick signals, but responses were more accurate to speech messages.

Research in Tucson and Charlotte confirmed that when users knew the type of device they were going to be using, the fastest starts were for the APS having rapid ticks. In Tucson, initiation of crossings having the rapid tick WALK indication were significantly faster than crossings having other indications; the pattern was the same in Charlotte, although results were not statistically significant. There was no measure for accuracy in identifying the crossing being signaled by the WALK indication.

AR0072306

Vibrotactile WALK Indication

It is recommended that every pushbutton-integrated APS have a vibrating arrow to indicate the WALK interval to persons who have both vision and hearing impairments (deaf-blind). All the pushbutton-integrated APS currently marketed in the U.S. have this feature, and it is the accepted means of providing pedestrian signal information to deaf-blind pedestrians in the U.S.

It was the intent of this project to include a total of eight to ten participants who were deaf-blind and who traveled and crossed streets independently. However, it was not possible to recruit this number of deaf-blind participants in the two cities involved. Nonetheless, there were seven participants who reported, or who were suspected of having, some degree of hearing loss in addition to blindness.

Participants used the vibrotactile arrow on a total of 38 trials in the experiment. Some of this use was likely to have been by persons with no hearing loss who wanted to confirm which APS was providing the WALK signal.

The mean subjective rating regarding the helpfulness of the vibratory WALK signal was 6.36 in Tucson and 4.37 in Charlotte, both strongly positive. There were positive comments regarding the vibrotactile arrow in response to an open-ended question asking participants to identify what APS features they liked most and least. There were no negative comments.

Response to Ambient Sound

All APS should be responsive to ambient sound. APS volume must be loud enough to be heard by users, but quiet enough to be tolerated by neighbors. Current Guidance provided in *MUTCD* 4E is the best that can be offered at this time.

All pushbutton-integrated APS currently marketed in the U.S. are responsive to ambient sound, according to guidance in *MUTCD* 2003 4E.

> 4E.06 — The accessible walk signal tone should be no louder than the locator tone, except when there is optional activation to provide a louder signal tone for a single pedestrian phase.
>
> Automatic volume adjustment in response to ambient sound should be provided up to a maximum volume of 89 dBA. Where automatic volume adjustment is used, tones should be no more than 5 dBA louder than ambient sound.
>
> 4E.09 — Pushbutton locator tones should be intensity responsive to ambient sound, and be audible 1.5 to 3.7 m (6 to 12 ft) from the pushbutton, or to the building line, whichever is less.

APS manufacturers differ in the ways in which they accomplish the automatic volume adjustment. First, the rates for sampling ambient sound vary. Second, the algorithm varies for how fast the signal responds to increases in ambient sound and in how fast the increased volume decays. Third, sensitivity of the automatic volume adjustment differs. In addition, the microphone unit is housing also affect response to ambient sound.

It will never be possible to satisfy the volume requirements of all users, while causing minimal noise pollution. It was apparent in the research in Tucson and Charlotte that some participants found some sounds too loud, and others found them too quiet. The most common

AR0072307

response was that they were too quiet. Nonetheless one neighbor strongly objected to the sound of the APS on the corner where he lives, and it had to be turned down. Differences in user need for APS volume make the possibility of individual actuation of a louder signal for one pedestrian phase appealing. APS can be adjusted to be very quiet, yet offer users the opportunity to elevate the volume when they desire it (*see Louder Signal below*).

Secondary APS Features

Pushbutton Information Message

A pushbutton information message is recommended, as it is particularly helpful to some users. A pushbutton information message is essential on APS where the WALK indication is a speech message. This is a message emitted from the APS when the button is pushed during flashing or steady DON'T WALK intervals. The message should be "Wait, to cross Oakdale at North Avenue." (Emphasis and pause after Wait are intentional.) This message provides users with the name of the street controlled by that pushbutton and the name of the other street at the intersection. The message may come on with any button press during DON'T WALK intervals, but it may also come on only in response to an extended button press. The message should sound immediately if the pushbutton is depressed for one second or longer (74).

In Tucson and Charlotte, during trials when they had only a general description of APS features, few participants used the extended button press that was required to actuate the pushbutton information message. However, following hands-on familiarization with each of the three APS having this feature, participants chose to use the feature on more than 70% of crossings in both cities. When asked to mention features they liked most or least on each APS, there were a number of positive comments regarding the pushbutton information message, and there were no negative comments. Mean ratings for the statement "The pushbutton information message was easy to understand." were all at or above 4.0.

Louder Signal (Beaconing Signal)

The inclusion of the opportunity to obtain louder signals during the pedestrian phase is recommended. This feature may assist some pedestrians who are blind or who have low vision, including those who have hearing loss, in locating the opposite corner. The louder signal is actuated by an extended button press, and operates only during the next pedestrian phase. It includes both the WALK signal and the subsequent locator tone for that pedestrian phase. Because it requires special actuation, and is operative for a single pedestrian phase, the louder signal is rarely obtrusive in the environment, while it is available to users when they have need for it.

Because the majority of pedestrians with blindness or low vision are over the age of 60, by which age they also have some upper frequency (age-related) hearing loss, and because the population of older pedestrians with vision impairments is increasing, the availability of louder signals on request is potentially useful to a great many pedestrians who are blind or who have low vision. By 2010, it is estimated that there will be 20 million people in the U.S. over the age of 45 who are blind or who have low vision.

In the Tucson and Charlotte research, there was only one APS that had a louder signal available at the time of the experiment. The louder signal was requested by the same extended button push that actuated the pushbutton information message when it was present, so data on use of the extended button press does not clearly indicate whether the extended press was used to actuate the pushbutton information message, the louder signal, or both. Therefore the best

AR0072308

demonstration regarding the usefulness and desirability of the louder beaconing feature, available on request, is from subjective data.

When asked to rate the extent of their agreement with the statement, "The louder signal feature was helpful," the mean rating was positive (3.94), with only four participants giving it a negative rating.

Tactile Map at Crosswalk

A tactile map of what will be encountered in a crosswalk may be helpful to some pedestrians who are blind or who have low vision, at some crossings. Where used, it should have standard symbols. Refer to the *Guide* for recommended symbols for tactile crosswalk maps.)

A tactile map of the associated crosswalk was available on only one APS used in this research, and it was a feature that was totally unfamiliar to all participants. Tactile maps, on the whole, are only moderately familiar to and are only occasionally used by people who are blind. Nonetheless, after participants were familiarized with this feature, 17% chose to use the map in Tucson, and 28% in Charlotte.

Participants were asked to rate the extent of their agreement with the statement: "The crossing map was useful and easy to understand." Mean ratings were 4.0 in Tucson, and 4.2 in Charlotte, indicating that the map was relatively desirable and easy to read. With additional experience with this particular map, it is possible that many people would find it easy to read and understand. We have no data to indicate with certainty what proportion of users would choose to use such a map at unfamiliar crossings, and it is unlikely that it would be used when making familiar crossings.

GENERAL INSTALLATION GUIDELINES

As for selection of APS features, a single standard for installation is not workable in the U.S., particularly for retrofit situations. Engineering judgment is required to determine the best way to install APS at a given intersection and crossing. Differences in curb radius, width of right of way, presence of parkway, curb ramp design and location, and existing infrastructure on corners make each installation different.

Described below are two different installation scenarios that will be applicable in most situations:

- Two Pushbuttons on One Corner, Mounted on Two Poles – Rapid Tick Walk Indication
  This design will apply most often in new construction and alterations, particularly when other alterations are being done on a corner, two poles should be installed for pushbutton integrated APS, as described in detail below.
- Two Pushbuttons on One Corner, Mounted on a Single Pole – Speech Walk Indication
  This design will apply most often where it is technically infeasible because of limited right-of-way, topography, or locations of other essential equipment on corners, to install two pushbutton integrated APS on a corner on separate poles. However, the APS features required for this situation are different than where each pushbutton-integrated APS is on its own pole.

AR0072309

Two Pushbuttons on One Corner, Mounted on Two Poles – Rapid Tick

Optimal location for pushbutton-integrated APS is between the edge of the crosswalk line (extended) farthest from the center of the intersection and the side of the curb ramp. APS should be between 1.5 feet and 6 feet from the edge of the curb, shoulder, or pavement. The control face and tactile arrow should be carefully aligned with the direction of travel on the associated crosswalk. In order to provide wheelchair users with access to the pushbuttons, all pushbuttons shall be located adjacent to a level all-weather surface.

Pushbutton-integrated APS shall be a maximum of 5 feet from the edge of the crosswalk line (extended) farthest from the center of the intersection. They shall be a maximum of 10 feet from the edge of the curb, shoulder, or pavement. At corners or signalized locations where two pedestrian pushbuttons are provided, the pushbuttons should be separated by a distance of at least 10 feet (*see Figure 7-2*).

A rapid tick WALK indication is recommended for installations following these guidelines for location and the use of two poles on a corner.

The research conducted in Portland (*see Chapter 4*) found that where pushbutton-integrated APS were mounted on separate poles, near the crosswalk line furthest from the corner of the intersection (approximately 3 feet from the curb line and approximately 10 feet apart), speed and accuracy in judging when the correct crosswalk had the WALK signal was significantly better than when APS were located according to other criteria (*see corner C, Figure 7-3*). Moreover, accuracy in identifying the onset of the correct WALK signal was significantly greater when both APS on the same corner used the same tone (rapid tick) than when the two APS used two different tones (cuckoo and rapid tick).

When pushbuttons are precisely and consistently located in this way, identification of which crossing is being signaled can be based solely on which pushbutton the WALK signal comes from. There is no need to remember a code (such as cuckoo for a north/south crossing and rapid tick for an east/west crossing) or to understand speech messages. Figure 7-4 provides examples of pole arrangements that meet the requirements for corners having different geometries.

Two Pushbuttons on One Corner, Mounted on a Single Pole – Speech

When it is necessary to mount two pushbuttons on one pole, it is recommended that they should be required to use speech message WALK signals rather than tone signals. Moreover, to be sure users know the street name to listen for in the WALK message.

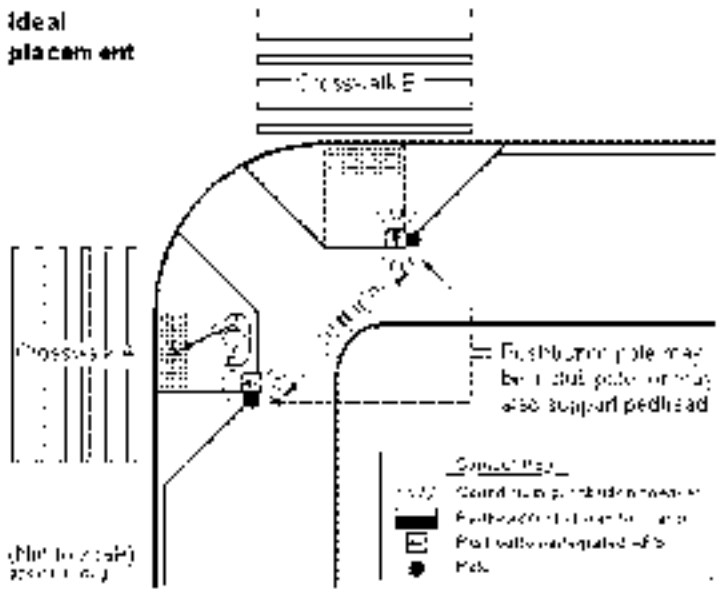

Figure 7-2. Optimal location of pushbutton-integrated APS.

AR0072310

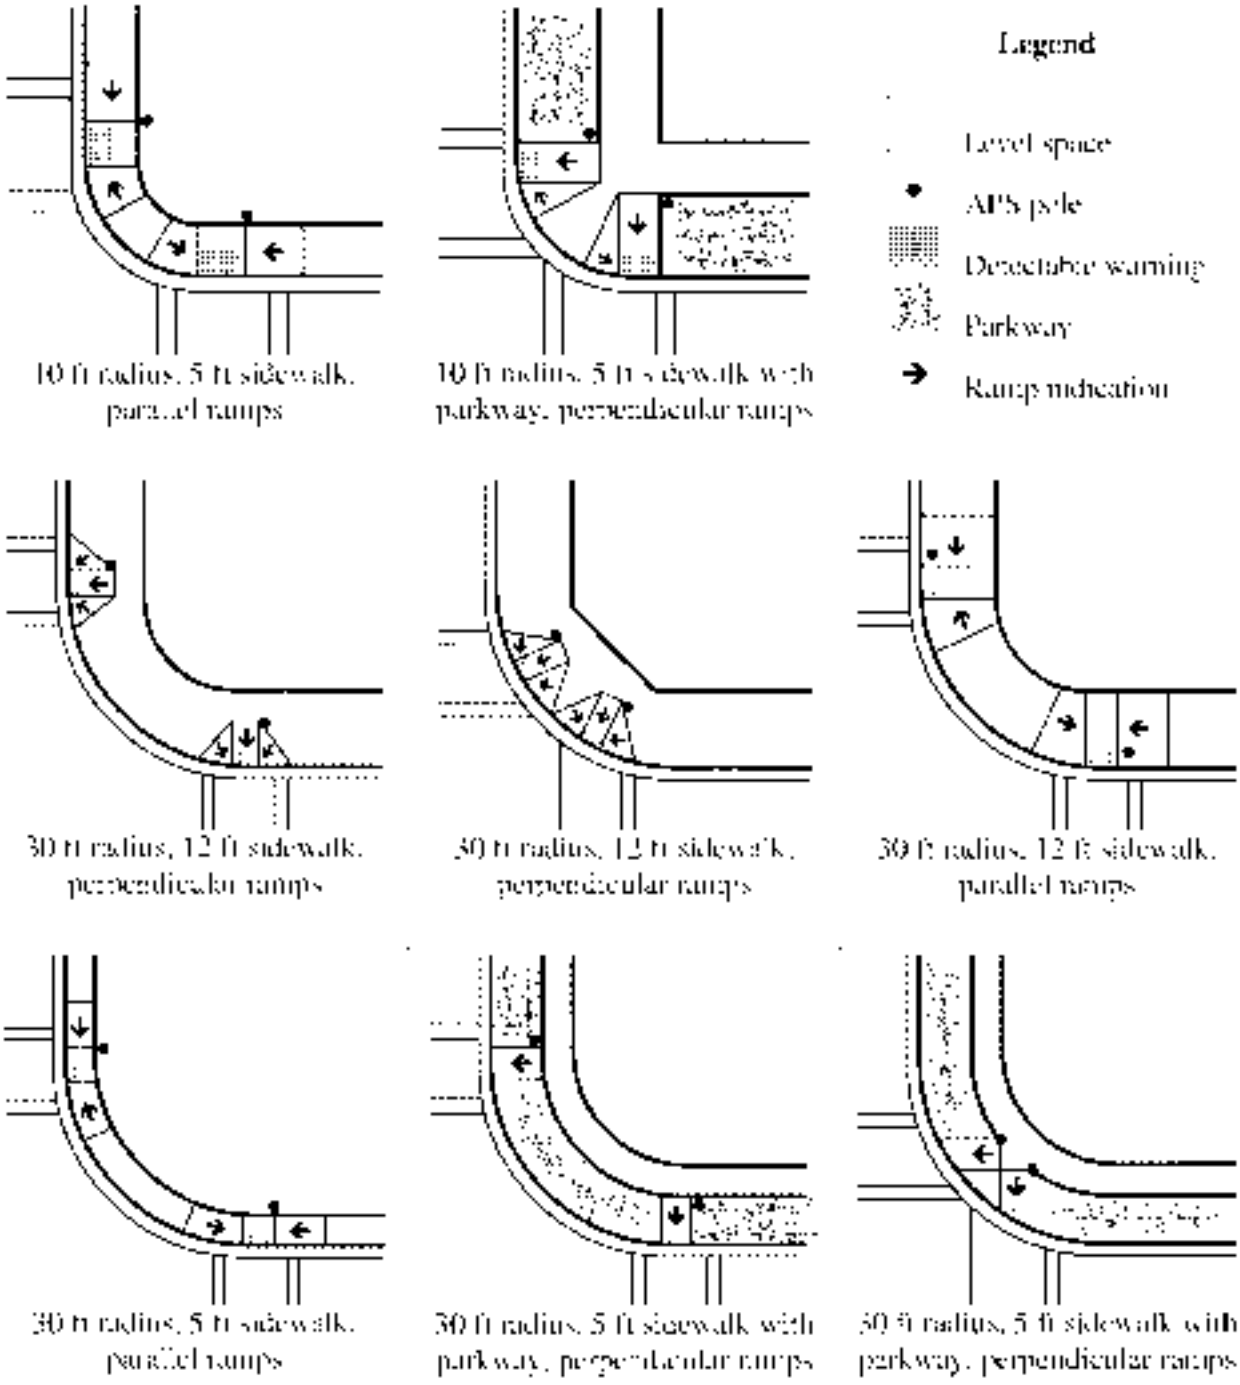

Figure 7-5. Examples of locations for pushbutton integrated APS on corners having various geometries.

AR0072311

pushbutton information messages identifying the intersection and the street to be crossed should also be required.

Research in Portland demonstrated that response to identifying which crosswalk had the WALK signal was significantly more accurate when the APS provided speech WALK signals from both APS than when the APS used two tones – cuckoo and rapid tick (see Chapter 4). The same rapid tick system was not used in the research when there were two pushbuttons on one pole because there would be no way for users to know which pushbutton was signaling, other than use of the vibrating arrow. When two pushbuttons are on a single pole, and particularly when that pole is at the back of the sidewalk, it is not practical for the pedestrian who is blind or who has low vision to stand with a hand on the vibrating arrow while simultaneously preparing to cross.

CAREFUL VOLUME ADJUSTMENT

Volume adjustment of APS is both very important and somewhat difficult. The *MUTCD* provides guidance for APS (*see above under Response to Ambient Sounds*). There is no evidence provided by this research that the current *MUTCD* guidance should be changed. But there was certainly evidence that sound level is closely related to such tasks as recognizing the presence and location of a locator tone, quickly responding to the onset of a WALK signal, and walking straight across the street.

MUTCD guidance discusses a minimum sound level that a locator tone or walk tone should exceed ambient sound (5 dBA), and an absolute maximum sound level in decibels on the A scale (89 dBA). While manufacturers can limit devices to a maximum of 89 dBA, setting an automatic sound level adjustment system to consistently provide a signal that is approximately 5 dBA above ambient sound is more art than science at the present time. Reasonably priced sound level meters, which are amenable to use in the field, are not capable of accurately measuring the sound levels of very short bursts of sound in comparison with more persistent, but still widely varying, sound levels of vehicles.

A more useful measure in the field is the guidance that APS sounds should be audible 6 to 12 feet from the APS, or to the building line, whichever is less. However, audible distance is a subjective measure that is inevitably influenced by each listener's own hearing, and by such influences on the audible distance of sounds as wind, humidity, and nearby reflective surfaces. Fine-tuning of sound levels in the field should be planned for in every APS installation. Visits may need to be made in both peak and off peak hours to get a setting that is appropriate in both situations.

There are some intersection geometries that make careful attention to sound level settings critical. Where a signalized intersection has a right turn lane that is not signalized, it is very important that an APS on a splitter island not be audible from across the unsignalized turn lane. If it the APS is heard from the opposite side of the unsignalized turn lane, a pedestrian who is blind or who has low vision may mistakenly believe that the APS indicates a WALK interval for the unsignalized lane.

At intersections having split phasing, it is very important that APS signals not be audible across the street. For example, a northbound pedestrian who is blind or who has low vision is waiting to cross an east/west street, and the north/south street is to her left (she is at the east crosswalk). She hears the APS on the opposite side of the north/south street (for the west

AR0072312

crosswalk) and assumes that there is a pedestrian phase for all pedestrians crossing the east/west street. She may cross directly into the path of southbound vehicles turning left across her path, which have a protected green left turn arrow.

SUMMARY

Experience with the installation and evaluation of APS indicates that particular attention is necessary in the installation process. Engineers and signal technicians need to take additional care in planning installations and making adjustments for the location of the pushbutton. For the devices to be effective for pedestrians with visual impairments, details matter. For example, the APS needs to be carefully positioned on the pole so that the tactile arrows are aligned with the intended crossing direction. There is also a need to become familiar with adjusting volume levels of the various tones and messages. It may be necessary to re-evaluate the sound level or devices at peak and off-peak hours to assure that the volume is properly adjusted. It is also important to be aware of the effect of installing an APS and not completing sound level adjustments before leaving. In one installation during this research, an APS was installed and became operational on Friday. The volume adjustment was not done until Monday, which resulted in a very loud locator tone operating over the weekend. By Monday, nearby residents were quite negative about the APS, which could have been avoided by either leaving it off until the technician had time to adjust the volume correctly, or adjusting the volume at the time of installation.

AR0072313

CHAPTER 8
INTERSECTION PRIORITIZATION TOOL

INTRODUCTION

One of the first questions that must be answered by local engineers and others responsible for the installation of APS devices is when and where is it appropriate to install such devices in other than new construction and alteration/reconstruction. In many cases, there is a need to prioritize intersections for APS installations. The *MUTCD* currently provides some guidance on this matter, but a more definitive approach is required to assist practitioners.

Several cities in the U.S. have highly structured rating scales that they have found useful in making decisions about which intersections or crosswalks should have APS (*40*). Factors that are typically included are:

- proximity to a facility for persons who are blind;
- proximity to alternate crossings;
- proximity to transit stops;
- proximity to key facilities used by all pedestrians;
- intersection geometry;
- vehicle speed;
- traffic volume (both heavy and light);
- number of vehicles per surge per crosswalk;
- signal complexity;
- pedestrian crash records;
- demonstrated need or user request;
- presence of pedestrian push buttons;
- surrounding land use and neighborhood acceptance; and
- existence of a signal which is susceptible to retrofitting (consideration should be given to both the physical infrastructure and the operational parameters, i.e., phasing, splits, and cycle length).

One of the weaknesses with the previous tools was a lack of validation with respect to the scoring system and the relative weights assigned to the different variables. In this project, an effort was made to develop a tool, have practitioners apply the tool, and then compare the objective ratings achieved with the tool to the subjective ratings of pedestrians with visual impairments and orientation and mobility (O&M) specialists. Provided in the remainder of this chapter is a discussion of the methodology used in the development of the tool. The tool itself, which includes a set of instructions for application, is provided in the companion documents, *Accessible Pedestrian Signals: A Guide to Best Practice*, and is also available on the web at www.walkinginfo.org/aps.

AR0072314

FIELD DATA COLLECTION

In each of three cities (Cambridge, Tucson, and Charlotte), a project staff member and one or more local transportation engineers and/or planners applied the Intersection Prioritization Tool to rate crosswalks at the intersections. The number of crossings in each city is shown in Table 8-1. These intersections were selected to capture the full range of crossing difficulty that may be experienced by a blind pedestrian, from very simple two-phase signals at relatively small intersections to large intersections with multiple phases and complex geometries. The scores from the tool were used to rank-order the crossings from most difficult (and in need of an APS) to least difficult.

TABLE 8-1 Number of crossings rated in each city

City	Number of Crossings
Charlotte, NC	33
Tucson, AZ	36
Cambridge, MA	40

A local O&M specialist and two blind pedestrians who were skilled independent travelers and who were selected by organizations of blind persons in that locale used their expert judgment to review each crossing and also prioritize the crosswalks in terms of difficulty and in most need of an APS. Following the evaluation of all crossings in each city, the evaluators met to compare their results, discuss areas of agreement and disagreement with respect to what made each crossing easy or difficult, and to suggest ways in which the Intersection Prioritization Tool could be revised so that results were consistent with the subjective scores of the blind travelers and O&M specialists.

CALIBRATION AND MODIFICATION

The objective scores from the practitioners and the subjective scores from the blind pedestrians and O&M specialists were used to calibrate and modify the tool. The goal of this task was to create a tool that would take observable characteristics of a pedestrian crossing and produce a score that would reflect the relative crossing difficulty and subsequent need for APS. Appropriately designed, the tool would include higher point values for characteristics that indicated a greater need for APS. The resulting scores could then be used to develop a prioritization of crossings based on need for APS.

The point values given to the various site characteristics included in the tool were initially drawn from the research team's knowledge of the relative importance of the characteristics and from the other similar tools that were previously mentioned. Starting with these initial point values, the calibration of the prioritization tool became an iterative process.

The characteristics of each crossing, which were captured in the field on paper, were entered into an electronic version (Excel workbook) of the prioritization tool. These data included intersection-wide characteristics, such as the type of signalization, and crosswalk-specific characteristics, such as crossing width and curb ramp configuration. Once all characteristics were entered, the prioritization tool calibration followed the iterative process explained below.

Step 1 – Use the Prioritization Tool to Calculate Scores for Each Crosswalk

The prioritization tool assigns point values based on the influence of a particular variable on a blind pedestrian's travel on the crossing. Higher point values indicate a greater difficulty for

AR0072315

the blind individual and therefore a greater potential benefit from an APS installation. The score for a particular crosswalk is a sum of two scores – the score for the intersection at which the crosswalk is located and a score for the crosswalk itself. The variables included on each worksheet are as follows:

Intersection Worksheet Variables

- Configuration
- Signalization
- Proximity to transit facilities
- Proximity to facilities for the visually impaired
- Proximity to major pedestrian attractions

Crossing Worksheet Variables

- Crossing width
- Speed limit
- Approach/crossing geometrics
- Pedestrian signal control
- Vehicle signal control
- Off peak traffic presence
- Proximity to alternative crossing with APS
- Pedestrian push button location
- Requests for APS

Step 2 – Rank Crosswalks by Prioritization Tool Score

The crosswalks are ranked from greatest to least according to the score from the prioritization tool.

Step 3 – Compare Prioritization Tool Rankings to Rankings Given by Evaluators

It was then necessary to compare the prioritization tool rankings to the evaluator rankings to determine how well the tool was emulating the subjective rankings of the visually-impaired pedestrians and O&M specialists. The calibration of the tool was performed by looking at the top group of sites (greatest need for APS) and the bottom group of sites (least need for APS) in each set of rankings. Since each evaluator has a different priority ranking of sites, it cannot be expected that the tool would match the evaluator rankings place-for-place. Instead, the calibration process seeks to have as many sites as possible in the top group of the prioritization tool rankings also be found in the top groups of the evaluator rankings, and likewise for the bottom group.

The method used in this calibration took each site in the prioritization tool ranking and counted how many times the site appeared in the evaluator rankings. The sum of these counts reflected how well the prioritization tool rankings compared to the evaluator rankings. The goal of the calibration was to maximize this sum.

AR0072316

Step 4 – Adjust Point Values; Repeat Steps 1 through 3

To attempt to maximize the sum obtained at Step 3, the point value for a particular variable was sometimes adjusted. For instance, if the presence of islands or medians on a crosswalk was worth 3 points in the previous run, that value may have been increased to 4 to determine what effect the point value increase had on the overall fit of the prioritization tool. Once any point value was changed, Steps 1 through 3 were run again. Point values for different characteristics were increased and decreased until the sum produced at Step 3 could not be increased.

Adjustment of point values was guided in large part by the comments made by the evaluators on each crosswalk. For instance, if the evaluators made comments to the effect that the presence of a vehicular right-turn-only phase increased their concern about a particular crossing, then the point value for right-turn-only phase would be increased to better align the tool with the evaluator rankings. Point values for characteristics that were not mentioned by an evaluator were adjusted on an exploratory basis.

Other Point Value Adjustments

Some variables could not be included in the calibration process, due to lack of data or small sample size. In these cases, point values were assigned based on the team's assessment of the hazard of each variable with respect to other variables that had been calibrated.

Data were not available for the following variables:

- Proximity of transit facilities
- Distance to facilities for visually impaired
- Distance to major pedestrian attraction
- Leading pedestrian interval
- Distance to alternative APS crossing
- Requests for APS

There were too few crossings with the following characteristics to allow for point calibration:

- Non-concurrent WALK signal
- Channelized right-turn lane under signal control

SUMMARY

The final, calibrated prioritization tool provides practitioners with a method for prioritizing locations for APS installation. The forms and instructions for the tool can be found in the companion document, *Accessible Pedestrian Signals: A Guide to Best Practice*.

AR0072317

CHAPTER 9
TRAINING AND RESOURCES

INTRODUCTION

As APSs are being installed in more and more cities, there is a need for guidance for decision-makers and practitioners. To this end, training materials were developed to provide guidance on when, where, and how APS devices should be installed. The materials consist of the companion resource document and a set of PowerPoint presentations that can be covered in a one-day course. These materials were organized to meet the needs of three specific audiences:

- Technicians, who are responsible for the installation, operation, and maintenance;
- Engineers/Administrators, who are involved in making decisions about when and where APS devices are needed and the features required; and
- Orientation and Mobility Specialists, who train pedestrians to use the devices and serve as advisors to the engineers.

The companion document, *Accessible Pedestrian Signals: A Guide to Best Practices*, is intended as a stand-alone document that contains all the training information developed in this project. It is also intended to be a resource document to accompany the one-day training course. While the course covers the basics of each topic area, the *Guide* contains more detail. In addition to the topics covered in the course (see below), the *Guide* also contains chapters on public education on APS, case studies in the U.S. and abroad, product-specific information, and an instruction manual for the APS Prioritization Tool.

The training course developed as part of this project is intended to be a one-day session that will cover the issues related to travel by those who are blind, traffic signalization, and when, where, and how APS devices should be installed. The course makes use of images, drawings, videos, and in-class demonstrations, as well as examples from real-world installations. The PowerPoint presentations contain scripts of the instructors' dialogue so that they may be read and understood outside of the course. Provided below is an outline of the modules covered in the training course and a brief description of the content of each module.

MODULE DESCRIPTIONS

Module A

Accessible Pedestrian Signals and Accessible Public Rights-of-Way (all audiences)

- Purpose and Description of APS – why APS are needed, scope of problems addressed, terminology
- History of Legislation and Current Guidance – TEA-21, *MUTCD*, 1973 Rehab Act, ADA, Draft PROWAG
- Resources – Federal agencies (FHWA, Access Board), consumer groups (ACB, NFB), professional organizations, local agencies

AR0072318

Module B

Travel Needs of Blind/Low-Vision Pedestrians (targeted at engineers)

- Blindness and Vision Loss – types of vision loss, definitions
- Travel Techniques and Aids – types of aids (dog guides, canes, etc.), O&M training
- Street crossings – analysis of situation, crossing techniques, crossing cues
- Challenges and Problems – examples (split phasing, mid-block signals, etc.)

Understanding Traffic Signals and Math in Intersection Design (targeted at O&M professionals)

- Terminology (e.g., cycles, phases, etc.)
- Signal Warrants (understanding why a signal may be installed)
- Type of Operation (pretimed, semi-actuated, full-actuated)
- Signal Timing (timing plans, walking speeds, understanding signal displays)

Module C

APS Features (all audiences)

- APS Features – locator tones, WALK interval tones and speech messages, vibrotactile feedback, tactile arrow, ambient noise adjustment, tactile maps, etc.
- Recommended Features – recommendations on type of WALK indication, etc. (from project research)

Module D

When to Install APS (targeted at engineers)

- Where APS are required – current guidance
- Application of ADA – new construction, alteration projects, existing facilities (retrofit)

APS Prioritization Tool (targeted at engineers)

- Overview – intended use and audience for Prioritization Tool
- Development – brief overview of the development and validation process
- Intersection and Crosswalk Worksheets – walks through each variable that was included in the Tool
- Example of Prioritization Tool use

Module E

Designing Installations (targeted at engineers)

- General Considerations for Installations – pole locations, intersection geometry
- Design Guidance for New Installations – Draft PROWAG, *MUTCD*
- Designing Installations in Retrofit Situations – how to conduct site evaluations and needs assessment, how to design in a non-ideal situation

Design Exercises

- Before/after photos of APS installations for group discussion

AR0072319

Module F

Installation, Operation, and Maintenance (targeted at technicians)

- Installation – infrastructure (poles, wiring, and other hardware), device mounting, adjustments (sound levels, ambient noise response, etc.)
- Adjusting Sound Settings – how to set volume for locator tone, WALK indication, etc.
- Post-Installation Checklist
- Maintenance – what to check and when

AR0072320

AR0072321

CHAPTER 10
CONCLUSIONS

In 2000, two sections on APS were added to the *Manual on Uniform Traffic Control Devices (MUTCD)*, which became the first set of national standards for APS in the U.S. The *MUTCD* defines an APS as "…a device that communicates information about pedestrian timing in nonvisual format such as audible tones, verbal messages, and/or vibrating surfaces" (*1*). The rest of the *MUTCD* language provides standards, guidance and options, but does not specify walk messages or address many possible device features. In 2002, the U.S. Architectural and Transportation Barriers Compliance Board (Access Board) published draft recommendations and requirements for APS installation in *Draft Guidelines for Accessible Public Rights-of-Way* (*2*). The *Draft Guidelines* call for the use of pushbutton-integrated signals that provide audible **and** vibrotactile indications of the walk interval.

This research was the basis for more precise and well supported standards and guidance on APS for inclusion in the *MUTCD* and the U.S. Access Board *Guidelines*. The research results have been forwarded to the Signals Technical Committee of the NCUTCD and to the Federal Highway Administration (FHWA) as background and support for changes in Part 4 of the *MUTCD*, as well as to the U.S. Access Board.

Two separate research experiments were undertaken in this project to develop the recommended guidelines for APS features and APS installation. The purpose of first study was to determine the effect of APS features, which are commonly found on most of the APS equipment marketed in the U.S., on the ability of pedestrians who are blind to locate and use pushbuttons, determine time to cross, determine appropriate heading for crossing, and maintain alignment while crossing. The second study was conducted to evaluate the effects of pole location, number of poles used in relation to number of APS devices, and type of WALK indication on the ability of pedestrians with visual or cognitive impairments to determine which crosswalk at a corner had the WALK signal. In addition to these two research studies, additional information about APS performance was gleaned from an engineering evaluation of the equipment installed during this research study, as well as from a series of cold weather case studies.

The result of these efforts is a set of recommended guidelines to help practitioners choose the most appropriate APS features to fit the needs of each application and make sound installation decisions. The recommendations are briefly summarized below; a more extensive description and justification for each can be found in Chapter 5.

Primary APS Features

Primary APS features are those that, on the basis of psychophysical research as well as subjective data, should be included in all pushbutton integrated APS, regardless of intersection geometry or signalization.

Pushbutton Locator Tone – It is recommended that all pushbutton-integrated APS be required to have pushbutton locator tones that sound at one second intervals during flashing and steady DON'T WALK intervals, as described in *MUTCD* 4E.09. No particular tone is recommended.

AR0072322

Pushbutton Style – Pushbuttons should be clearly defined and be tactually identifiable.

Tactile Arrow – It is recommended that tactile arrows be required on all pushbutton-integrated APS as indications of which crosswalk is controlled by which pushbutton. There is no recommendation for changes to arrow specifications currently provided in the *Draft Guidelines*.

Actuation Indication – It is recommended that an audible actuation indication be required on pushbutton-integrated APS. This may be either a tone or a speech message.

Audible WALK Indication – The recommended WALK indication is a rapid tick signal, a signal that differs markedly from the locator tone in its repetition rate, and should be on for the duration of the walk interval except where the pedestrian signal rests in WALK, in which case it may be limited to approximately seven seconds. The WALK indication should repeat at ten times per second, while the locator tone repeats at once per second. However, accuracy in understanding which crossing is being signified is dependent on excellent location of APS (see below) in which two APS at one corner are located on individual poles and spaced apart as described in *MUTCD* 4E.09.

Vibrotactile WALK Indication – It is recommended that every pushbutton-integrated APS have a vibrating arrow to indicate the WALK interval to persons who have both vision and hearing impairments (deaf-blind).

Responsive to Ambient Sound – All APS should be responsive to ambient sound. APS volume must be loud enough to be heard by users, but quiet enough to be tolerated by neighbours. All pushbutton-integrated APS currently marketed in the U.S. are responsive to ambient sound, according to guidance in *MUTCD* 2003, Section 4E, which remains the best that can be offered at this time.

Secondary APS Features

Secondary features are those that have been shown to facilitate crossings by some pedestrians who are blind, but which may (1) not be indicated for use at all intersections, (2) not be desired or needed by all pedestrians who are blind or who have low vision, or (3) have limited research support.

Pushbutton Information Message – A pushbutton information message is recommended, as it is particularly helpful to some users. A pushbutton information message is essential on APS where the WALK indication is a speech message. This is a message emitted from the APS when the button is pushed during flashing or steady DON'T WALK intervals. The message should be "Wait, to cross Oakdale at North Avenue." (Emphasis and pause after Wait are intentional.) This message provides users with the name of the street controlled by that pushbutton and the name of the other street at the intersection. This message is typically called with an extended button press. (pushbutton is depressed for one second or longer) during DON'T WALK intervals (34).

Louder Signal (Audible Beaconing) – The inclusion of the opportunity to obtain louder signals during the pedestrian phase is recommended. This feature may assist some pedestrians who are blind or who have low vision, including those who have hearing loss, in locating the opposite corner. The louder signal is actuated by an extended button press, and operates only during the next pedestrian phase. It includes both the WALK signal and the subsequent locator tone for that pedestrian phase.

AR0072323

Tactile Map of Crosswalk – A tactile map of what will be encountered in a crosswalk may be helpful to some pedestrians who are blind or who have low vision, at some crossings. Where used, it should have standard symbols (*see Figure 5-1 for recommended symbols for tactile crosswalk maps*).

Installation Guidance

A single standard for installation is not workable in the U.S., particularly for retrofit situations. Engineering judgment is required to determine the best way to install APS at a given intersection and crossing. Differences in curb radius, width of right-of-way, presence of parkway, curb ramp design and location, and existing infrastructure on corners make each installation different. The recommendations summarized below apply to two types of installation scenarios and are intended to provide general guidance to the practitioner. For more details on and the justification for these recommendations, refer to Chapter 5.

Two Pushbuttons on One Corner, Mounted on Two Poles – Rapid Tick

This design will apply most often on new construction and major alterations that result in reconstruction of the corners of the intersection (e.g., new sidewalks, curb ramps, signal poles, etc.). In this case, two poles should be installed on each corner with pushbutton-integrated APS on each pole.

Optimal location for the pushbutton-integrated APS is between the edge of the crosswalk line (extended) furthest from the corner of the intersection and the side of the curb ramp. APS should be between 1.5 feet and 6 feet from the edge of the curb, shoulder, or pavement. The control face and tactile arrow should be carefully aligned with the direction of travel on the associated crosswalk. In order to provide wheelchair users with access to the pushbutton, all pushbuttons shall be located adjacent to a level all-weather surface.

Pushbutton-integrated APS shall be a maximum of 5 feet from the edge of the crosswalk line (extended) farthest from the center of the intersection. They shall be a maximum of 10 feet from the edge of the curb, shoulder, or pavement. In this two-pole scenario, the pushbuttons should be separated by a distance of at least 10 feet.

A rapid tick WALK indication is recommended for installations following these guidelines. When pushbuttons are precisely and consistently located in this way, identification of which crossing is being signaled can be based solely on which pushbutton the WALK signal comes from. There is no need to understand speech messages or to remember a cycle (such as cuckoo for a north/south crossing and rapid tick for an east/west crossing).

Two Pushbuttons on One Corner, Mounted on a Single Pole – Speech

This design will apply most often where it is technically infeasible because of limited right-of-way, topography, or locations of other essential equipment on corners, to install two pushbutton-integrated APS on a corner on separate poles. However, the APS features required for this situation are different than where each pushbutton-integrated APS is on its own pole.

For this one-pole scenario, it is recommended that the APS be required to use speech message WALK signals rather than tone signals. Moreover, to be sure users know the street name to listen for in the WALK message, pushbutton information messages identifying the intersection

AR0072324

and the street to be crossed are also necessary. Wording of speech WALK indications and pushbutton information messages should conform to recommended format (see Chapter 7, Recommended Guidelines).

Volume Adjustment

Volume adjustment of APS is both very important and somewhat difficult. The *MUTCD* Guidance discusses a maximum sound level by which a pushbutton locator tone or walk tone should exceed ambient sound (5 dBA), and an absolute maximum sound level in decibels on the A scale (89 dBA). While manufacturers can limit devices to a maximum of 89 dBA, setting an automatic sound level adjustment system to consistently provide a signal that is approximately 5 dBA above ambient sound is more an art than science at the present time.

A more useful measure in the field is the guidance that APS sounds should be audible 6 to 12 feet from the APS, or to the building line, whichever is less. However, audible distance is a subjective measure that is inevitably influenced by each listener's own hearing, and by such influences on the audible distance of sounds as wind, humidity, and nearby reflective surfaces. Fine tuning of sound levels in the field should be planned for in every APS installation. Visits may need to be made in both peak and off-peak hours to get a setting that is appropriate in both situations.

INTERSECTION PRIORITIZATION

One of the first questions that must be answered by local engineers and others responsible for the installation of APS devices is when and where is it appropriate to install such devices in other than new construction and alteration/reconstruction. In many cases, there is a need to prioritize intersections for APS installations. The *MUTCD* currently provides some guidance on this matter, but a more definitive approach is needed by practitioners.

As part of this research effort, a tool was developed, applied by practitioners, and then validated by comparing the objective ratings achieved with the tool to the subjective ratings of pedestrians with visual impairments and orientation and mobility (O&M) specialists. The tool itself, which includes a set of instructions for application, is provided in the companion document, *Accessible Pedestrian Signals: A Guide to Best Practice*, and is also available on the web at www.walkinginfo.org/aps.

TRAINING AND RESOURCES

Training materials were developed to provide guidance on where and how APS should be installed. The training is directed at three main audiences – traffic engineers, O&M instructors, and signal technicians. The materials consist of a set of PowerPoint presentations that comprise a one-day training course, and a companion resource document, *Accessible Pedestrian Signals: A Guide to Best Practice*.

ADDITIONAL RESEARCH NEEDED

The results of this research have produced a set of recommended guidelines for APS installation and operation that will make it easier and safer for pedestrians with visual impairments to cross streets at signalized intersections. In time, the results will make their way

AR0072325

into the *MUTCD* and other guides, which will lead to greater uniformity in the field. At the same time, this research discovered a number of issues requiring further investigation. Provided below is a list of topics to be considered for future research:

- Tone types (best accepted by nearby residents)
- Sound volume (best means of providing response to ambient sound, range and speed of response, range of decibel levels)
- Speech message clarity (consistency, programming and downloading messages, standardized library)
- Combining speech message and tones
- Audible message during flashing DON'T WALK (tone vs. speech, countdown)
- Use of APS to aid alignment before crossing and while crossing
- Beaconing (volume, duration after press)
- Guidance on the need for pushbutton APS on side streets.
- Location/Size/Color of tactile arrow
- Tactile map (consistency, availability, guidelines)
- Cold weather issues (future follow-up on case studies, comparison study)
- APS effect on general pedestrian population (use of pushbutton, latency to begin crossing)

John Piro
Capitol Records
1750 N. Vine Street
Hollywood, CA 90028

RE: Capitol Records, First Fl. Crawl Space, 1750 N. Vine Street, Hollywood, CA 90028.

Job Description: Removal of 160 Ln. Ft. of TSI., completed on June 2, 1995.

Dear Mr. Piro:

QHI, INC. has successfully completed the above referenced project during the period noted.

Enclosed please find QHI, INC.'s documentation of our activities for this project. Certain portions of this documentation may have been replicated for your agent or third party monitoring firm.

Should you have any questions regarding this submittal, please contact me at (714) 724-9979.

Sincerely,

QHI, INC.

Darrin McElroy

7500 Redhill Ave., Ste. 240, Irvine, CA 92714 (714) 724-9979 FAX: (714) 724-9968
In California: 800-540-5502

CONTROLS: DESCRIBE WORK PRACTICES AND CONTROLS TO BE USED AT THE DEMOLITION AND RENOVATION SITE. FOR ASBESTOS REMOVAL WORK, INDICATE RULE 1403 PROCEDURE # 1, 2, 3, 4 OR 5, OR COMBINATIONS OF PROCEDURES USED. FOR PROCEDURES 4 AND 5, SUBMIT PLANS FOR SCAQMD APPROVAL. PROCEDURE #:

1 - & 3

ASBESTOS DETECTION PROCEDURE: DESCRIBE THE METHODS AND PROCEDURES USED TO DETERMINE WHETHER ASBESTOS IS PRESENT AT THE SITE, INCLUDING THE ANALYTICAL METHODS:

PLM

FOR ORDERED DEMOLITION SEND A COPY OF THE ORDER AND GIVE THE AGENCY NAME.

AUTHORIZING PERSON: TITLE:

DATE OF ORDER: DATE ORDERED TO BEGIN:

FOR EMERGENCY REMOVAL GIVE DATE AND HOUR OF EMERGENCY AND DESCRIBE THE SUDDEN, UNEXPECTED EVENT:

EXPLAIN HOW THE EVENT WOULD CAUSE UNSAFE CONDITIONS, EQUIPMENT DAMAGE OR UNREASONABLE FINANCIAL BURDEN

CONTINGENCY PLAN: DESCRIBE ACTIONS AND PROCEDURES TO BE FOLLOWED IF UNEXPECTED ASBESTOS IS FOUND DURING DEMOLITION OR REGULATED ASBESTOS MATERIAL BECOMES CRUMBLED, PULVERIZED, OR REDUCED TO POWDER

Stop work, reevaluate materials and procedures before proceeding.

TRAINING CERTIFICATION: I CERTIFY THAT AN INDIVIDUAL TRAINED IN THE PROVISIONS OF REGULATION SCAQMD RULE 1403 AND NESHAP WILL BE ON SITE DURING THE REMOVAL AND EVIDENCE THAT THE REQUIRED TRAINING HAS BEEN ACCOMPLISHED BY THIS PERSON WILL BE AVAILABLE FOR INSPECTION DURING NORMAL BUSINESS HRS

PRINT NAME OF OWNER/OPERATOR: Jerry L. Hendrickson SIGNATURE OF OWNER/OPERATOR: DATE: 05/18/95

INFORMATION CERTIFICATION: I CERTIFY THAT THE ABOVE INFORMATION IS CORRECT AND THAT ENCLOSED AND ATTACHED ATTACHMENTS

SIGNATURE OF OWNER/OPERATOR: Jerry L. Hendrickson DATE: 05/18/95

THIS NOTIFICATION WILL NOT BE ACCEPTED WITHOUT THE REQUIRED ASBESTOS FEE (SCAQMD RULE 301). PLEASE MAKE CHECK PAYABLE TO "SCAQMD". THE FEE VARIES AND DEPENDS ON THE GRAND TOTAL OF ASBESTOS AMOUNT TO BE REMOVED. FEES ARE NOT REFUNDABLE AND ARE AS FOLLOWS:

FROM 161 TO 1,000 SQUARE FEET	$40.12
FROM 1,001 TO 5,000 SQUARE FEET	$75.90
FROM 5,001 TO 10,000 SQUARE FEET	$177.10
MORE THAN 10,001 SQUARE FEET	$278.30
DEMOLITIONS	$25.30
REVISIONS	$10.12

CANCELLATION OF NOTIFICATIONS, REMOVAL PROJECTS AT OWNER-OCCUPIED SINGLE FAMILY DWELLINGS, AND REMOVAL PROJECTS OF LESS THAN 160 SQUARE FEET ARE EXEMPT FROM ASBESTOS FEES.

NOTE: STATE LAW REQUIRES THAT YOU PROVIDE A COPY OF DEMOLITION NOTIFICATIONS TO YOUR LOCAL FIRE AND SAFETY DEPARTMENT. PLEASE ASK A COPY.

MAIL TO: SCAQMD, RULE 1403 ASBESTOS NOTIFICATIONS, P.O. BOX 4950, DIAMOND BAR, CA 91765-0960

ie sampling and analytical methods described below present the elements of ie available methods such as NIOSH 7400 method which OSHA considers to be sential to achieve adequate employee exposure monitoring. All employers who e required to utilize analytical laboratories that use this procedure for llecting and analyzing samples. E.P.A recommends re-occupancy level of .01 f/cc or less before clean up is considered complete. If employees of M.G company did not collect the samples, the flow rates and calibration formation used to calculate the results were provided by the client.

Mr. Samuel Unger, Executive Officer
California Regional Water Quality Control Board
Los Angeles Region
320 West Fourth Street, Suite 200
Los Angeles, CA 90013

Dear Mr. Unger:

SUBMITTAL OF WATERSHED MANAGEMENT PROGRAM FOR THE CITY OF LOS ANGELES AREA IN JURISDICTIONAL GROUP 7 OF THE SANTA MONICA BAY WATERSHED

Please find attached the Watershed Management Program (WMP) for the City of Los Angeles area in Jurisdictional Group 7 of the Santa Monica Bay watershed. The City of Los Angeles, as lead agency for this area, has prepared this WMP on behalf of itself and the Los Angeles County Flood Control District (LACFCD). LACFCD has reviewed the draft WMP prior to submission to the Regional Water Board, and we appreciate their collaboration in the preparation of the document.

The City of Los Angeles and LACFCD originally intended to develop an Enhanced Watershed Management Program (EWMP) for the City of Los Angeles area in Jurisdictional Group 7, as indicated in our Notice of Intent jointly submitted with the Notice of Intent or Jurisdictional Groups 2 and 3 on June 27, 2013. However, Regional Board staff requested the City of Los Angeles and LACFCD to develop a WMP instead of an EWMP because of antidegradation conditions in Jurisdictional Group 7 and limited opportunities for implementation of regional projects capable of capturing and retaining runoff from the 85th percentile storm event. Accordingly, the City of Los Angeles and LACFCD submitted a revised Notice of Intent for a WMP for the City of Los Angeles area in Jurisdictional Group 7 on December 16, 2013.

The WMP for the City of Los Angeles area in Jurisdictional Group 7 mostly relies on implementing the Minimum Control Measures as provided by section VI.D of the new MS4 Permit (Order No. R4-2012-0175), because of the aforementioned antidegradation conditions and limited opportunities for regional projects with groundwater recharge. In addition, water quality data pertaining to this area and information of potential sources and quantities of urban runoff pollutants are very limited at this

time. Accordingly, implementation of the Coordinated Integrated Monitoring Program will indicate if there is a need to identify additional structural watershed control measures through the adaptive management process for the WMP for the City of Los Angeles area in jurisdictional Group 7.

We appreciate the discussions with and the input received from Regional Water Board staff during the development of this WMP and we look forward to the comments on the WMP by your staff and finalizing this document.

Should you have any questions about this submittal, please contact me at Shahram.Kharaghani@lacity.org or phone (213) 485-0587, or your staff may contact Dr. Huub Cox at Hubertis.Cox@lacity.org or phone (213) 485-3984.

Sincerely,

Robert Vega for

AR0072355

1 Introduction

1.1 Background and Regulatory Framework

The National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Permit No. R4-2012-0175 (Permit) was adopted November 8, 2012 by the Los Angeles Regional Water Quality Control Board (Regional Board) and became effective December 28, 2012. The purpose of the Permit is to ensure the MS4s in Los Angeles County are not causing or contributing to exceedances of water quality objectives set to protect the beneficial uses in the receiving waters in the Los Angeles region.

The Permit allows Permittees to customize their stormwater programs through the development and implementation of a Watershed Management Program (WMP) or an Enhanced Watershed Management Program (EWMP) to achieve compliance with receiving water limitations (RWLs) and water quality based effluent limits (WQBELs). The City of Los Angeles (City) has been a participating agency of Jurisdictional Group 7 (JG7) of the Santa Monica Bay Watershed since the adoption of the Santa Monica Bay Beaches Bacteria Total Maximum Daily Loads (TMDLs) in 2003. However, the City of Los Angeles and the other MS4 permittees in JG7 could not reach an agreement for a collaborative approach to satisfying the requirements of the MS4 permit. Therefore, on November 21, 2013 the Regional Board requested that the City and the Los Angeles County Flood Control District (LACFCD, collectively referred to as the Santa Monica Bay JG7 WMP Group (SMB JG7 WMP Group), pursue a WMP instead of an EWMP. The primary reasons for this request included: 1) MS4 discharges to Santa Monica Bay are anticipated to be minimal due to the small contributing drainage areas; and 2) opportunities for structural best management practices (BMPs) implementation are limited due to the geography of the WMP area (e.g., cliffs at bluffs, landslide and liquefaction hazards, etc.). In December of 2013, the SMB JG7 WMP Group submitted a revised Notice of Intent to develop a WMP for the City of Los Angeles land area within the JG7 area to fulfill the requirements of the Permit.

This WMP, in combination with the JG7 Coordinate Integrated Monitoring Program (CIMP), was prepared to satisfy Part V.C.1 of the Permit, which includes the following tasks:

1. Prioritize water quality issues resulting from stormwater and non-stormwater discharges from the MS4 to receiving waters within each Watershed Management Area (WMA);
2. Identify and implement strategies, control measures, and BMPs to achieve the outcomes specified in Part VI.C.1.d;
3. Execute an integrated monitoring program and assessment program, pursuant to Attachment E – MRP, Part VI, to determine progress towards achieving applicable limitations and/or action levels in Attachment G;
4. Modify strategies, control measures, and BMPs as necessary, based on analysis of monitoring data collected pursuant to the monitoring and reporting program (MRP) to ensure that applicable WQBELs, RWLs and other milestones set forth in the WMP are achieved in the required timeframes; and
5. Provide appropriate opportunity for meaningful stakeholder input, including but not limited to, a permit-wide watershed management program technical advisory committee (TAC) that will advise and participate in the development of the WMPs and EWMPs from month 6 through the date of program approval.

AR0072356

1.2 SMB JG7 WMP Group Geographical Area

The SMB JG7 WMP Group area is located within the southern portion of the Santa Monica Bay WMA, which encompasses an area of approximately 414 square miles and includes the Santa Monica Bay and land area that drains into the Bay. The boundary of the Santa Monica Bay, as defined for the National Estuary Program, extends from the Los Angeles/Ventura County line to the northwest, southeast toward Point Fermin located on the Palos Verdes Peninsula. The land area that drains into the Bay follows the crest of the Santa Monica Mountains on the north to Griffith Park; then extends south and west across the Los Angeles coastal plain to include the area east of Ballona Creek and north of the Baldwin Hills. South of Ballona Creek, the natural drainage is a narrow coastal strip between Playa del Rey and Palos Verdes (Regional Board 2011). **Figure 1-1** depicts the location of the SMB JG7 WMP Group within the Santa Monica Bay Watershed.

The SMB JG7 area includes the Cities of Rancho Palos Verdes, Palos Verdes Estates, Rolling Hills, Rolling Hills Estates, and the City of Los Angeles. This SMB JG7 WMP only addresses the area owned by the City and LACFCD within JG7, which includes the following water bodies as listed in the Basin Plan:

- Los Angeles County Coastal Nearshore Zone
- Royal Palms Beach
- Whites Point County Beach

The SMB JG7 WMP area, which consists of land owned by the City and includes any LACFCD infrastructure, totals approximately 977 acres, which is approximately 9% of the entire JG7 area within the Santa Monica Bay Watershed. **Figure 1-1** illustrates the extent of the SMB JG7 WMP Group Area. The geographical scope of the SMB JG7 WMP Group area excludes areas of land totaling approximately 47 acres for which the MS4 permittees do not have jurisdiction, including land owned by the Los Angeles Air Force Base Pacific Crest Housing Area. With the exclusion of these areas, the SMB JG7 WMP area covers 907 acres. The majority of the land uses within the WMP area consist of residential (approximately 69%) and vacant/open space (approximately 26%), with the remaining area consisting of a mixture of commercial, educational, and industrial land uses. There are no designated transportation or agricultural land uses in the WMP area. The open space area includes 102 acres of restored coastal sage scrub habitat and hiking trails located within the White Point Nature Preserve Wild Park.

Table 1-1
SMB JG7 WMP Land Use Summary

Land Use	% of Total
Commercial	3%
Industrial	0.1%
Education	3%
Multi-Family Residential	12%
Single Family Residential	56%
Open Space	26%
Total	100%

The City of Los Angeles JG7 WMP area includes 218 catch basins and seven storm drain outfalls owned and operated by either the City of Los Angeles or the LACFCD. The majority of the storm drain outfalls in the SMB JG7 WMP area are circular pipes extending from the Cliffside, around one hundred feet above the rocky shoreline. The majority of the outfalls themselves are inaccessible at the pipe outlet.

AR0072357

Introduction

The coastline along and several inland sites within the SMB JG7 WMP area is characterized as being subject to landslide and liquefaction hazards (City of Los Angeles Bureau of Engineering, 2011). This characterization was exemplified by the destruction of the SMB 7 7 1 MDL shoreline monitoring site due to landslide in 2009

1.3 Watershed Management Program Development Process

The WMP for the SMB JG7 WMP Group includes four major components, as follows:

1. **Water Quality Priorities:** The identification of water quality priorities is an important first step in the WMP process. Water quality priorities, described in Section 2, are defined for individual constituents within a specific water body, termed as Water Body-Pollutant Combinations (WBPCs). Categories of the WBPCs are defined in the Permit. Priorities are assigned to the WBPCs based on the categorization. The water quality priorities will provide the basis for prioritizing implementation activities within the WMP.

2. **Watershed Control Measures/Minimum Control Measures:** Development of the WMP requires identification of control measures/BMPs, as described in Section 4, expected to be sufficient to meet receiving water and effluent limitations set forth in the MS4 Permit (Regional Board, 2012). BMPs vary in function and type, with each BMP providing unique design characteristics and benefits from implementation. The overarching goal of BMPs in the WMP is to reduce the impact of stormwater and non-stormwater runoff on receiving water quality.

3. **Reasonable Assurance Analysis:** A key element of each WMP is the reasonable assurance analysis (RAA), described in Section 4, which is used to demonstrate *"…that the activities and control measures…will achieve applicable WQBELs and/or RWLs with compliance deadlines during the Permit term"* (Section C.5.b.(v), page 63). The Permit presumes the RAA as a quantitative demonstration that control measures, specifically BMPs, will be effective. In other words, the RAA not only demonstrates the cumulative effectiveness of BMPs to be implemented, but it also supports their selection. However, due to zero target load reductions and alternative compliance measures for the identified WBPCs, a quantitative analysis is not necessary at this time. Therefore, the SMB JG7 WMP group has decided to present a qualitative RAA discussion, acknowledging that a quantitative RAA may become necessary in the future based on results of future CIMP monitoring.

4. **Adaptive Management Process:** The WMP is intended to be implemented as an adaptive program, as described in Section 5. As new program elements are implemented and information is gathered over time, the WMP will undergo modifications to reflect the most current understanding of the watershed and present a sound approach to addressing changing conditions. As such, the WMP will employ an adaptive management process that will allow the WMP to evolve over time.

1.4 Watershed Management Program Overview

This WMP has been prepared to outline the steps that will be taken by the SMB JG7 WMP Group in compliance with the requirements and deadlines set forth within the MS4 Permit. This document is organized into the following sections:

- **Section 1** – Introduction
- **Section 2** – Identification of Water Quality Priorities
- **Section 3** – Watershed Control Measures
- **Section 4** – Reasonable Assurance Analysis Approach
- **Section 5** – Adaptive Management Process
- **Section 6** – References

AR0072360

2
Identification of Water Quality Priorities

To develop the WMP, the Permit requires that SMB JG7 WMP Group establish water quality priorities within their WMA. In accordance with the Permit Section IV.C.5(a), this section characterizes the water quality conditions within the SMB JG7 WMP area, identifies water quality priorities, determines water body-pollutant classifications, and assesses pollutant sources. The water quality priorities identified in this section provide the basis for prioritizing project implementation; selecting and scheduling BMPs (if needed); and focusing monitoring activities developed in the CIMP.

2.1 Water Quality Characterization

Figure 2-1 identifies the receiving waters in the SMB JG7 WMP Group area, as depicted in the Water Quality Control Plan, Los Angeles Region (Basin Plan) (Regional Board, 1995, Updated 2011). **Table 2-1** summarizes the beneficial uses for each of these water bodies, as designated in the Basin Plan. As beneficial uses designated as "potential" have not yet been established, these uses will not be evaluated further in the WMP. The SMB JG7 WMP Group area includes the water bodies listed below.

- Los Angeles County Coastal Nearshore Zone
- Royal Palms Beach
- Whites Point County Beach

Beneficial use designations for these water bodies include the following:

- **Water Contract Recreation (REC-1):** Uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, white water activities, fishing, or use of natural hot springs.
- **Non-Contact Water Recreation (REC-2):** Uses of water for recreational activities involving proximity to water, but not normally involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, picnicking, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.
- **Industrial Services Supply (IND):** Uses of water for industrial activities that do not depend primarily on water quality including, but not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, firs protection, or oil well re-pressurization.
- **Navigation (NAV):** Uses of water for shipping, travel, or other transportation by private, military, or commercial vessels.
- **Commercial and Sport Fishing (COMM):** Uses of water for commercial or recreational collection of fish, shellfish, or other organisms intended for human consumption or bait purposes.
- **Marine Habitat (MAR):** Uses of water that support marine ecosystems including, but not limited to, preservation or enhancement of marine habitats, vegetation such as kelp, fish, shellfish, or wildlife (e.g., marine mammals, shorebirds).
- **Preservation of Biological Habitats (BIOL):** Uses of water that support designated areas of habitats, such as Areas of Special Biological Significance (ASBS), established refuges, parks,

AR0072361

sanctuaries, ecological reserves, or other areas where the preservation or enhancement of natural resources requires special protection.

- **Migration of Aquatic Organisms (MIGR):** Uses of water that support habitats necessary for migration, acclimatization between fresh and salt water, or other temporary activities by aquatic organisms, such as anadromous fish.
- **Spawning, Reproduction, and/or Early Development (SPWN):** Uses of water that support high quality aquatic habitats suitable for reproduction and early development of fish.
- **Shellfish Harvesting (SHELL):** Uses of water that support habitats suitable for the collection of filter feeding shellfish (e.g., clams, oysters, and mussels) for human consumption, commercial, or sports purposes.
- **Wildlife Habitat (WILD):** Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.
- **Rare, Threatened, or Endangered Species (RARE):** Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Table 2-1
Beneficial Uses of Water Bodies and Coastal Features Designated in the Basin Plan

Water Body (and Tributaries)	Beneficial Uses											
	REC-1	REC-2	WILD	RARE	IND	NAV	COMM	MAR	BIOL	MIGR	SPWN	SHELL
Los Angeles County Coastal Nearshore Zone[a]	E	E	E	E[c]	E	E	E	E	E[an]	E	E[f]	E
Royal Palms Beach	E	E	E			E	E	E			P	E
Whites Point County Beach	E	E	E			E	E	E			P	E

E = Existing beneficial use

P = Potential beneficial use

c = One or more rare species utilizes all or part of bays, estuaries, and coastal wetlands for foraging and/or nesting.

f = Aquatic organisms (e.g., all life stages of anadromous species and certain species of estuarine fishes) migrate through all bays, estuaries, lagoons, and coastal wetlands to a certain extent for spawning and early development. This may include migration into areas that are already influenced by freshwater inputs.

an = Areas of Special Biological Significance (ASBS) along coast from Latigo Point to Laguna Point and Big Sycamore Canyon and Arrowhead Cove Ecological Reserves and Point Fermin Marine Life Refuge.

a = Nearshore is defined as the zone bounded by the shoreline and the 30 foot depth contours, whichever is further from the shoreline, throughout the area from Rincon Creek to the San Gabriel River Estuary.

2.1.1 Water Quality Objectives/Criteria

The Clean Water Act (CWA) requires that the State Water Resources Control Board (SWRCB) and Regional Boards conduct a water quality assessment that addresses the condition of its surface waters [required in Section 305(b) of the CWA] and provides a list of impaired waters [required in CWA Section 303(d)] that is then submitted to the U.S. Environmental Protection Agency (USEPA) for review and approval. The 2010 Integrated Report and updated 303(d) list were approved by the SWRCB on August 4, 2010 and by the USEPA on October 11, 2011. The 2010 303(d) listed water bodies and associated pollutants within the SMBRWQ WMP Group area are summarized in **Table 2-2**.

AR0072362

Table 2-2
2010 303(d)-Listed Water Bodies in the SMB JG7 WMP Group Area

Water Body	Pollutant Class	Pollutant	Notes
Santa Monica Bay Beaches	Pathogens	Coliform Bacteria	Addressed by Bacteria TMDL
	Pesticides	DDT	Addressed by PCB/DDT TMDL
	Other Organics	PCBs	Addressed by PCB/DDT TMDL
Santa Monica Bay (Los Angeles County Coastal Nearshore Zone)	Trash	Debris Plastic Pellets	Addressed by Trash TMDL
	Pesticides	DDT (tissue & sediment)	Addressed by PCB/DDT TMDL
	Other Organics	PCBs (tissue & sediment)	Addressed by PCB/DDT TMDL
	Toxicity	Sediment Toxicity	Addressed by PCB/DDT TMDL
	Miscellaneous	Fish Consumption Advisory	Addressed by PCB/DDT TMDL

Water bodies are subject to water quality objectives in the Basin Plan or Basin Plan Amendments, such as those to implement TMDLs. There are currently three TMDLs in effect for the water bodies within the SMB JG7 WMP Group area as listed in Attachment M of the Permit. These TMDLs are summarized in **Table 2-3**

Table 2-3
Santa Monica Bay TMDLs

TMDL Name	Agency	Effective Date
SMB Beaches Bacteria TMDL, Reconsideration of Certain Technical Matters of the SMB Beaches Bacteria TMDL, Resolution R12-007[1]	Regional Board	Not yet effective
SMB TMDL for DDT and PCBs	USEPA	March 26, 2012
SMB Nearshore Debris TMDL, Resolution R10-010	Regional Board	March 20, 2012
SMB Beaches Bacteria TMDL, Dry Weather, Resolution 2002-022[2]	Regional Board	July 15, 2003
SMB Beaches Bacteria TMDL, Wet Weather, Resolution 2002-022[2]	Regional Board	July 15, 2003

[1] This TMDL revision is not yet approved by USEPA
[2] This TMDL was revised pursuant to Resolution R12-2007

Table 2-4 identifies the applicable WQBELs and/or RWLs established pursuant to TMDLs included in Attachment M of the Permit. The water quality objectives as listed in the Basin Plan are also applicable to water bodies based on the designated beneficial uses. The Trash TMDL final WQBELs are effective March 26, 2020. The effective date of the polychlorinated biphenyl (PCB) and

AR0072363

dichlorodiphenylchloroethane (DDT). final WQBELs will be specified later in this document, since the USEPA-developed TMDL lacks a compliance schedule. The Bacteria TMDL final WQBELs and RWLs are currently effective for both dry weather and wet weather.

Table 2-4
Final Permit RWLs and WQBELs for SMB TMDLs

Reference	Parameter	Effluent Limitation/ Receiving Water Limitation
SMB Nearshore Debris TMDL	Trash – WQBEL	Zero
	Plastic Pellets – WQBEL	Zero
TMDL for PCBs/DDTs (for LA County MS4)	DDT – WLA	27.08 g/yr (based on 3-year averaging period)[2]
	PCBs – WLA	140.25 g/yr (based on 3-year averaging period)[2]
	Total coliform (daily maximum) – WQBEL	10,000 Most Probable Number (MPN)/100 mL
	Total coliform (daily maximum) if the ratio of fecal- to total coliform exceeds 0.1 – WQBEL	1,000 MPN/100 mL
SMB Beaches Bacteria TMDL	Fecal coliform (daily maximum) – WQBEL	400 MPN/100 mL
	Enterococcus (daily maximum) – WQBEL	104 MPN/100 mL
	Total coliform (geometric mean[1]) – WQBEL/RWL	1,000 MPN/100 mL
	Fecal coliform (geometric mean[1]) – WQBEL/RWL	200 MPN/100 mL
	Enterococcus (geometric mean[1]) – WQBEL/RWL	35 MPN/100 mL

[1] The rolling 30-day geometric mean is calculated based on the previous 30 days. The modified 2012 TMDL which has not yet been approved by USEPA, requires the weekly calculation of a rolling six-week geometric mean using five or more samples taken on all calculation weeks on Sunday.
[2] Group-based WQBELs that apply to all SMB MS4 permittees. The individual-based WQBELs for SMB JRP WMP Group members would be an area-weighted fraction of this.
MPN/100 mL = most probable number of organisms per milliliter.

Grouped RWLs for the Santa Monica Bay Beaches Bacteria TMDL are also expressed in the Permit in terms of allowable exceedance days (AEDs), which vary by season and by Coordinated Shoreline Monitoring Plan (CSMP) monitoring station. AEDs applicable to SMB 7-6 and 7-8 are summarized and discussed in **Table 2-6**, presented in the following Section 2.1.4.

[illegible] Resolution 2020-048, the [illegible] elects to participate in the Water Quality Equivalency Option for SMB Beaches Bacteria TMDL compliance. [illegible] Permit, [illegible] compliance [illegible] Final [illegible] Permit for [illegible] by 15 [illegible] http://[illegible].ca.gov/losangeles/[illegible]/Resolution_No_2020-048.pdf.

AR0072364

2.1.2 QA/QC Criteria

Quality assurance/quality control (QA/QC) criteria have been established to verify that data referenced in this water body characterization are qualified for use. All data used have either been peer reviewed; were submitted as part of an official record, such as in an agency's Annual Report to the Regional Board; or have met QA/QC criteria established by another party, such as the County, City Environmental Health Division, Regional Board, or California Environmental Data Exchange Network (CEDEN), which includes the Bight Program. Data not meeting these criteria have not been used in this water body characterization.

2.1.3 Detailed Data Analysis

A detailed monitoring data analysis was conducted to:

1. Evaluate the status of TMDL compliance;
2. Evaluate the status of 303(d) listings (i.e., whether any WBPCs meet the SWRCB's 303[d] delisting criteria);
3. Identify other WBPCs that meet 303(d) listing criteria; and
4. Identify remaining WBPCs demonstrating exceedance(s) of applicable receiving water limitations.

Monitoring data analyzed are summarized in **Table 2-5**, and existing monitoring stations are shown in **Figure 2-1**. It should be noted that the data presented are receiving water quality data and do not imply MS4 contributions.

Table 2-5
Existing Monitoring Programs

Program Name	Monitoring Period	Monitoring Locations	Parameters Analyzed	Frequency
Coordinated Shoreline Monitoring Program	2004-2013	Santa Monica Bay Beaches	Bacteria	Varies by site, weekly or daily
Southern California Bight Regional Monitoring	1994 - 2013	Santa Monica Bay Offshore/Nearshore	General suite in 1995 and 1998; PCBs and DDTs in 2003 and 2008	Varies by site

2.1.4 TMDL Compliance Status

Table 2-6 summarizes the shoreline monitoring bacteria data for 2003 through 2013 with respect to the number of exceedance days (EDs) at SMB-7-06 and SMB-7-08, as defined in the TMDL (exceeding one of four single sample daily maximum REC-1 WQOs). Both sites are open beach locations, and as such, any exceedance is not necessarily directly attributable to the MS4. Compliance at SMB-7-07 is not reported here because it was destroyed in a landslide in 2009 and is neither accessible nor monitored. Geometric mean exceedance days are not reported here. A summary of the average, median, minimum, and maximum water quality results from sampling at SMB 7-06 and SMB 7-08 is included in Attachment A. If follow-up samples were collected for weekly sites then those were included in this analysis, which may increase the number of reported EDs. As shown in **Table 2-6**, the summer dry weather AEDs have been exceeded eight out of the eleven years (73%) and three out of the eleven years (27%) between 2003 and 2013 for stations SMB-7-6 and SMB-7-8, respectively. The winter dry weather AEDs have been exceeded six out of the eleven years (55%) and one out of the eleven years (9%) between 2003 and 2013 for stations SMB-7-6 and SMB-7-8, respectively. The wet weather AEDs have been exceeded four out of the eleven years (36%) and two out of the eleven years (18%) between 2003 and 2013 for stations SMB-7-6 and SMB-7-8, respectively. It should be noted that 2005 recorded the most annual rainfall in Los Angeles County history (34 inches), which likely contributed to the abnormal number of exceedances.

AR0072365

Figure 2-1
Existing Monitoring Stations
SMB JG7 WMP

June 2014

AR0072366

Table 2-6
Summary of Exceedance Days
(bold text signifies Exceedance Days > Allowable Exceedance Days)

Station (type)	Season	AEDs	Number of Exceedance Days per TMDL Year										
			2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013
SMB-7-6 (open beach)	Dry-Summer[1]	0	1	1	1	2	0	2	0	1	0	1	1
	Dry Winter[2]	1	**3**	1	**11**	1	**2**	0	**5**	1	2	**2**	0
	Wet[3]	1*	1	1	**28**	1	0	2	1	**3**	**2**	1	0
SMB 7 0 (open beach)	Dry Summer[1]	0	1	1	0	0	0	0	0	0	0	3	0
	Dry-Winter[2]	1	0	0	**2**	0	0	0	1	0	1	0	0
	Wet[3]	1*	0	0	**13**	0	0	0	1	0	**2**	1	0

[1] Summer Dry Weather: April 1 - October 31
[2] Winter Dry Weather: November 1 - March 31
Wet Weather: November 1 - October 31 days with > 0.1 inches of rain and the three days following
[3] 2003 3 occasions in November and December
AEDs are based on weekly sampling. Exceedance days were calculated based on the raw data. For example, in cases where more than one sample was collected in a single week, these results were still considered against the weekly AEDs. This approach is consistent with annual monitoring reports but overestimates actual exceedance weeks.

AR0072367

2.1.5 Other Water Body-Pollutant Combinations that meet 303(d) Listing Criteria

There were no WBPCs identified within the SMB JG7 WMP geographical scope that were found to meet the 303(d) listing criteria.

2.1.6 Remaining Water Body-Pollutant Combinations Demonstrating Exceedance(s) of Applicable Receiving Water Limitations

Water quality data were compared to WQBELs and/or water quality objectives to determine if exceedances occurred within the last five (5) years. Those constituents that either had no exceedances within the past five (5) years or did not meet the 303(d) listing criteria for impairment, are discussed below but will not be considered in the prioritization process at this time.

USEPA's Santa Monica Bay DDTs and PCBs TMDL (USEPA 2012) relies on a limited dataset to establish stormwater load allocations, relying on a single study (Curren *et al.* 2011) from a single creek (Ballona Creek, which is outside the SMB JG7 WMP area) to extrapolate MS4 wasteload allocations to other SMB watersheds based on percent urban area. The Santa Monica Canyon, Ballona Creek, and Hermosa Beach watersheds combined represent 94% of the developed area draining to Santa Monica Bay. The TMDL does not present sufficient data to assign MS4 contributions to the DDT and PCB concentrations observed in Santa Monica Bay.

The Bight Regional Monitoring program includes six[1] offshore sampling locations within the SMB JG7 WMP geographical scope that were sampled between 1994 and 2008. Two sites (1267 SCBPP and 808 3389) were only sampled in 1994 and 1998, respectively, which is outside the range of recent data (10 years). The other sampling locations include sediment-based data from 2003 and 2008. The only TMDL sediment-based targets applicable to the SMB JG7 WMP area are for DDTs and PCBs; therefore, DDTs and PCBs are the only analytes included in this analysis. The sampling sites containing these data from 2003 and 2008 were located between 0.5 and 2 miles off the coastline of the SMB JG7 WMP Area. **Table** 2-7 summarizes the results from these sampling sites.

[1] The Bight regional monitoring program includes sediment chemistry data from 94 stations in the Santa Monica Bay region. Of these stations, sediment data from only six locations during the 2003 and 2008 sampling events were located within the SMB JG7 WMP area.

AR0072368

Table 2-7
Bight '03 and '08 PCB and DDT Monitoring Results[a]

Station ID	Station Description	Date	PCB[b] (ug/kg OC)	DDT[b] (ug/kg OC)
B08-7324	Approximately 0.5 miles off the coast of Point Fermin Park Beach	7/24/2008	103	**3,865**
B03-4042/ B08-7321	Approximately 0.6 miles off the coast of Point Fermin Park Beach	8/19/2003	**5,318**	**60,400**
		7/24/2008	**2,923**	**5,171**
B03-4170	Approximately 0.75 miles off the coast of Point Fermin Park Beach	8/21/2003	**1,051**	**22,984**
B03-4202/ B08-7320	Approximately 2 miles off the coast of White's Point Beach	8/20/2003	**9,419**	**111,497**
		7/24/2008	**19,420**	**125,515**

[a] Bold text signifies an exceedance of the sediment targets (normalized to total organic carbon) set forth in the PCBs and DDT TMDL for Santa Monica Bay. These established targets are 2,300 ug/kg OC for total DDT and 700 ug/kg OC for total PCBs.
[b] These are estimated values that assume one half of the method detection limit for all non-detect results.

Since the Bight samples were collected 0.5 to 2 miles off the coast away from any MS4 outfalls, this does not represent sufficient evidence to establish potential linkage of MS4 discharges to observed sediment concentrations.

2.2 Water Body-Pollutant Prioritization

Based on the water quality characterization, the WBPCs identified in **Table 2-8** have been classified into one of three categories, in accordance with Section IV.C.5(a)ii of the Permit. This categorization is intended to prioritize WBPCs in order to guide the implementation of structural and institutional BMPs.

AR0072369

Table 2-8
Water Body Pollutant Prioritization
(Listed in order of compliance deadline, interim and final are included, passed deadlines are shown in bold font)

Category	Water Body	Pollutant	Compliance Deadline
1	SMB Beaches	Summer dry weather bacteria	**7/15/2006 for single sample AEDs**
		Winter dry weather bacteria	**7/15/2009 for single sample AEDs**
		Wet weather bacteria	**7/15/2013 for single sample AEDs**[1]
			7/15/2013 for geometric mean (GM)[1]
	SMB Offshore/ Nearshore	Debris	9/20/2016 (20% load reduction)
			9/20/2017 (40% load reduction)
			9/20/2018 (60% load reduction)
			9/20/2019 (80% load reduction)
			9/20/2020 (100% load reduction)
	SMB	DDTs	[No compliance deadline specified in TMDL][2]
		PCBs	[No compliance deadline specified in TMDL][2]
2	No Category 2 WBPCs have been identified at this time		
3	No Category 3 WBPCs have been identified at this time		

[1] Per Resolution 2006-008, the Regional Board is pursuing a non-integrated water resources approach to SMB Beaches Bacteria TMDL compliance, which results in a final wet weather compliance deadline of at most 10 years after July 15, 2003 (http://www.waterboards.ca.gov/losangeles/board_decisions/adopted_orders/resolutions/2006/Res_2006-008_SMB_Bac_TMDL.pdf).

[2] Although the TMDL does not have a formal compliance schedule for the WLAs, Table 6-5 of the TMDL does specify a timeline for the DDT PCB targets in water and sediment. Additionally, the WLA target was set at existing waste load so full implementation considered over

As part of the adaptive management process, categorization of future WBPCs may be adjusted based on data obtained from monitoring, source evaluations, and BMP implementation. Data collected as part of the approved CIMP may result in future Category 3 designations in instances when receiving water limits are exceeded and MS4 discharges are identified as contributing to such exceedances. Under these conditions, the appropriate agencies will adhere to Section VI.C.2.a.iii of the Permit.

2.2.1 Category 1 – Highest Priority

WBPCs under Category 1 (highest priority) are defined in the Permit as "*water body-pollutant combinations for which water quality-based effluent limitations and/or receiving water limitations are established in Part VI.E and Attachments I through R of the Permit).*"

The WMP of bacteria over and dry weather at the Santa Monica Bay Beaches within the SMB 1G7 WMP area (including Royal Palms Beach, White Point Beach, and Point Fermin Park Beach) fall within Category 1 because they are listed in the Santa Monica Bay Beaches Bacteria TMDL.

Similarly, a Debris TMDL exists for Santa Monica Bay. Section VI.E.5.b(i) of the Permit states, "*Pursuant to California Water Code section 13360(a), Permittees may comply with the trash [debris] effluent limitations using any lawful means. Such compliance options are broadly classified as full capture, partial capture, institutional controls, or combined frequency of cleaning and collection… and any combination of these may be employed to achieve compliance.*" While trash will not be modeled as

AR0072370

part of the RAA, the RAA will address how the JG7 agencies will comply with the TMDL WQBELs by providing details on the planned implementation of the methods listed above, primarily through their Trash Monitoring and Reporting Program.

Although a USEPA TMDL exists for DDTs and PCBs for Santa Monica Bay, the TMDL relies on a limited dataset outside of the JG7 watershed area to establish stormwater load allocations. The TMDL mass-based waste load allocations for DDTs and PCBs are equivalent to the estimated existing stormwater loads (i.e., based on data used in the TMDL), so MS4 load reduction is required. As a result, it is anticipated that for the WMP RAA, no reductions in DDT and PCB loading from the JG7 MS4s are required to meet the TMDL WQBELs. And while DDTs and PCBs cannot be modeled as a stormwater pollutant for the RAA (due to the lack of land use event mean concentrations and BMP performance data), it will be qualitatively evaluated. It is also noted that the implementation of future institutional and/or structural BMPs throughout the SMB JG7 WMP area will lead to a reduction in runoff volume and associated sediment loading from the MS4s, thereby further reducing the existing mass load of any sediment bound DDTs and/or PCBs to the Santa Monica Bay. For these reasons, while DDT and PCBs will be included as Category 1 pollutants, they will be prioritized lower than bacteria and debris within Category 1, and will continue to be evaluated further through the CIMP monitoring effort.

2.2.2 Category 2 – High Priority

Category 2 (high priority) WBPCs are defined as *"pollutants for which data indicate water quality impairment in the receiving water according to the State's Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (State Listing Policy) and for which MS4 discharges may be causing or contributing to the impairment."*

There are no WBPCs within the SMB JG7 WMP area that currently qualify as Category 2.

2.2.3 Category 3 – Medium Priority

Category 3 (medium priority) designations are to be applied to WBPCs that are not 303(d) listed but which exceed applicable receiving water limitations contained in the Permit and for which MS4 discharges may be causing or contributing to the exceedance.

There are no WBPCs within the SMB JG7 WMP area that currently qualify as Category 3.

2.3 Source Assessment

The following data sources have been reviewed as part of the source assessment for bacteria and DDT/PCBs in the Santa Monica Bay subwatersheds:

- Findings from the Permittees' Illicit Connections and Illicit Discharge (IC/ID) Elimination Programs;
- Findings from the Permittees' Industrial/Commercial Facilities Programs;
- Findings from the Permittees' Development Construction Programs;
- Findings from the Permittees' Public Agency Activities Programs;
- TMDL source investigations;
- Watershed model results;
- Findings from the Permittees' monitoring programs, including but not limited to TMDL compliance monitoring and receiving water monitoring; and
- Any other pertinent data, information, or studies related to pollutant sources and conditions that that contribute to the highest water quality priorities.

Since the only receiving water in the SMB JG7 WMP area is the Santa Monica Bay, the following source assessment is broken down by pollutant.

AR0072371

2.3.1 Indicator Bacteria

Wet weather runoff event mean concentrations (EMCs) for fecal coliform, based on the Southern California Coastal Water Research Project (SCCWRP) land use data for the Los Angeles region (Stein *et al.* 2007), indicate that the highest concentrations are expected from agricultural land uses (there are none in the SMB JG7 WMP area), followed by commercial and educational, single family residential, multi-family residential, open space, industrial, and transportation. The SCCWRP study also found that in some cases the levels of fecal indicator bacteria at the recreational (beach) and agricultural land use sites were as high as those found in primary wastewater effluent in the United States. Tetra Tech *et al.* (2011) also found that horse stable sites contributed to significantly higher wet weather EMCs than other land use types.

The Santa Monica Bay Beaches Bacteria TMDL for both dry and wet weather was the first bacteria TMDL adopted by the Regional Board in the State of California. The Santa Monica Bay Beaches Bacteria TMDL was recently opened for reconsideration, although the source assessment was not part of this update. As a result, the general findings from the original source assessment remain unchanged. These findings are summarized in the 2012 Basin Plan Amendment for the reopened Santa Monica Bay Beaches Bacteria TMDL (Attachment A to Resolution No. R12-007):

> *"With the exception of isolated sewage spills, dry weather urban runoff and storm water conveyed by storm drains and creeks is the primary source of elevated bacterial indicator densities to beaches. Limited natural runoff and groundwater may also potentially contribute to elevated bacterial indicator densities during certain dry weather."* (Regional Board, 2012c).

The Santa Monica Bay Beaches Bacteria TMDL source assessment maintains that dry weather urban runoff and storm water runoff is the primary source of elevated bacteria concentrations at Santa Monica Bay beaches. Although definitive information regarding the specific sources of bacteria within the watershed is not presented, speculation provided in the dry weather staff report provides some insight into possible sources.

> *"Urban runoff from the storm drain system may have elevated levels of bacterial indicators due to exposure to sewage leaks and spills, illicit connections of sanitary lines to the storm drain system, runoff from homeless encampments, illegal discharges from recreational vehicle holding tanks, and malfunctioning septic tanks among other things. Stormwater can also be a direct source of bacteria to recreational waters. The bacteria indicators used to assess water quality are not specific to human sources; therefore, fecal matter from animals and birds can also be a source of elevated levels of bacteria, and vegetation and fecal waste can be a source of elevated levels of total coliform bacteria, specifically."* (Regional Board, 2002).

The 2010-2011 and 2011-2012 Los Angeles County Municipal Stormwater Permit Individual Reports for the JG7 agencies report that both sanitary sewer overflows and IC/ID, while eliminated shortly after being reported, do sometimes occur in their jurisdictions (but not necessarily within the SMB JG7 WMP area).

Additionally, information on non-MS4 sources of surfzone bacteria were compiled and based on a comprehensive review of Southern California published literature, as part of comments on the reopened Bacteria TMDL (City of Malibu, 2012):

> *"A number of recent Santa Monica Bay studies have further identified and confirmed natural non-anthropogenic sources of fecal indicator bacteria (FIB) including plants, algae, decaying organic matter, beach wrack and bird feces … implicating these as potentially significant contributors to exceedances (Boehm et al. 2011, Ishii et al. 2012). Beach sands, sediments*

AR0072372

and beach wrack have been shown to be capable of serving as reservoirs of FIB, possibly by providing shelter from ultraviolet (UV) inactivation and predation to allow for regrowth (Imamura et al. 2011; Ishii et al. 2012; Lee et al, 2006; Ferguson et al, 2005; Gipson et al, 2011; Griffith, 2012; Litton et al. 2010; Phillips et al. 2011; Song et al. 2013; Solarno et al. 2011, and Weston Solutions, 2010). In wet environments include semi-feral or "natural" strains that live and grow in water, soil, plants and insects (Griffith, 2012). Thus, elevated levels of enterococci in water could be related to input from natural sources. The phenomenon of regrowth of FIB from other anthropogenic or natural sources has been suggested by several studies as a possible source of beach bacteria exceedances (Griffith, 2012; Litton et al, 2010; Weston Solutions, 2010; Ishii et al. 2013; Wertheim et al, 2010)."

Other sources of bacteria during wet weather are anticipated to include other non-MS4 permitted stormwater discharges such as Industrial General Permit sites, Construction General Permit sites, Phase II MS4 Sites (e.g., college campuses), State/Federal owned lands, non-MS4 open space areas such as wildlife habitat, and the California Department of Transportation (Caltrans).

2.3.2 DDT and PCBs

As stated previously, limited data are available to characterize DDT and PCBs within Santa Monica Bay, particularly since direct discharges of these pollutants from publically-owned treatment works (POTWs) have ceased. The largest concentration of DDT and PCBs within Santa Monica Bay is contained within the Palos Verdes shelf, which is being addressed by the USEPA as a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) site. Loadings from the shelf to the Bay are large and have been well characterized (USEPA, 2013).

With respect to stormwater, the TMDL does not specifically characterize MS4 loadings, though it does recognize that *"DDT and PCBs are no longer detected in routine stormwater sampling from Ballona Creek to Malibu Creek."* However, the TMDL also states that current detection limits used to analyze DDT and PCB concentrations are too high to appropriately assess the water quality.

No other data or source information is available at this time. Once three years of water quality data are collected from Ballona Creek and Santa Monica Canyon 4 channel and evaluated consistent with the recommendations by USEPA in the TMDL to utilize a three-year averaging period", then further source assessment will be considered and the categorization and prioritization of PCB and DDTs as MS4-related pollutants of concern will be reevaluated.

The three-year averaging period is recommended by the USEPA TMDL to account for wet and dry years. Three years of data should be sufficient to capture a representative range of wet and dry years. USEPA states specifically, in the Attachment A to the TMDL, that exceptions to the PCB and DDT water quality objectives shall not be determined based on fewer than three years of data.

AR0072373

3
Watershed Control Measures

The Permit specifies that control measures, also referred to as BMPs, shall be identified to ensure that stormwater discharges meet RWLs and WQBELs as established in the Permit and to reduce overall impacts to receiving waters from stormwater and non-stormwater runoff.

BMPs are typically grouped into two broad categories, structural and institutional. Structural BMPs are physically-constructed control measures that alter the hydrology or water quality of stormwater or non-stormwater within the MS4 and are designated as either centralized or distributed based on their location within a watershed and size of contributing drainage area. Institutional BMPs are source control measures that prevent the release of flow/pollutants or transport of pollutants within the MS4 area, but do not involve construction of physical facilities. Minimum control measures (MCMs) are a subset of institutional BMPs.

Due to the zero required load reductions and the SMB JG7 WMP geography (outfalls are located on unstable cliffs and there are landslide and liquefaction hazards throughout the SMB JG7 WMP area), there are currently no centralized or distributed BMPs planned in the SMB JG7 WMP area at this time. In the event that CIMP monitoring demonstrates a need for quantitative RAA modeling and BMP implementation, BMPs may be selected based on performance data, subsurface conditions, land uses within the contributing drainage areas, and other relevant characteristics.

3.1 Minimum Control Measures/Institutional BMPs

The Permit requires the implementation of MCMs in Parts VI.D.4 through VI.D.10. These MCMs are similar to the programs required under the previous MS4 Permit (Order No. 01-182).

Although the previous MS4 Permit required implementation of MCMs, some of the key modifications introduced by the current MS4 Permit related to MCMs include:

- The Permit calls for more outreach and education as part of the Public Information and Participation Program (PIPP). Permittees, for example, will be required to maintain a website with stormwater-related educational materials.
- Permittees are expected to record additional information on industrial and commercial facilities within their jurisdiction as part of their Industrial/Commercial Facilities Program. For example, industrial/commercial facilities records will need to list receiving waters for which each respective facility is tributary to.
- The Permit provides more detailed criteria on BMP sizing and specification for use in the Permittees' Planning and Land Development Program, formerly the Development Planning Program, and calls for annual reporting of implemented mitigation projects.
- An Erosion and Sediment Control Plan (ESCP), which includes elements of a Storm Water Pollution Prevention Plan (SWPPP), replaces the Local SWPPP (L-SWPPP) as a required document for construction activities meeting certain criteria as a prerequisite to building/grading permit issuance.
- The Permit also requires Permittees to use an electronic tracking system to track construction activities within their jurisdiction and mandates slightly more aggressive inspection schedules.
- The Public Agency Activities Program remains largely unchanged with the exception of requiring Permittees to inventory existing developments for BMP retrofitting opportunities.

AR0072374

A comprehensive comparison between program requirements of the previous and current MS4 Permits is summarized in **Table 3-1**. Permittee activities under the Storm Water Management Program are summarized in the Los Angeles County Unified Annual Stormwater Reports; the report for the most recent reporting year is available at http://ladpw.org/wmd/npdesrsa/annualreport/index.cfm (Los Angeles County Department of Public Works, 2012).

As required by the Permit, the agencies in the SMB JG7 WMP group are continuing to implement the MCMs required under the 2001 MS4 Permit until the WMP is approved by the Regional Board. Applicable new MCMs will be implemented by the time the WMP is approved by the Regional Board. A brief description of each Program MCM and the tasks associated with each are summarized next. The implementation summaries of the Program MCM tasks identified are available in the Unified Annual Stormwater Report published by the Los Angeles County Department of Public Works.

The agencies in the SMB JG7 WMP group have also developed mechanisms for tracking information related to new development/re-development projects that are subject to post-construction BMP requirements in Part VI.D.7 of the MS4 Permit.

3.1.1 Customization of MCMs

In lieu of the requirements of Parts VI.D.4 through VI.D.10 of the Permit, the SMB JG7 WMP Group may customize MCMs within each of the general categories. The motivation for considering customization is made more apparent in the Regional Board's response to a comment that the Permit should establish criteria that will be used to support any customization of MCMs; the Regional Board responded with the following:

> *The Order specifies that at a minimum, Permittees' programs shall be consistent with 40 CFR section 122.26(d)(2)(iv)(A)-(D). In response to comments that the Order is overly prescriptive, specifying criteria could restrict customization within these categories of minimum control measures. The criterion to allow customization is based on showing equivalent effectiveness, for example, a municipality who has identified a group of facilities within their jurisdiction as the largest source of constituents could be allowed to focus their inspection efforts on controlling the constituents from this subset of facilities.*
> (http://www.waterboards.ca.gov/losangeles/water_issues/programs/stormwater/municipal/StormSewer/CommentLetters/E_MCM%20Matrix%2010-26-12%20Final.pdf)

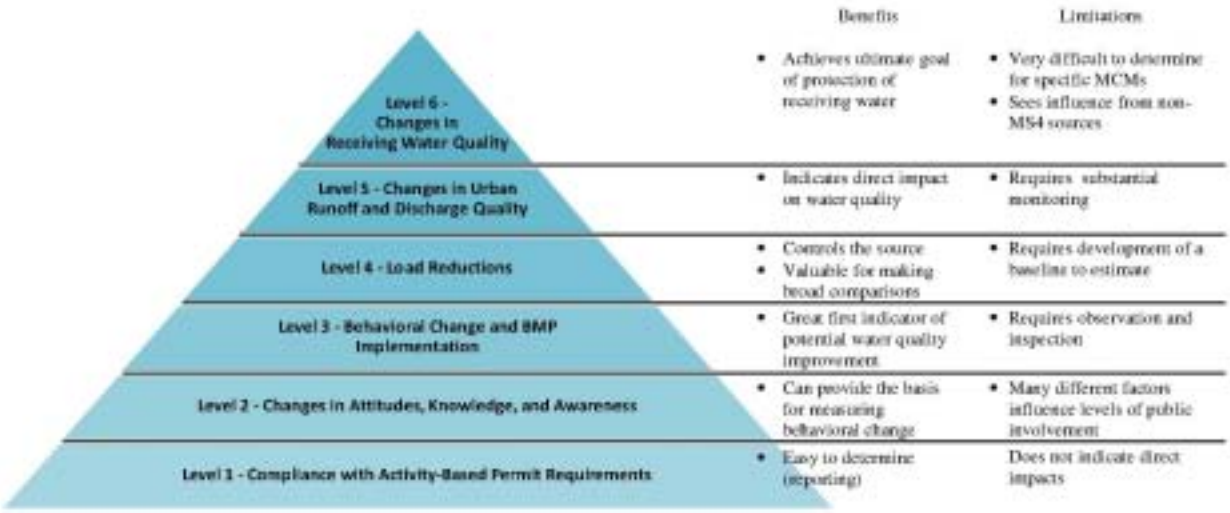
The opportunity for customization may provide benefit by allowing the SMB JG7 WMP Group to assess the effectiveness of their current programs and to modify their programs to better serve local conditions and objectives. If an effectiveness assessment is conducted on a specific MCM activity and it can be reasonably shown that customization of the MCM would result in equal or improved effectiveness on attitudes or knowledge, behavior or implementation, load reduction, or water quality, then a defensible recommendation for modification of that activity can be made, resulting in greater resources available for more effective activities.

The SMB JG7 WMP Group is not planning to customize MCM activities at this time. However, in the event that MCM customization would be beneficial to the identified WBPCs or if CIMP results indicate adjustments would be beneficial and/or needed, the first step in customizing MCM activities would be the development of a framework to assess the effectiveness of each MCM in its current implementation. For each MCM that can be assessed in this manner, recommendations for customizations can be developed with reasonable assurance of impact to effectiveness.

The California Stormwater Quality Association (CASQA) provides such a framework for the effectiveness assessment of Stormwater Management Programs (CASQA, 2006). The outcome is a hierarchy that categorizes the classification of outcome types (levels) that will allow MCMs to be placed into one or more categories for subsequent outcome assessment. The outcome levels, Level 1 through Level 6, are summarized in **Figure 3-1**.

AR0072378

Figure 3-1
General Classification of Outcome types (adapted from CASQA)



3.1.2 MCMs and Outcome Levels

The outcome types in this effectiveness assessment framework are interrelated. The Permit's stormwater management program is, by design, intended to improve the water quality in receiving waters. The means by which this goal is intended to be met is through the implementation of compliance measures by the SMB JG7 WMP Group. Compliance with these activity-based measures results in Level 1 outcomes. Assessments of these activities can provide further understanding of the outcomes they have. Ideally, each activity will contribute to the improvement at the Level 6 receiving water quality level; however, tracking effectiveness at this level is difficult.

A summary of the MCM activities of the agencies within the SMB JG7 WMP Group is included in the 2011-12 Annual Stormwater Report (Los Angeles County Department of Public Works, 2012). In addition to the standard reporting, the agencies answered a list of questions in an Assessment of Program Effectiveness. This summary largely includes responses that may be considered as Level 1 outcomes (compliance) with Level 2, Level 3, and Level 4 outcomes for select MCMs. Several obstacles inhibit the ability to achieve a Level 5 or Level 6 assessment, including:

- Available budget;
- Lack of comprehensive monitoring;
- Timing of MCM activities and corresponding runoff events; and/or
- General complexity of the hydrology and conveyance.

All SMB JG7 WMP Group members were in compliance with the Permit during the 2011-12 reporting year (Level 1 outcome). **Table 3-2** summarizes effectiveness assessment metrics and potential outcomes associated with select MCMs within each Program Element of the Storm Water Management Program. The following is a brief description of the Program MCMs and outcome levels that can be achieved through the effectiveness assessment framework described.

3.1.2.1 Public Information and Participation Program

The PIPP is intended primarily to reach out and educate the general public, students, business owners, facility operators, city staff, and others on stormwater. This outreach is accomplished in many ways; examples include "No Dumping" messages on storm drain inlets; public education materials; information

AR0072379

websites; community events; reporting hotlines; and specialized awareness programs, such as the used oil program. The program elements are intended to directly impact awareness and the behavior of different target audiences (Level 2 and Level 3 outcomes). Consequently, these behavioral changes may impact constituent loads to the MS4 indirectly, but the actual Level 4 through Level 6 impact of a specific MCM in this category may be difficult to quantify.

3.1.2.2 Industrial/Commercial Facilities Program

Permittees are required to conduct an Industrial/Commercial Facilities Program designed to prevent illicit discharges, reduce discharges of stormwater, and prevent industrial/commercial discharges to the MS4 from causing or contributing to receiving water quality exceedances. These facilities are tracked and inspected to ensure use of BMPs to control stormwater discharges. In addition, the program aims to contribute to the education of business owners and facility operators regarding SWPPP. The effectiveness of this program can be assessed leading to insight on how awareness (Level 2) and BMP implementation (Level 3) are affected.

3.1.2.3 Planning and Land Development Program

The Planning and Land Development Program involves developers early in the land development stage, with the integration of BMPs and Low Impact Development (LID) controls to reduce constituent loading to the MS4 and minimize runoff intensity generated from impervious areas. Behavioral change (Level 3) can be assessed through permitting staff observations. Also, it may be possible to assess constituent load reductions (Level 4) through land developer BMP choices and water quality of runoff entering the MS4 (Level 5) if monitoring stations are considered during the planning stage of development and redevelopment.

3.1.2.4 Development Construction Program

Similar to the Planning and Land Development Program, the Development Construction Program establishes requirements for construction activities to eliminate illicit discharges and prevent water quality violations from stormwater discharges from the construction site. The Program establishes criteria for BMPs and controls through an Erosion and Sediment Control Plan, with elements of a SWPPP. The effectiveness of this program can be assessed through inspections to verify BMP implementation (Level 3), Level 2 awareness outcomes can be assessed through the use of a website that informs contractors on proper BMP selection and prerequisite checklists for permitting.

3.1.2.5 Public Agency Activities Program

Activities ranging from street sweeping, catch basin cleaning, public facility maintenance, and storm drain operation fall under the Public Agency Activities Program. These activities are essential MCMs that can also be measured for effectiveness. Level 3 through Level 5 outcomes (behavior, load reduction, MS4 water quality) can all be assessed through appropriate evaluation metrics. The impact to receiving water quality (Level 6) may be possible to determine if appropriate monitoring is in place, with phased implementation of MCM activities to isolate performance evaluation.

3.1.2.6 Illicit Connections and Illicit Discharges Elimination Program

IC/IDs are controlled through the IC/ID Elimination Program and by implementing a procedure for reporting, tracking, and responding to reports of IC/IDs, as well as establishing protocols for the regular inspection of storm drains. The effectiveness of the reporting procedure can be assessed on a Level 2 (awareness) basis, and response activities can have their effectiveness determined directly through monitoring of the MS4 water quality (Level 5). A quantitative analysis of behavioral change (Level 3) as a result of enforcement actions is also achievable.

3.1.3 Next Steps to MCM Customization

The assessment framework outlines the process to determine baseline MCM effectiveness, providing the foundation for customization. Pending the results of the approved CIMP, opportunities for modifying

AR0072380

MCM activities may be proposed by the SMB JG7 WMP Group as part of the adaptive management process.

It should be noted, however, that institutional BMPs for MCMs such as street and median sweeping implementations, storm inlet and conveyance system cleaning, pet waste program enhancements, etc. are anticipated to cumulatively result in a pollutant load reduction between 5% and 8%. Additionally, assuming past data also reflect future trends, it is anticipated that 0.1 – 0.2% of residential, commercial, and industrial properties will implement LID annually through development or redevelopment projects*. Although RWLs are currently being met, it is anticipated that implementation of LID will further enhance the water quality in this region.

* LID is any technique or practice that reduces the impacts of development/redevelopment projects with the SMB JG7 WMP Group agrees over the next 10 years to encourage LID. Examples of LID techniques include, but are not limited to, rainwater harvesting, green roofs, permeable pavement, bioretention, and vegetated swales. LID techniques must be approved by the City prior to their use in MS4 Improvement Plans.

AR0072381

Table 3-2
Effectiveness Assessment Measures for Various Activities under the Storm Water Management Program

Program MCM	Permittee Activity	Possible Assessment Metric	Outcome Level
Public Information and Participation Program	Advertising / media campaigns (e.g., Used Oil / Used Oil Filter Program)	Year-over-year change in no. of impressions	L2
		Survey results	L2, L3
	Educational programs (e.g., Generation Earth, Environmental Defenders, public workshops)	Year-over-year change in attendance	L2
		Quiz results	L2, L3
	E-Waste collection events	Amount of Household Hazardous Waste/E-Waste	L3, L4
	888-CLEAN-LA hotline	Change in no. of calls	L2
	www.888CleanLA.com	No. of unique visitors / document downloads	L2
Industrial/Commercial Facilities Program	Website on program details	No. of unique visitors / document downloads	L2
	Electronic tracking	Inspections: change in no. of Notices of Violation (NOV) / non-compliance	L3
Planning and Land Development Program	Pre-permitting assessment	No. of developers incorporating BMPs and LID in early-stage	L3
	Annual reporting	% of stormwater capture	L3, L4
	Integrated control measures	Measure performance through planned monitoring	L5
Development Construction Program	Website on program details	Number of hits / document downloads	L2
	Electronic tracking	Inspections: change in no. of NOV / non-compliance	L3
Public Agency Activities Program	Street sweeping	Street sweeper fleet (technology)	L3
		Year-over-year change in debris collected	L3, L4
	Catch basin cleaning	Year-over-year change in trash collected	L3, L4
	Installation of trash receptacles	Observations: cleanliness of public roadways	L3
	Sanitary sewer overflow response	Monitoring results of MS4 water quality	L5
IC/ID Elimination Program	IC/ID reporting hotline	Year-over-year change in no. of calls	L2
	Termination of IC/ID	Outfall monitoring: change in water quality	L5
	Enforcement actions	Change in occurrence	L3
Other	Support for Senate Bill (SB) 346 (Brake Pad Initiative)	% of vehicles with reduced-copper-content brake pads	L4

AR0072382

4
Reasonable Assurance Analysis

Typically, an important component of the WMP is the RAA. The RAA is a process that is used to demonstrate that institutional and structural control measures are expected to be sufficient for achieving applicable WQBELs and/or RWLs for the water body pollutant combinations that have compliance deadlines within the Permit term. In addition to using the RAA as a means to determine the efficacy of existing and potential control measures, the RAA also facilitates the selection of BMPs as well as the prioritization of BMP implementation.

For the SMB JG7 WMP, there are currently zero required load reductions for the Category 1 WBPCs: bacteria at the Santa Monica Bay Beaches and PCBs/DDTs in the Santa Monica Bay. Compliance with the Trash TMDL is being demonstrated through retrofitting of catch basins as outlined in the Trash Monitoring and Reporting Program (City of Los Angeles Department of Public Works, 2012). No Category 2 or Category 3 WBPCs have been identified based on currently available monitoring data. Furthermore, it is anticipated that implementation of MCMs and related activities will progressively improve water quality.

Therefore, no quantitative RAA modeling is required for this WMP. For purposes of completeness, however, each Category 1 WBPC is qualitatively discussed below.

4.1 Bacteria

The Implementation Plan for compliance with the Wet Weather Santa Monica Bay Beaches Bacteria TMDL for the larger JG7 documents historical monitoring at eight sampling locations between 1997 – 2000 for indicator bacteria. Based on the historical monitoring having fewer exceedances than the reference beach, the Implementation Plan concluded that *"as JG7 already meets the baseline goals and only needs to implement provisions to prevent "backsliding"; the non-integrated approach will be selected. No milestones are proposed, as existing conditions are the equivalent of compliance with the TMDL"* (Regional Board, 2012). As a result, the Implementation Plan states that JG7 should continue to implement BMPs, review the LA County Sanitation Districts' data, and perform investigations as necessary. Tables M-1 and M-2 of Attachment M to the MS4 Permit also show that the compliance monitoring locations within the SMB JG7 WMP geographical area, SMB 7-6 and SMB 7-8 are subject to antidegradation conditions because the beaches have fewer exceedance days than the reference beach. Therefore, there is a zero required load reduction for bacteria, and reasonable assurance is demonstrated.

As part of the adaptive management process based on monitoring data collected through the approved CIMP, structural and/or nonstructural BMPs may be proposed if needed.

4.2 PCBs and DDTs

The Santa Monica Bay TMDL for DDTs and PCBs developed WLAs for stormwater throughout the Santa Monica Bay watershed. Because the SMB JG7 WMP group area is not distinctly defined in the TMDL, the WLAs assigned to the entire Santa Monica Bay WMA are being used for this discussion. Table 6-3 in the TMDL lists the existing annual DDT and PCB loads as compared to the annual maximum allowable loads. The existing estimated loads for all of Santa Monica Bay and most of the individual watersheds are lower than the maximum allowable loads. As such, the WLAs for the entire Santa Monica Bay WMA were set equal to the existing annual loads for DDTs and PCBs as 28 grams per year (g/yr) and 145 g/yr, respectively. Therefore, there is a zero required load reduction for PCBs and DDTs, and reasonable assurance is demonstrated.

AR0072383

As part of the adaptive management process based on monitoring data collected through the approved CIMP, additional structural and/or nonstructural BMPs may be proposed if needed.

4.3 Debris, and Plastic Pellets

Compliance with the Debris TMDL will be met through a phased retrofit of all 218 catch basins throughout the JC7 WMP area (182 City owned and 38 County owned) by 2016, ahead of the Regional Board implementation goal's for 2020 completion date. Consistent with the City's Trash Monitoring and Reporting Plan (TMRP) of City of Los Angeles Department of Public Works, 2012, *"vertical inserts with 5-mm openings and flow activated operable screen covers are the best suited for implementation within the City to achieve compliance with Trash TMDLs."*

There are no industrial facilities within the SMB JC7 WMP area that use, store, transport, manufacture, or handle plastic pellets. Therefore, the City's Plastic Pellet Monitoring and Reporting Plan (PMRP) will only include an emergency response plan.

AR0072384

5
Adaptive Management Process

The Notice of Intent submitted to the Regional Board in December 2013 provided a schedule of interim milestones for the development of the CIMP and WMP Plan. At this time, the SMB JG7 WMP Group does not anticipate any deviations from the schedule. Completed milestones and projected completion dates for future milestones are presented in **Table 5-1.** The catch basin retrofit schedule, as provided in the TMRP, is also included in the table.

Table 5-1
WMP Schedule of Interim and Final Milestones

Deliverable	Planned Date of Completion
Submit Final Draft WMP to the Regional Board	June 2014
Submit Final Draft CIMP to the Regional Board	June 2014
57 catch basin opening cover and/or insert retrofits (cumulative) (26%)	December 2015
161 catch basin opening cover and/or insert retrofits (cumulative) (100%)	July 2016

The WMP is intended to be implemented as an adaptive program. As new program elements are implemented and information is gathered over time, the WMP will undergo modifications to reflect the most current understanding of the watershed and present a sound approach to addressing changing conditions. As such, the WMP will employ an adaptive management process that will allow the WMP to evolve over time.

5.1 Compliance Schedule

The compliance deadlines in the Santa Monica Bay Beaches Bacteria TMDL are currently in effect for SMB 7-6 and SMB 7-8. The TMDL for PCBs and DDTs does not include a compliance schedule for the WLAs for the Santa Monica Bay WMA, but because the WLAs were set based on the existing loads, the Santa Monica Bay WMA is considered to be in compliance, and therefore a compliance schedule for this TMDL is not being proposed at this time. The compliance schedule for the Santa Monica Bay Nearshore and Offshore Debris TMDL is provided in **Table 5-1.**

Part VI.C.8 of the Permit details the adaptive management process to be included in the WMP that includes the following requirements:

i. Permittees shall adapt the WMP to become more effective every two years from the date of program approval based on, but not limited to, a consideration of:

   (1) Progress toward achieving WQBELs and/or RWLs;

   (2) Permittee monitoring data;

   (3) Achievement of interim milestones;

   (4) Re-evaluation of water quality priorities and source assessment;

   (5) Non-Permittee monitoring data;

   (6) Regional Board recommendations; and

AR0072385

(7) Recommendations through a public participation process.

i. Permittees shall report any modifications to the WMP in the annual report.

ii. Permittees shall implement any modifications to the WMP upon approval by the Regional Board or within 60 days of submittal if the Regional Board expresses no objections.

The adaptations to the WMP as called for in the adaptive management process essentially include a re-evaluation of water quality priorities, an updated source assessment, an effectiveness assessment of watershed control measures, and a RAA. The CIMP will gather additional data on receiving water conditions and stormwater/non-stormwater quality to inform these analyses. This process will be repeated every two years as part of the adaptive management process.

5.2 Re-Characterization of Water Quality Priorities

Water quality within the SMB IGT WMP Group will be re-characterized using data collected as part of the approved CIMP. WBPC's may be updated as a result of changing water quality. Category 2 WBPC's will be identified based on data collected as part of the approved CIMP. These classifications will be important for refocusing improvement efforts and informing the selection of future watershed control measures.

Demonstration that MS4 discharges have caused or contributed to the exceedance of receiving water limitations will be made by meeting both of the following criteria:

- Simultaneously collected water samples, as consistent with the CIMP, exceed the receiving water limitations as sampled in the receiving water and exceed the WQBELs, action levels as defined in Appendix G, or receiving water limits, in that order, at the MS4 outfall; and
- The number of simultaneous samples and simultaneous exceedances meet the criteria in Tables A.1 and A.2 in California's Water Control Policy (Regional Board, 2004).

5.3 Source Assessment Re-evaluation

The assessment of possible sources of water quality constituents will be re-evaluated based on new information from the CIMP implementation efforts. The identification of non-MS4 and MS4 pollutant sources is an essential component of the WMP because it determines whether the source can be controlled by watershed control measures. As further monitoring is conducted and potential sources are better understood, the assessment becomes more accurate and informed.

5.4 Effectiveness Assessment of Watershed Control Measures

The evaluation of BMP effectiveness is an important part of the adaptive management process and the overall WMP. Implementation of the CIMP can provide a quantitative assessment of structural BMP effectiveness, if BMPs are implemented in the future, as it relates to actual pollutant load reduction to determine how selected BMPs have performed at addressing established water quality priorities. In addition, the adaptive management process is a required step for the customization of MCMs as detailed previously. Effectiveness assessment becomes important for the selection of future control measures to be considered.

5.5 Update of Reasonable Assurance Analysis

The RAA is an iterative process that depends on the continuous refinement and calibration of the watershed models when used. Data gathered as a result of the CIMP will support adaptive management at multiple levels, including (1) generating data not previously available to support model updates (i.e. through the course of the CIMP, modeling becomes necessary in the SMB IGT WMP); and (2) tracking

AR0072386

improvements in water quality over the course of WMP implementation. This process is illustrated in **Figure 5-1**.

Regional Transportation Improvement Program (RTIP)

The Regional Transportation Improvement Program (RTIP) is a capital listing of all transportation projects proposed over a six-year period for the SCAG region. The projects include highway improvements, transit, rail and bus facilities, high occupancy vehicle lanes, signal synchronization, intersection improvements, freeway ramps, etc. In the SCAG region, a biennial RTIP update is produced on an even-year cycle.

The RTIP is prepared to implement projects and programs listed in the Regional Transportation Plan (RTP) and is developed in compliance with state and federal requirements. County Transportation Commissions have the responsibility under State law of proposing county projects using the current RTIP's policies, programs, and projects as a guide, from among submittals by cities and local agencies. The locally prioritized list of projects are forwarded to SCAG for review. From this list, SCAG develops the RTIP based on consistency with the current RTP, inter-county connectivity, financial constraint and conformity satisfaction.

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS
RTP
2008
REGIONAL TRANSPORTATION PLAN
Making the Connections
ADOPTED
MAY 2008

To the Region:

The Regional Council of the Southern California Association of Governments (SCAG) proudly presents the 2008 Regional Transportation Plan (RTP): Making the Connections, adopted on May 8, 2008. Success in transportation and transportation planning is about making the connections, whether it's connecting from bike to bus or truck to rail, relating the travel choices we make with environmental consequences, ensuring that land-use and transportation planning go hand-in-hand, or more equitably linking our transportation finance mechanisms to those who benefit directly from the use of the system.

Southern California's transportation network is severely overburdened and underfunded. For at least the last two decades, we have consistently ranked as the nation's most congested metropolitan area. It is anticipated that over the next 25 years, the region's population will increase by 6 million people and cargo trade through our ports and airports will triple in the same time period, doubling our truck traffic. As a result, roadway speeds are expected to decrease and traffic delays to increase over the next 25 years, all changes that directly impact our environment and air quality.

The 2008 RTP strives to provide a regional investment framework to address the region's transportation and related challenges. It is a $531.5 billion Plan (in nominal or year-of-expenditure dollars) that emphasizes the importance of system management, goods movement, and innovative transportation financing. It looks to strategies that preserve and enhance the existing transportation system and integrate land use into transportation planning.

The RTP was developed in collaboration with agencies from across the region, including our 14 subregions. We worked with county transportation commissions, subregional organizations, transit agencies, tribal nations, non-profits and advocacy groups, and other interested stakeholders. The majority of projects that you will see in the Plan were submitted by our region's five county transportation commissions and the Imperial Valley Association of Governments.

Our region faces great challenges, and we cannot afford to try to solve them solely on a city or even county level. We must look at the bigger picture of Southern California as a region, to look at strategies and new transportation systems that will make this region function the best that it can, and at the end of the day, to make Southern California a place that we are all proud to call our home.

Sincerely,

Gary Ovitt

President, Southern California Association of Governments
Fourth District Supervisor, County of San Bernardino, California

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS

REGIONAL TRANSPORTATION PLAN 2008

MISSION STATEMENT

Leadership | Vision | Progress

Leadership, vision and progress which promote economic growth, personal well-being, and livable communities for all Southern Californians.

The Association will accomplish this Mission by:

- Developing long-range regional plans and strategies that provide for efficient movement of people, goods and information; enhance economic growth and international trade; and improve the environment and quality of life.
- Providing quality information services and analysis for the region.
- Using an inclusive decision-making process that resolves conflicts and encourages trust.
- Creating an educational and work environment that cultivates creativity, initiative, and opportunity.

Funding: The preparation of this document was financed in part through funds from the Federal Highway Administration and Federal Transit Administration. Additional financial assistance was provided by the California State Department of Transportation.

RESOLUTION NO. 08-497-2

RESOLUTION OF THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS APPROVING THE 2008 REGIONAL TRANSPORTATION PLAN (2008 RTP) AND RELATED CONFORMITY DETERMINATION

WHEREAS, the Southern California Association of Governments (SCAG) is a Joint Powers Agency established pursuant to Section 6500 et seq. of the California Government Code;

WHEREAS, SCAG is the designated Metropolitan Planning Organization (MPO) pursuant to 23 U.S.C. §134(d) for the counties of Los Angeles, Riverside, San Bernardino, Ventura, Orange, and Imperial, and as such is responsible for preparing the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP) pursuant to 23 U.S.C. §134 et seq., 49 U.S.C. §5303 et seq., and 23 C.F.R. §450.312;

WHEREAS, SCAG is the designated Regional Transportation Planning Agency (RTPA) under state law, and as such is responsible for preparing, adopting and updating the RTP pursuant to Government Code Sections 65080 et seq.;

WHEREAS, the projects included in the RTP must be based on the continuing, cooperative, and comprehensive transportation planning process mandated by 23 U.S.C. §134(c) (3) and 23 C.F.R. §450.312;

WHEREAS, on August 10, 2005, the Safe, Accountable, Flexible, and Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) was signed into law, Pub. L. No. 109-59, Title VI, Section 6001(a), 119 Stat. 1839. SAFETEA-LU includes new and revised metropolitan transportation planning provisions and requires that all state and MPO actions on RTPs and RTIPs (including amendments, revisions or updates) comply with the SAFETEA-LU planning provision beginning July 1, 2007;

WHEREAS, SCAG staff conducted an analysis of the 2004 Regional Transportation Plan ("2004 RTP") which was in place at the time of the enactment of SAFETEA-LU, and thereafter identified the key issues or "gaps" in the 2004 RTP which needed to be addressed in order to comply with SAFETEA-LU. The effort led to the Regional Council's adoption in March 1, 2007 of an Administrative Amendment to the 2004 RTP (hereinafter referred to as the "Administrative Amendment") addressing these gaps. The Administrative Amendment to the 2004 RTP also allowed SCAG to take advantage of the four-year update cycle under SAFETEA-LU such that SCAG can adopt the next RTP update by the spring of 2008;

WHEREAS, in accordance with SAFETEA-LU, SCAG also approved and adopted a Public Participation Plan on March 1, 2007, to serve as a guide for SCAG's public involvement process. This Public Participation Plan was further amended on October 4, 2007, to provide more explicit details as to SCAG's strategies, procedures and techniques for public participation on the RTP, RTIP and the Overall Work Program (OWP);

WHEREAS, the Metropolitan Transportation Planning Final Planning Rule ("Final Rule") was promulgated by the U.S. Department of Transportation Federal Highway Administration and Federal Transit Administration on February 14, 2007, and became effective on March 16, 2007. The Final Rule included, among other things, more specific requirements relating to the content of metropolitan transportation plans (also known as RTPs).

WHEREAS, updates to the RTP must be consistent with all other applicable provisions of federal and state law including:

(1) SAFETEA-LU (23 U.S.C. §134 et seq.);

(2) The metropolitan planning regulations at 23 C.F.R. Part 450, Subpart C (i.e. the provisions of 23 C.F.R. §450.300 et seq. as set forth in the Final Rule);

(3) California Government Code §65080 et seq.; Public Utilities Code §130058 and 130059; and Public Utilities Code §44243.5;

(4) §§174 and 176(c) and (d) of the Federal Clean Air Act (42 U.S.C. §§7504 and 7506(c) and (d));

(5) Title VI of the 1964 Civil Rights Act and the Title VI assurance executed by the State pursuant to 23 U.S.C. §324;

(6) The Department of Transportation's Final Environmental Justice Strategy (60 Fed. Reg. 33896 (June 29, 1995)) enacted pursuant to Executive Order 12898, which seeks to avoid disproportionately high and adverse impacts on minority and low-income populations with respect to human health and the environment; and

(7) Title II of the 1990 Americans with Disabilities Act (42 U.S.C. §§12101 et seq.) and accompanying regulations at 49 C.F.R. §27, 37, and 38;

WHEREAS, SCAG staff has been engaged in the preparation of the 2008 RTP update since the spring of 2007, with a focus on maintaining and improving the transportation system through a balanced approach that considers system preservation, system operation and management, improved coordination between land-use decisions and transportation investments, and strategic system expansion to accommodate future growth through the year 2035;

WHEREAS, the 2008 Draft RTP was released by SCAG's Transportation and Communications Committee (TCC) on December 6, 2007 for public review and comment, and a Notice of Availability was issued. The 2008 Draft RTP included a financially constrained plan and a strategic plan. The constrained plan includes transportation projects that have committed, available or reasonably available revenue sources, and thus are probable for implementation. The strategic plan is an illustrative list of additional transportation investments that the region would pursue if additional funding and regional commitment were secured; and such investments are potential candidates for inclusion in the constrained RTP through future amendments or updates. For purposes of the 2008 RTP update, the strategic plan is provided for information purposes only and is not part of the financially constrained and conforming RTP;

WHEREAS, the 2008 Draft RTP also included a financial plan identifying the revenues available to support the SCAG region's surface transportation investments. The financial plan was developed following basic principles including incorporation of county and local financial planning documents in the region where available, and utilization of published data sources to evaluate historical trends and augment local forecasts as needed;

WHEREAS, pursuant to 23 C.F.R. §450.316(b)(1)(iv), SCAG must provide adequate public notice of public involvement activities and time for public review and comment at key decision points, including approval of plans and transportation improvement programs. SCAG followed the provisions of its adopted Public Participation Plan and subsequent Amendment No. 1 regarding public involvement activities for the 2008 RTP. For example, three duly-noticed public hearings were conducted within the SCAG region to allow stakeholders, elected officials and the public to comment on the 2008 Draft RTP;

WHEREAS, the 2008 Draft RTP serves as the basis of the 2008 Final RTP, and addresses public comments and issues relating to projects and other relevant data which arose subsequent to the release of the 2008 Draft RTP. The public comment period for the 2008 Draft RTP closed on February 19, 2008. SCAG received approximately 150 written comments. Staff has fully considered these comments in preparing the 2008 Final RTP;

WHEREAS, there were several comments relating to the Growth Forecast/Land Use discussion in the 2008 Draft RTP. In part because of the public comments, the Regional Council on March 6, 2008, approved the Baseline Growth Forecast with a statement of advisory land use policies/ strategies for the 2008 Final RTP;

WHEREAS, there were also project-specific comments made as part of the public comment period. Additional information was also provided regarding certain transportation projects that were included in the 2008 Draft RTP, contingent upon adequate documentation that these projects meet the fiscal constraint requirements. Based upon staff's analysis as well as input from the TCC and Regional Council, the projects in the 2008 Final RTP represent projects which meet the fiscal constraint requirements of SAFETEA-LU and the Final Rule;

AR0072409

WHEREAS, in non-attainment and maintenance areas for transportation-related criteria pollutants, the MPO, as well as the FHWA and FTA, must make a conformity determination on any updated or amended RTP in accordance with the Federal Clean Air Act to ensure that federally supported highway and transit project activities conform to the purpose of the State Implementation Plan (SIP);

WHEREAS, transportation conformity is based upon a positive conformity finding with respect to the following tests: (1) regional emissions analysis, (2) timely implementation of Transportation Control Measures, (3) financial constraint, and (4) interagency consultation and public involvement;

WHEREAS, the 2008 Draft RTP included the Draft Conformity Report which concluded with a positive transportation conformity determination for all applicable non-attainment areas in the SCAG region. After the release of the Draft Conformity Report, SCAG was informed that the U.S. Environmental Protection Agency (EPA)'s review of the ozone and PM2.5 motor vehicle emission budgets for the South Coast Air Basin submitted by the California Air Resources Board (ARB) raised concerns such that the ARB was required to revise and resubmit the emission budgets to EPA. This requirement led to SCAG making appropriate revisions to the draft conformity analysis to reflect the new emissions budgets and release a subsequent Draft Conformity Report for an additional 30-day public review period ending April 28, 2008;

WHEREAS, the Conformity Report contained in the 2008 Final RTP makes a positive transportation conformity determination. Using the final motor vehicle emission budgets released by ARB and found to be adequate by EPA, this conformity determination is based upon staff's analysis of the applicable transportation conformity tests;

WHEREAS, in accordance with the interagency consultation requirements, 40 C.F.R. 93.105, SCAG consulted with the respective transportation and air quality planning agencies, including but not limited to, extensive discussion of the Draft Conformity Report before the Transportation Conformity Working Group (a forum for implementing the interagency consultation requirements) throughout the update process;

WHEREAS, SCAG is required to comply with the California Environmental Quality Act ("CEQA") [Cal. Pub. Res. Code § 21000 et seq.] in updating the Regional Transportation Plan;

WHEREAS, SCAG released for public review and comment a Draft 2008 Regional Transportation Plan Program Environmental Impact Report ("Draft PEIR") on January 3, 2008;

WHEREAS, the public comment period for the Draft PEIR closed on February 19, 2008. SCAG has fully considered these comments, and written responses to comments received are included in the Final PEIR Addendum;

WHEREAS, prior to the adoption of this resolution, the Regional Council certified the Final PEIR prepared for the 2008 Final RTP to be in compliance with CEQA;

WHEREAS, the Final Rule stipulates that each project or project phase included in the RTIP shall be consistent with the approved RTP (23 C.F.R. Section 450.324(g));

WHEREAS, this RTIP consistency requirement would be applicable with the Regional Council's adoption of the 2008 Final RTP. SCAG staff, therefore, amended the 2006 RTIP so as to be consistent with the 2008 Draft RTP. Such amendment to the 2006 RTIP was referred to as "Amendment #06-13" to the 2006 RTIP, and was released for public review by a Notice of Availability along with the 2008 Draft RTP and the Draft Conformity Report. The majority of changes to the 2006 RTIP included as part of RTIP Amendment #06-13 are modeling network changes (due to changes in project completion dates) and there are a few changes due to project description changes;

WHEREAS, the Regional Council has had the opportunity to review the 2008 Final RTP and its related appendices, and consideration of the 2008 Final RTP was made by the Regional Council as part of a public meeting held on May 8, 2008.

NOW, THEREFORE BE IT RESOLVED, by the Regional Council of the Southern California Association of Governments as follows:

1. The Regional Council approves and adopts the 2008 Final RTP for the purpose of complying with the requirements of SAFETEA-LU and all other applicable laws and regulations as referenced in the above recitals. In adopting this 2008 Final RTP, the Regional Council finds as follows:

a. The 2008 Final RTP complies with all applicable federal and state requirements, including the SAFETEA-LU planning provisions. Specifically, the 2008 Final RTP fully addresses the requirements relating to the development and content of metropolitan transportation plans as set forth in 23 C.F.R.§450.322 et seq., including issues relating to: transportation demand, operational and management strategies, safety and security, environmental mitigation, the need for a financially constrained plan, consultation and public participation, and transportation conformity.

b. The 2008 Final RTP represents the SCAG region's collective vision for addressing our transportation needs through 2035 within the constraints of committed, available, and reasonably available revenue resources.

2. The Regional Council hereby makes a positive transportation conformity determination of the 2008 Final RTP. In making this determination, the Regional Council finds as follows:

a. The 2008 Final RTP passes the four tests and analyses required for conformity, namely: regional emissions analysis; timely implementation of Transportation Control Measures; financial constraint analysis; and interagency consultation and public involvement.

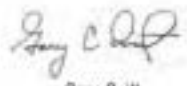
b. The effective date of the transportation conformity determination is deferred to the effective date of the adequacy findings made by the U.S. EPA regarding applicable emission budgets for the SCAG region.

3. In approving the 2008 Final RTP, the Regional Council also approves and adopts Amendment #06-13 to the 2006 RTIP, in order to address the consistency requirement of the federal law.

4. In approving the 2008 Final RTP, the Regional Council approves the staff findings as set forth in its reports and incorporates all of the foregoing recitals in this resolution.

5. SCAG's Executive Director or his designee is authorized to transmit the 2008 Final RTP and its conformity findings to the Federal Transit Administration and the Federal Highway Administration to make the final conformity determination in accordance with the Federal Clean Air Act and EPA Transportation Conformity Rule at 40 C.F.R. Parts 51 and 93.

APPROVED AND ADOPTED by the Regional Council of the Southern California Association of Governments at a regular meeting this 8th day of May 2008.



Gary Ovitt

EXECUTIVE SUMMARY

Success in transportation and transportation planning is about making the connections, whether it's connecting from bike to bus or truck to rail; relating the travel choices we make with environmental consequences; ensuring that land-use and transportation planning go hand in hand, or more equitably linking our transportation financing mechanisms to those who benefit directly from use of the system. The 2008 Regional Transportation Plan (RTP) connects the six-county region of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties to a future vision in which innovative solutions address the daunting challenges we face today.

The 2008 RTP presents the transportation vision for this region through the year 2035 and provides a long-term investment framework for addressing the region's transportation and related challenges. The Plan is the culmination of a multi-year effort focusing on maintaining and improving the transportation system through a balanced approach that considers system preservation, system operation and management, improved coordination between land-use decisions and transportation investments, and strategic expansion of the system to accommodate future growth.

Leadership, vision, and progress are three main components of the Southern California Association of Government's (SCAG) Mission Statement that apply to the RTP development process. In demonstrating a commitment to leadership, SCAG identified regional goals that reflect a balanced approach to transportation planning and decision-making. In providing a vision, the SCAG Regional Council adopted policies to guide the development of the RTP and identified transportation priorities for the region. Lastly and most importantly, in its commitment to demonstrate progress, SCAG continues to rely extensively on performance measurement as a means to identify the most beneficial investments for the region (see Table 1). Together, these elements contribute to a strong and focused RTP.

TABLE 1 RTP GOALS AND RELATED PERFORMANCE OUTCOMES

RTP Goals	Mobility	Accessibility	Reliability	Productivity	Safety	Sustainability	Preservation	Cost-Effectiveness	Environmental	Environmental Justice
Maximize mobility and accessibility for all people and goods in the region	✓	✓						✓		✓
Ensure travel safety and reliability for all people and goods in the region	✓		✓		✓					
Preserve and ensure a sustainable regional transportation system						✓	✓		✓	✓
Maximize the productivity of our transportation system	✓			✓						
Protect the environment, improve air quality and promote energy efficiency						✓			✓	✓
Encourage land use and growth patterns that complement our transportation investments and improve the cost-effectiveness of expenditures	✓	✓							✓	
Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies*										

* SCAG does not yet have an agreed-upon security performance measure; therefore, it is not included in this table.

This forward-looking Plan consists of two sections: a financially constrained plan and a strategic plan. While the constrained plan includes strategies that have committed, available, or reasonably available revenue sources, the stra-

AR0072416

tegic plan identifies further needs that require further study and consensus building before difficult decisions can be made as to whether the region is willing to commit funds to include them in a future RTP's constrained plan.

Transportation Planning Challenges

The SCAG Region is one of the largest and most complex metropolitan areas in the nation, and its transportation challenges are equally large and complex. Growth trends and travel patterns in the SCAG Region pose difficult challenges for our multimodal transportation system.

THE SHAPE AND PATTERN OF FUTURE GROWTH

Southern California is running out of land to support low-density future growth. The ocean and mountains pose natural barriers to development. Environmentally sensitive areas, such as coastal wetlands and natural habitat areas, hem in the region and dot the urbanized area. A significant amount of land is also owned by the state and federal governments for the public benefit and is off limits to development. The centrifugal force of growth continues to push the development footprint of the urbanized area outward. At the same time, pushing back on dispersed development are natural barriers, financial constraints to pay for outward expansion, and public resistance to unsustainable "leap frog" growth into green fields and sensitive habitat areas. Nearly all natural locations for urban development have been consumed, leaving us with hard choices about how we are to grow and change to meet the demands of the future.

The SCAG Region is the second-most populated metropolitan area in the United States. Nearly one-half of all Californians live in the SCAG Region, and 1 in 17 people living in the entire United States resides here. By July 1, 2007, the region's population had reached 18.6 million residents, having grown by 2 million residents (12 percent) from just seven years ago. Furthermore, the region saw greater population growth between 2000 and 2007 (2 million residents) than that which occurred throughout the 1990s (1.9 million residents). By the year 2035, the region is projected to be home to 24 million residents.

As the region grows, the average person will be older due to aging "baby boomers," and Hispanics will become the majority ethnic group. These shifting demographic patterns will influence future travel behavior as the elderly tend to travel less and recent immigrants tend to use public transportation more than other population groups.

MOBILITY CHALLENGES

The projected growth is expected to place even greater demands on the transportation system. The SCAG Region is served by an extensive multimodal transportation system addressing all aspects of travel in the region, including commuters; shoppers; public transit patrons; truckers delivering goods both regionally and locally, such as groceries to the local supermarkets; as well as fire, police, and other emergency personnel. The roadway and freight rail networks serve the largest maritime ports system in the United States (the Ports of Long Beach, Los Angeles, and Hueneme) and a number of large airports, including the fifth-largest airport in the world (Los Angeles International Air-

AR0072417

port—LAX). But as impressive as this system may seem, it has not kept pace with population growth and transportation demand.

Although the region's population has more than doubled since 1970, expenditures on the roadway system have actually decreased significantly since then. As a result, traffic delays have nearly tripled over the last twenty years, and 5.7 million person-hours are lost each day to traffic delays. Additionally, traffic bottlenecks (caused by merges, weaves, lane drops, stalls, accidents, and other factors) result in reduced roadway productivity. This "lost" capacity in the AM peak period, attributable to a large extent to non-recurring incidents such as accidents, weather conditions, stalled vehicles, etc., could have the effect of the loss of approximately 286 lane-miles of freeway capacity when it is needed the most. The cost of physically adding this lost capacity by widening existing facilities would exceed $4 billion.

Beginning in the 1980s, a major shift occurred away from building roadways and into transit projects and services. Between 2000 and 2005, regional transit use increased by more than 16 percent, and in 2005, our region reached the highest ridership per capita in about 20 years. However, as we are far from having a "complete" public transportation system with frequent service, extensive coverage, and good connectivity, less than 3 percent of all trips and person-miles traveled are taken on public transit.

AGING INFRASTRUCTURE

The need to preserve our transportation assets adequately was brought to the nation's attention after the Minnesota I-35W bridge collapse during the summer of 2007. We must recognize that our roadway network and transit systems developed over the past decades are aging. These regional assets represent hundreds of billions of dollars of investments that must be protected in order to serve us and future generations. Without these assets, or even a portion of these assets, the region's mobility would be significantly compromised.

Unfortunately, our region's roadways, especially the State Highway System, owned and operated by Caltrans, have not been maintained adequately due to constrained state and federal funding. Deferred maintenance leads to higher costs. Whereas pavement surface damage requires an investment of $64,000 per lane-mile to bring it to a state of good repair, the costs escalate significantly if these investments are not secured in a timely manner. The costs for minor damage repair escalate more than fivefold to $387,000, and the costs for major damage repair escalate to an astronomical $900,000 per lane-mile.

EXPLOSIVE GROWTH IN GOODS MOVEMENT

The SCAG region's goods movement system serves as the gateway for both international and domestic commerce. Supported in part by its geographical advantages such as deep-water marine ports, highly developed network of highways and railways, availability of transloading facilities, and its large internal market, goods movement is the fastest-growing segment of the region's transportation sector. Every state in the nation receives goods that pass through Southern California, and the region is a cornerstone of the nation's global competitiveness.

The San Pedro Bay Ports, which include the Los Angeles and Long Beach Ports, currently handle approximately 40 percent of the volume imported into the country and approximately 24 percent of the nation's exports, and one out of every seven jobs in Southern California depends on this trade. Container volume processed by the San Pedro Bay Ports grew by almost 60 percent in volume between the years 2000 and 2006, and is expected to nearly triple by 2030.

As the only deep-water port between Los Angeles and San Francisco, the Port of Hueneme in Ventura County is a major shipping point for automobiles, fresh fruit, and produce. Approximately $7 billion in cargo traverses through this Port annually, and trade-related activity generated by the Port contributes significantly to the local economy.

Cross-border trade activity also contributes to the region's international trade growth, with the growth in Mexico's manufacturing industry increasing truck trips through Calexico East in Imperial County by 77 percent between 1994 and 2005.

AR0072418

More than 75 percent of the containers processed by the ports in 2006 and 2007 involved a truck trip within the SCAG Region, either to a rail intermodal facility, a warehouse, or a transload facility. These trucks contribute to the existing congestion in the region and will contribute to future congestion even more, as the number of trucks is projected to more than double for several major freeways by 2030.

Recent projections included in SCAG's Inland Empire Railroad Main Line Study suggest that the number of freight trains on most Burlington Northern Santa Fe (BNSF) and Union Pacific (UP) lines will more than double between 2000 and 2025 in response to a tripling of container volume at the San Pedro Bay Ports. Freight rail poses serious quality-of-life issues for many communities. Some towns and cities witness 100 trains per day that literally split their communities into two sections for extended periods of time.

AVIATION CAPACITY AND GROUND ACCESS CONSTRAINTS

The SCAG Region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment. These airports support both growing passenger and freight movement, and there are significant challenges in meeting the future airport capacity needs of Southern California. Work on SCAG's 2004 RTP concluded that an Aviation Decentralization Strategy is needed to meet the forecast doubling of air passenger demand by 2030, from the current 90 million annual passengers (MAP) to 170 MAP (according to the 2004 RTP). This is because the four urban air carrier airports in Los Angeles and Orange Counties are all highly constrained. Their collective acreage amounts to 5,540 acres, which is less than 17 percent of the 34,000 acres of Denver International, and less than the 7,700 acres of Chicago O'Hare. At 3,500 acres, LAX is a very small international airport despite being the third-busiest airport in the country and fifth-busiest in the world in terms of passengers served. All of these urban airports have little room to expand because of severe encroachment by surrounding communities.

AIR QUALITY, CLIMATE CHANGE, AND ENERGY CHALLENGES

The SCAG Region continues to have the worst air quality in the nation despite improvements gained in the last two decades. The recently documented health impacts of air pollution on people living in the South Coast Air Basin are staggering. Of all the people nationwide who are exposed to PM2.5 levels that exceed the federal health-based standard, 52 percent live here. Of all the people statewide who are exposed to these levels, 82 percent live here. This is estimated to result in 5,400 premature deaths and 980,000 lost work days per year.[1]

Much of the region continues to exceed the National Ambient Air Quality Standards (NAAQS) identified in the Clean Air Act. Most of the SCAG Region is classified as non-attainment areas for some criteria pollutants. Further, as demonstrated by the recent Air Quality Management Plan (AQMP)/State Implementation Plan (SIP) efforts of local air districts and the Air Resources Board (ARB), the region's efforts to attain the NAAQS continue to be challenging, as the South Coast Air Basin, the Ventura County portion of the South Central Coast Air Basin, the Western Mojave Air Basin, and the Riverside County portion (Coachella) and the Imperial County portion of the Salton Sea Air Basin will all be "bumping up" to worse ozone non-attainment designations since they cannot achieve the NAAQS in the time previously assumed. Further, the attainment plan to meet the ozone standard in the South Coast Air Basin includes undefined long-term ("black box") measures of approximately 200 tons per day of nitrogen oxides (NOx), which is a daunting amount of as-yet-unidentified emission reductions. Of additional concern are the upcoming 24-hour PM2.5 standards, which will require even greater reductions as well as possibly more stringent ozone standards. Consequently, the ARB, South Coast Air Quality Management District (SCAQMD), and SCAG are committed to producing a white paper that identifies strategies to address the shortfall issues. Furthermore, there are strategies and programs in this Plan that will be incorporated into the white paper.

[1] Personal Communication, Richard Bode, California Air Resources Board, 2007.

AR0072419

In addition to the aforementioned challenges, efforts to reduce greenhouse gases (GHG) will present another tremendous challenge to the transportation sector. Transportation is the largest source of GHG emissions in California, representing 38 percent of emissions, and emissions from the transportation sector have grown more rapidly than from other sources over the past ten years.[2] California is the second-largest emitter of GHG emissions in the United States and the twelfth-largest emitter in the world, exceeding most nations.

At the same time, environmental and geopolitical factors are causing energy experts to question the long-term viability of a fossil fuel–based energy future. Travel demand forecasts generally assume that the future will include an abundant and relatively inexpensive supply of transportation fuels. If transportation fuel prices continue to increase, it would have a ripple effect on numerous areas including construction costs, gas tax revenue, travel and aviation demand, air emissions, mode choice and growth patterns. One area of uncertainty is how commuters may respond to higher gasoline prices. For example, a recent study suggests that with a ten percent increase in the gas price, there is a less than one percent change in gas consumption, while other data show that an increase in gas prices coincides with an increase in transit ridership. In addition, growth patterns may alter future demand for transportation fuels. Mixed land uses (i.e., residential developments near work places, restaurants, and shopping centers) with access to public transportation have been shown to save consumers over 500 gallons of gasoline per year.[3] Energy uncertainty requires serious consideration and further study.

TRANSPORTATION FINANCE CHALLENGES

While this region does not lack the creativity and resolve to develop innovative solutions to our problems, we continue to face shortfalls in transportation funding. As the critical factor that often determines whether beneficial projects can be implemented, transportation finance is perhaps the region's most imminent challenge. The following briefly describes current and projected challenges that are likely to impact transportation revenues within the 2008 RTP time frame.

Over the past four decades, transportation revenues (from gasoline taxes collected per gallon) in California have not kept pace with the state's ever-evolving demographic characteristics. Indicators such as vehicle miles traveled, population, and personal income growth have all outpaced the rate of transportation revenue growth. In addition, gas taxes are collected in cents per gallon. Without periodic adjustment or indexing, these funds will not keep pace with needs. Although the passage and recent renewal of local "self-help" transportation sales taxes have greatly improved funding for transportation, gasoline tax revenues continue to decline in value due to inflation.

The viability of the State Highway Account also remains a critical issue. The state's gasoline tax revenues are now exclusively dedicated to funding the

[2] United States Department of Transportation, Federal Highway Administration. Transportation and Global Climate Change: A Review and Analysis of the Literature. (June 1998.) DOT-T-97-03.

[3] Victoria Transport Policy Institute. Transportation Demand Management Encyclopedia.

AR0072420

needs of the State Highway Operation and Protection Program (SHOPP)—at a level, however, that is considerably less than actual needs. Continued underinvestment in the rehabilitation and maintenance needs of the state highway system has serious ramifications—rapidly increasing the number of distressed lane-miles on the state highway system and eroding the condition of the state's bridges. In recent years, transportation has relied heavily on the State General Fund to pay for capacity-enhancing projects. Reliance on the State General Fund means that transportation funding is subject to the state's annual budget process, which can be lengthy and unpredictable.

The need to establish a reliable and sustainable transportation funding source is even stronger, as the Federal Highway Trust Fund may not have enough resources to meet all of its obligations by the end of the decade. Expenditures authorized under SAFETEA-LU have outstripped revenues generated by the federal per-gallon gasoline tax. Accordingly, the viability of the Highway Trust Fund will be a critical issue in the discussions for the next round of the federal transportation reauthorization legislation, which will start in 2009.

Finally, over the last four years, construction costs in California and the nation have increased at an unprecedented rate and much faster than general inflation. The recent run-up in construction prices is due to a variety of factors, including a residential and commercial building boom as well as higher demand for construction materials in developing countries, most notably, China. Although these trends are likely to fluctuate, they have caused many transportation projects to exceed their budgets in the short term and made long-term project cost forecasting uncertain.

Transportation Strategy

SECURITY AND SAFETY FIRST

The SCAG Region is vulnerable to many types of catastrophic events including earthquakes, floods, fires, hazardous material incidents, dam failures, civil unrest, transportation accidents, tsunamis and terrorism. Through hard experience, California has in place an emergency and response structure designed to be innovative for the different locations and types of emergencies. There are many agencies that will participate in the response to a disastrous event and ensure that their jurisdictions are prepared to respond to these hazards. This Plan details nine measures that SCAG, as a planning agency, will undertake to enhance the region's ability to achieve and sustain at-risk target levels of capability to prevent, protect against, respond to, and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, and the region.

The mantra, "Safety First," applies to our transportation system no less than to any other sector of our region. When examined historically, fatal and injury collisions (rate per million vehicle miles traveled) have steadily decreased in California since the 1930s. As SCAG and Caltrans both recognize the continuation of this positive trend as a priority, in 2007, the region fully funded highway collision reduction and emergency response needs, estimated at $317 million and $110 million, respectively. In addition, this Plan forecasts expenditures of $10 billion for safety-related projects and services. Furthermore, in 2005, the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) required that each state develop a Strategic Highway Safety Plan (SHSP), which this RTP must be and is consistent with. These actions emphasize the level of collaboration among SCAG, Caltrans, and its stakeholders to examine safety on a system basis so that the region can use all the tools available to decrease traffic injuries and fatalities.

MANAGING OUR TRANSPORTATION SYSTEM WISELY

Since our challenges are multifaceted, our approach to tackling them must be as well. The region recognizes that maintaining and improving mobility will no longer depend solely on expanding its transportation system. Instead, an integrated approach is needed to maximize mobility. State transportation stakeholders have developed a tiered approach based on the idea that transportation investments would have more impact if they were prioritized strategically. Represented by the pyramid below, this approach frames the following discussion.

AR0072421

FIGURE 1 MOBILITY PYRAMID

SYSTEM MONITORING AND EVALUATION

First, it is imperative that we understand the problem in order to fix it. We must have an in-depth understanding of how our system performs and why it performs that way so that we can identify the optimal mix of strategies and projects that yield the highest returns on the region's investments. The base of the mobility pyramid, entitled "System Monitoring and Evaluation," is the foundation of sound system management. SCAG has developed performance measures to improve data collection and to track and monitor the progress of the transportation system so that the region can make informed decisions regarding transportation investments. For example, the Freeway Performance Measurement System (PeMS), developed by UC Berkeley, Caltrans, and the California Partners for Advanced Transit and Highways (PATH), has the ability to measure freeway speeds, delay, and reliability for the regional freeway system. Additionally, transportation professionals and decision-makers have recently committed to improving the region's ability to properly fund the investments needed to comprehensively monitor and evaluate system performance. These investments include detection, closed-circuit television systems, bus global positioning systems, and automatic ridership counting systems. Although funding is modest for these activities, they lead to more informed decisions.

MAINTENANCE AND PRESERVATION

Over the decades, the region has invested hundreds of billions of dollars in our multimodal transportation system. Preserving these assets is a critical priority, especially as preservation needs have been historically underfunded in our region. On top of existing funding for preservation and maintenance, our highway system needs an additional $30 billion through 2035, and our arterial and transit system needs another $10 billion.

Recognizing that every dollar expended today toward maintenance and preservation will save much more in the future, this Plan commits $8 billion of new funding to preservation.

INTEGRATED LAND USE AND DEMAND MANAGEMENT

Integrated Growth Forecast

The Baseline Growth Forecast sets the stage for a future regional growth scenario, as it ties housing to transportation planning, considering both needs simultaneously in communities throughout the region. This approach ensures that the resulting assumptions are consistent with planned transportation infrastructure. Based on a combination of recent and past trends, reasonable key technical assumptions, and existing and new local policy options, the Baseline Growth Forecast provides the basis for developing the land use assumptions at the regional and small-area levels which build the 2008 RTP Plan Alternative.

AR0072422

Advisory Land Use Policies and Strategies

The 2008 RTP Plan Alternative incorporates the Baseline Growth Forecast and the approved transportation network. However, in the rapidly growing SCAG Region, these trends could be tempered, and in some cases bolstered, by policies and strategies designed to improve future travel patterns and vehicle emissions. In response, SCAG adopted a set of advisory land use policies and strategies for future regional planning efforts and for localities to consider as they accommodate future growth. These policies and strategies were founded upon the principles developed through the regional growth visioning efforts begun in 2001.

- Identify regional strategic areas for infill and investment
- Structure the plan on a three-tiered system of centers development
- Develop "complete communities"
- Develop nodes on a corridor
- Plan for additional housing and jobs near transit
- Plan for a changing demand in types of housing
- Continue to protect stable existing single-family areas
- Ensure adequate access to open space and preservation of habitat
- Incorporate local input and feedback on future growth

Travel Demand Management (TDM)

In an effort to address travel demand, TDM strategies are designed to influence an individual's travel behavior by making alternatives to the single-occupant automobile more attractive, especially during peak commute periods, or by enacting regulatory strategies. Some examples of TDM strategies are carpools and vanpools, public transit, non-motorized modes, congestion pricing, and providing the public with reliable and timely traveler information.

In total, this Plan dedicates over $1.3 billion to TDM investments.

Increasing Rideshare (Carpool and Vanpool)

The SCAG Region continues to invest heavily in High-Occupancy Vehicle (HOV) infrastructure that provides incentives for commuters to share rides with others. While HOV utilization is growing over time, the percent of total travelers using carpools and vanpools is not. SCAG and its partners will strengthen their efforts to encourage this efficient mode, which reduces travel time and improves air quality.

Increasing Work at Home

Increasing the number of workers who work at home (self-employed, home-based business owners) or who telework/telecommute (wage and salary employees conducting some or all of their work from home) decreases home-based work trips, vehicle-miles of travel, congestion, and vehicle emissions. National and regional surveys of those who telecommute indicate that it is a lack of support and trust from "management," rather than the provision of equipment or the desire of workers to telecommute, that hampers the growth of telecommuting. Therefore, this Plan recommends formalizing and

AR0072423

expanding partnerships among public- and private-sector stakeholders, and to promote telecommuting to increase opportunities for workers regionally to telecommute in lieu of daily commuting.

Non-Motorized Transportation

Bicycling and walking play an important role in our transportation system. According to the 2001 National Household Travel Survey, 50 percent of all trips made nationwide in urban areas were shorter than 3 miles, and 28 percent of all trips were under 1 mile. These trips are ideal for biking, walking, and transit or a combination of those modes of travel.

Regionwide, however, our average commute distance to work is 19.2 miles, too far for many bicyclists and all pedestrians. However, the integration between bicycle and transit nodes offers the opportunity to extend the commuting range of bicyclists. Bicycle transportation infrastructure has a role in regional mobility and air quality improvements. Every automobile driver that switches to an alternative transportation choice (walking, bicycling, using transit) reduces air pollution, congestion, the need for increasing roadway capacity, and improves public health.

Bicycle and pedestrian improvements are included as part of many larger street maintenance and construction projects, and should always be included in general plan updates, with which SCAG can assist in the development through the Compass Blueprint Program. These investments and the supporting policies all aim to maximize the benefits of this efficient mode of transportation. In addition, this Plan supports several policies that aim to work with local governments and increase the safety, convenience, and attractiveness of bicycling and walking as modes of travel.

The RTP allocates over $1.8 billion for non-motorized transportation.

MAXIMIZING TRANSPORTATION SYSTEM PRODUCTIVITY

Beyond managing our travel demand, this region needs to invest in maximizing the productivity of our existing system and increase its efficiency. The region has built a vast and expensive transportation system, which can be tweaked and modernized to carry more people and goods in a day or during peak commute conditions. Such investments include implementing advanced traffic control strategies such as signal coordination and ramp metering, improved incident management, and smaller physical infrastructure modifications such as auxiliary lanes.

Recognizing that funding productivity improvements provides a higher return on investments than most other transportation projects, this Plan allocates an additional $2 billion, representing 20 percent of the region's operations improvement shortfall. As these allocations are programmed and implemented, SCAG hopes that the benefits will become apparent to decision-makers and the public, and that additional funding can be secured to address the remaining shortfall.

Strategic Transit Service Policies

In an effort to maximize transit productivity, this Plan calls upon regional transit operators to address significant challenges to achieve better operational efficiency, maintain a discipline of cost recovery through a consistent fare policy, embrace the use of performance metrics to better serve their existing customer base, and attract new transit users. The Plan encourages the regional transit operators to work cooperatively to offer complementary services, with ease of transfer between modes and operators. It further encourages utilization of new intelligent transportation system (ITS) technologies that measure system performance and offer their customers reliable "on-time" performance and real-time information.

SYSTEM COMPLETION AND EXPANSION

Beyond the preceding strategies and improvements that have been evaluated thus far, the past and future growth in transportation demand calls for the expansion of our existing transportation system. As such, more than half of the available transportation revenues in the region are dedicated to the completion and expansion of our people and goods movement transportation systems.

AR0072424

Highway Improvements

Major categories of highway improvements included in this Plan are HOV lanes and connectors, mixed-flow (or general purpose) lanes, toll facilities and High-Occupancy Toll (HOT) lanes, and strategic arterial improvements. A significant number of system expansion projects have already been committed through SCAG's Regional Transportation Improvement Program (RTIP) for the highway network. These priority projects close critical gaps in the system, relieve significant bottlenecks, and address inter-county travel needs.

HOV Gap Closures and Connectors

Southern California has invested heavily in HOV lanes, producing one of the nation's most comprehensive HOV networks and highest rideshare rates. Several experiments involving HOV lanes are being conducted throughout the region in an effort to improve the functionality of this already-proven TDM strategy. In 2007, the first continuous-access HOV lanes opened on SR-22 in Orange County. Since the HOV lane system is a regional network, operations should be coordinated across jurisdictional boundaries to optimize performance and minimize confusion. SCAG supports further study and evaluation of these proposed operational changes to the HOV lane system to fully understand the mobility, safety, and air quality impacts, as well as any implications for a proposed regional HOT lane system.

This Plan includes many additional investments to extend the HOV network, strategically close gaps in the HOV network, and construct additional direct freeway-to-freeway connectors to maximize the overall system performance by minimizing weaving conflicts and maintaining travel speeds.

Mixed Flow

Since mixed-flow lanes carry more traffic than any other component of our transportation system, mixed-flow capacity enhancements are also necessary to address traffic bottlenecks and relieve congestion on heavily traveled corridors. This is especially true in areas outside of the urban core where transit service and the HOV network are not fully developed. This Plan includes a variety of mixed-flow lane additions, the majority of which are located outside of Los Angeles County.

Toll and High-Occupancy Toll (HOT) Lane Corridors and Facilities

This Plan also includes the expansion of the existing HOT lane and toll road system in Orange County to address the congested commuter corridor between housing-rich Riverside County and job-rich Orange County. Additionally, improvements to several major corridors in other parts of the region are proposed to be financed by tolls, including the SR-710 Gap Closure and the High Desert Corridor.

Transit

The RTP's Integrated Land Use and Transit policies and strategies work hand in hand to improve mobility and air quality. The investment in new rail and bus transit corridors has spawned investment throughout the region in new housing, retail, and business development at and near transit stations. Since 2003, the region has experienced substantial growth in daily regional transit

AR0072425

trips as transit has become an increasingly integral mode of transportation for the movement of people to and from home, work, school, shopping, and cultural and recreational activities.

This Plan recommends closing critical gaps in the transit system to improve service, and extending routes to serve a greater number of passengers. In addition, the coordination of development in and around transit stations and corridors, improved service reliability and performance, and a highly focused transit capital investment program appear to yield the best results within the budget limitations that the region faces.

Heavy and light rail projects are planned for Los Angeles County, while Orange County focuses on several new bus rapid transit (BRT) corridors. Riverside and San Bernardino Counties are planning a mix of new rail and BRT projects.

Aviation

SCAG's Regional Aviation Decentralization Strategy is very similar to the 2030 decentralized regional aviation system adopted for the 2004 RTP. It respects all legally enforceable policy and physical-capacity constraints at urban airports. It also assumes much more willingness on the part of the airlines to invest in new flights at new and emerging airports, and a package of market and ground access incentives to promote decentralization at underutilized suburban airports.

Airport Ground Access

The Regional Aviation Decentralization Strategy calls for making substantial airport ground access improvements throughout the region, in both the short term and long term.

The short-term program emphasizes relieving immediate bottlenecks around airports through arterial, intersection and interchange improvements, and increasing transit access to airports. To this end, SCAG is working with Los Angeles World Airports (LAWA) on planning and programming a regional system of FlyAways, based on the very successful Van Nuys FlyAway, where passengers park their cars and take a bus to LAX. The locations of the proposed new FlyAways can be optimized by taking advantage of the region's developing HOV and light and heavy rail networks that can provide direct linkages to Ontario and Palmdale as well as LAX. Making seamless HOV and rail connections with enhanced service to those and other suburban airports will also compose SCAG's short- and medium-range airport ground access strategy. The FlyAway, HOV and rail improvements to the suburban airports will help establish a pattern of decentralization, by attracting a critical mass of passengers and airline service at those emerging airports.

In the long run, however, the region will need a high-speed rail system, discussed below, to reach our adopted air passenger and air cargo forecasts. The high speed, reliability, and predictability of high-speed airport access will be needed to overcome the increasing unpredictable traffic congestion. For example, the Initial Operating Segment (IOS) of SCAG's proposed High-Speed Regional Transport (HSRT) system from West Los Angeles to Ontario will take only 33 minutes to travel from end to end. Therefore, the regional high-speed rail system is an integral component of the 2008 RTP Preferred 2035 regional aviation demand forecast.

High-Speed Regional Transport (HSRT)

SCAG has advanced a vision of regional transport based on high-performance, high-speed, and environmentally sensitive alternatives. An HSRT system has the potential for relieving both airport and freeway congestion in urbanized areas by providing an alternative to the automobile as well as making less-congested airports more accessible to air travelers, and providing alternative capacity for freight movement in the region.

The HSRT system is a long-term vision connecting the region's ports, airports, and urban activity centers. The system can be constructed in multiple stages that can each be financially viable. The financial performance will be enhanced as the system is extended throughout the region and the volume of users increases. The HSRT plan is constructed on three core components: a goods movement/logistics component to connect the San Pedro Bay Ports

AR0072426

with an inland port facility via the high-speed, high-capacity link; an aviation system component to create a direct and reliable link capable of connecting airports and urban centers; and a surface transport system component to link urban activity centers throughout the region.

Another high-speed regional transport project being studied is a magnetically levitated train between Las Vegas and Anaheim by the California-Nevada Super Speed Train Commission (CNSSTC) that would include a critical Anaheim-Ontario segment, which would further the airport decentralization strategy for the region. Also, the California High-Speed Rail Authority (CHSRA) is charged with planning, designing, constructing, and operating a high-speed steel wheels on steel rails train system that would connect Northern and Southern California. This system contains 210 miles planned in the SCAG Region, including a 30-mile segment between Orange County and LA Union Station.

Goods Movement Strategies

To enable the region to handle the dramatic growth in the goods movement sector, the Plan calls for approximately $13 billion in freight rail investments, nearly $18 billion in a freight HSRT system, and over $5 billion in highway investments. These investments integrate air quality mitigation into the goods movement system improvements, yielding substantial air quality benefits and reducing its current and long-term impacts on public health and the environment.

Dedicated Lanes for Clean-Technology Trucks

Over the past several RTP updates, the region has been exploring dedicated truck-lane facilities and continues to refine the concept of such user-supported corridors to improve the flow of goods. More recent effort has focused on adding dedicated truck lanes for clean-technology vehicles along truck-intensive corridors in Southern California. Operationally, such a corridor would be aligned to connect freight-intensive locations such as the Ports, warehousing/distribution center locations, and manufacturing locations. These dedicated facilities would have fewer entrance/egress locations than typical urban interstates to smooth the flow of goods.

This proposal has the potential to relieve many of the negative truck impacts in Southern California such as recurrent delay, pavement deterioration, safety, emissions, and design deficiencies. Dedicated truck lanes would also increase reliability in the freeway system. Despite these benefits, substantial financial constraints as well as environmental impact considerations could hinder project implementation. Recognizing these challenges, the 2008 RTP funds the I-710 segment as the first phase of a comprehensive system that addresses truck-related issues in the region. This segment includes roughly 78 lane-miles (two lanes in each direction) of dedicated lanes for clean-technology trucks along alignments extending from Ocean Blvd. in Long Beach to the intermodal railroad yards in Commerce/Vernon. This represents an investment of over $5 billion.

The region's longer-term strategic vision would include an east-west corridor and the I-15 freeway, serving strategic distribution centers in Barstow. Major corridor studies have already been completed for I-710, SR-60, and I-15. An Environmental Impact Report/Environmental Impact Statement (EIR/EIS) and preliminary engineering are currently underway for the I-710. The techni-

AR0072427

cal analysis for the 2008 RTP assumes the implementation of dedicated lanes accommodating clean-technology vehicles along the I-710 corridor until a preferred alternative is identified by the EIR/EIS.

Regional Freight Rail Investment and Emission-Reduction Package

Freight rail investments consist of additional mainline capacity, grade separations, and locomotive engine upgrades. About half of the rail-related investments are for grade crossing separations, which reduce traffic congestion, improve safety, and reduce pollution. Substantial air quality benefits can be realized by accelerating fleet modernization with cleaner technologies.

The UP and BNSF mainlines east of downtown Los Angeles will reach capacity before the end of the decade and will need to be triple-tracked or even quadruple-tracked in some segments. Investments in this Plan include $3.2 billion in mainline rail capacity improvements, $6.0 billion to build an estimated 131 highway-rail grade separations east of downtown Los Angeles, and a total of $3.8 billion for accelerating upgrades to cleaner diesel locomotive engines—namely, Tier 4 engines.

In March of 2007, the US Environmental Protection Agency (EPA) proposed new standards to reduce emissions from diesel locomotives: Tier 3 and Tier 4 exhaust emission standards for newly built engines with high-efficiency catalytic after-treatment technology. Tier 3 engines will be available in 2009 and the associated estimated reduction in emissions is to less than 50 percent of current conditions. The reduction in emissions from Tier 4 engines is estimated at 90 percent of current conditions. This Plan assumes nearly $2 billion in federal EPA funding to subsidize the deployment of Tier 4 engines in the region.

Alternative Technology–Based Goods Movement/Logistics

The region is also exploring new alternative technology–based systems that can provide greater throughput and reliability with near zero emissions (the emissions would be only those associated with electricity generation). A recent analysis carried out by the IBI Group considered the application of an HSRT system for the movement of containers (logistics and systems technology) to

and from the San Pedro Bay Ports. This container movement system would provide a high-capacity, fast, and efficient method of moving containerized cargo from the Ports to an inland port facility in San Bernardino. The system capitalizes on the inherent savings of multiple uses on a single infrastructure by operating on shared alignments with the HSRT passenger system. The technology permits operation of HSRT freight vehicles on a shared guideway with passenger vehicles even during peak hour service. Freight vehicle trips can be interspersed with passenger trips while still meeting required passenger vehicle headways. Additionally, full utilization of the freight line can be achieved during the passenger system's off-peak hours. The deployment of the HSRT system would create value in associated components which could in turn contribute to the HSRT's total financial performance.

The connection for the HSRT system would begin at the Ports and join up with the IOS[4] at a point just east of the Los Angeles Union Passenger Terminal (LAUPT). This alignment runs north-south and is assumed to follow a route parallel to the I-710/Alameda Corridor. After connecting to the IOS and other segments, the freight-only service would be interspersed with passenger service.

[4] The Initial Operating Segment (IOS) is discussed in further detail in the supplemental HSRT Report and Appendices.

AR0072428

TABLE 2 SUMMARY OF SYSTEM COMPLETION AND EXPANSION PROJECT TYPES

Project Type	Cost
Highway Improvements	**$77.2 billion**
Mixed Flow Lanes and Interchanges/Ramps	$26.2 billion
HOV	$8.3 billion
Toll Lanes	$25.6 billion
Arterial	$17.1 billion
Transit Improvements	**$44.0 billion**
Commuter Rail	$6.2 billion
Heavy Rail	$5.7 billion
Light Rail	$1.7 billion
Bus Rapid Transit	$0.9 billion
Bus	$21.3 billion
Other Transit	$8.2 billion
High-Speed Regional Transport	**$29.1 billion**
Goods Movement Strategies	**$36.4 billion**
Mainline Rail Capacity Improvements	$3.2 billion
Highway-Rail Grade Separations	$6.0 billion
Upgrade to Tier 4 Engines	$3.8 billion
Alternative Technology–Based Goods Movement System	$17.9 billion
Dedicated Lanes for Clean-Technology Trucks	$5.1 billion
Truck Climbing Lanes	$0.4 billion
Total	**$186.7 billion**

Figures reflect investments above current commitments in the Regional Transportation Improvement Program (RTIP).

MITIGATING ENVIRONMENTAL IMPACTS

California law requires SCAG to prepare and certify a Program Environmental Impact Report (PEIR) prior to adopting the RTP. The PEIR evaluates the environmental impacts of the RTP and proposes specific measures to mitigate impacts to the maximum extent feasible. Although this RTP, in and of itself, is a plan to mitigate the transportation-related effects of population growth, such as traffic congestion and poor air quality, because the transportation improvements can result in additional growth, the PEIR goes further by recommending additional environmental mitigation at the program level for those resource areas that would be affected by the Plan (and associated growth) such as land use, open space, biological resources, water and energy. The section below summarizes the mitigation program. A list of all the mitigation measures included in the 2008 RTP PEIR will be included in the Environmental Mitigation Report of the Final 2008 RTP.

The general purpose of the mitigation measures included in the PEIR and summarized below is to identify how to protect the environment, improve air quality, and promote energy efficiency in concert with the proposed transportation improvements and related planning. They provide a framework through which implementing agencies and subregions can address the environmental impacts of RTP projects, while implementing RTP goals and policies. The PEIR provides three different types of mitigation measures. The first type can be implemented by SCAG at the regional level. These measures are generally aimed at gathering additional information that can assist in measuring impacts and determining appropriate mitigation and promoting policies that reduce impacts. The second type of measures are to be implemented at the local level by implementing agencies, and individual cities and counties. These measures can strengthen planning documents to ensure for provision of mitigation in the planning process. The third type of measures are project specific and seek to reduce impacts for the myriad different types of projects anticipated in the region. As a programmatic document, many of the measures in the PEIR refer to performance standards because site-specific conditions are not reasonably evaluated at the programmatic level.

AR0072429

SUMMARY OF THE ENVIRONMENTAL MITIGATION PROGRAM

This Plan discusses mitigation for the following areas:

- Open Space
- Energy
- Air Quality and Climate Change
- Transportation
- Population and Housing
- Land Use
- Aesthetics
- Public Services
- Biological Resources
- Geology, Soils, and Seismicity
- Cultural Resources
- Water Resources
- Hazardous Materials
- Safety and Security
- Noise

AR0072430

Financial Plan

The 2008 RTP financial plan identifies how much money is available to support the region's surface transportation investments including transit, highways, local road improvements, system preservation and demand management goals. It also addresses the need for investment in goods movement infrastructure. Improving ground access in and around major goods movement facilities, and enhancing major highways and railways are critical to maintaining the health of Southern California's economy. The 2008 RTP calls for traditional and non-traditional revenue sources for implementing a program of infrastructure and environmental improvements to keep both freight and people moving.

The 2008 RTP financial plan identifies a number of new revenue sources to provide additional funding beyond existing transportation dollars. The SCAG Region's financially constrained plan includes a core revenue forecast of existing local, state, and federal sources along with new funding sources that are reasonably available over the time horizon of the RTP. The plan also includes action steps to obtain the revenues necessary for implementing the region's transportation vision.

In developing the financial plan, SCAG followed a few basic principles to guide its regional financial forecast:

- Incorporate financial planning documents developed by local county transportation commissions and transit operators in the region where available;
- Ensure consistency with both local and state planning documents;
- Utilize published data sources to evaluate historical trends and augment local forecasts as needed; and
- Recommend new funding sources that target beneficiaries of transportation investments.

REASONABLY AVAILABLE REVENUES

There are several new funding sources that are reasonably expected to be available. These sources will increase the revenues available for the 2008 RTP. The region also expects to leverage innovative financing strategies.

Table 3 presents twelve categories of funding sources and financing techniques that were evaluated for the RTP. They were selected as a result of their use in other areas of the state, the burgeoning potential, historical precedence and likelihood of implementation within the time frame of the 2008 RTP. These funding sources are considered to be reasonably available and are included in the financially constrained plan. For each funding source, SCAG has examined the policy and legal context of implementation and has prepared an estimate of the revenue potential.

AR0072431

TABLE 3 NEW REVENUE SOURCES AND INNOVATIVE FINANCING STRATEGIES (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Description	Amount	Actions to Ensure Availability	Responsible Party
Value Capture Strategies	Various techniques assumed: formation of special districts, including Benefit Assessment Districts, Mello-Roos Community Facility Districts, as well as tax increment financing and joint development to provide gap financing for specific transit investments (Gold Line extension, Purple Line extension, and the HSRT system). SCAG also assumes one-time proceeds from the sale of Caltrans-owned property within the SR-710 tunnel vicinity.	$3.7	Pursue necessary approvals for special districts by 2012 (Benefit Assessment Districts require majority approval by property owners; Mello-Roos tax requires two-thirds approval); work with private entities for joint development opportunities; also, work with Caltrans to utilize proceeds from real estate sales to partially fill funding gap for the SR-710 tunnel; pursue legislation to enable sales and to establish escrow account for the proceeds	MPO, transit operators, local jurisdictions, property owners along project corridors, developers, Caltrans
Local Option Sales Tax Extension	Half-cent sales tax measure extension for Imperial County—existing Measure D expires in 2010	$0.8	Local sales tax measure to be placed on ballot by 2010	Imperial County
Highway Tolls (includes toll revenue bond proceeds)	Toll revenues generated from SR-710 tunnel, I-710 dedicated truck lanes, High Desert Corridor, and CETAP Corridor	$22.0	Region was granted authority under AB 1467 (2006) to impose tolls and work with private entities for the financing of goods movement-related facilities including the I-710 dedicated truck lanes; additional state legislative approval needed for SR-710 tunnel	MPO, local county transportation commissions (LACMTA, SANBAG, RCTC), State Legislature
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	Estimate equivalent to additional ten cent per gallon gasoline tax imposed by the state and federal government starting in 2012—extrapolation of historical trend	$17.0	Congressional and state legislative approval	MPO, State Legislature, Congress
Container Fees (includes container fee bond proceeds)	Charge imposed on containerized cargo moving through the Ports of LA/LB (includes railroad user fees for rail capacity improvement program); fees are directly linked to specific goods movement projects	$41.5	Negotiated by Ports, shipping community, regional stakeholders or state legislative approval (upon passage of SB 974 or other legislative effort)	Ports, shippers, goods movement stakeholders (MPO, railroads, local county transportation commissions), State Legislature
Private Equity Participation	Public-Private Partnership arrangement whereby a private entity designs, finances, builds, operates, and maintains a facility under a lease arrangement for a fixed period of time	$4.4	Region was granted authority under AB 1467 (2006) to work with private entities for the financing of freight-related projects; additional state legislative approval needed for SR-710 tunnel	MPO, local county transportation commissions, private consortium, State Legislature

AR0072432

Revenue Source	Description	Amount	Actions to Ensure Availability	Responsible Party
Private Activity Bonds (PAB)	Interest savings from the issuance of tax-exempt private activity bonds	$0.4 (included in container fees)	Work with railroads and other regional stakeholders to receive federal PAB allocation	MPO, freight railroads, local county transportation commissions, US DOT
U.S. Environmental Protection Agency (EPA) funding for clean freight rail technology	EPA subsidies to help mitigate locomotive emissions per the 2007 State Implementation Plan (SIP)	$1.9	Work with railroads, AQMD, ARB and US EPA for federal clean technology funding allocation	MPO, freight railroads, AQMD, ARB, US EPA
Interest Earnings	Interest earnings from toll bond proceeds (High Desert Corridor, CETAP, SR-710 tunnel, and I-710 truck lanes)	$0.4	See Highway Tolls	See Highway Tolls
Riverside County Measure A (Bond Anticipation Notes)	Short-term debt to help fund the CETAP Corridor in anticipation of the sale of Measure A revenue bonds	$1.5	Issuance of debt subject to RCTC Board policy	RCTC
Transportation Infrastructure Finance and Innovation Act (TIFIA) Loan	The TIFIA Loan program provides credit assistance for transportation investments of national/regional significance; TIFIA loan assumed for the CETAP Corridor	$0.9	Work with USDOT and RCTC to evaluate applicability of the TIFIA loan program for the CETAP Corridor; further feasibility work necessary to assess traffic and revenue potential on CETAP Corridor	MPO, RCTC, USDOT TIFIA Office
HSRT Passenger System (Private Contribution & User Fee)	User-fee supported initiative for HSRT system. Assumes private-sector development: design, finance, build, operate and maintain. See HSRT Report for further details	$26.2	For the IOS: form JPA, finalize development of a comprehensive business plan; work with private entity to ensure commitment	MPO, Private Consortium, local/regional stakeholders

AR0072433

SUMMARY OF REVENUE SOURCES AND EXPENDITURES

The SCAG Region's financially constrained RTP includes revenues from both the core and reasonably available revenue sources. A summary of these forecasted revenues and expenditures is presented in Figures 3 and 4. As shown in these figures, the SCAG Region's budget over the next 30 years totals an estimated $531.5 billion.

As shown in Figure 2, transit and highway expenditures are roughly comparable at 41 and 36 percent, respectively, of the RTP costs for each category. About 12 percent of costs are attributable to an "other" category, reflecting proposed investments in HSRT systems as well as freight rail capacity and grade separation improvements. Consistent with historical practice, agencies in the region are expected to bond against future revenues to provide additional funding in the early years of the plan. As a result, debt service equal to historical payments and future bonding needs has been included as part of the RTP. Anticipated debt service payments make up 11 percent of total costs.

AR0072434

TABLE 4 PERFORMANCE MEASURES

Performance Measure	Measure(s)	Definition	Performance Target	Performance Outcome Summary
Mobility	Speed Delay	Speed – experienced by travelers regardless of mode Delay – excess travel time resulting from the difference between a reference speed and actual speed Delay per capita can be used as a supplemental measure to account for population growth impacts on delay.	Improvement over Base Year	Between the Baseline and Plan scenarios: • Speed increases by 8 percent • Total daily person delay decreases by 16 percent • Daily delay per capita decreases by 16 percent
Accessibility	Percent PM peak period work trips within 45 minutes of home Distribution of work trip travel times		Improvement over Base Year	Between the Base Year and Plan scenarios: • Accessibility increases by 2 percent
Reliability	Percent variation in travel time	Day-to-day change in travel times experienced by travelers. Variability results from accidents, weather, road closures, system problems and other non-recurrent conditions.	Improvement over Base Year	Between the Base Year and Plan scenarios: • Percent variation decreases in both the AM and PM peak periods by approximately 10 percent
Productivity	Percent capacity utilized during peak conditions	Transportation infrastructure capacity and services provided. Roadway Capacity – vehicles per hour per lane by type of facility Transit Capacity – seating capacity by mode	Improvement over Base Year	Between the Base Year and Plan scenarios: • Lost lane-miles decreases in both the AM and PM peak periods by 20 percent
Safety	Accident rates	Measured in accidents per million vehicle-miles by mode for: • Fatalities • Injuries • Property	"0" for all accident types and modes	Between the Base Year and Plan scenarios: • Fatalities, injuries, and property damage per million persons decrease by at least 4 percent
Sustainability	Total cost per capita to sustain system performance at Base Year levels	Focus is on overall performance, including infrastructure condition. Preservation measure is a subset of sustainability.	Improvement over Base Year	Between the Base Year and Plan scenarios: • Reliability, productivity, safety, and preservation improve
Preservation	Maintenance cost per capita to preserve system at Base Year conditions	Focus is on infrastructure condition. Subset of sustainability.	Improvement over Base Year	Between the Base Year and Plan scenarios: • Percent of lane-miles requiring rehabilitation decreases by 14 percent • Percent of bridges requiring rehabilitation decreases by 45 percent
Cost-Effectiveness	Benefit-to-Cost (B/C) Ratio	Ratio of benefits of travel alternatives to the costs of travel including infrastructure, maintenance, travel time, environmental, accident, and vehicle operating costs. This can be used to evaluate impacts of mode split changes resulting from RTP investments.	Improvement over Base Year	The Plan provides $2.21 return for every $1.00 invested.
Environmental	Emissions generated by travel	Measured/forecast emissions include CO, NOX, PM2.5, PM10, SOX, and VOC. CO2 as secondary measure to reflect greenhouse gas emissions.	Meet SIP Emission Budgets & Transportation Conformity requirements	The conformity analysis indicates a positive conformity finding for the Draft Plan based on the draft emission budgets received by the Air Resources Board and the other required tests. The formal conformity finding will be based on the finalized emission budgets analyzed in comparison to the RTP as prepared for adoption.
Environmental Justice	Distribution of benefits and costs Accessibility Environmental Emissions Noise	Share of net benefits and costs by mode, household income, race/ethnicity: • RTP expenditures • Taxes paid (e.g., income, sales & use, gas) • Access to jobs (see "Accessibility") • Travel time savings by mode • Environmental impacts from PEIR	Equitable distribution of benefits and costs	The Plan results in no disproportionate negative impacts on the grounds of income, race, color, or national origin.

AR0072435

Plan Performance

This Plan follows the success of recent RTPs in the use of the following system performance measures to demonstrate the effectiveness of this Plan:

- Mobility
- Accessibility
- Reliability
- Productivity
- Safety
- Sustainability
- Preservation
- Cost-Effectiveness
- Environment
- Environmental Justice

Using quantifiable performance measures, three scenarios are compared to determine the performance of the Plan:

- Base Year 2003 scenario—Existing conditions based on the transportation network as of 2003
- Baseline 2035 scenario—Future conditions in 2035 based on the existing transportation system and near-term constrained projects
- Plan 2035 scenario—Future conditions in 2035 based on the existing transportation system, near-term constrained projects, and long-term constrained projects

In every category, the Plan 2035 scenario shows improvement over the Baseline 2035 scenario (Table 4).

TRANSPORTATION CONFORMITY ANALYSIS

Transportation conformity is required under the federal Clean Air Act (CAA) to ensure that federally supported highway and transit project activities are consistent with ("conform to") the purpose of the SIP.[5] Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. Conformity applies to areas that are designated non-attainment, and those redesignated to attainment after 1990 ("maintenance areas") for the following transportation-related criteria pollutants: ozone, particulate matter (PM2.5 and PM10), carbon monoxide (CO), and nitrogen dioxide (NO2).

This Plan must pass the following tests and analyses to meet the requirements for a positive conformity finding:

- Regional Emission Analysis
- Timely Implementation of Transportation Control Measures (TCMs) Analysis
- Financial Constraint Analysis
- Interagency Consultation and Public Involvement Analysis

Due to recent litigation relative to U.S EPA's Eight-Hour Ozone Phase 2 Rule, EPA has instructed ARB to revise the established method of demonstrating Reasonable Further Progress (RFP) in ozone non-attainment areas that utilize reductions from other areas to demonstrate attainment (e.g., upwind areas). In the SCAG Region, such areas include the Ventura County portion of the South Central Coast Air Basin (SCCAB), the Western Mojave Desert Air Basin (MDAB) (Antelope Valley and a portion of San Bernardino County), and the Coachella Valley portion of the Salton Sea Air Basin (SSAB). Therefore, at this time, there are no AQMPs or SIPs and, thus, no 8-hour ozone transportation

[5] To comply with the CAA in achieving the NAAQS, the ARB develops SIPs for federal non-attainment and maintenance areas. In California, SIP development is a joint effort of the local air agencies and ARB working with federal, state, and local agencies (including the MPOs). Local Air Quality Management Plans (AQMPs) are prepared in response to federal and state requirements.

AR0072436

emission budgets for these areas. SCAG has worked closely with the ARB and EPA to resolve this issue. As agreed upon by ARB and EPA, ARB has adopted Early Progress Plans (i.e., emissions inventories and transportation emission budgets) for areas that need upwind reductions to show RFP. The Early Progress Plans establish the transportation emission budgets while EPA decides how to respond to the RFP issue raised by the litigation. EPA found these emission budgets adequate in April 2008.

In addition, EPA's review of the South Coast ozone and PM2.5 emission budgets raised concerns such that the ARB was required to revise and resubmit the emission budgets to EPA. This requirement dictated that SCAG make appropriate revisions to the conformity analysis to reflect the new emission budgets and re-release the Draft Conformity Report. SCAG staff worked closely with the federal reviewing agencies regarding the emission budget adequacy and conformity approval review process timeline. From these efforts, all agencies confirmed they will expedite their respective reviews to allow for approval of SCAG's conformity finding before the current (2004) RTP conformity finding expires on June 7, 2008.

The conformity analysis indicates a positive conformity finding for the 2008 RTP. The detailed transportation conformity analyses for the 2008 RTP are included in the 2008 RTP Conformity Report.

ENVIRONMENTAL JUSTICE

As a government agency that receives federal funding, SCAG is responsible for implementing Title VI of the Civil Rights Act of 1964 and for conforming to federal Environmental Justice (EJ) principles, policies, and regulations. As part of meeting these requirements, SCAG has performed an EJ analysis to demonstrate responsiveness to potential imbalances caused by the development of the plans, programs, and policies in the 2008 RTP.

SCAG's EJ analysis examined performance measures to determine any disproportionate negative impacts. Performance measures provide a way to quantitatively assess the impact of the Plan. In the development of the Plan, SCAG utilized a number of performance measures designed to assess the overall equity. An overview of the findings is listed below:

- Accessibility to Employment: The results indicate that low-income and minority communities in the region will have higher levels of access to employment via local bus and rail with the 2008 RTP. The results indicate that on a regional scale, no disproportionate impacts are anticipated between income groups as a result of the Plan.
- Accessibility to Parks: All income groups for the whole region will have greater park accessibility due to the infrastructure investments proposed in the 2008 RTP. However, a multi-agency effort must be undertaken in order to further address and remedy the issue of inequity of park access.
- Distribution of Plan Expenditures (Investments): SCAG analyzed the distribution of Plan expenditures based on mode usage information by income quintile. Under the Plan, approximately 28 percent of investments will go to modes predominantly used by the lowest quintile group, while 16 percent will be invested in modes most likely to be used by the highest income category (Quintile V). The current analysis also reveals that under the 2008 RTP, Plan investments will be distributed more equitably on the basis of system usage by ethnic/racial groups. In other words, transportation investments would go to modes likeliest to be used by low-income and minority households.
- Taxes Paid: Overall, tax burdens are anticipated to fall heavily on higher income groups. The lower-income groups (Quintile I and Quintile II), which use bus and light rail as their primary modes of travel, are anticipated to pay 22 percent of taxes.
- Distribution of Transit Travel Time Savings: The results in the 2008 analysis also reveal that the two lowest-income quintiles will pay just over 20 percent of total taxes collected in the region, but will enjoy 65 percent of the local transit time savings. The two highest-income quintiles' share of taxes (60 percent) will exceed the benefits they receive in local transit time savings (16 percent), accounting for only 9 percent of total bus and light rail usage. The findings indicate that transit travel times for

AR0072437

lower-income groups for both work and non-work trips are expected to decrease due to the number of new bus and rail improvements proposed in the 2008 RTP.

- Distribution of Auto Travel Time Savings: The amount of taxes paid by those in Quintile V (36 percent) will exceed their share of benefits (27 percent). The lowest-quintile group will benefit the least, accounting for 12 percent of auto usage and 11 percent of auto travel time savings. Higher-income groups are anticipated to have the most benefit in auto travel time savings, but will also incur the highest taxes.
- Auto Travel Distance Reductions: The lowest quintile group is expected to have the least amount of benefits, accounting for 12 percent of auto usage and travel distance savings. They will also pay the least amount of taxes at 9 percent. The taxes paid by the highest-income group (35 percent) are anticipated to exceed their share of benefits (27 percent). Similar to the findings for Auto Travel Time Savings, higher-income groups are anticipated to have the most benefits because their primary mode of travel will be the automobile.
- Air Pollutant Emissions: Overall, the region as a whole will generally experience an improvement in air quality via reductions in transportation-related emissions due to ongoing mobile source emission controls and investments in the Plan. On a regional scale, the analysis did not reveal any disproportionate impact between ethnic/racial categories.
- Noise: The results in the 2008 RTP analysis indicate that low-income and minority groups will be disproportionately impacted by aviation and highway noise.

Future Connections: The Strategic Plan

The strategies in the Constrained Plan represent the region's collective vision for addressing our transportation needs within the constraints of committed, available, or reasonably available revenue sources. The Strategic Plan goes beyond the Constrained Plan, and includes projects that merit further consideration for inclusion in the Constrained Plan in the future as consensus evolves and funding becomes available.

Supplemental Reports (Appendices)

Additional detail on the various topics discussed in this Plan is contained in 18 standalone reports that also act as the appendices for the 2008 RTP. The reports include all backup data that support assumptions made in the development of the Plan, as well as additional information on areas of interest in regards to our regional transportation system.

AR0072438

I. OVERVIEW

Success in transportation and transportation planning is about making the connections, whether it's connecting from bike to bus or truck to rail relating the travel choices we make with environmental consequences, ensuring that land-use and transportation planning go hand in hand, or more equitably linking our transportation financing mechanisms to those who benefit directly from use of the system. The 2008 RTP connects the SCAG Region to a future vision where innovative solutions address the daunting challenges we face today.

The 2008 RTP presents the transportation vision for this region through the year 2035 and provides a long-term investment framework for addressing the region's transportation and related challenges. The Plan is the culmination of a multi-year effort focusing on maintaining and improving the transportation system through a balanced approach that considers system preservation, system operation and management, improved coordination between land-use decisions and transportation investments, and strategic expansion of the system to accommodate future growth.

The SCAG Region is economically, culturally, and ethnically one of the most diverse metropolitan regions in the world. It has a complex transportation system that includes extensive roadway, transit (bus and rail), and freight rail networks, along with major intermodal, seaport, and airport facilities. Exhibit 1.1 shows the major transportation infrastructure in the SCAG Region. Highlights of our vision for our region and the regional transportation system in 2035, embodied in this document, may be summarized as follows:

- A well-maintained and managed roadway network free of potholes and other roadway hazards
- A transportation system where most of the gaps have been addressed
- A safe, secure, reliable, and equitable public transportation system
- A seamless public transportation system that provides efficient access to jobs, shopping, recreation, education, health care and other activities

- More travel choices in addition to solo driving and public transportation, such as improved access to non-motorized transportation
- More people living closer to job centers and transit corridors and hubs
- Improved air quality for all, and
- A vibrant economy supported by an efficient goods-movement system

The 2008 RTP, built on regional consensus, is flexible and recognizes the unique and complex nature of the region. The 2008 RTP is an update to the 2004 RTP, and it replaces the 2004 RTP in its entirety.

Leadership, Vision, Progress

Leadership, vision and progress are three main components of SCAG's Mission Statement that apply to the Regional Transportation Plan (RTP) development process. In demonstrating a commitment to leadership, the region identified seven goals that reflect a balanced approach to transportation planning and decision-making. In providing a vision, the SCAG Regional Council adopted

AR0072440

policies to guide the development of the RTP and identified transportation priorities for the region. Lastly and most importantly, in its commitment to demonstrate progress, SCAG continues to rely extensively on performance measurement as a means to identify the most beneficial investments for the region. Together, these elements contribute to a strong and focused RTP.

REGIONAL GOALS

The goals of the 2008 RTP have expanded from 2004 to encompass transportation security. These seven goals are in no particular order and demonstrate the need to balance many priorities in the most cost-effective manner.

TABLE 1.1 RTP GOALS

RTP Goals
• Maximize mobility and accessibility for all people and goods in the region
• Ensure travel safety and reliability for all people and goods in the region
• Preserve and ensure a sustainable regional transportation system
• Maximize the productivity of our transportation system
• Protect the environment, improve air quality and promote energy efficiency
• Encourage land use and growth patterns that complement our transportation investments
• Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies

These priorities are identified in the following:

- The region's vast investments in multimodal transportation infrastructure must be protected. This infrastructure is maturing and requires attention and maintenance. The region cannot afford to replace the existing infrastructure and must protect it for future generations.
- A maturing system dictates an increased operational focus that leverages technology to maximize the system's productivity. This same investment will also increase reliability by minimizing the variations of travel time due to incidents, weather, and other factors. The region cannot expand the transportation system significantly, so the existing system must be utilized to its fullest. The vitality of the region's economy is inextricably linked to efficient and reliable transportation. The region must be able to respond to and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, the transportation network and the regional economy.
- Air quality for the region's residents must be improved and meet federal regulations. Not doing so would undermine the health of our population and risk losing billions of federal funding to the region.
- The investments in the RTP must address travel safety and modal balance; recognize the importance of providing safe travel choices; meet the needs of the transit dependent and the goods movement community; and provide connections among the highway system, ports, and airports.
- The RTP must also integrate land-use policies as a means to influence transportation performance and the economy. Without such integration, transportation needs in the future will significantly outpace the ability to pay for them.
- The RTP must address all these priorities in the most cost-effective manner so that outcomes/benefits can be maximized and so that users get the most for their expenditures.

RTP GUIDING POLICIES

The SCAG Regional Council (RC) adopted five policies to guide the development of the RTP (Table 1.2). These RTP policies, unchanged since 2004, emphasize the importance of tracking the Plan's performance through specific indicators.

AR0072441

TABLE 1.2 RTP POLICIES

	RTP Policies
1	Transportation investments shall be based on SCAG's adopted Regional Performance Indicators.
2	Ensuring safety, adequate maintenance, and efficiency of operations on the existing multi-modal transportation system will be RTP priorities and will be balanced against the need for system expansion investments.
3	RTP land-use and growth strategies that differ from currently expected trends will require a collaborative implementation program that identifies required actions and policies by all affected agencies and subregions.
4	HOV gap closures that significantly increase transit and rideshare usage will be supported and encouraged, subject to Policy #1.
5	Progress monitoring on all aspects of the Plan, including timely implementation of projects, programs, and strategies, will be an important and integral component of the Plan.

PERFORMANCE-BASED PLAN

As with previous RTPs, this is an outcome-/performance-based plan. The first RTP policy requires that performance measures play a critical role in the plan development. Performance measures quantify the outcomes that are important to individuals, businesses, and the region. They quantify regional goals and provide a way to evaluate progress over time. This is SCAG's fourth performance-based RTP. Starting in 1998, SCAG was the first Metropolitan Planning Organization (MPO) to rely extensively on performance measurement as a means to identify the most effective investments for the region. The performance indicators for the 2008 RTP represent an evolution that builds on earlier successes and adds specificity and technical depth to the original indicators.

Assessing the degree to which the impacts of the 2008 RTP investments meet the regional goals requires complex technical analysis. Performance measurement is a critical part of this analysis, and is used for estimating the potential impacts of investments. The same measures will be used to monitor progress in meeting the performance expectations of the RTP. This monitoring will allow the region to correct its course over time as lessons are learned and new trends are established. Performance measures are closely tied to the broader goals to ensure that the implementation of this Plan moves us closer to achieving these goals. Table 1.3 depicts the relationship between the RTP goals and performance measures, while Table 1.4 describes the performance measures in greater detail.

TABLE 1.3 RTP GOALS AND RELATED PERFORMANCE MEASURES

RTP Goals	Mobility	Accessibility	Reliability	Productivity	Safety	Sustainability	Preservation	Cost-Effectiveness	Environmental	Environmental Justice
Maximize mobility and accessibility for all people and goods in the region	✓	✓						✓		✓
Ensure travel safety and reliability for all people and goods in the region	✓		✓		✓					
Preserve and ensure a sustainable regional transportation system						✓	✓		✓	✓
Maximize the productivity of our transportation system	✓			✓						
Protect the environment, improve air quality and promote energy efficiency						✓			✓	✓
Encourage land use and growth patterns that complement our transportation investments and improve the cost-effectiveness of expenditures	✓	✓							✓	
Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies*										

* SCAG does not yet have an agreed-upon security performance measure; therefore, it is not included in this table.

TABLE 1.4 PERFORMANCE MEASURES

Performance Measure	Measure(s)	Definition	Performance Target	Calculation Data Sources
Mobility	Speed Delay	Speed – experienced by travelers regardless of mode Delay – excess travel time resulting from the difference between a reference speed and actual speed Delay per capita can be used as a supplemental measure to account for population growth impacts on delay.	Improvement over Base Year	Travel demand model outputs AM peak, PM peak, Off-peak, Daily Link speeds, travel times, trips
Accessibility	Percent PM peak period work trips within 45 minutes of home Distribution of work trip travel times		Improvement over Base Year	Travel demand model outputs • PM peak • OD travel times • OD person trips
Reliability	Percent variation in travel time	Day-to-day change in travel times experienced by travelers. Variability results from accidents, weather, road closures, system problems and other non-recurrent conditions.	Improvement over Base Year	Highways – PeMS Transit – National Transit Database or triennial audit reports
Productivity	Percent capacity utilized during peak conditions	Transportation infrastructure capacity and services provided. Roadway Capacity – vehicles per hour per lane by type of facility Transit Capacity – seating capacity by mode	Improvement over Base Year	Highways – PeMS Transit – National Transit Database or triennial audit reports
Safety	Accident rates	Measured in accidents per million vehicle-miles by mode for: • Fatalities • Injuries • Property	"0" for all accident types and modes	Highways – freeway accident rates from Caltrans Transit – National Transit Database or triennial audit reports
Sustainability	Total cost per capita to sustain system performance at Base Year levels	Focus is on overall performance, including infrastructure condition. Preservation measure is a subset of sustainability.	Improvement over Base Year	Subregional submittals Regional population forecast
Preservation	Maintenance cost per capita to preserve system at Base Year conditions	Focus is on infrastructure condition. Subset of sustainability.	Improvement over Base Year	Subregional submittals Regional population forecast
Cost-Effectiveness	Benefit-to-Cost (B/C) Ratio	Ratio of benefits of travel alternatives to the costs of travel including infrastructure, maintenance, travel time, environmental, accident, and vehicle operating costs. This can be used to evaluate impacts of mode split changes resulting from RTP investments.	Improvement over Base Year	Travel demand model outputs Revenue forecasts RTP project expenditures Other cost estimates
Environmental	Emissions generated by travel	Measured/forecast emissions include CO, NOX, PM2.5, PM10, SOX, and VOC. CO2 as secondary measure to reflect greenhouse gas emissions.	Meet SIP Emission Budgets & Transportation Conformity requirements	Travel demand model outputs EMFAC2007
Environmental Justice	Distribution of benefits and costs Accessibility Environmental Emissions Noise	Share of net benefits and costs by mode, household income, race/ethnicity: • RTP expenditures • Taxes paid (e.g., income, sales & use, gas) • Access to jobs (See "Accessibility") • Travel time savings by mode • Environmental impacts from PEIR	Equitable distribution of benefits and costs	Travel demand model outputs Revenue forecasts RTP project expenditures PEIR

AR0072444

WHY UPDATE THE RTP?

SCAG is the federally designated MPO for the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. As the MPO, SCAG develops the RTP and updates it every four years through a continuous, comprehensive and cooperative process. Transportation investments in the SCAG Region that receive state and federal funds or require federal approvals (such as environmental clearance) must be consistent with the RTP and must be included in SCAG's Regional Transportation Improvement Program (RTIP) when ready for funding. As the programming document for funds, the RTIP complements the corresponding years of the RTP. The RTIP is a six-year program and is coordinated with the State Transportation Improvement Program (STIP) every two years. Following are key reasons the RTP should be updated.

REFLECT CURRENT CONDITIONS

As the economy, demographics, finances, and other factors change, SCAG has a responsibility to modify the RTP to reflect the latest information and conditions. Factors that have changed since the 2004 RTP was adopted include:

- New information on population and employment growth
- New or reauthorized transportation funding sources
- 2007 South Coast Air Quality Management Plan (AQMP) and new motor vehicle emission budgets and emission factors
- Rapid increases in construction costs in the past four years, and
- Other shifts in regional priorities determined by SCAG and the county transportation commissions (CTCs)

COMPLY WITH FEDERAL REQUIREMENTS

The Safe, Accountable, Flexible, Efficient Transportation Equity Act – A Legacy for Users (SAFETEA-LU) was signed into law in August 2005, and expands upon previous planning requirements. The federal requirements for metropolitan transportation plans include the following key provisions:

- An open, inclusive process that ensures public input and considers the needs of those traditionally underserved by the existing system
- A plan horizon period of not less than 20 years into the future
- The most recent assumptions for population, travel and congestion, land use, vehicle fleet mix, employment and economic activity
- A financially constrained plan funded by revenues that are committed, available, or reasonably available over the time frame of the RTP
- Conformity to State Implementation Plans (SIPs) for air quality
- A discussion of potential environmental mitigation activities
- Consistency with state and local planned growth and economic development patterns, and
- Consideration of eight planning factors and strategies, in the local context, that address: economic vitality through global competitiveness, productivity and efficiency; safety; security; accessibility and mobility for people and freight; the environment, energy conservation, and the quality of life; integration and connectivity of the multimodal transportation system; efficient system management and operation; and preservation of the existing transportation system

COMPLY WITH STATE REQUIREMENTS

The state, whose requirements largely mirror the federal requirements, has adopted extensive RTP guidelines. Key state requirements include:

- Compliance with the California Environmental Quality Act (CEQA)
- Consistency with the five-year STIP as incorporated into SCAG's six-year RTIP
- Program-level performance measures that include objective criteria that reflect the goals and objectives of the RTP, and
- A policy element (Chapter 1), an action element (Chapter 3) and a financial element (Chapter 4)

AR0072445

Our Approach

The development of the 2008 RTP is based on a collaborative and bottom-up process involving numerous parties. Each of the six counties in the SCAG Region has a transportation commission or authority, with the exception of Imperial County, where the Imperial Valley Association of Governments (IVAG) serves as the countywide transportation agency. These agencies are charged with implementing countywide transportation planning activities, allocating locally generated transportation revenues and, in some cases, operating transit services.

Additionally, there are 14 subregions within the SCAG Region. These subregional councils of governments (COGs) are groups of neighboring cities and communities (sometimes an entire county) that work together to identify, prioritize and seek transportation funding for needed investments in their respective areas.

The SCAG Region also includes all or part of thirteen air quality non-attainment or maintenance areas in five air basins. Federal law requires that transportation and air quality planning are coordinated in these non-attainment and maintenance areas. The SCAG Region further includes all of Caltrans Districts 7, 8 and 12, and the Imperial County portion of District 11. SCAG develops the RTP primarily in coordination and consultation with the county transportation commissions (CTCs), COGs, transit operators, Caltrans, air districts and other transportation stakeholders. Key stakeholders involved in the development and update of the RTP are identified in Table 1.5.

AR0072447

TECHNICAL APPROACH

The technical approach to the RTP update is depicted in Figure 1.1. The first step in the process, which was initiated over three years ago, starts with the review and update of the basic assumptions in the existing RTP, including the goals and objectives. It is important to validate the basic planning assumptions and to ensure that the goals and objectives still speak to the region's needs, challenges, and aspirations.

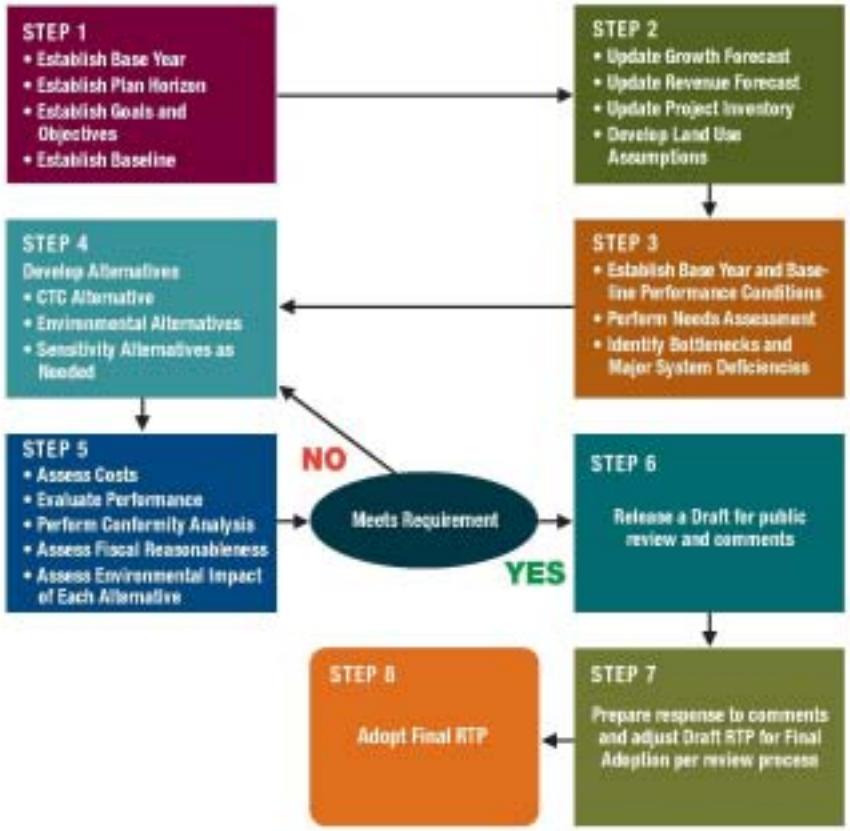
The second step is to ensure that all the data, including growth forecast, revenue forecast, cost information, project scope changes, etc., are updated. It is critical to involve key project sponsors, such as the CTCs, local jurisdictions, Caltrans, and transit operators during this step. Updating and validating the technical data and building the necessary consensus to move forward is a lengthy process.

The third step in the RTP development process involves taking the updated data and reassessing system deficiencies, bottlenecks, and chokepoints in the system to identify system improvement needs.

The fourth step targets improvements and strategies, including growth strategies, in developing alternative scenarios to be considered and tested against performance standards for potential inclusion in the updated Plan. Evaluation of the alternatives is based on a set of performance measures established through a consensus process. Additionally, fiscal reasonableness, transportation conformity and programmatic environmental impacts of the alternatives are also assessed. The best-performing alternative is forwarded as the preferred alternative recommendation to SCAG's policy board if it meets all of the requirements. If it fails to meet any of the requirements, the alternatives are adjusted and reevaluated until a preferred alternative meets all the requirements.

A Draft RTP that documents the preferred alternative as the Plan is then released for public review and comments for a minimum of 45 days. Finally, all comments received and appropriate staff responses are documented prior to finalizing the Plan. The Draft Plan is adjusted if and as needed to address the comments and issues raised during this period before recommending its final adoption as the new RTP for the region.

FIGURE 1.1 RTP UPDATE/DEVELOPMENT PROCESS



PUBLIC PARTICIPATION

A key component of the RTP development process is seeking public participation. Public input helps SCAG prioritize and address transportation needs in

AR0072448

the region. SCAG seeks participation and comment on the RTP from an array of stakeholders, listed in Table 1.6. The RTP is developed in consultation with all interested parties, and SCAG ensures that they have a reasonable opportunity to comment on the contents of the RTP.

TABLE 1.6 NON-GOVERNMENTAL GROUPS FROM WHICH SCAG SEEKS PARTICIPATION AND INPUT

Participatory Non-Governmental Groups
• Citizens
• Public transit users
• Pedestrians
• Users of bicycle transportation facilities
• Transportation agency employees
• Freight shippers
• Providers of freight transportation services
• Private providers of transportation
• Representatives of the disabled
• Nonprofit organizations
• Ethnic and minority groups
• Older and retired persons
• Special-interest nonprofit agencies
• Environmental groups
• Educational institutions
• Women's organizations
• Private sector

To ensure compliance with federal and state requirements, SCAG implements a public involvement process to provide complete information, timely public notice and full public access to key decisions, and to support early and continuing public involvement in developing its regional plans. Since its inception, SCAG has engaged in a public involvement process in developing its regional transportation plans and programs. As a result of changes in SAFETEA-LU in 2005, SCAG has broadened its current participation activities to engage a more extensive group of stakeholders in its planning and programming processes, as reflected in SCAG's Public Participation Plan adopted by the Regional Council in March 2007 and subsequently amended in October 2007. SCAG consulted with a range of interested parties as required by SAFETEA-LU in developing the public participation strategies, procedures and techniques noted herein. SCAG solicited comments and feedback from a diverse number of stakeholders through mailings, email correspondences, workshops, presentations, meetings, telephone communications and website postings.

By using the feedback and comments received on SCAG's Public Participation Plan, SCAG has implemented the following techniques and strategies for RTP outreach:

- Development of an Integrated Inter-Departmental Outreach Team that encourages innovative outreach efforts and is comprised of staff from various divisions, including Communications, Member Relations, and Transportation Planning
- Development of presentation materials for the public in a variety of formats to reach broader audiences: translated materials into languages other than English; developed interactive PowerPoint presentations, fact sheets, surveys, brochures, and maps
- Enhancement of website capabilities that allows SCAG to post all RTP-related information on its website to ensure that it is accessible and transparent to the public. The website is compliant with the 1990 Americans with Disabilities Act.
- Coordination of outreach efforts with other stakeholder organizations to maximize outreach opportunities

AR0072449

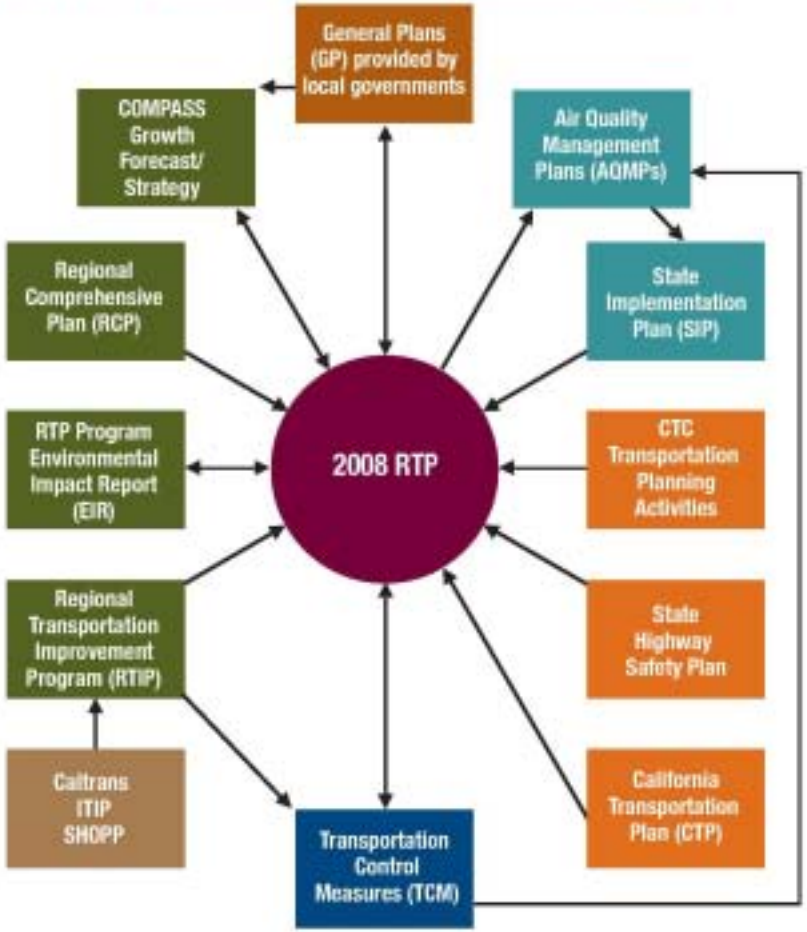
- Development of an outreach schedule that notifies all individuals and groups of activities where SCAG will be presenting the RTP and encourages attendance
- Supporting multiple committees and task forces involving our partners, stakeholders, and interested groups that developed the key components of the Plan
- Holding multiple public workshops before the release of the RTP to allow direct participation by interested parties
- Reaching out to traditionally underrepresented and/or underserved audiences
- Considering comments received in the deliberations regarding proposed plans and programs
- Evaluation of public participation activities to continually improve the outreach process

RTP outreach consists of three phases: Pre-Draft (February 2007 to November 2007), Post-Draft (December 2007 to February/March 2008), and Post-RTP adoption (March/April 2008 to July 2008). SCAG has developed an RTP hotline and email address exclusively for RTP inquiries at 213-236-1960 and RTPinfo@scag.ca.gov.

In addition to these targeted outreach efforts, all regular and special meetings of the RTP task forces, the Transportation and Communications Committee (TCC) and the SCAG RC are publicly noticed and opportunities for public comment are provided. There are currently seven RTP task forces and key transportation subcommittees: Goods Movement, Transportation Finance, High-Speed Regional Transport, Aviation, Plans & Programs Technical Advisory Committee (TAC), Regional Transit Technical Advisory Committee, and the Compass Blueprint Partnership. Also, federally required interagency consultation is done through the monthly meetings of the Transportation Conformity Working Group (TCWG). Specific public comments on the RTP are being recorded and considered by SCAG in the development of the 2008 RTP.

RELATING OTHER PLANS AND PLANNING ACTIVITIES TO THE RTP

FIGURE 1.2 RELATIONSHIP OF PLANNING ACTIVITIES TO THE RTP



A number of SCAG planning activities directly impact the RTP development and update, as depicted in Figure 1.2. The Regional Comprehensive Plan (RCP) is a vision of how the region can balance resource conservation, economic vitality, and quality of life. The RTP Program Environmental Impact Report (PEIR) fulfills legal requirements by identifying potential environmen-

AR0072450

tal effects of the RTP Alternatives and identifying ways to mitigate the effects. Lastly, the Regional Transportation Improvement Program (RTIP) is the critical implementation document that provides funding for all major transportation projects in the region for the next six years.

There are several other related planning activities initiated and managed outside of SCAG by partner agencies. Caltrans is responsible for developing and administering the Interregional Transportation Improvement Program (ITIP) and the State Highway Operations and Protection Program (SHOPP). These programs feed directly into SCAG's RTIP and form the basis of the baseline for the RTP. Furthermore, the RTIP is an integral part of the RTP and represents the first six years of the long-range plan. Caltrans is also responsible for developing and updating a statewide Long-Range Transportation Plan, which is a policy document called the California Transportation Plan (CTP). SCAG must consider and incorporate the CTP in the update of the RTP.

The CTCs are responsible for the development and administration of their respective countywide TIPs. Some also choose to develop county-specific long-range transportation plans even though they are not legally required to do so. SCAG must consider and coordinate such activities of the CTCs in developing and updating the RTP.

Local governments, including city and county governments, are responsible for preparing, updating and administering their local General Plans. Existing General Plans serve as input to the growth forecast work, and the adopted RTP, in turn, should influence future updates of the General Plans.

Finally, local air districts are responsible for developing Air Quality Management Plans (AQMP) for their respective air districts, which feed into the State Implementation Plan (SIP) and establish allowable emission budgets for criteria pollutants. The RTP serves as the input to the development of the AQMPs, and the emission budgets identified by the SIP through this process, in turn, establish the thresholds with which subsequent conformity analyses must comply.

RTP Framework

Federal planning and conformity rules require that a conforming RTP be financially constrained. It must demonstrate that all projects identified in the constrained plan have adequate funding. A conforming RTP cannot simply be a wish list of projects. If we were to rely on existing funding sources, the fiscal reality is that our region would not have enough money to fund all of our transportation needs. Figure 1.3 depicts the funding framework for this RTP.

AR0072451

FIGURE 1.3 RTP FRAMEWORK

At the core of the Plan is the RTIP, which not only represents the first six years of the Plan, but also represents ongoing operations and maintenance commitments. Every project that seeks federal, state or local funding for implementation must be included in the RTIP. The first ring outside of the core, together with the core, represents the fiscally constrained plan that is used to demonstrate transportation conformity. These projects can be reasonably funded within the planning horizon of the RTP.

The outer ring, called the Strategic Plan, represents projects of merit that currently do not have sufficient funding or regional commitment. They should be considered for funding in the future as it becomes available. Projects typically flow from the outer ring to the core, as funding and commitments for these projects materialize and as they continue to meet the performance criteria established for the Plan.

Another way to look at the outer ring is to view projects in this domain as potential candidates for inclusion in the financially constrained RTP through future amendments. This helps streamline the RTP amendment process. However, given the time horizon of the RTP and the dynamic environment in which transportation projects get funded and implemented, it is foreseeable that there are current projects outside our vision that may warrant inclusion in future RTP amendments. This framework is flexible enough to allow for amending projects into the RTP that are not in the Strategic Plan.

Overview of the Plan

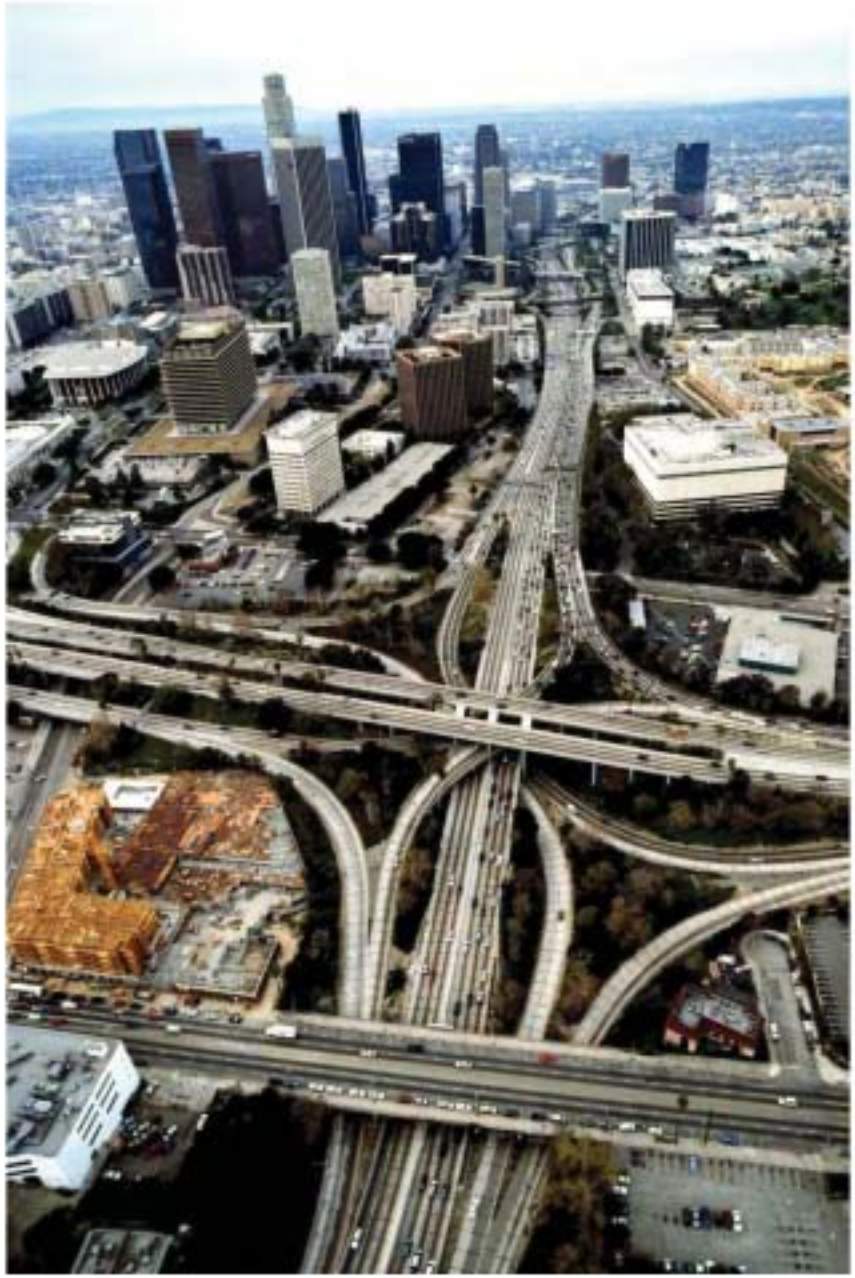
First and foremost, this Plan puts forth a collective vision for the future of our regional transportation system. Our vision is based on a careful analysis of our transportation system, the future growth of our region, our mobility needs, air quality improvement needs, and our need to preserve the environment and mitigate harmful environmental impacts of the proposed transportation improvements.

The Plan carefully and deliberately articulates major challenges associated with our transportation system as well as achieving our vision. Key challenges addressed in the Plan include dramatic growth as well as changes in the characteristics of our demographics, the aging infrastructure, and the unprecedented demand on our goods movement system and our airports. The Plan also articulates our air quality and environmental challenges, and the constraints that they will place on our ability to make necessary improvements to our transportation system, particularly our goods movement infrastructure. On top of all of this, the region will continue to face serious funding shortfalls that will challenge our ability to simply keep our system afloat if we were to do nothing to improve our transportation funding situation.

Given our vision and the challenges, this Plan recognizes that our approach must be balanced, systematic, multimodal, and at the same time targeted to yield the best performance outcomes based on the established set of performance measures. Our integrated system investment approach is depicted by the Mobility Pyramid shown in Figure 3.3. According to this approach, our first priority is to invest in system monitoring and evaluation strategies so that decision-makers can better understand how the system performs and make

AR0072452

well-informed decisions on how to fix our problems. Next, we must preserve our multimodal transportation system, which has cost the region hundreds of billions of dollars to build. The next strategy recognized in this hierarchy is the tremendous potential of coordinating and integrating land use choices with transportation-investment decisions. Effective implementation would not only result in more efficient and effective utilization of available system capacity, but also in the preservation of our environment. We must also make sure that we are getting the most out of our available system by managing our system and our demand better. Such strategies are cost-effective, easy to implement, and environmentally superior to the more capital-intensive system expansion-options. Having monitored and maintained our existing system, and having maximized system efficiency and system productivity through system management, land use coordination, and demand management, the Plan recognizes that targeted system expansion will still be needed to accommodate future growth. Therefore, the Plan proposes a balanced investment approach that would address all modes of transportation, including highways, the public transportation system, the goods movement system, non-motorized transportation, as well as airport ground access improvements.



AR0072453

Finally, while recognizing financial constraints, the Plan puts forth a suite of new and innovative funding strategies that are realistic, practical, and achievable within the time frame of the Plan. The Plan also recognizes that in spite of our best efforts, there simply will not be enough money to implement solutions to all of our transportation needs. The Plan includes a strategic component that identifies projects that cannot be funded at this point, but merit further consideration in future plan updates based on additional studies, funding support, and stakeholder consensus.

AR0072454

II. TRANSPORTATION PLANNING CHALLENGES

The SCAG Region is one of the largest and most complex metropolitan areas in the nation, and its transportation challenges are equally large and complex. This chapter describes growth trends and travel patterns in the SCAG Region and the challenges that these trends and other factors pose for our multimodal transportation system.

The Shape and Pattern of Future Growth

Southern California is running out of land to support low-density future growth. The ocean and mountains pose natural barriers to development. Environmentally sensitive areas, such as coastal wetlands and natural habitat areas, hem in the region and dot the urbanized area. A significant amount of land is also owned by the state and federal governments for the public benefit and is off limits to development.

Freeways provide access to farmland and grazing areas that could be used to accommodate future growth along the east-west axis of the region. There is little access to the north except through mountain passes that are choked with car and truck traffic. The centrifugal force of growth continues to push the development footprint of the urbanized area outward. At the same time, pushing back on dispersed development are natural barriers, financial constraints to pay for outward expansion, and public resistance to unsustainable "leap frog" growth into green fields and sensitive habitat areas. Nearly all natural locations for urban development have been consumed, leaving us with hard choices about how we are to grow and change to meet the demands of the future.

Much of the urbanized area is fighting gridlock as 95 percent or more of the population drives back and forth to work to accomplish the tasks of daily living, and another 3 to 5 percent take transit or walk. Growth management strategies and ballot initiatives are aimed at preserving and protecting prime farm and grazing land from residential development pressures, while preserving historic buildings, single-family neighborhoods and prime industrial land for economic development.

Many are starting to realize that, as large as the region is in total area, it is running out of developable land to support a significantly unbalanced auto-oriented development pattern. There is an increasing need for reinvestment and increased development near public transit, along corridors and in-town, mixed-use urban centers. Southern California has the nation's largest bus ridership and an emerging metro, commuter, and light rail transit network that provides a better balance of transportation choices that can reduce auto travel and support more pedestrian, mixed-use and transit-oriented development.

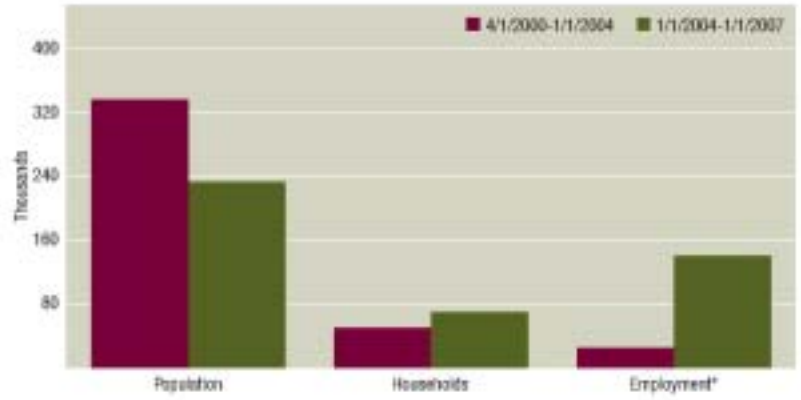
This section describes the population, employment, and demographic changes that happened in the recent past and may be expected in the SCAG Region over the next 30 years without a change in regional policy. These demographic and economic changes are an integral part of planning the transportation system to ensure that the users' needs are addressed.

POPULATION GROWTH

The SCAG Region is the second most populated metropolitan area in the United States. Nearly one-half of all Californians live in the SCAG Region, and 1 in 17 people living in the entire United States resides here. By July 1, 2007, the region's population had reached 18.6 million residents, having grown by 2 million residents (12 percent) from 16.6 million people just seven years ago. The population growth (2 million residents) of the SCAG Region between 2000 and 2007 was higher than the population growth (1.9 million residents) that occurred throughout the 1990s. Figure 2.1 shows the growth pattern of population, households, and employment between 2000 and 2007. Population growth slows down in the middle 2000s (2004-2007), while both household and employment growth are much faster in the middle 2000s than in the early 2000s.

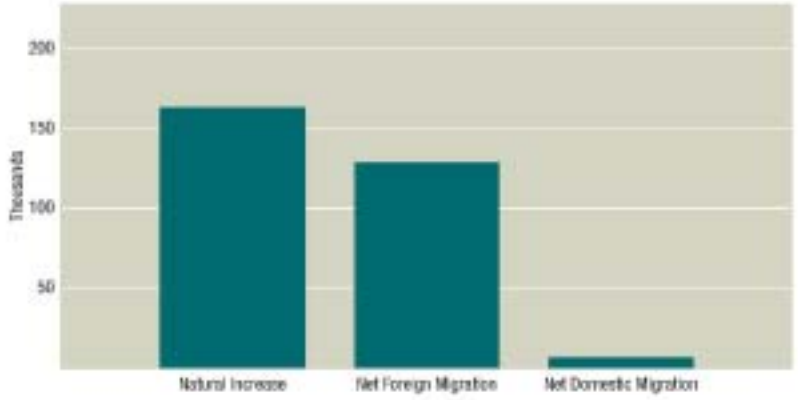
AR0072456

FIGURE 2.1 ANNUAL AVERAGE GROWTH IN POPULATION, EMPLOYMENT, AND HOUSEHOLDS, 2000-2004 AND 2004-2007



Source: California Department of Finance, California Employment Development Department, SCAG Employment Estimates

FIGURE 2.2 COMPONENTS OF ANNUAL POPULATION GROWTH, 2000-2006



Source: California Department of Finance

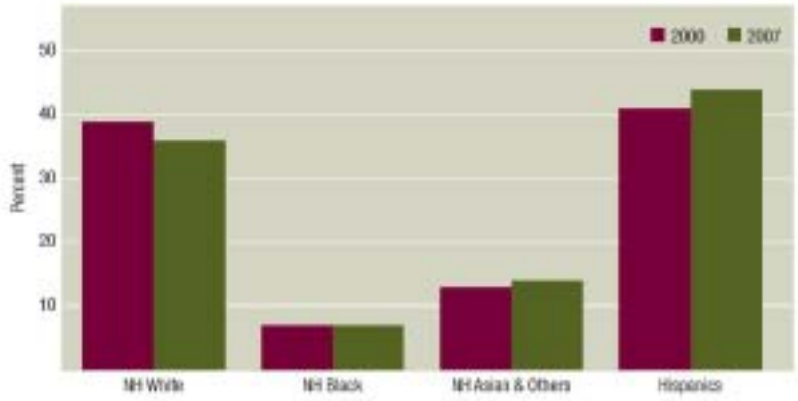
Two major sources of population growth since the 2000 Census are natural increase (births minus deaths) and net foreign immigration (people who move here from foreign countries minus those who move away to foreign countries). Natural increase accounted for 55 percent of the population gain in the region. Although the total fertility rate of women of child-bearing ages remains stable in recent years, Hispanic women still maintain a relatively higher total fertility rate. The life expectancy of Southern California residents increased while the death rate decreased.

Net foreign immigration, mostly from Mexico, Central America, and Asia, accounted for 43 percent of the population gain in the region. Foreign immigration, including unauthorized immigrants, was not affected by the region's economic cycle. Southern California is still an attractive destination and a gateway for new immigrants, although international migration to the region has leveled off in recent years.

As of July 1, 2007, there is no racial or ethnic majority in the region. Hispanics constitute 44 percent of the region's population, followed by Non-Hispanic (NH) Whites at 36 percent, NH Asians and Others at 13 percent, and NH Blacks at 7 percent. Since 2000, Hispanics have increased their share of the population by 3 percent, while NH Whites have decreased their share by the same percentage. There has been little change in the share of other racial/ethnic groups between 2000 and 2007. The region is moving toward a Hispanic majority.

AR0072457

FIGURE 2.3 ETHNIC COMPOSITION OF POPULATION, 2000 AND 2007



Source: California Department of Finance

The region shows an aging pattern of population growth between 2000 and 2007. According to California Department of Finance (DOF) estimates, nearly 80 percent of population growth occurred in the age group of 36 years old or older. Age groups of 4-10 years old and 27-35 years old declined by 6 percent and 8 percent, respectively, over the same period. The absolute decline of school-age children and younger adults raises a concern about future school construction needs and labor force in younger workers.

TABLE 2.1 AGE COMPOSITION OF POPULATION, 2000 AND 2007

Age	7/1/2000	7/1/2007	Change	% Change
0-3	1,017,000	1,078,000	62,000	6%
4-10	1,977,000	1,868,000	(109,000)	-6%
11-26	3,885,000	4,528,000	642,000	14%
27-35	2,413,000	2,227,000	(187,000)	-8%
36+	7,333,000	8,860,000	1,526,000	17%
Total	16,626,000	18,560,000	1,934,000	12%

Source: SCAG Baseline Growth Forecast

Los Angeles County accounted for 41 percent of the region's growth over the last seven years, adding 813,000 residents, while Riverside and San Bernardino Counties together added 804,000 residents. In terms of relative growth, the Inland Empire and Imperial Valley are the fastest-growing areas in the region. Riverside County grew by 40 percent, San Bernardino County by 19 percent and Imperial County by 22 percent. Nearly 46 percent of the region's growth occurred in areas outside of Los Angeles and Orange Counties. Los Angeles and Orange Counties were the slowest-growing counties, adding only 9 percent each to its populations during the same period.

FIGURE 2.4 POPULATION GROWTH BY COUNTY, 2000-2007

Source: California Department of Finance

AR0072458

FIGURE 2.5 PERCENT GROWTH IN POPULATION BY COUNTY, 2000-2007

Source: California Department of Finance

HOUSEHOLD GROWTH

Since the 2000 US Census, there was a net addition of 410,000 households, bringing the regional total to nearly 5.8 million in 2007. However, population growth outpaced household growth with only one household for every five persons added. The rapidly growing population is reflected in larger households rather than in the formation of new households. The average persons-per-household ratio in the region has increased from 3.07 in 2000 to 3.19 in 2007. The increasing household size may be caused by the cultural propensity of some groups such as recent immigrants to form large inter-generational families or by the limited supply of affordable housing units. Workforce housing affordability and availability issues have affected the quality of life in the region. The insufficient supply of affordable housing in job-rich urban areas maintains existing trends in urban sprawl, longer commute patterns, congested freeways and worsening air quality.

EMPLOYMENT GROWTH

In 2006, the region's total employment, including self-employment, was estimated to be nearly 8 million, having grown by 500,000 jobs (7 percent) from 2000. The region's economy is robust in terms of the number and the types of jobs available to residents looking for jobs, with the unemployment rate of the region at a historic low of 4.6 percent in 2006. The previous record in the region was 5 percent in 2000. The region's employment has been steadily growing since the recession of the early 1990s. The region experienced a net loss of 500,000 jobs during the recession period between 1990 and 1993, then overcame the recession by adding a net 780,000 jobs between 1996 and 2000. After slow growth in jobs in 2002 and 2003, the region is regaining its economic strength by increasing new annual job growth beyond these early decade levels.

The overall pattern of employment change is driven by the decline in manufacturing sector jobs due to globalization. Between 2000 and 2005, the manufacturing sector jobs dropped from 1,023,000 jobs to 835,000 jobs, a loss of 188,000 jobs. The share of the manufacturing sector jobs declined by 3 percent. Other significant economic sectors experiencing the absolute loss of jobs include 1) information, 2) agriculture and mining, and 3) transportation and warehousing, and utility. In contrast, 1) construction, 2) financial activity, 3) leisure and hospitality, 4) retail trade, and 5) other service sectors added a significant number of additional jobs to the regional economy. The growth in the construction and financial activity sectors was caused by the strong residential housing development. The increases in some service-sector jobs are directly associated with the increase in total population and an increase in the aged population in the region. The growth of service-sector jobs, in particular, population-serving jobs, is likely to continue in the future.

The strong regional job growth directly influences domestic migration, because it induces more domestic in-migration than domestic out-migration, while weak job growth causes more domestic out-migration than domestic in-migration. More net in-migration influences the job growth in the "population-serving" retail and service sectors.

AR0072459

TABLE 2.2 EMPLOYMENT BY SECTOR, 2000 AND 2005

Sectors (NAICS)	2000		2005		Change

INCOME

Income is one of most important indicators of economic well-being of residents in the region. In 1999, per capita income of the region, as a measure of the wealth of the residents, was approximately $21,000. By 2006, this amount grew to $25,000, an increase of 20 percent. After adjusting for inflation, per capita income of the region has declined from 1999 to 2006 (-5.7%). Per capita income of the region remains at the same level as the nation, but is lower than that of California by 6 percent. The relative income level of the region to the nation has declined from 1.27 in 1959 to 0.98 in 1999. Over the last three decades, the SCAG Region's per capita income ranking dropped from the 4th highest in 1969 to 7th in 1989, and 16th in 1999. The SCAG region continued to rank last in terms of per capita income among the 17 largest metropolitan regions in the nation in 2005.

Median household income increased by 22 percent from 1999 to 2006. However, this increase was only about 80 percent of what was required to keep up with inflation. Thus, real median household income was down by 4%. In 2006, median household income of the region was 15 percent above the national average, but was lower than that of California by 1.5 percent. The relative income level of the region to the nation has remained 9 percent to 23 percent above the national average for the periods of 1969, 1979, 1989, and 1999. The relative median household income level of the region has increased from 1.09 in 1999 to 1.15 in 2006.

Average income statistics, however, mask how much poverty is present in the region. In 2006, nearly 14 percent of the region's residents lived in poverty compared to around 13 percent for California and the nation as a whole. Around 18 percent of Imperial County residents live in poverty, followed by Los Angeles County at 15 percent. The poverty rates of Ventura, Orange, and Riverside County residents are lower than those of California or the nation.

Partly because of the higher than national average poverty levels and partly because of the high cost of home ownership in California, the region lags the nation in homeownership rates. During the last decade, median home values in California and the most populous areas of the region have risen due to construction activity lagging population growth, low inventory and historically low interest rates. Median home values in California now reach the $462,000 mark, which is more than double the national median. In 2006, 56.5 percent of regional residents owned their own home compared to 67.3 percent for the nation as a whole.

PATTERNS OF FUTURE GROWTH

A baseline growth forecast is a future snapshot of the most likely population and employment distribution without regional policy input. It reflects historical trends, based on reasonable key technical assumptions and existing and

AR0072460

newly approved local or regional projects. Specifically, the baseline growth forecast is a result of updating the 2004 RTP no-project growth forecast with the current demographic and economic trends, the latest land use changes, newly approved regionally significant projects, general plan or specific plan update, and/or zoning revisions. Also included are demand forecasts for cargo and passengers at the regional ports and airports. The port and airport demand forecasts include projects that improve operations and increase capacity. Intermodal expansion was assumed in terms of additional capacity at the ports for goods movement growth, and the trips associated therewith were assumed to be located in the Inland Empire. The VMT and related emissions regarding such trips are incorporated into the modeling analysis.

According to the baseline growth forecast summarized in Figure 2.6, the region will add 5.9 million people to reach 24 million people by 2035. Supporting this population in 2035 will be a total of 10.3 million jobs in 2035 with 2.5 million new jobs. This level of population and job growth is expected to yield 2 million additional households in the region at an average of three persons per household. The substantial amount of projected growth will pose serious transportation and air quality challenges for the region.

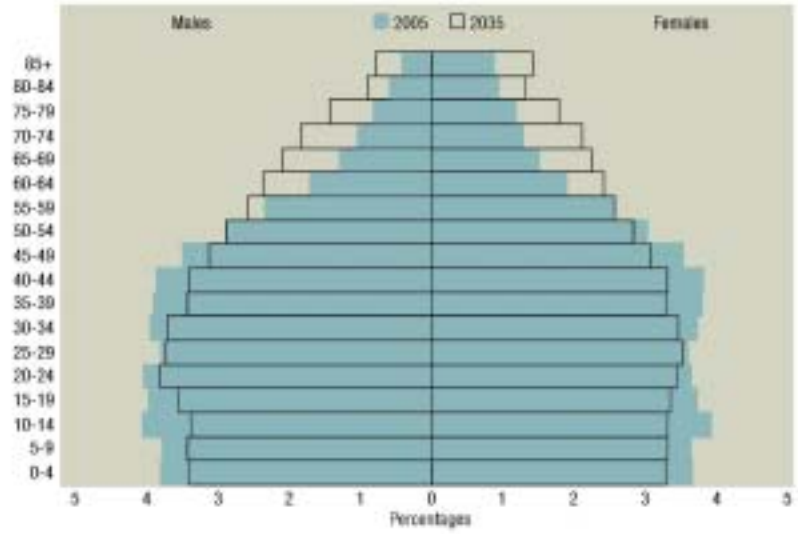
*** Model estimate*
Source: SCAG Baseline Growth Forecast

Where will all these people come from? Approximately 85 percent of the region's population growth in the future is due to natural increase. The region is expected to experience a net loss in domestic migration, but this will be more than offset by international immigration. As the region grows, the average person will be older, and Hispanics will become the majority ethnic group. The population in the region will become older because of aging "baby boomers" born between 1946 and 1964. The median age will rise from 32.9 years in 2005 to 35.9 in 2035. The population aged 65 and older will grow four-and-a-half times faster than the working-age population (16-64 years old) between 2005 and 2035. As a result, workers in the region will support a larger share of the older "baby boomer" population in 2035.

AR0072462

FIGURE 2.7 POPULATION AGE PYRAMID, 2005 AND 2035



Source: SCAG Baseline Growth Forecast

Due to the retirement of "baby boomers," the region may experience severe shortages of skilled labor. The aging baby boomers may postpone the retirement or the female labor force may increase the labor force participation. If domestic migration does not make up the shortage of skilled labor, then more foreign immigration will be needed. The skills of the new labor force, particularly recent immigrants, will probably not match the requirements of the skilled jobs. This could depress the overall income level of the workers and households. Long-term strategies to achieve growth and equitable distribution of income should be considered, including appropriate and enhanced educational opportunities and a phased retirement system.

Shifting demographic patterns will also influence travel behavior. The elderly people travel less than the younger population and the elderly workers tend to work at home. If necessary, they commute to work for a shorter distance. Recent immigrants tend to use public transportation much more than other population groups. Urban density levels may also increase since foreign-born residents urbanize less land. Many SCAG Region foreign-born, Hispanic, and Asian residents have modest incomes, larger household sizes, and tend to double up in existing urban areas, thereby increasing population density. The socioeconomic characteristics and lifestyle choices associated with immigration are consistent with a more compact urban form.

The overall number of persons per household will be smaller in the region in 2035 as downward pressures are exerted by aging "baby boomers" and lower birth rates, while there are upward pressures from increasing Hispanic populations with relatively large households (especially recent immigrants). The number of persons per household may increase in some built-out areas over the projection horizon due to the limited availability of developable land. The racial and ethnic composition of households will reflect the population diversity and create demand for a wider variety of housing types than are most prevalent today. Specifically, there will be more need for close-in and infill housing, condominiums and multi-family housing.

Jobs will be created across all employment sectors, except the manufacturing sector. The largest gains will be in service-sector jobs as the shift in the region from manufacturing jobs to service-sector jobs continues. Between 2005 and 2035, service-sector jobs will lead in total growth and comprise the largest share of total jobs. The makeup of service sector jobs will also change, with different employment opportunities. Three top leading sectors include 1) education and health services, 2) professional and business services, and 3) construction. These fast-growing sectors are supported by the continued growth of population and demographic changes (e.g., aging of baby boomers). With continued globalization, the share of the manufacturing sector will continue to decline from 11 percent in 2005 to 8 percent in 2035. The manufacturing sector still remains important and there are growth opportunities in the high-tech manufacturing sector. The decline of the manufacturing sector might result in the lower income level of workers and households. The policy strategies might focus on creating more high-wage and salary service sectors, which include 1) information, 2) public administration, 3) financial activities, 4) wholesale trade, and 5) transportation and warehousing, and utilities. The

AR0072463

logistics sector, comprising wholesale trade, transportation, and warehousing, might become more important in the region's economic growth as the region's foreign trade activities continue to grow. The significant growth of the construction sector might influence the future traffic congestion in the region. The workers in the construction sector tend to commute to work for longer distances, but they use carpooling much more than other workers.

TABLE 2.4 EMPLOYMENT BY SECTOR, 2005 AND 2035

Sectors (NAICS)	2005		2035		Change

Source: SCAG Baseline Growth Forecast

The overall economic well-being of residents in the region improves during the planning period. The median household income of the region is expected to increase by one-half percent per year from $46,000 (in 1999 dollars) in 2005 to $53,000 (in 1999 dollars) in 2035. The higher-income households with more than $100,000 (in 1999 dollars) increase two or three times faster than low- and middle-income households. The projected income level and

distribution affects auto ownership, trip generation, and mode choice. For example, higher household income implies more cars available for travel, more trip generation, and more driving than transit use.

Where do we live and work now, and where will we live and work in the future? The regional baseline forecasts are distributed to counties, subregions, and smaller geographies through an interactive collaborative process in which cities, subregions, regional agencies, experts, and stakeholders participated. Input from local jurisdictions plays an important role in determining the baseline growth distribution within their boundaries. Exhibit 2.1 shows where we lived in 2003 and Exhibit 2.2 shows where we are forecast to live in 2035. Exhibit 2.3 shows the difference between the two time periods. In terms of where we work, Exhibit 2.4 shows 2003 employment clusters, while Exhibit 2.5 shows anticipated 2035 employment clusters. Exhibit 2.6 shows the difference between the two time periods.

AR0072471

Mobility Challenges

The projected growth in the region is expected to place even greater demands on the transportation system. The SCAG Region is served by an extensive multimodal transportation system addressing all aspects of travel in the region, including commuters; shoppers; public transit patrons; truckers delivering goods both regionally and locally, such as groceries to the local supermarkets; as well as fire, police, and other emergency personnel. The roadway and freight rail networks serve the largest maritime ports system in the United States (the Ports of Long Beach, Los Angeles, and Hueneme) and a number of large airports, including the fifth-largest airport in the world (Los Angeles International Airport–LAX).

The region has over 20,750 centerline miles and over 65,000 lane-miles of roadways, including one of the most extensive High-Occupancy Vehicle (HOV) lane systems in the country. Additionally, the region has a growing network of tolled lanes and High-Occupancy Toll (HOT) lanes. Regionally significant arterials provide access to the freeway system and often serve as parallel alternate routes; in some cases, they are the only major system of transportation available to travelers.

The public transit network in the SCAG Region has been growing significantly over the last two decades, and this growth accelerated since the 2004 RTP. The region has approximately 640 bus routes and about 50 local bus operators, four commuter express bus services, two subway lines and three light rail lines operating in Los Angeles County, and the Metrolink commuter rail network spanning five of the six counties and northern San Diego County.

Despite this vast multimodal network, transportation in the SCAG Region is facing serious, unprecedented challenges. Although the first thought about Southern California transportation is congestion, other major related challenges are equally (or more) serious.

To truly understand these challenges, it is important to understand how we got to this point. How did we become the most congested metropolitan region in the country? Only by developing an in-depth understanding of the current situation and the factors that led to this situation can we try to develop consensus on the tough choices that are before us.

ROADWAY CONGESTION

The second-largest metropolitan area in the United States with over half of California's residents, the Southern California region is the most congested metropolitan area in the country. Over the past twenty years, traffic delays have nearly tripled in the region, and SCAG's Regional Transportation Model estimates the following alarming traffic delay statistics (defined as the difference in travel time between free-flow conditions and actual conditions):

- 3.9 million vehicle-hours of daily delay
- 5.7 million person-hours of daily delay
- 15 minutes of delay per capita during peak commute periods

Almost as frustrating as daily recurrent delay is the variability of travel time. For example, trips that on average take 30 minutes often last much longer due to incidents, collisions, weather, special events, construction activities, or other difficult-to-predict conditions. The frequency of such unpredictable delays over and beyond the "normal" congestion has been increasing steadily on our roadways. The combination of increasing congestion and decreasing predictability of travel times has led to our region's status as the capital of congestion in the country.

ROADWAY PRODUCTIVITY LOSSES

Roadways are built to provide traffic capacity to vehicles. For instance, freeways are generally built to provide a capacity of between 1,600 and 2,000 vehicles per hour per lane. When a segment of the freeway provides this "design" capacity, it is considered productive. However, the roadway system loses its productivity when it is unable to provide the capacity that it was designed to serve. This occurs at locations commonly referred to by transportation planners and engineers as bottlenecks and the queues building up behind

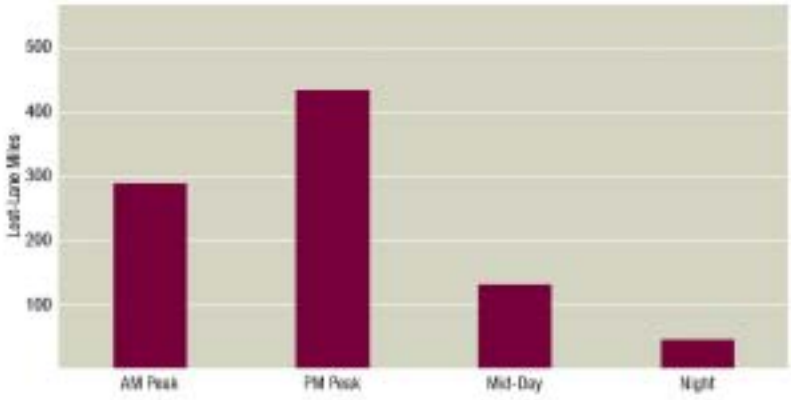
AR0072472

these bottlenecks (e.g., at freeway-to-freeway interchanges). The resulting productivity losses of the system occur generally during peak demand periods and are caused by merges, weaves, lane drops, stalls, accidents, and other factors. So, in effect, when demand is highest, system productivity actually decreases. Many freeway segments in the SCAG Region experience productivity losses and end up serving between 1,000 and 1,500 vehicles per hour per lane instead of the almost 2,000 vehicles per hour per lane for which they were designed.

When these productivity losses are aggregated, they can be presented in terms of "Lost Lane-Miles," which reflect the equivalent capacity subtracted from the roadway system. Figure 2.8 presents the results of an analysis to estimate the lost productivity in the SCAG Region based on actual traffic data from the region's freeway system during the four major time periods of the day: AM Peak, PM Peak, Mid-Day, and Night.

This "lost" capacity in the AM peak period, attributable to a large extent to non-recurring incidents such as accidents, weather conditions, stalled vehicles, etc., could have the effect of the loss of approximately 286 lane-miles of freeway capacity when it is needed the most. The cost of physically adding this lost capacity by widening existing facilities would exceed $4 billion.

FIGURE 2.8 PRODUCTIVITY RESULTS BY TIME PERIOD



Source: Freeway Performance Measurement System (PeMS)

SUPPLY NOT KEEPING UP WITH DEMAND

As mentioned previously, people are moving further away from established urban areas, at least partly because of housing costs. This creates incremental demand for travel. The size of the roadway system, however, has not kept pace with population and transportation demand. Figure 2.9 illustrates this problem. The figure shows that while California's population and total vehicle miles traveled have more than doubled since 1970, expenditures on this vital system have decreased significantly beginning in the early 1970s and still have not reached the level of investments made during the 1960s. Once the preservation and operations costs are subtracted from these expenditures and the high construction inflation is accounted for, it is easy to understand why the supply of roadways did not keep up with the demand growth for over three decades.

AR0072473

FIGURE 2.9 CALIFORNIA POPULATION, TRAVEL, AND HIGHWAY EXPENDITURE TRENDS*

* Includes expenditures for local assistance and state highway capital outlay. Office of Transportation Economics/DOTP 9/2006

Source: California Department of Transportation

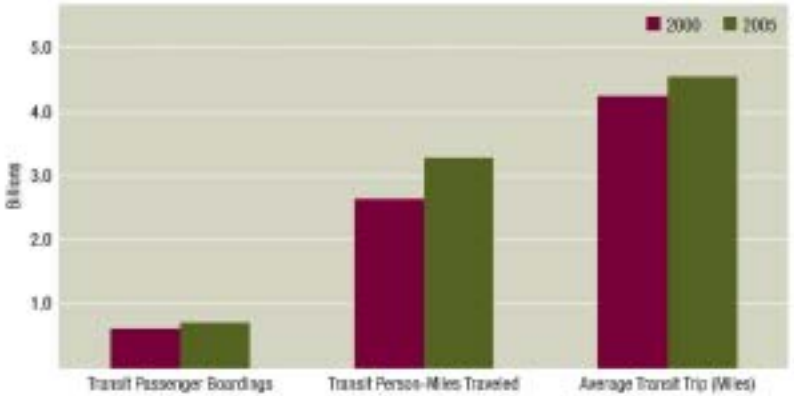
Note that these trends were not altogether unintentional. In fact, starting in 1980, a major shift occurred away from building roadways and into transit projects and services. This trend was planned and executed deliberately and understandably.

GROWING, BUT STILL MODEST PUBLIC TRANSIT USAGE

The investments in public transit since the 1980s have started to pay off. This success of transit is easily measured. Between 2000 and 2005, regional transit use increased by more than 16 percent, from 622 million annual unlinked passenger trips to more than 722 million, as shown in Figure 2.10. Transit person-miles traveled (PMT) increased by more than 24 percent to nearly 3.3 billion person-miles in 2005.

Continuing a trend of more per capita transit use that began in the mid-1990s, transit ridership per capita has reached nearly 40 boardings per person in the region by 2005. This rate had not been seen since the mid-1980s. Our regional investments in new transit modes and innovative services are a significant factor in achieving this growth. Additionally, more people are traveling longer distances, as shown in Figure 2.10. The length of an average transit trip increased from under 4.3 miles in 2000 to more than 4.5 miles in 2005. This represents a seven percent increase.

FIGURE 2.10 TRANSIT BOARDINGS AND PERSON-MILES TRAVELED, 2000-2005



Source: Federal Transit Administration (FTA) National Transit Database

However, regional transit operators still struggle to attract a significantly higher share of the traveling public. Despite the increase in boardings and per capita transit use, SCAG's Regional Travel Demand Model estimates that in 2003, less than 3 percent of all trips and person-miles traveled in the region were taken on public transit. A bright note is that since the rate of growth in transit use has outpaced growth in highway and arterial VMT by more than threefold since the year 2000, there are indications that regional investments may attract a greater share of the public in the future, especially with rising gasoline prices.

The development of new rail and bus transit corridors has spawned investment in new housing, retail, and business development at and near transit

AR0072474

stations. These changes in land use, as outlined in the Compass Blueprint program, primarily through transit-oriented development, may result in fewer auto trips and reduced VMT by creating urban environments that provide better access to jobs and services, which in turn encourages more walking, bicycling and transit use.

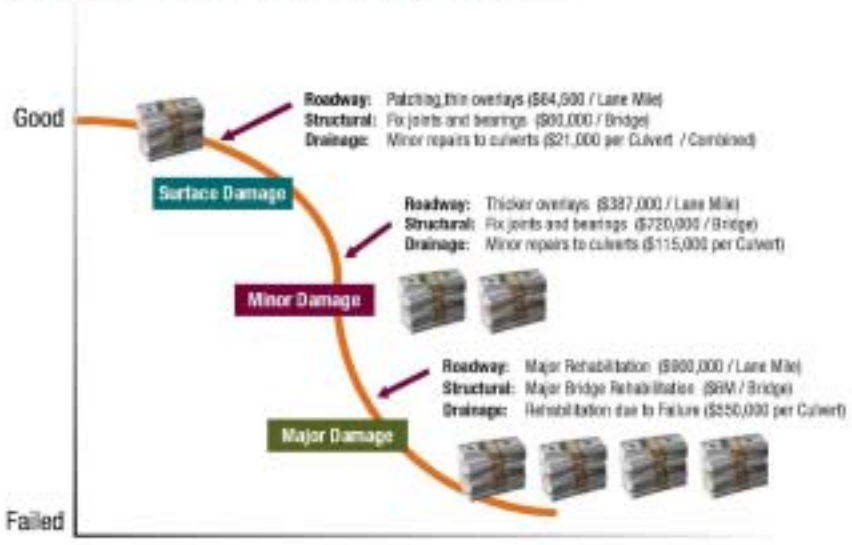
AGING INFRASTRUCTURE

The need to preserve our transportation assets adequately was brought to the nation's attention after the Minnesota I-35W bridge collapse during the summer of 2007. We must recognize that our roadway network and transit systems developed over the past decades are aging. These regional assets represent hundreds of billions of dollars of investments that must be protected in order to serve us and future generations. Without these assets, or even a portion of these assets, the region's mobility would be significantly compromised.

Unfortunately, our region's roadways, especially the State Highway System that is owned and operated by Caltrans, have not been maintained adequately. Caltrans reports that 28 percent of its pavement requires rehabilitation (based on 2005 statistics). Regional arterial studies have concluded similar needs.

Deferred maintenance leads to higher costs, as shown in Figure 2.11. Whereas pavement surface damage requires an investment of $64,000 per lane-mile to bring it to a state of good repair, the costs escalate significantly if these investments are not secured in a timely manner. In fact, the costs for minor damage repair escalate more than fivefold to $387,000, and the costs for major damage repair escalate to an astronomical $900,000 per lane-mile.

FIGURE 2.11 PRESERVATION COST-EFFECTIVENESS



EXPLOSIVE GROWTH IN GOODS MOVEMENT

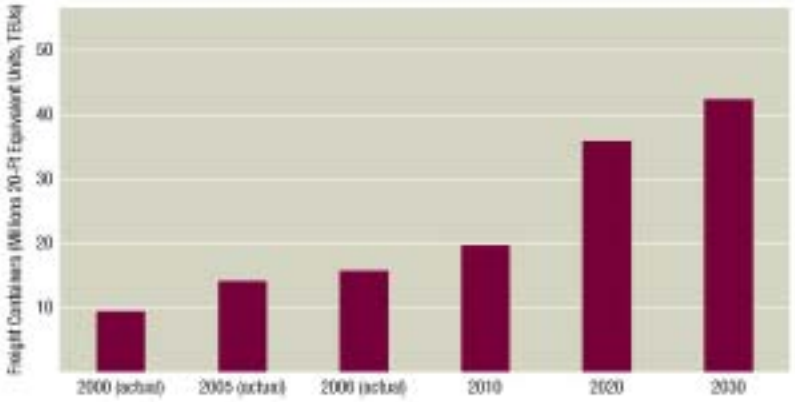
The SCAG Region's goods movement system serves as the gateway for both international and domestic commerce. Supported in part by its geographical advantages such as deep-water marine ports, and highly developed network of highways and railways, availability of transloading facilities and its large internal market, goods movement is the fastest-growing segment of the region's transportation sector. Every state in the nation receives goods that pass through Southern California, and the region is a cornerstone of the nation's global competitiveness.

The San Pedro Bay Ports, which include the Los Angeles and Long Beach Ports, currently handle approximately 40 percent of the volume imported into the country and approximately 24 percent of the nation's exports, and one out of every seven jobs in Southern California depends on this trade. Figure 2.12 reflects the explosive growth in container volume processed by the San Pedro

AR0072475

Bay Ports. It shows an almost 60 percent increase in volume between the years 2000 and 2006. Moreover, it also shows that this type of growth will continue, leading to an almost tripling of container volume by 2030.

FIGURE 2.12 SAN PEDRO BAY PORTS CONTAINER VOLUME TREND AND PROJECTIONS



Source: Port of Long Beach and Port of Los Angeles

As the only deep-water port between Los Angeles and San Francisco, the Port of Hueneme in Ventura County is a major shipping point for automobiles, fresh fruit and produce. Approximately $7 billion in cargo traverses through this Port annually, and trade-related activity generated by the Port contributes significantly to the local economy.

Cross-border trade activity also contributes to the region's international trade growth, with the growth in Mexico's manufacturing industry increasing truck trips through Calexico East in Imperial County by 77 percent between 1994 and 2005.

More than 75 percent of the containers processed by the ports in 2006 and 2007 involved at least one truck trip within the SCAG Region, either to a rail intermodal facility, a warehouse, or a transload facility. These trucks contribute to the existing congestion in the region and will contribute to future congestion even more, as the number of trucks is projected to increase significantly for several major freeways, as shown in Table 2.6.

TABLE 2.6 DAILY TRUCK VOLUMES BY CORRIDOR (THOUSANDS)

Freeway	2003*	2035*

Source: SCAG Model

Recent projections included in SCAG's Inland Empire Railroad Main Line Study suggest that the number of freight trains on most Burlington Northern Santa Fe (BNSF) and Union Pacific (UP) lines will more than double between 2000 and 2025 in response to a tripling of container volume at the San Pedro Bay Ports. Although freight rail does not add to freeway congestion, it does pose serious quality of life issues for many communities. Some towns and cities witness 100 trains per day that literally split their communities into two sections for extended periods of time. Exhibit 2.8 shows the Colton crossing and suggests how rail traffic can seriously affect the quality-of-life and safety of a community.

As the expanding goods movement sector continues to have a positive impact on our economy, it will also have critical and far-reaching impacts on our region's transportation system and public health. An essential element to improving the region's goods movement system will be to reduce its current and long-term impacts on public health and the environment.

AVIATION CAPACITY AND GROUND ACCESS CONSTRAINTS

The SCAG Region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment. Exhibit 2.7 shows the SCAG regional air carrier airport system. The system has six established air carrier airports, including Los Angeles International (LAX), Bob Hope (formerly Burbank), John Wayne, Long Beach, Ontario and Palm Springs. There are also four new and emerging air carrier airports in the Inland Empire and North Los Angeles County. These include San Bernardino International Airport (formerly Norton Air Force Base [AFB]), March Inland Port (joint use with March Air Reserve Base), Southern California Logistics Airport (formerly George AFB) and Palmdale Airport (joint use with Air Force Plant 42). The regional system also includes 45 general aviation airports and two commuter airports (Oxnard and Imperial), for a total of 57 public use airports.

There are significant challenges in meeting the future airport capacity needs of Southern California. Work on SCAG's 2004 RTP concluded that an Aviation Decentralization Strategy is needed to meet the forecast doubling of air passenger demand by 2030, from the current 90 million annual passengers (MAP) to 170 MAP (according to the 2004 RTP). This is because the four urban air carrier airports in Los Angeles and Orange Counties—LAX, Bob Hope, Long Beach and John Wayne—are all highly constrained. Their collective acreage amounts to 5,540 acres, which is less than 17% of the 34,000 acres of Denver International, and less than the 7,700 acres of Chicago O'Hare. At 3,500 acres, LAX is a very small international airport despite being the third-busiest airport in the country and fifth-busiest in the world in terms of passengers served. All of these urban airports have little room to expand because of severe encroachment by surrounding communities. In addition, two of these airports—Long Beach and John Wayne—have strict limits on allowable flights that are legally enforceable (one is a city ordinance and the other is a court settlement agreement) since they predate the Federal Airport Noise and Capacity Act of 1990 (ANCA).

The challenge of meeting future aviation demand in the SCAG Region is inextricably tied to airport ground access, since in order to meet that demand the region will need to get future air passengers from the urban areas of Los Angeles and Orange Counties to available airport capacity in the Inland Empire and North Los Angeles County. The challenge is complicated by the fact that the regional roadway system will become increasingly unreliable, with daily delay on the system expected to more than double. This will place a great

AR0072478

burden on the air traveler, who will have to allow for more time to get to the airport to catch his or her flight. It will make it difficult to expand the new airports with available capacity, since until they fully mature they will have few alternative flights to offer air travelers who miss their flights because of unreliable ground access. Unless the regional airport ground access system is substantially improved, many potential air travelers will choose not to fly at all, which will translate to substantial economic loss to the region.

Southern California airports play a crucial role in international trade, particularly with Pacific Rim countries, and to the regional economy. The value of airborne commodity exports out of the Los Angeles Customs District are about equal to waterborne exports, and airborne export values would be significantly greater if service exports, including impacts from tourism, were added to total export values. Therefore, the airport constraints our region faces pose a threat to our regional economy and well-being. A regional strategy is needed to help address this inter-regional mobility challenge.

Air Quality Challenges

The SCAG Region continues to have the worst air quality in the nation, even despite improvements gained in the last two decades. The recently documented health impacts of air pollution on people living in the South Coast Air Basin are staggering. Of all the people nationwide who are exposed to PM2.5 levels that exceed the federal health-based standard, 52% live here. Of all the people statewide who are exposed to these levels, 82% live here. This is estimated to result in 5,400 premature deaths and 980,000 lost work days per year.[1] These impacts, and the fact that a substantial portion of emissions are outside of local and state control, led SCAG to urge via Resolution the declaration of a state and federal emergency to address the air quality health crisis. Subsequently, the South Coast Air Quality Management District (SCAQMD), the California Air Resources Board (ARB), and SCAG collaboratively completed the difficult task of developing a plan to achieve the federal health-based PM2.5 and ozone standards in the South Coast Air Basin. Implementation of this plan will require vigorous effort and significant resources from both public and private stakeholders.

[1] Personal communication, Richard Bode, California Air Resources Board, 2007.

ATTAINMENT OF AIR QUALITY STANDARDS

Much of the region continues to exceed the National Ambient Air Quality Standards (NAAQS) identified in the Clean Air Act. The table below summarizes the non-attainment and maintenance areas within the SCAG Region.

TABLE 2.7 SCAG REGION NON-ATTAINMENT AND MAINTENANCE AREAS

Ozone	PM10	PM2.5	CO	NO_2
South Coast Air Basin (SCAB),	SCAB	SCAB	SCAB	SCAB
Coachella Valley portion of Salton Sea Air Basin (SSAB),	Coachella Valley portion of SSAB			
Ventura County portion of South Central Coast Air Basin (SCCAB),	San Bernardino portion of MDAB			
Western portion of Mojave Desert Air Basin (MDAB),	Imperial County portion of SSAB			
Imperial County portion of SSAB				

AR0072479

Further, as demonstrated by the recent AQMP/SIP efforts of local air districts and the ARB, the region's efforts to attain the NAAQS continue to be challenging, as the South Coast Air Basin, the Ventura County portion of the South Central Coast Air Basin, the Western Mojave Air Basin, and the Riverside County portion (Coachella) and the Imperial County portion of the Salton Sea Air Basin will all be "bumping up" to worse ozone non-attainment designations since they cannot achieve the NAAQS in the time previously assumed. Further, the attainment plan to meet the ozone standard in the South Coast Air Basin includes undefined long-term ("black box") measures of approximately 200 tons per day of nitrogen oxides (NOx), which is a daunting amount of as-yet-unidentified emission reductions. Of additional concern are the upcoming 24-hour PM2.5 standards, which will require even greater reductions as well as possibly more stringent ozone standards. Consequently, the ARB, SCAQMD, and SCAG are committed to producing a white paper that identifies strategies to address the shortfall issues. Furthermore, there are strategies and programs in this Plan that will be incorporated into the white paper.

AIR QUALITY IMPACTS AND PROJECT IMPLEMENTATION

Another important consideration for air quality and transportation planning is the general inability of project sponsors to move proposed projects through the environmental review process. Community opposition is demanding mitigation of emissions from existing as well as future transportation facilities. Of equal concern, the failure to implement adequate SIPs for the region could result in federal sanctions, such as a ban on approval of new highway projects, loss of highway funding, and restrict our ability to spend local and private dollars, as well as more stringent emissions offsets for stationary sources.

Given the challenges that lie ahead, increased public awareness and a reinvigorated collaborative effort from all agencies and stakeholders are critical to bring this region into attainment of the federal air quality standards and to begin to address greenhouse gas (GHG) reduction targets. SCAG's contribution to this collaborative effort is essential, as emissions reductions from

AR0072480

goods movement, marine ports, aviation and land use have come to be front and center of the air quality challenge.

Climate Change

In addition to the aforementioned challenges, efforts to reduce GHGs will present another tremendous challenge to the transportation sector. Transportation is the largest source of GHG emissions in California, representing 38 percent of emissions (Figure 2.13), and emissions from the transportation sector have grown more rapidly than other sources over the past ten years.[2] California is the second-largest emitter of GHG emissions in the United States and the twelfth-largest emitter in the world, exceeding most nations. The Intergovernmental Panel on Climate Change of the United Nations has found overwhelming evidence that global climate change is occurring and is caused by human activity.[3] Global climate change involves an increase in the average atmospheric temperature of the earth caused by an enhanced greenhouse effect. Changes to the atmospheric temperatures would likely cause an increase in sea levels and alter weather patterns, thereby increasing the frequency and severity of extreme weather worldwide. Climate change also poses serious risks to our economy, water supply, biodiversity, and public health.[4]

These potentially catastrophic impacts have led to new efforts to reduce the amount of GHG emissions released into the atmosphere. In 2006, California passed the Global Warming Solutions Act, or AB 32, which requires a reduction of the state's GHG emissions to 1990 levels by 2020. This emissions target is equal to a 25% reduction from current levels. Longer-term targets have also been set through Executive Order S-3-05, which calls for a reduction of GHG emissions to 80% below 1990 levels by 2050. These reduction targets will have implications on the transportation sector and alter the way we fuel our future. For example, California's Low Carbon Fuel Standard (Executive Order S-01-07) requires a reduction in the carbon intensity of California's passenger vehicle fuels by at least 10 percent by 2020. The California Air Resources Board identified the Low Carbon Fuel Standards as a discrete early action item under AB 32, with a regulation to be adopted and implemented by 2010. Other transportation-related discrete early action items include green ports, Smart Way truck efficiency, and a tire inflation program.[5] In addition, AB 1007 requires the development and adoption of a state plan to increase the use of alternative transportation fuels by establishing a roadmap to help reduce our dependence on foreign oil. The State Alternative Fuels Plan was adopted by the California Energy Commission on December 5, 2007.

Energy

Environmental and geopolitical factors are causing energy experts to question the long-term viability of a fossil fuel-based energy future. The 2008 RTP begins to recognize the uncertainty of petroleum-based future, and seeks to better understand the implications of potential energy constraints. Travel demand forecasts generally assume that the future will include an abundant and relatively inexpensive supply of transportation fuels. If transportation fuel prices continue to increase, it would have a ripple effect on numerous areas including construction costs, gas tax revenue, travel and aviation demand, air emissions, mode choice and growth patterns. One area of uncertainty is how commuters may respond to higher gasoline prices. For example, a recent study suggests that with a ten percent increase in the gas price, there is a less than one percent change in gas consumption,[6] while other data show that an increase in gas prices coincides with an increase in transit ridership.[7] In addition, growth patterns may alter future demand for transportation fuels. Mixed land uses (i.e., residential developments near work places, restaurants, and shopping centers) with access to public transportation have been shown to save consumers over 500 gallons of gasoline per year.[8] Energy uncertainty requires serious consideration and further study. SCAG, with input from stakeholders, will continue to research the relationship between transportation, land use and energy uncertainty. The following issues have been recommended for additional study and deliberation prior to development of the next Regional Transportation Plan:

- How the price and availability of transportation fuels affects revenues and demand
- How increases in fuel efficiency could affect revenues and emissions

- How the cost of goods movement affects international trade and employment, and
- How the escalation of fuel prices affects the cost of infrastructure construction, maintenance and operation

Transportation Finance Challenges

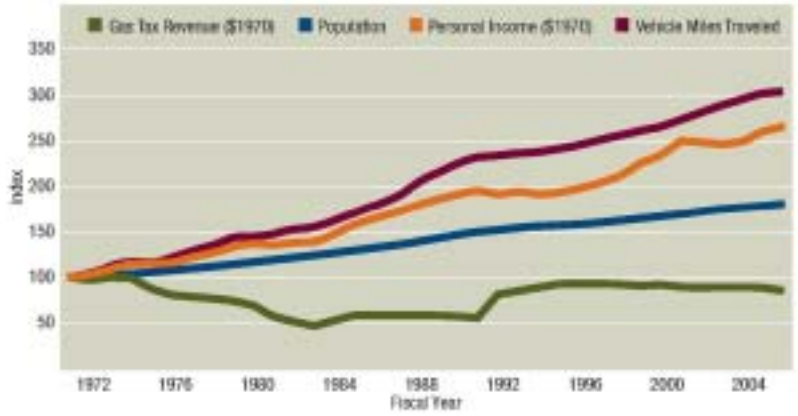
ONGOING FISCAL CHALLENGES

The SCAG Region continues to face shortfalls in transportation funding. The following briefly describes current and projected challenges that are likely to impact transportation revenues flowing to the region.

EROSION OF GASOLINE TAX REVENUES DUE TO INFLATION

Over the past four decades, transportation revenues (from gasoline taxes collected per gallon) in California have not kept pace with the state's ever-evolving demographic characteristics. Figure 2.14 shows how these tax revenues have fluctuated in real-dollar terms (adjusted for inflation) in relation to the steady growth in the demographic indicators. Indicators such as vehicle miles traveled, population, and personal income growth have all outpaced the rate of transportation revenue growth. The largest contributing factor is that the gasoline taxes are collected in cents per gallon. Without periodic adjustment or indexing, these funds will not keep pace with needs. Although the passage and recent renewal of local "self-help" transportation sales taxes have greatly improved funding for transportation, gasoline tax revenues continue to decline in value due to inflation.

FIGURE 2.14 REVENUE AND DEMAND TRENDS IN THE SCAG REGION



Sources: California Department of Transportation, California Department of Finance, U.S. Department of Labor

STATUS OF THE STATE HIGHWAY ACCOUNT

The viability of the State Highway Account remains a critical issue. The state's gasoline tax revenues are now exclusively dedicated to funding the needs of the State Highway Operation and Protection Program (SHOPP)—at a level, however, that is considerably less than actual needs. Continued underinvestment in the rehabilitation and maintenance needs of the State Highway System has serious ramifications—rapidly increasing the number of distressed lane-miles on the State Highway System and eroding the condition of the state's bridges. In recent years, transportation has relied heavily on the State General Fund to pay for capacity-enhancing projects. For example, funding for the State Transportation Improvement Program (STIP) has been dependent on Proposition 42 transfers (sales tax on gasoline). Reliance on the State General Fund means that transportation funding is subject to the state's annual budget process, which can be lengthy and unpredictable. Although the

AR0072483

recently passed transportation bond measure (Proposition 1B) serves as an important down payment, reliable and sustainable funding sources for transportation are necessary to meet the needs of a growing population.

STATUS OF THE FEDERAL HIGHWAY TRUST FUND

The need to establish a reliable and sustainable transportation funding source is even stronger, as the Federal Highway Trust Fund may not have enough resources to meet all of its obligations by the end of the decade. Expenditures authorized under SAFETEA-LU have outstripped revenues generated by the federal per-gallon gasoline tax. As a result, the viability of the Highway Trust Fund will be a critical issue in discussions for the next round of the federal transportation reauthorization legislation, which will start in 2009.

CONSTRUCTION COST INCREASES

Over the last four years, construction costs in California and the nation have increased at an unprecedented rate and much faster than general inflation. Figure 2.15 shows increases in the California Highway Construction Cost Index since the 1970s compared to the Consumer Price Index. The recent run-up in construction prices is due to a variety of factors, including a residential and commercial building boom as well as higher demand for construction materials in developing countries, most notably, China. Although these trends are likely to fluctuate, they have caused many transportation projects to exceed their budgets in the short term and made long-term project cost forecasting uncertain.

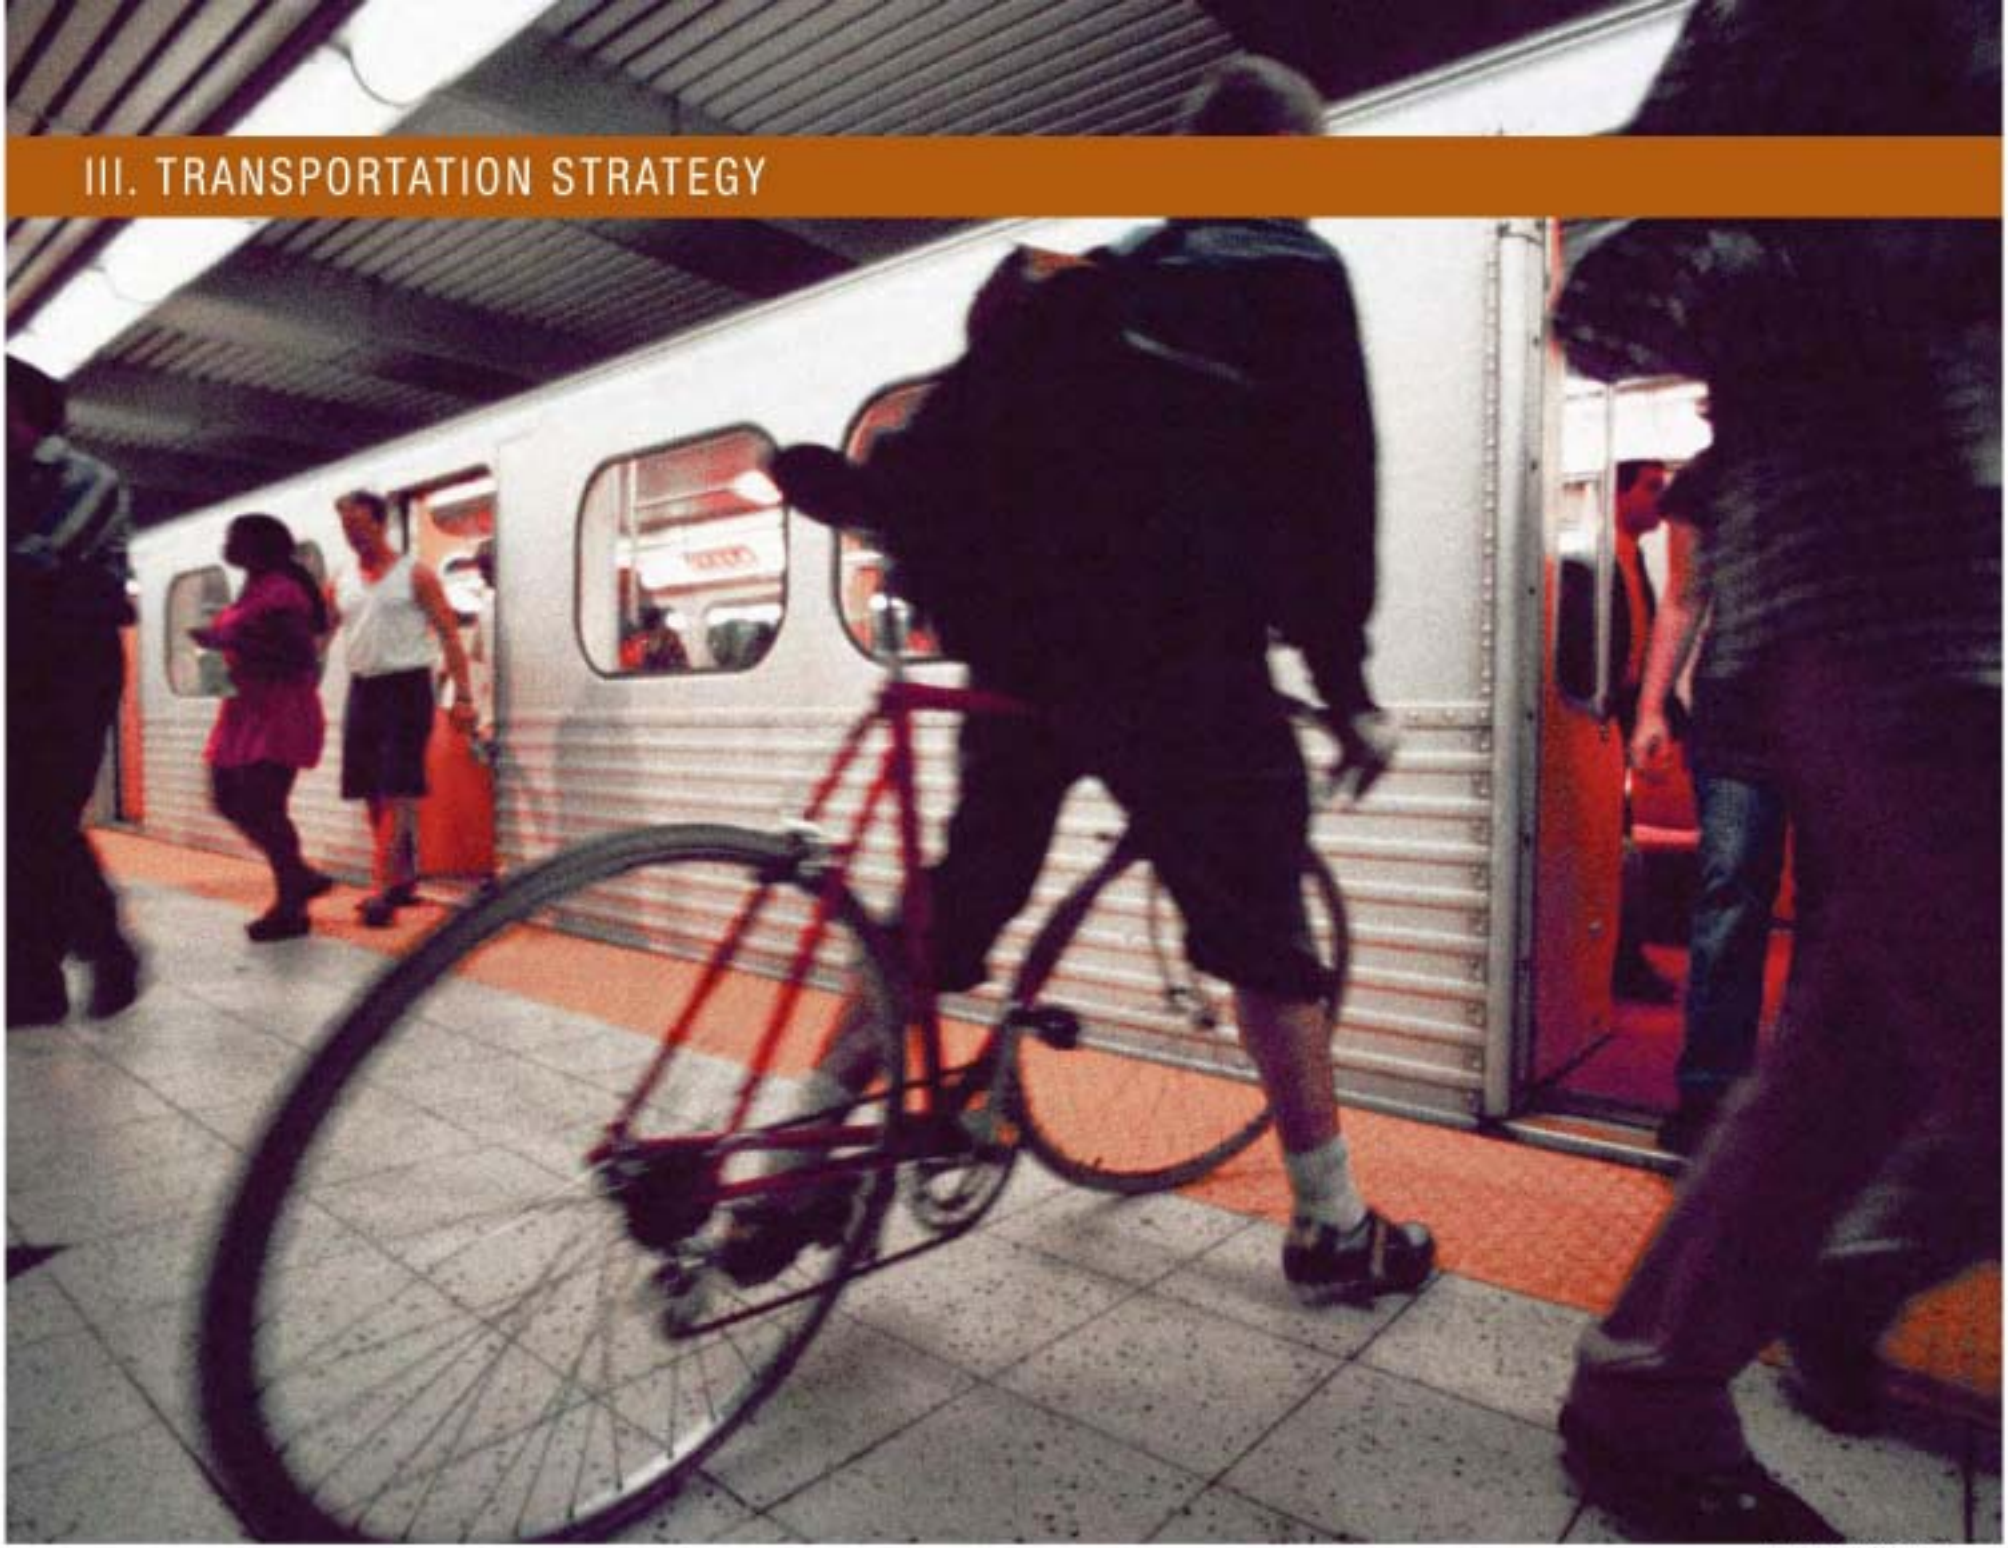
AR0072484

III. TRANSPORTATION STRATEGY



The mobility challenges presented in Chapter II are linked to the continued growth of the SCAG Region. The demographic, economic, and geographic constraints unique to our region exacerbate the condition of an already burdened transportation system. To address these challenges, this chapter identifies the policies, strategies, and investments necessary to maintain, manage, and improve the region's transportation system through the year 2035. This vision reflects a regional consensus achieved over the last four years.

This chapter is organized into three main sections. The first section discusses SCAG's efforts to enhance transportation security and safety measures in the region, and specifically lists SCAG's responsibilities in emergency preparedness. The second section describes the various transportation strategies the SCAG Region has agreed to fund and implement through 2035. Particular focus is given towards the regional goods movement system because of the critical impact it has on the region's mobility, economy, and public health. The complete listing of RTP investments is contained in the separate RTP Project List available at www.scag.ca.gov. The third and last section identifies the environmental impacts posed by the transportation strategies listed in this chapter, and describes feasible approaches to mitigate those impacts.

Security and Safety First

TRANSPORTATION SECURITY

The SCAG Region is vulnerable to many types of catastrophic events including earthquakes, floods, fires, hazardous material incidents, dam failures, civil unrest, transportation accidents, tsunamis and terrorism.

California, through hard experience, has in place an emergency and response structure designed to be innovative for the different locations and types of emergencies. There are many agencies that will participate in the response to a disastrous event and ensure that their jurisdictions are prepared to respond to these hazards. To assist in this effort, this chapter identifies SCAG's potential role and responsibility in regards to the relationship between transportation and emergency preparedness.

SECURITY AND EMERGENCY PREPAREDNESS

SCAG's Regional Preparedness Goal is stated as, "to achieve and sustain at-risk target levels of capability to prevent, protect against, respond to, and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, and the region."

SCAG'S ROLE

SCAG does not intend to undertake a first response or emergency management role. As a metropolitan planning organization (MPO), SCAG is limited to essentially three roles:

1. Provide a policy forum to help develop regional consensus and education on security policies and emergency response
2. Assist in the planning and programming of transportation infrastructure repairs, and
3. Leverage projects and planning functions (including Intelligent Transportation Systems, also known as ITS) that can enhance or provide benefit to transportation security efforts and those responsible for planning and responding to emergencies:
   - Integrate security into the regional ITS architecture, and
   - Become a central repository/mirror for regional Geodata that can be used for planning, training, response and relief efforts of law enforcement personnel and emergency responders

AR0072486

POLICIES

Within the goal of transportation security, SCAG aims to help prevent, protect from, respond to, and recover from major human-caused or natural events in order to minimize the threat and impact to lives, property, the transportation network and the regional economy.

Through stakeholder input, the Southern California Association of Governments (SCAG) developed an action plan and constrained policies detailing nine measures that the agency will undertake in the region's transportation security planning.

1. SCAG should help ensure the rapid repair of transportation infrastructure in the event of an emergency.
   a. SCAG, in cooperation with local and state agencies, should identify critical infrastructure needs necessary for: a) emergency responders to enter the region; b) evacuation of affected facilities; and c) restoration of utilities.
   b. SCAG, in cooperation with CTCs, California, and the federal government, should develop a transportation recovery plan for the emergency awarding of contracts to rapidly and efficiently repair damaged infrastructure.
2. SCAG should continue to deploy and promote the use of intelligent transportation system technologies that enhance transportation security.
   a. SCAG should work to expand the use of ITS to improve surveillance, monitoring and distress notification systems and to assist in the rapid evacuation of disaster areas.
   b. SCAG should incorporate security into the Regional ITS Architecture.
   c. Transit operators should incorporate ITS technologies as part of their security and emergency preparedness and share that information with other operators.
   d. Aside from deploying ITS technologies for advanced customer information, transit agencies should work intensely with ethnic, local and disenfranchised communities through public information/outreach sessions ensuring public participation is utilized to its fullest. In case of evacuation, these transit-dependent persons may need additional assistance to evacuate to safety.

3. SCAG should establish transportation infrastructure practices that promote and enhance security.
   a. SCAG should work with transportation operators to plan and coordinate transportation projects, as appropriate, with the Department of Homeland Security grant projects, to enhance the regional transit security strategy (RTSS).

AR0072487

b. SCAG should establish transportation infrastructure practices that identify and prioritize the design, retrofit, hardening, and stabilization of critical transportation infrastructure to prevent failure; to minimize loss of life and property, injuries; and avoid long-term economic disruption.

c. SCAG should establish a Transportation Security Working Group (TSWG) with goals of RTP consistency with RTSS, and to find ways SCAG programs can enhance RTSS.

4. SCAG should establish a forum where policy-makers can be educated and regional policy can be developed.

   a. SCAG should work with local officials to develop regional consensus on regional transportation safety, security, and safety/security policies.

5. SCAG will help enhance the region's ability to deter and respond to acts of terrorism and human-caused or natural disasters through regionally cooperative and collaborative strategies.

   a. SCAG should work with local officials to develop regional consensus on regional transportation safety, security, and safety/security policies.

   b. SCAG should encourage all SCAG elected officials to be educated in National Incident Management System (NIMS).

   c. SCAG should work with partner agencies and federal, state and local jurisdictions to improve communications and interoperability and to find opportunities to leverage and effectively utilize transportation and public safety/security resources in support of this effort.

6. SCAG will work to enhance emergency preparedness awareness among public agencies and with the public at large.

   a. SCAG should work with local officials to develop regional consensus on regional transportation safety, security, and safety/security policies.

7. SCAG should work to improve the effectiveness of regional plans by maximizing the sharing and coordination of resources that would allow for proper response by public agencies.

   a. SCAG should encourage and provide a forum for local jurisdictions to develop mutual aid agreements for essential government services during any incident recovery.

AR0072488

8. SCAG will help to enhance the capabilities of local and regional organizations, including first responders, through provision and sharing of information.
    a. SCAG should work with local agencies to collect regional GeoData in a common format, and provide access to the GeoData for emergency planning, training and response.
    b. SCAG should establish a forum for cooperation and coordination of these plans and programs among the regional partners including first responders and operations agencies.
    c. SCAG should develop and establish a regional information sharing strategy, linking SCAG and its member jurisdictions for ongoing sharing and provision of information pertaining to the region's transportation system and other critical infrastructure.
9. SCAG should provide the means for collaboration in planning, communication, and information sharing before, during, or after a regional emergency.
    a. SCAG should develop and incorporate strategies and actions pertaining to response and prevention of security incidents and events as part of the ongoing regional planning activities.
    b. SCAG should offer a regional repository of GIS data for use by local agencies in emergency planning and response in a standardized format.
    c. SCAG should enter into mutual aid agreements with other MPOs to provide this data, in coordination with the California OES in the event that an event disrupts SCAG's ability to function.

TRANSPORTATION SAFETY

The safety of the region's multimodal system is a critical priority for SCAG and the California Department of Transportation (Caltrans), which owns and operates the State Highway System. When examined historically, fatal and injury collisions (rate per million vehicle miles traveled) have steadily decreased in California since the 1930s.

While traffic fatalities in the SCAG Region are below the rest of California (the SCAG Region represents almost half of California's population), the number of fatalities has increased every year since 1999 after declining in the latter part of the 1990s.

In 2005, just over 1,800 people in the SCAG Region were killed in traffic accidents. Statewide, 4,304 were killed. Every year since 2002, the total number of traffic injuries in the SCAG Region has surpassed that in the rest of the state. Much of that can be attributed to the growth in vehicle miles traveled.

Additionally, in 2005, 372 pedestrians and 66 bicyclists were killed in the SCAG Region, representing 50 percent of pedestrians and 57 percent of bicyclists killed in California.

The 2008 RTP continues the commitment to improve safety for the region. In 2007, the region fully funded highway collision reduction and emergency response needs, estimated at $317 million and $110 million, respectively. This was the only category that was fully funded. Activities within this category include the construction of median barriers and response to landslides, as depicted in Exhibits 3.1.1 and 3.1.2.

AR0072489

EXHIBIT 3.1.1 HIGHWAY COLLISION REDUCTION MEASURES

EXHIBIT 3.1.2 EMERGENCY RESPONSE NEEDS

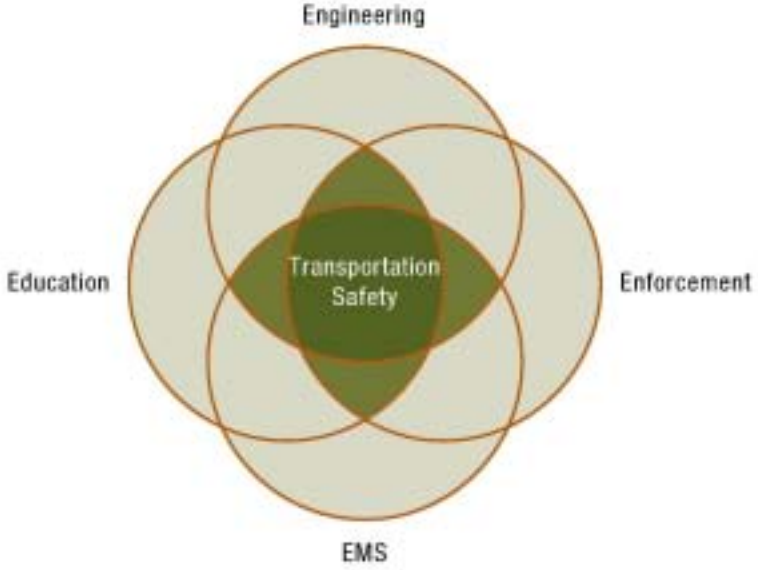
Through 2035, the RTP forecasts expenditures of $10 billion for safety-related projects and services. This is in addition to safety standards considered as part of every project design. The scope of this RTP goes beyond specific funding for safety preparedness or emergency response. It emphasizes the collaboration among SCAG, Caltrans, and their stakeholders to examine safety on a system basis so the region can use all the tools available to decrease traffic injuries and fatalities. The result of this collaboration is the California Strategic Highway Safety Plan.

CALIFORNIA STRATEGIC HIGHWAY SAFETY PLAN

In 2005, the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) was passed. The legislation required that each state develop a Strategic Highway Safety Plan (SHSP) and that all metropolitan long-range transportation plans should be consistent with the SHSP.

When addressing transportation safety, the four Es are frequently referenced to describe the multidisciplinary nature of transportation safety planning. The four Es are Engineering, Education, Emergency Medical Services (EMS), and Enforcement. The area in which planners have the most ability to effect change is likely to be engineering and the development of physical improvements to the transportation system.[1]

FIGURE 3.1 THE FOUR "E" ELEMENTS IN TRANSPORTATION SAFETY PLANNING



Additionally, a fifth E, or Evaluation, can be applied to this paradigm. Evaluation refers to monitoring and reviewing the effectiveness of the other four Es, allowing modifications where applicable. The California draft SHSP lists 16 challenge areas designed to reduce accidents, fatalities and injuries. Figure 3.2 presents the 16 Challenge Areas and resultant strategies that were developed during several workshops held by Caltrans for various stakeholder agen-

[1] Transportation Planner's Safety Desk Reference, Report No. FHWA-HEP-07-005.

AR0072490

FIGURE 3.2 CHALLENGE AREAS AND THE CORRESPONDING REGIONAL RESPONSE AS OUTLINED IN THE STRATEGIC HIGHWAY SAFETY PLAN (SHSP)

SAFETEA-LU requires that the region's plan be consistent with the California Strategic Highway Safety Plan

SHSP Challenge Area	RTP Discussion	Regional Response
• Reduce the Occurrence and Consequence of leaving the roadway and head-on collisions • Improve Driver Decisions about Rights of Way and Turning • Improve Intersection and Interchange Safety for Roadway Users • Make Walking and Street Crossing Safer • Improve Safety for Older Roadway Users • Improve Commercial Vehicle Safety • Improve Bicycle Safety	In Safety Chapter	• Identify projects that address safety in designated "hot spots" • Encourage transportation projects that specifically enhance safety or complement education, enforcement or EMS for each challenge area • Request RTP project submissions that identify the portion of the project that is applied to safety elements and/or project components for motorized and non-motorized users, including older drivers, bicyclists and pedestrians.
• Reduce Impaired Driving Related Fatalities • Ensure Drivers are Licensed and Competent • Increase Use of Safety Belts and Child Safety Seats • Reduce Young Driver Fatalities • Reduce Speeding and Aggressive Driving • Improve Motorcycle Safety • Enhance Work Zone Safety • Improve Post Crash Survivability • Improve Safety Data Collection, Access and Analysis	Outside of SCAG's RTP Role	• Endorse Cooperation with regional and local law enforcement, emergency response and education agencies as they address these transportation safety challenges. • Work with the state and county transportation commissions to determine if various project submissions have potential benefit to safety in these challenge areas.

AR0072491

cies statewide, including SCAG. Each Challenge Area contains the following elements:

- Establishment of a goal for improving safety by 2010
- Background information on the Challenge Area including a history of fatalities from 1995 – 2004
- Strategies being considered for implementation to achieve the Challenge Area goal
- Institutional and other issues that could affect the success of the implementation

Separate security and safety reports elaborate on the contents of this table.

Managing Our Transportation System Wisely

The region recognizes that maintaining and improving mobility will no longer depend solely on its ability to expand its multimodal transportation system. Instead, an integrated approach--based on the statewide GoCalifornia initiative--is needed to maximize mobility. Depicted in Figure 3.3, the five elements of the pyramid represent integrated strategies that work cooperatively to maximize mobility. The pyramid depicts the idea that transportation investments would have more impact if they were prioritized strategically as suggested. System monitoring and evaluation is the basic foundation upon which the other strategies are built. System expansion and completion will provide the desired mobility benefits to the extent that investments in, and implementation of, the strategies below it achieve progress. An improvement in mobility will occur when strategic investments in each of the elements are coordinated between the elements. The mobility pyramid provides the framework for the discussion of the RTP's transportation investment strategies.

Complementing our transportation investment philosophy is the performance-measures approach utilized in developing this Plan. While the pyramid approach ensures that our funding priorities are clear and rational, performance measures ensure that the best performing projects are included in the Plan for funding.

FIGURE 3.3 MOBILITY PYRAMID

SYSTEM MONITORING AND EVALUATION

In order to be effective system managers, we must have an in-depth understanding of how our system performs and why it performs that way. For instance, we all know congestion is a problem in the region. But we must also be able to quantify congestion and understand its various causes. Only by understanding these causes can we identify the optimal mix of strategies and projects that yield the highest returns on the region's investments. The same holds true for transit, goods movement, and aviation.

The base of the mobility pyramid, entitled "System Monitoring and Evaluation," is the foundation of sound system management. It calls for the use of

AR0072492

performance measures to track and monitor the progress of the transportation system so that the region can make informed decisions regarding transportation investments. Transportation professionals and decision-makers have recently committed to improving the region's ability to properly fund the investments needed to comprehensively monitor and evaluate system performance. These investments include detection, closed-circuit television systems, bus global positioning systems, and automatic ridership counting

systems. Although funding is modest for these activities, they lead to more informed decisions. Further discussion of system monitoring is contained in Chapter VI.

As we move forward, our focus will evolve into a comprehensive system management approach, which aims to protect, maximize the productivity of, and strategically expand our transportation system.

PROTECTING OUR REGION'S TRANSPORTATION ASSETS

Over the decades, the region has invested hundreds of billions of dollars in our multimodal transportation system. The system is now aging and requires immediate attention. Preserving our assets is a critical priority of this RTP.

In a sense, the region must make up for past funding shortfalls. As discussed in Chapter II, roadway expenditures have not kept up with demand over the last three decades. As a result, we have not properly funded roadway preservation needs. The recent passage of the Infrastructure Bond injected much needed funding to highway preservation. However, SCAG estimates that an additional $30 billion is required to bring the system into a comprehensive state of adequate repair.

SCAG also estimates that an additional $10 billion is required for arterials and transit preservation needs. The subsequent shortfall for highway, arterial, and transit preservation needs totals $40 billion. Deferring maintenance only increases this shortfall over time.

Recognizing that every dollar expended today to address this shortfall would save much more in the future, the region committed $8 billion of new funding to preservation, thereby addressing at least 20 percent of preservation needs. As more funding becomes available, additional commitments will be made. These additional investments will ensure that over the next thirty years, our infrastructure will be in a better condition than it is today. This also

AR0072493

means that user costs (e.g., vehicle maintenance costs) will decline compared to today.

SCAG will continue to work with its stakeholders, particularly county transportation commissions and Caltrans, to prioritize funding for preservation and maintenance.

INTEGRATED LAND USE AND DEMAND MANAGEMENT

The next set of strategies on the mobility pyramid focus on better managing demand on the transportation system through the integrated growth forecast, a statement of advisory land use policies and strategies, and encouraging alternative modes of travel.

INTEGRATED GROWTH FORECAST

In February 2005, SCAG initiated the 2008 RTP Growth Forecast Update Process, now known as the 2008 "Integrated Growth Forecasting" process. The resulting Baseline Growth Forecast established the projected population, employment, households and housing units for use in the 2008 RTP.

The Baseline Growth Forecast sets the stage for a future regional growth scenario, as it ties housing to transportation planning, considering both needs simultaneously in communities throughout the region. This approach ensures that the resulting assumptions are consistent with planned transportation infrastructure. Based on a combination of recent and past trends, reasonable key technical assumptions, and existing and new local policy options, the Baseline Growth Forecast provides the basis for developing the land use

AR0072494

assumptions at the regional and small-area levels which build the 2008 RTP Plan Alternative. A detailed description of the growth forecast methodology is available in the 2008 RTP Growth Forecast Report.

Advisory Land Use Policies and Strategies

The 2008 RTP Plan Alternative incorporates the Baseline Growth Forecast and the approved transportation network. However, in the rapidly growing SCAG Region, these trends could be tempered, and in some cases bolstered, by policies and strategies designed to improve future travel patterns and vehicle emissions. In response, SCAG adopted a set of advisory land use policies and strategies for future regional planning efforts and for localities to consider as they accommodate future growth. These policies and strategies were founded upon the principles developed through the regional growth visioning efforts begun in 2001.

- **Identify regional strategic areas for infill and investment**

  Identify strategic opportunity areas for infill development of aging and underutilized areas and increased investment in order to accommodate future growth. This strategy makes efficient use of existing and planned infrastructure, revitalizes communities, and maintains or improves quality of life.

  Strategic areas are primarily identified as those with potential for:

  - Transit-oriented development (TOD)
  - Existing and emerging centers
  - Small mixed-use areas

- **Structure the plan on a three-tiered system of centers development**

  Identify strategic centers based on a three-tiered system of existing, planned, and potential, relative to transportation infrastructure. This strategy more effectively integrates land use planning and transportation investment.

- **Develop "complete communities"**

  Create mixed-use districts or "complete communities" in strategic growth areas through a concentration of activities with housing, employment, and a mix of retail and services, located in close proximity to each other. Focusing a mix of land uses in strategic growth areas creates complete communities wherein most daily needs can be met within a short distance of home, providing residents with the opportunity to patronize their local area and run daily errands by walking or cycling rather traveling by automobile.

- **Develop nodes on a corridor**

  Intensify nodes along corridors with people-scaled, mixed-use developments. Many existing corridors lack the residential and commercial concentration to adequately support non-auto transit uses, without which the existing transit system cannot fully realize its potential for accommodating additional trips and relieving the transportation system. These nodes along the corridor also create vibrant, walkable communities with localized access to amenities, further reducing reliance on the automobile for a variety of trips.

- **Plan for additional housing and jobs near transit**

  Pedestrian-friendly environments and more compact development patterns in close proximity to transit serve to support and improve transit use and ridership. Focusing housing and employment growth in transit-accessible locations through this transit-oriented development approach will serve to reduce auto use and support more multimodal travel behavior.

- **Plan for a changing demand in types of housing**

  Shifts in the labor force, as the large cohort of aging "baby boomers" retires over the next 15 years and is replaced by new immigrants and "echo boomers," will likely induce a demand shift in the housing market for additional development types such as multi-family and infill housing in central locations, appealing to the needs and lifestyles of these large populations.

AR0072495

- **Continue to protect stable existing single-family areas**

  Continue to protect stable existing single-family neighborhoods as future growth and a more diverse housing stock are accommodated in infill locations near transit stations, in nodes along corridors and in existing centers. Concurrently, focusing growth in central areas and maintaining less development in outlying areas preserves the housing option for large-lot single-family homes, while reducing the number of long trips and vehicle miles traveled to employment centers.

- **Ensure adequate access to open space and preservation of habitat**

  Ensure access to open space and habitat preservation despite competing quality-of-life demands driven by growth, housing and employment needs, and traditional development patterns. Development patterns that focus growth in centers and corridors make the most efficient use of developed land and minimize encroachment on public open space and natural habitat. This approach would ensure improved access to existing large-scale and neighborhood-scale open space.

- **Incorporate local input and feedback on future growth**

  Continue public outreach efforts and incorporate local input through the Integrated Growth Forecast process. This innovative approach provides a more accurate forecast that integrates future land use and transportation planning through growth projections for population, employment, households and housing units. Public workshops, scenario planning, and stakeholder outreach improve the accuracy and feasibility of pursuing regional plans at the local level.

These policies have evolved since 2001, when SCAG initiated one of the first large-scale regional growth visioning efforts in the nation. Through its Compass Blueprint Growth Vision, SCAG sought to integrate land use and transportation through a consensus-built regional plan. Compass Blueprint was developed with the goal of accommodating the six million additional residents expected by 2030, while improving mobility for all residents, fostering livability in all communities, and enabling prosperity for all people, and promoting sustainability for future generations. The 2004 Growth Vision Alternative was approved and adopted by the Regional Council as the Preferred Growth Alternative for the 2004 Regional Transportation Plan. The Compass Blueprint principles that were established provide the foundation for the advisory land use policies and strategies adopted in the 2008 Regional Transportation Plan.

These advisory policies and strategies encourage changes to the urban form that improve accessibility to transit and create more compact development, which yields a number of transportation benefits to the region, including reductions in travel time, vehicle miles traveled, vehicle hours traveled, and vehicle hours of delay, as well as increased transit use and mode share. All of these effects lead to tangible air quality improvements.

SCAG's Compass Blueprint Program has become a model for turning regional vision into local reality. Since 2004, SCAG has used innovative planning tools, creative strategies and dynamic partnerships to expand its Suite of Services and Demonstration Project consulting services that are available to all local governments in the region, free of charge.

As a voluntary program, SCAG provides these cutting-edge tools, analyses and comprehensive planning services to cities that seek additional technical expertise or strategic planning in order to implement a plan, ordinance or program consistent with the Compass Blueprint Principles.

Popular tools in the Compass Blueprint Suite of Services include photo-morph and 3D video "fly-through" visualizations, a sophisticated "Tipping Point" return-on-investment tool that simulates a developer's pro forma for potential projects and the "Envision" GIS based land use scenario-building tool. Building upon the Suite of Services, Compass Blueprint Demonstration Projects combine public participation, design and financial analysis to produce local plans that respond to community interests and are market feasible, i.e., plans that will be adopted and realized because of their benefits to all stakeholders. Demonstration Projects range from parcel-specific zoning analyses to county-wide plans around transit stations, and include an array of services including tipping point and business functionality analyses, design charrettes and com-

AR0072496

munity workshops, housing prototypes and conceptual land use plans, parking studies, and transit-oriented development strategies.

With an ever-growing portfolio of completed, documented Demonstration Projects, an expanding Suite of Services, and significant improvements to existing tools, implementation efforts have seen sustained improvement since the Growth Vision was adopted. SCAG recently launched "Toolbox Tuesdays," a series of training seminars for local planning staff through which they can learn the skills and software capabilities necessary to build their own in-house capacities for using the Compass Blueprint-developed tools. This transferability is a cornerstone of the implementation strategy. Demonstration Projects are scoped to be just that -- examples for others to emulate. The Compass Blueprint website and annual Awards Program event are other important vehicles for sharing lessons learned. Services have been sought through the Compass Blueprint program for over 50 sites in jurisdictions all over the region.

TRAVEL DEMAND MANAGEMENT

Travel demand management (TDM) strategies are designed to influence an individual's travel behavior by making alternatives to the single-occupant automobile more attractive, especially during peak commute periods. There are two types of TDM strategies: voluntary, or "soft," strategies – such as preferential parking for carpoolers – that aim to lure some to alter their travel behavior in response to voluntary inducements; and "hard" strategies – such as congestion pricing – that shift the behavior of a large number of travelers by changing the price of travel. TDM also can include regulatory strategies, such as regional employer ridesharing mandates.

TDM strategies that encourage the use of alternatives modes of transportation to the single-occupant vehicle include rideshare (carpools and vanpools), transit (bus and rail), and non-motorized modes (bicycling and walking). Additional TDM strategies include alternative work-hour programs, such as compressed work-week programs, flextime (variable work schedules), and work at home (telework-part time and home-based businesses/self-employed-full time) and parking management (preferential parking for carpoolers and parking pricing). Providing the public with reliable and timely traveler information is an operational strategy that allows people to make better decisions about when and how to travel. Knowledge about current travel conditions on the transportation system can be used by travelers to select among alternatives to driving alone or by avoiding making the trip altogether, which is also known as congestion avoidance.

The potential effectiveness of TDM now and in the future depends largely on social and institutional commitments that cause individual travelers to choose a mode of travel other than solo driving, as well as funding (marketing and incentives that change travel behavior). If we were to do nothing beyond our current efforts, the region would not sustain the current levels of ridesharing, non-motorized and telework/telecommute/work at home, let alone expand them over the 2008 RTP period. The region recognizes the importance of TDM strategies and includes a significant level of funding to meet the TDM goals.

AR0072497

The "soft" strategies identified in this Plan include increasing ridesharing, work at home, and non-motorized transportation. For rideshare, telecommute, and park-n-ride activities, the RTP provides investments of over $1.3 billion through 2035. In the future, we will need to emphasize some of the "hard" strategies, especially parking and congestion pricing. This will require significant analysis, consensus building, and public education. However, pricing benefits have proven to be more sustainable over time and complement the integrated land use strategies adopted by the region.

Increasing Rideshare (Carpool and Vanpool)

The SCAG Region continues to invest heavily in High-Occupancy Vehicle (HOV) infrastructure that provides incentives for commuters to share rides with others. While HOV utilization is growing over time, the percent of total travelers using carpools and vanpools is not. SCAG and its partners will strengthen their efforts to encourage this efficient mode, which reduces travel time and improves air quality. These efforts will include:

- Program public funds in the RTIP to help maintain the public sector share of the existing rideshare market and to increase the number of carpools
- Provide "seamless" intra- and inter-county carpool services to the regional traveler
- Formalize and expand partnerships among public- and private-sector stakeholders to improve delivery of vanpool services regionally
- Increase the number of commuter vanpools through more effective marketing and the provision of non-monetary public-sector incentives
- Identify current dedicated funding sources and work with county transportation commissions and partners on identifying additional new funding sources
- Expand the provision for vanpool services in the region by encouraging employers to offer incentives, and develop policies that encourage employers to provide such services
- Maintain and sustain a regionally coordinated marketing strategy among the public and private sectors to enhance vanpool programs, increase ridership and improve outreach efforts

Increasing Work at Home

Increasing the number of workers who work at home (self-employed, home-based business owners) or who telework/telecommute (wage and salary employees conducting some or all of their work from home) decreases home-based work trips, vehicle-miles of travel, congestion and vehicle emissions. National and regional surveys of those who telecommute indicate that it is a lack of support and trust from "management," rather than the provision of equipment or the desire of workers to telecommute, that hampers the growth

AR0072498

of telecommuting. The 2008 RTP, therefore, recommends the following actions:

- Formalize and expand partnerships among public- and private-sector stakeholders to increase opportunities for wage and salary workers regionally to telecommute in lieu of daily commuting
- Promote telecommuting to increase opportunities for wage and salary workers regionally to telecommute in lieu of daily commuting.

Non-Motorized Transportation

Commuter trips within the region average a self-reported distance to work of 19.2 miles, too far for many bicyclists and all pedestrians. However, the integration between bicycle and transit nodes offers the opportunity to extend the commuting range of bicyclists. In addition to work trips, there are many ways that bicycling and walking are playing an important role in our transportation system. According to the 2001 National Household Travel Survey, in urban areas, 50 percent of all trips were less than 3 miles, and 28 percent of all trips were less than 1 mile. These trips are ideal for biking, walking, and transit or a combination of those modes of travel.

Bicycle transportation infrastructure has a role in regional mobility and air quality improvements. Every single percent of automobile drivers that switch to alternative transportation choice (walking, bicycling, using transit) reduces air pollution, congestion, the need for increasing roadway capacity, and, in the case of walking and bicycling, improves public health.

Bicyclist and pedestrian improvements are included as part of many street maintenance and construction projects. These investments and the supporting policies summarized below all aim to maximize the benefits of these efficient modes of transportation.

1. Decrease bicyclist and pedestrian fatalities and injuries in the state to 25% below 2000 levels. Ways to address non-motorized safety were discussed under Transportation Safety.
2. Increase accommodation and planning for bicyclists and pedestrians: The needs of non-motorized travel (including pedestrian, bicyclists and persons with disabilities) need to be fully considered for all transportation planning projects.
3. Increase bicycle and pedestrian use in the SCAG Region as an alternative to utilitarian vehicle trips: Create and maintain an atmosphere conducive to non-motorized transportation, including well-maintained bicycle and pedestrian facilities, easy access to transit facilities, and increasing safety and security. While pedestrian sidewalks are fairly well established in most areas, it is estimated that there are only 3,218 miles of dedicated bicycle facilities in the region, with an additional 3,170 miles planned.
4. Increase non-motorized transportation data: To make non-motorized modes an integral part of the region's intermodal transportation planning process and system, reliable data for planning are needed. Non-motorized transportation data needs include, but are not limited to, comprehensive user statistics; user demographics; bicycle travel pat-

AR0072499

terns/corridors; accident mapping; bikeway system characteristics; and sub regional improvement projects and funding needs.

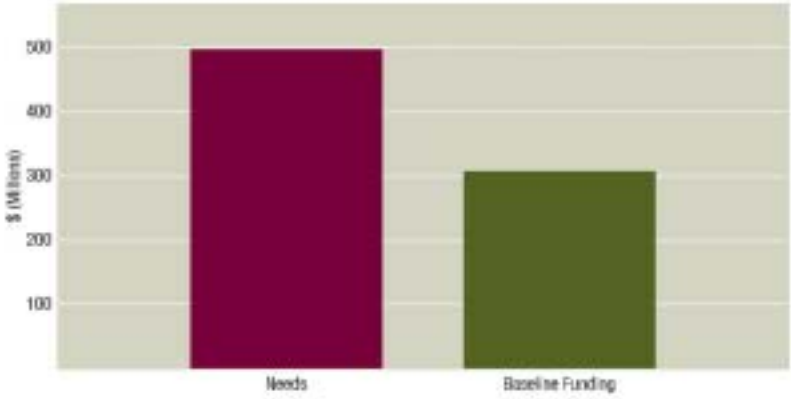
5. Bicyclists and pedestrians should always be included in general plan updates. SCAG also encourages the development of local Non-Motorized Plans. Also, Non-Motorized Plans that have been created or updated within the previous five years are eligible for bicycle transportation account (BTA) funds. SCAG can assist in the development of these plans through the Compass Blueprint Program.
6. Develop a Regional Non-Motorized Plan: SCAG will work with all counties and their cities to coordinate and integrate all Non-Motorized Plans from counties and jurisdictions in the SCAG Region in a collaborative process, including interested stakeholders.

The RTP allocates over $1.8 billion for non-motorized transportation.

The region has built a vast and expensive transportation system. Like any system, it can be operated to be much more productive. Just like a factory can be refined and modernized to produce more output per day or hour, our transportation system can be refined and modernized to carry more people and goods in a day or during peak commute conditions.

Chapter II of this document discussed the lost productivity quantified in terms of "lost lane-miles" on the State Highway System. Similar productivity losses occur for all modes when they are not operated adequately. The investments needed to maximize the productivity of our system through 2035 total $308 million, and include implementation of advanced traffic control strategies (e.g., signal coordination, ramp metering), improved incident management, and smaller physical infrastructure modifications (e.g., auxiliary lanes). Figure 3.4 shows that originally planned investments in operational strategies for the highway system reflect a shortfall of approximately $190 million per year.

FIGURE 3.4 SCAG REGION HIGHWAY OPERATIONS NEEDS VS. BASELINE FUNDING, 2007-2035



Source: SCAG estimates based on Caltrans SHOPP and county transportation commission project submittals

The shortfall through 2035 adds up to $8.4 billion once inflation is taken into account. Similarly, SCAG estimates a deficit of $1.6 billion through 2035 for implementing operational strategies for arterials of regional significance and transit.

Recognizing that funding these provide a higher return on investments than most other transportation projects, this RTP allocates an additional $2 billion, representing 20 percent of the shortfall. As these allocations are programmed and implemented, it is SCAG's hope that the benefits will become apparent to decision-makers and the public, and additional funding is secured to address the remaining shortfall.

AR0072500

SCAG will work with stakeholders, particularly the county transportation commissions and Caltrans, to better determine the benefits and cost effectiveness of operational strategies. SCAG will also continue to partner with Caltrans on corridor system management plans.

Transit Operations

In addition to funding for operations, the 2008 RTP highlights the following policies to improve the performance of the regional transit system.

Strategic Transit Service Policies

In an effort to maximize transit productivity, the 2008 RTP calls upon regional transit operators to address significant challenges to achieve better operational efficiency, maintain a discipline of cost recovery through a consistent fare policy, embrace the use of performance metrics to better serve their existing customer base, and attract new transit users. The Plan encourages the regional transit operators to work cooperatively to offer complementary services, with ease of transfer between modes and operators. It further encourages utilization of new intelligent transportation system (ITS) technologies that measure system performance and offer their customers reliable "on-time" performance and real-time information.

Reliability and On-Time Performance

On-time performance is the key to delivering the greatest customer satisfaction. Wait times are affected by service irregularities and therefore customers are more sensitive to unpredictable delays. Reliability can also be related to transfer times between buses or between modes (bus to train). When customers experience long unscheduled gaps in service and if timely connections are not made, they are less likely to see transit as a viable alternative.

The Plan recommends that SCAG and transit operators analyze and assess the use of ITS technologies to track, report, and improve on-time performance of transit systems. In addition, operators should utilize this data to identify the causes of delay and use it to improve performance of transit systems through operational improvements, rapid bus implementation, and better scheduling of services. SCAG will seek funding in the next OWP (FY08-09) to conduct this assessment.

Transit Service Levels

Frequency of service is also a concern for transit customers. Long waits for service make transit service inconvenient and deter the use of transit. Poor service levels limit the potential use of transit for non-work trips for social, retail, recreational, and tourism purposes. SCAG should work cooperatively with regional and local transit operators to develop service delivery policies to optimize transit service levels, including frequency, coverage, and hours of operation to achieve maximum potential use of our transit investments. SCAG will seek funding in the next OWP (FY08-09) to conduct this assessment.

Fare Policies, Fare Media, and Subsidies to Transit

SCAG recommends that an analysis be conducted to identify and recommend appropriate adjustments to transit fares to maximize transit usage, including fare-free concepts. This includes utilizing new automated fare media to allow for ease of transit use; increasing subsidy levels to maximize transit usage; and analyzing regional transit fare policies to assess the proper level of fares, optimal fare media to allow for ease of connectivity among transit systems, appropriate subsidy policies, and appropriate mechanisms to assure stable operational funding to maximize transit use in the region. SCAG will seek funding in the next OWP (FY08-09) to conduct this assessment.

Increase Transit Service Connectivity

SCAG recommends that transit operators assess how to better restructure transit services, as needed, to more effectively connect different urban centers and activities. SCAG also recommends that transit operators assess ways to enhance connectivity and ease of transfer between transit modes. In consultation with transit operators, SCAG will conduct an analysis of transit operations; identify existing and emerging hubs and centers; and analyze how to more effectively ensure optimal coverage, access, and connectivity to regional centers. SCAG will also work with transit operators to develop service poli-

AR0072501

cies and route structures that support the RTP land use concepts, facilitate intermodal transit connectivity, and maximize transit usage. SCAG will seek funding in the next OWP (FY08-09) to conduct this assessment.

SYSTEM COMPLETION AND EXPANSION

Despite the increases in funding commitments to both preservation and operations, more than half of the available transportation revenues in the region are dedicated to the completion and expansion of our people and goods movement transportation systems. This section first summarizes the expansion investments for the SCAG Region by mode, and then presents additional regionally significant expenditures to facilitate and mitigate the movement of goods in the SCAG Region.

HIGHWAY IMPROVEMENTS

Major categories of highway improvements included in the 2008 RTP are High- Occupancy Vehicle (HOV) lanes and connectors, mixed-flow (or general purpose) lanes, toll facilities and High-Occupancy Toll (HOT) lanes, and strategic arterial improvements.

A significant number of system expansion projects have already been committed through SCAG's RTIP for the highway network. These priority projects close critical gaps in the system, relieve significant bottlenecks, and address inter-county travel needs. Recent extraordinary increases in the costs of concrete and steel have resulted in substantial project cost increases and forced implementing agencies to piece together enough additional funding to deliver the improvements. Voter approval of Proposition 1B in November 2006 brought much-needed revenue to the table, through programs such as the Corridor Mobility Improvement Account (CMIA). Much of the additional improvements recommended in the 2008 RTP, beyond those projects that are already in the delivery pipeline, have been committed through local sales tax revenues such as those recently approved by voters in Orange, Riverside, and San Bernardino Counties. The proposed projects and strategies are based on a performance framework established for the 2004 RTP and updated for the 2008 RTP.

Recently completed Regionally Significant Transportation Investment Studies (RSTIS) have helped to identify additional corridor improvements needed in the SCAG Region. These corridor projects provide capacity enhancements and mobility improvements to address rapidly growing inter-county travel, often on already congested facilities with few alternatives. These projects have been incorporated into the RTP, and they will depend in part on financial contributions from the private sector for their construction, operation, and maintenance.

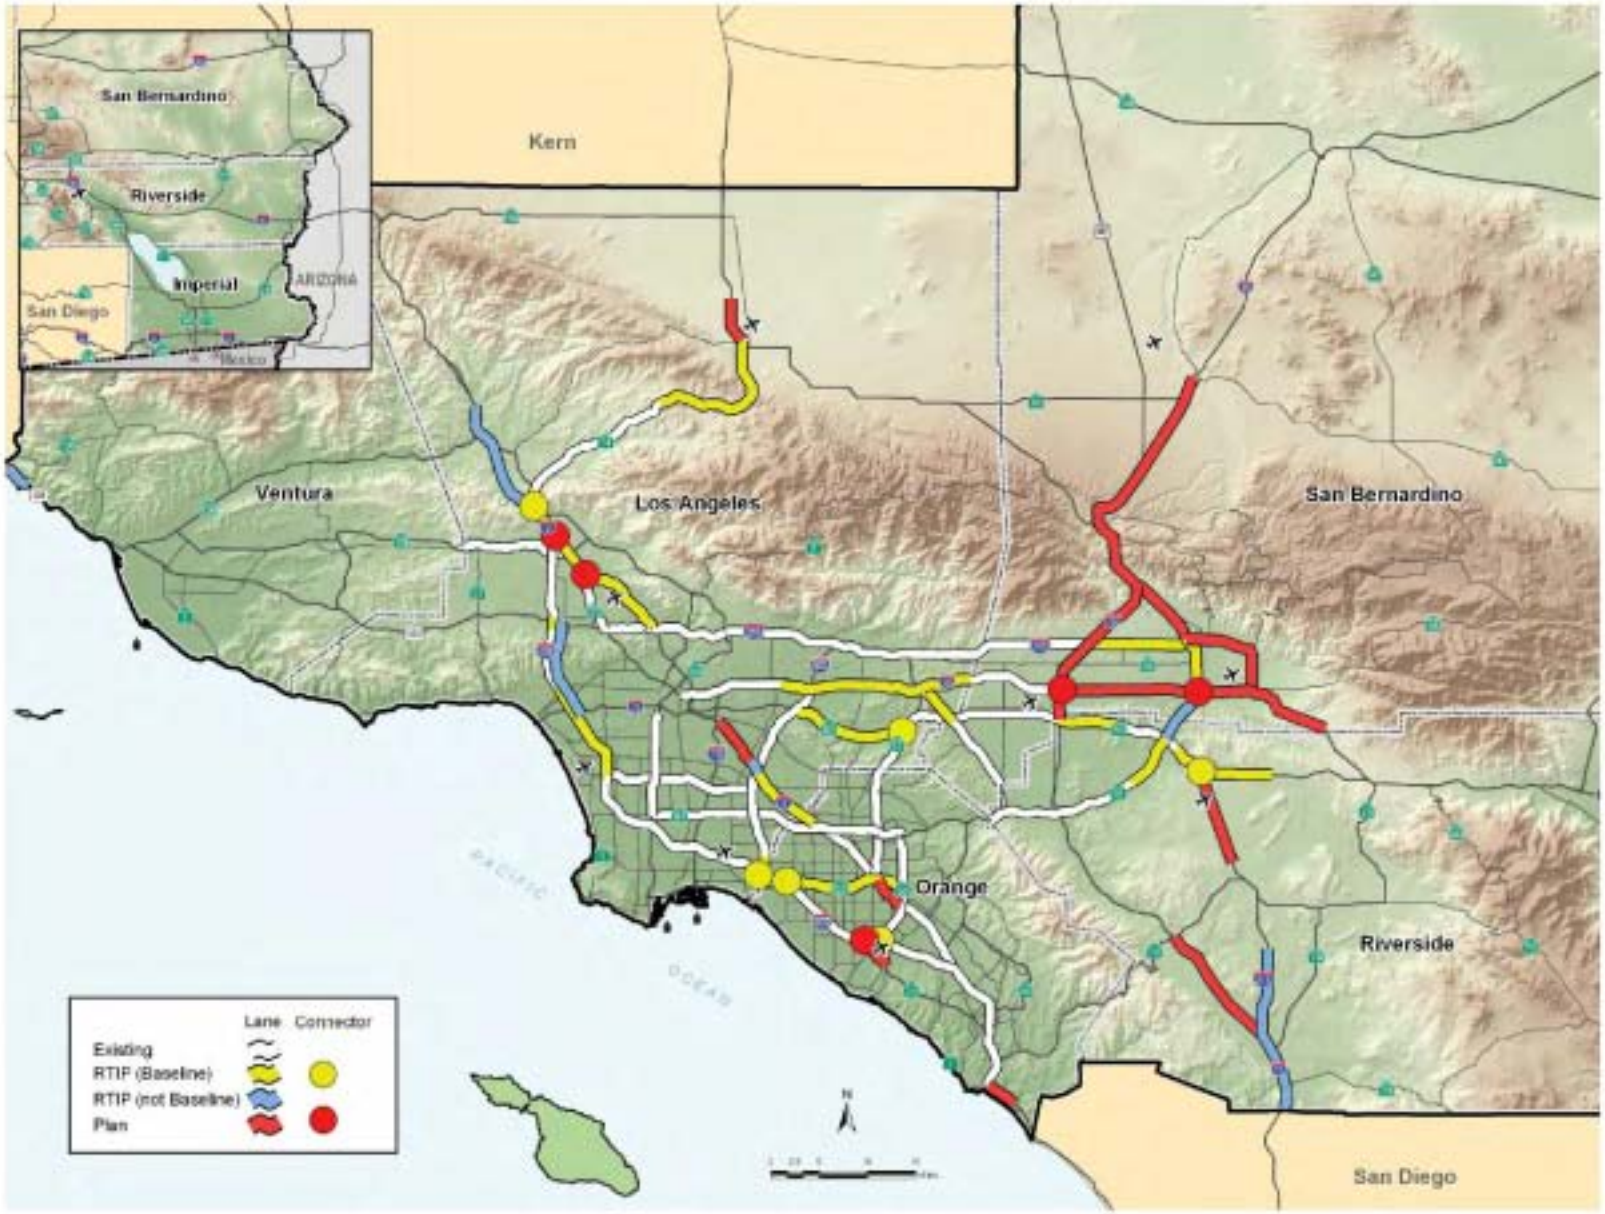
HOV Gap Closures and Connectors

Southern California has invested heavily in HOV lanes, producing one of the nation's most comprehensive HOV networks and highest rideshare rates. The HOV projects proposed in the RTP focus on strategic gap closures and freeway-to-freeway direct HOV connectors to complete the system. The HOV lane network could eventually serve as the backbone of a regional HOT lane or managed lane system. Determining the feasibility of such a regional system will require further study and discussion before inclusion in a future RTP update.

In 2007, the new SR-22 HOV lanes in Orange County opened as the first continuous-access HOV lanes in Southern California. Monitoring and evaluation of these HOV lanes will conclude in 2008 and transportation officials will decide whether the continuous access will be made permanent.

AR0072502

EXHIBIT 3.2 HOV GAP CLOSURES AND CONNECTORS



Source: Southern California Association of Governments, ESRI StreetMap USA, Teleatlas

AR0072503

The HOV lane system is a regional network and operations should be coordinated across jurisdictional boundaries to optimize performance and minimize confusion. SCAG supports further study and evaluation of these proposed operational changes to the HOV lane system to fully understand the mobility, safety, and air quality impacts, as well as any implications for a potential regional HOT lane system.

Projects in the Pipeline

The RTIP includes HOV gap closures and connectors as shown in Exhibit 3.2.

- I-405 in the Westside of Los Angeles
- SR-91 in Riverside
- I-5 and SR-14 connecting the San Fernando Valley to North Los Angeles County
- I-5 and I-605 connecting Los Angeles and Orange Counties
- I-10 and SR-60 connecting Los Angeles and San Bernardino Counties
- SR-60 and I-215 connecting Riverside and San Bernardino Counties
- US-101 connecting Ventura and Santa Barbara Counties
- HOV connectors at I-5/SR-14, SR-57/SR-60, SR-22/I-405, I-405/I-605, and SR-60/I-215

Additional Investments

The 2008 RTP calls for additional investments to extend the HOV network and construct additional connectors, as shown in Table 3.1 and in Exhibit 3.2. It invests close to $8 billion for HOV improvements through 2035. These gap closures and connectors help users to maximize the overall system performance by minimizing weaving conflicts and maintaining travel speeds.

Mixed Flow

Since mixed-flow lanes carry more traffic than any other component of our transportation system, mixed-flow capacity enhancements are necessary to address traffic bottlenecks and relieve congestion on heavily traveled corridors. This is especially true in areas outside of the urban core where transit service and the HOV network are not fully developed. The majority of mixed-flow projects in the pipeline and proposed in the 2008 RTP are located outside of Los Angeles County.

Projects in the Pipeline

The RTIP contains mixed-flow lane additions on the following routes (see Exhibit 3.3).

- Brawley Bypass in Imperial County
- I-5, I-405, and SR-57 connecting Los Angeles and Orange Counties
- SR-91 connecting Orange and Riverside Counties
- CETAP Mid-County Parkway in Riverside County
- SR-60 and I-215 connecting Riverside and San Bernardino Counties
- I-15 and I-215 connecting Riverside and San Diego Counties
- US-395 in northern San Bernardino County
- Completion of the 210 freeway in San Bernardino County
- SR-23, SR-118, and US-101 in Ventura County

Additional Investments

The 2008 RTP invests $26.2 billion through 2035 for mixed-flow improvements and interchange ramps. Major mixed-flow improvements are listed in Table 3.2 and shown in Exhibit 3.3.

AR0072506

Toll and High-Occupancy Toll (HOT) Lane Corridors and Facilities

The 2008 RTP proposes to expand upon the existing HOT lane and toll road system in Orange County to address the congested commuter corridor between housing-rich Riverside County and job-rich Orange County. Additionally, improvements to several major corridors elsewhere in the region are proposed to be financed by tolls.

Projects in the Pipeline

The RTIP includes lane additions to each of the toll roads in Orange County and the construction of the Foothill South corridor connecting to I-5 in San Diego County (see Exhibit 3.4).

- SR-73 – San Joaquin Hills Corridor
- SR-133/SR-241/SR-261 – Eastern Transportation Corridor
- SR-241 – Foothill Transportation Corridor North
- SR-241 – Foothill Transportation Corridor South (extension to I-5)

Additional Investments

The recommendations from several recent major RSTIS efforts examining inter-county travel have been considered in the development of the 2008 RTP. First, the Riverside County to Orange County study completed in 2006 identifies a comprehensive set of improvements that includes extending the SR-91 Express Lanes into Riverside County and providing direct connections to and from the Express Lanes. Additionally, the study identifies two major new facilities, one parallel to the SR-91 and one on a new alignment further south. Secondly, a North Los Angeles County study completed in 2004 recommended a new east-west facility called the High Desert Corridor to connect the high-growth areas of Lancaster/Palmdale and Victor Valley. While the RSTIS provides input to the RTP on a locally preferred strategy, SCAG recognizes and respects the local processes that must continue to solidify community consensus and further refine each project.

In 2006, MTA completed a technical feasibility study examining the potential for constructing the SR-710 Gap Closure between the I-10 and I-210 freeways as a tunnel. SCAG has further assessed the potential for the Gap Closure to be financed in part through a public-private partnership. A number of tolling structures were considered in the financial analyses, including both flat-rate

AR0072507

EXHIBIT 3.4 HOT LANES AND TOLL FACILITIES

Source: Southern California Association of Governments, ESRI StreetMap USA, Teleatlas

AR0072508

and variable-toll rate structures. SCAG anticipates that structuring financing alternatives with lower-cost Private Activity Bonds (PABs) and 30- to 50-year -term bonds could help to improve shareholders' internal rate of return.

Additionally, SCAG's current evaluations to date indicate that the project is feasible from a construction standpoint. Two 46-foot inner diameter tunnels could provide two levels of lanes. The upper level could include three lanes for passenger vehicles, and two lanes in the middle level could accommodate truck and high-occupancy vehicles. The SR-710 Gap Closure is estimated to cost $4.6 billion.

The 2008 RTP invests $25.6 billion for toll and HOT lane facilities. These additional investments are listed in Table 3.3 and shown in Exhibit 3.4.

TABLE 3.3 HOT LANES AND TOLL FACILITIES

Project	County	Implementation Schedule*
SR-710 Tunnel Gap Closure (710/Valley Blvd to California Blvd/Pasadena Ave)	Los Angeles	2020
High Desert Corridor (I-5 to US-395)	Los Angeles/ San Bernardino	2030
SR-91/SR-241 HOT connectors	Orange	2020

Arterial Improvements

Local streets and roads account for over 80 percent of the total road network and carry a high percentage of total traffic. In many cases, arterials serve as alternate parallel routes to congested freeway corridors. In mature urban areas there is often little right-of-way available for capacity enhancements. In the fast-growing suburban and exurban parts of the region, local jurisdictions ensure that roadway capacity improvements keep pace with new developments by implementing mitigation fees. In all parts of the region, operational and technological improvements have the potential to maximize system productivity in a more cost-effective way than simply adding capacity. Such strategic "smart street" improvements include spot widening, signal prioritization, driveway consolidation and relocation, and grade separations at high-volume intersections. The 2008 RTP invests approximately $17.1 billion for arterial system improvements as shown in Table 3.4.

TABLE 3.4 ARTERIAL INVESTMENT SUMMARY

County	Investment (in billions, nominal dollars through 2035)
Imperial	$1.0
Los Angeles	$1.5
Orange	$2.0
Riverside	$6.9
San Bernardino	$4.8
Ventura	$0.9
Regional Total	$17.1

Note: Numbers may not add due to rounding

AR0072509

TRANSIT STRATEGIES

Public transit has grown in recent years to become an increasingly integral mode of transportation for the movement of people to and from jobs, school, shopping, and cultural and recreational activities. The region has experienced substantial growth in daily regional transit trips since 2003, and anticipates the trend to continue.

The goals of public transportation services are to ensure mobility for people without access to automobiles, and to provide attractive alternatives for drive-alone motorists or discretionary riders. The public transportation strategies and programs presented in the RTP are developed with these goals in mind. As listed previously in this chapter, these strategies target improving customer service and system reliability, achieving financial stability for operators, and enhancing the safety and security of the system for all riders and operators.

Transit Expansion

The RTP recommends closing critical gaps in the transit system to improve service, and extending routes to serve a greater number of passengers. Our regional transit investments in new modes and innovative services are a significant factor in achieving increased transit use. The development of new rail and bus transit corridors has also spawned investment in new housing, retail, and business development at and near transit stations.

Projects in the Pipeline

The transit projects that are programmed in the RTIP and ready for implementation include expansions to the Bus Rapid Transit (BRT) system, commuter rail, and light rail. Refer to Exhibit 3.5 for an illustration of bus transit projects, and Exhibit 3.6 for rail projects that are included in the 2008 RTP.

Bus Rapid Transit (BRT) is designed to provide fast, high-quality bus service to passengers by taking advantage of signal priority at intersections, operating in mixed traffic or in a dedicated right-of-way, and providing improved bus stop spacing at planned stations. The following BRT projects are programmed in the RTIP:

- Metro Rapid Bus Expansion (to 28 lines) in LA County
- San Fernando Valley North-South BRT (Reseda/Sepulveda & Canoga Corridor) in LA County
- Wilshire Metro Rapidway in LA County
- Harbor Blvd. BRT (Fullerton to Costa Mesa) in Orange County
- Westminster/17th BRT (Santa Ana to Long Beach) in Orange County
- 28-Mile BRT (Brea Mall to Irvine Transportation Center) in Orange County
- E Street Transit Corridor (San Bernardino to Loma Linda) in San Bernardino County

Metrolink is the commuter rail service that operates in five Southern California counties. The Southern California Regional Rail Authority (SCRRA) provides and maintains Metrolink services and facilities. The following commuter rail project is programmed in the RTIP.

- Perris Valley Line (Riverside to Perris) in Riverside County

Light Rail Transit (LRT) utilizes electric-powered vehicles that operate primarily on exclusive rights-of-way. The Metro Rail system comprises the Metro Blue, Green, Red, Purple and Gold Lines. LRT projects programmed in the RTIP include:

- Gold Line Eastside Extension (Union Station to Atlantic) in LA County
- Exposition Corridor Phase 1 (Downtown LA to Culver City - Washington/National) in LA County
- Exposition Corridor Phase 2 (Culver City - Washington/National to Santa Monica) in LA County
- Gold Line Foothill Extension Phase 1 (Pasadena to Azusa-Citrus) in LA County
- Crenshaw Corridor in LA County (may be BRT or LRT)

AR0072512

Additional Investments

The 2008 RTP invests over $44.0 billion in transit projects. Of this amount, nearly $23.3 billion is allocated to bus and intermodal facilities; nearly $6.2 billion to commuter rail projects; and close to $14.5 billion to heavy rail, light rail, and other projects. The major projects included in the RTP that address system gaps and provide strategic corridor expansion are listed in Table 3.5.

TABLE 3.5 TRANSIT CORRIDOR PROJECTS

Project	County	Implementation Schedule*
Regional Connector LRT (Union Station to 7th St/Metro Center)	Los Angeles	2035
Gold Line Foothill Extension Phase 2 (Azusa-Citrus to Montclair)	Los Angeles	2020
Westside Extension (Metro Purple/Red Line Extension)	Los Angeles	2020
Green Line Extension (Mariposa/Nash to Century/Sepulveda LAX, technology TBD)	Los Angeles	2030
Katella BRT (Orange Transportation Center to Long Beach/Blue Line)	Orange	2014
Edinger BRT (Tustin to Huntington Beach)	Orange	2018
Beach Blvd BRT (Huntington Beach to Buena Park)	Orange	2012
La Palma BRT (Anaheim to Buena Park)	Orange	2018
Great Park/Spectrum 5-Mile Transit System	Orange	2012
Western Riverside BRT (Magnolia Corridor Phase 1 City of Riverside; Moreno Valley Corridor Phase 2 City of Moreno Valley)	Riverside	2018
Coachella Valley BRT	Riverside	2018
Perris Valley Line Extension (Perris to San Jacinto)	Riverside	2030
Perris Valley Line Extension (Perris to Temecula)	Riverside	2030
Redlands Extension (4th St/Mt. Vernon to Grove/Central, rail technology TBD)	San Bernardino	2014

AR0072513

AVIATION

The SCAG Region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment. The system has six established air carrier airports including Los Angeles International (LAX), Bob Hope (formerly Burbank), John Wayne, Long Beach, Ontario and Palm Springs. There are also four new and emerging air carrier airports in the Inland Empire and North Los Angeles County. These include San Bernardino International Airport (formerly Norton AFB), March Inland Port (joint use with March Air Reserve Base), Southern California Logistics Airport (formerly George AFB) and Palmdale Airport (joint use with Air Force Plant 42). Southern California airports play a crucial role in international trade, particularly with Pacific Rim countries, and to the regional economy. The value of airborne commodity exports out of the Los Angeles Customs District are about equal to waterborne exports, and airborne export values would be significantly greater if service exports, including impacts from tourism, were added to total export values.

The aviation strategy is very similar to the 2030 decentralized regional aviation system adopted for the 2004 RTP. It respects all legally enforceable policy and physical-capacity constraints at urban airports. It assumes much more willingness on the part of the airlines to invest in new flights at new and emerging airports, and a package of market and ground access incentives to promote decentralization at underutilized suburban airports.

The aviation strategy incorporates the HSRT system Initial Operating Segment (IOS) running from West Los Angeles to Ontario Airport, and extending west to LAX and east to San Bernardino International. The region is projected to reach 165.3 million annual passengers (MAP) in 2035 (190.7 MAP including San Diego).

Regional Aviation Policies

New regional aviation policies have been developed for the 2008 RTP with input from both the SCAG Aviation Task Force and the SCAG Aviation Technical Advisory Committee. They respond to changing circumstances and new priorities in the regional aviation system. The policies are divided into Aviation Guiding Principles and Aviation Action Steps, as follows:

Aviation Guiding Principles:

- Provide for regional capture of economic development opportunities and job growth created by the prospect of significant regional air traffic growth between now and 2035

AR0072514

- Distribute maximum opportunity to Southern California airports where population and job growth are expected to be strong and where local communities desire air traffic for economic development
- Reflect environmental, environmental justice and local quality-of-life constraints at existing airports that operate in built-out urban environments
- Reflect that each county should have both the obligation and the opportunity to meet its own air traffic needs where feasible
- Reflect that the region as a whole has an obligation to help pay the costs of airport environmental mitigation and ground access improvement in counties that serve a disproportionate share of regional air travel demand at their airports

Aviation Action Steps:

- Support capacity enhancements at existing and potential airports to handle anticipated increases in passengers and cargo volume where it is desired
- Mitigate the effects of expanding airports and maximize air passenger and air cargo utilization of outlying airports in less-populated areas so that community impacts are minimized
- Support the continued responsibility of SCAG for developing regional aviation and ground access plans for the region
- Support the close cooperation between SCAG and other aviation organizations to facilitate the implementation of adopted regional aviation plans prepared by SCAG
- Support legislative, marketing and ground access initiatives that promote the decentralization of aviation demand to underutilized suburban airports where it is desired
- Support more flexible use of airport revenues for off-airport ground access projects
- Support giving priority to key airport ground access projects in the programming of transportation projects in the RTP and the RTIP
- Support the development of a regional network of new FlyAways that connect to multiple airports via HOV, light rail and commuter rail facilities, to help decentralize aviation demand to underutilized suburban airports where it is desired
- Support efforts to redesign the regional airspace system that may be needed to reduce significant conflicts and delays associated with future air traffic in SCAG's adopted 2035 regional aviation forecast
- Support a more active role by the federal government in developing substantial incentives for airlines to upgrade their aircraft fleet to cleaner and quieter aircraft

Air Cargo Forecasts

The aviation strategy forecasts a total of almost 8.3 million tons of air cargo for the region's airports in 2035. The adopted 2030 air cargo forecast for the 2004 RTP was 8,724 tons. There is a variety of reasons why the new air forecast is lower than the adopted forecast in the last RTP. These include more domestic cargo being transported by truck and train, more international air cargo over-flying the region on longer-range aircraft or flying the Arctic Circle route with a stop at Anchorage, and high value-to-weight goods such as computers forecast to be lighter per unit volume. The 2035 modeling results of the air cargo forecast are shown in Table 3.7.

AR0072515

Region Total	**8,280**

Airport Ground Access

The 2008 RTP may have localized ground access impacts at a number of airports. The RTP will result in significant increases in airport activities (people as well as cargo) at Ontario, San Bernardino International, and Palmdale Airports. Regional Airport Demand Allocation Model (RADAM) modeling for the Preferred Scenario shows that airport ground access deficiencies are concentrated near airport areas but that background congestion affects both airports and local communities.

SCAG's adopted Regional Aviation Decentralization Strategy calls for making substantial airport ground access improvements throughout the region, in both the short term and long term. The short-term program emphasizes relieving immediate bottlenecks around airports through arterial, intersection and interchange improvements, and increasing transit access to airports. Many of these improvements were programmed in the RTIP, and have been updated with strong local input from airport, city and county transportation planners.

SCAG is currently working with Los Angeles World Airports (LAWA) on planning and programming a regional system of FlyAways, based on the very successful Van Nuys FlyAway, where passengers park their cars and take a bus to LAX. The locations of the proposed new FlyAways can be optimized by taking advantage of the region's developing high-occupancy vehicle (HOV) and light and heavy rail networks that can provide direct linkages to Ontario and Palmdale as well as LAX. Making seamless HOV and rail connections with enhanced service to those and other suburban airports will also compose SCAG's short- and medium-range airport ground access strategy. The FlyAway, HOV and rail improvements to the suburban airports will help establish a pattern of decentralization, by attracting a critical mass of passengers and airline service

AR0072516

at those emerging airports. SCAG is also working with the newly reactivated SCRAA in its ongoing efforts to restructure and redefine its mission, with the focus of helping to implement the Regional Aviation Decentralization Strategy through facilitating key airport ground access improvements.

Over the long term, SCAG aviation demand modeling indicates that the region will also need a system of high-speed rail to the suburban airports to reach our adopted air passenger and air cargo forecasts, which are moderate and even conservative when compared to other forecasts for the region such as those developed by the FAA. The high speed, reliability and predictability of high-speed airport access will be needed to overcome mounting and increasingly unpredictable traffic congestion. For example, the Initial Operating Segment of SCAG's proposed high-speed rail system from West Los Angeles to Ontario Airport will take only 33 minutes to travel from end to end, compared to over two hours by car in 2030. The regional high-speed rail system is an integral component of the 2008 RTP Preferred 2035 regional aviation demand forecast.

Provision of high-speed rail service to the suburban airports would also provide significant economic benefits to region. It is estimated that the regional aviation system with a full high-speed rail network would create an additional 76,600 direct, indirect and induced jobs by 2035, compared to a system with no high-speed access. These would include an additional 28,900 jobs from high-speed access to Palmdale Airport, and an additional 27,100 jobs from high-speed access to San Bernardino International Airport.

HIGH-SPEED REGIONAL TRANSPORT

SCAG has advanced a vision of regional transport based on high-performance, high-speed, and environmentally sensitive alternatives. A High-Speed Regional Transport (HSRT) system has the potential for relieving both airport and freeway congestion in urbanized areas by providing an alternative to the automobile as well as making less-congested airports more accessible to air travelers, and providing alternative capacity for freight movement in the region.

The HSRT system is a long-term vision connecting the region's ports, airports, and urban activity centers. The system can be constructed in multiple stages that can each be financially viable. The financial performance will be enhanced as the system is extended throughout the region and the volume of users increases. The HSRT plan is constructed on three core components:

- **Goods Movement/Logistics:**
  Connect the San Pedro Bay Ports with an inland port facility via the high-speed, high-capacity link. This would provide capacity to handle containers, relieving a major constraint to port expansion, and facilitate efficient and environmentally sensitive goods handling in areas that have sufficient space outside of the urban areas. A detailed discussion on goods movement strategies is included in this chapter.
- **Aviation System:**
  Create a direct and reliable link capable of connecting airports and urban centers. Continue use of LAX as a major hub and sharing de-

AR0072517

mand with other regional airports such as Ontario International Airport (ONT), Palmdale Regional Airport (PMD) and San Bernardino International Airport (SBD) based on a high-speed connection via the HSRT. This would enable a higher level of service for airport access and connecting passengers, improved operation of the aviation system for passengers and airborne cargo, and optimize investment in aviation system infrastructure.

- **Surface Transport System:**

  Link urban activity centers throughout the region, serving the needs of commuters while reducing the number of private vehicles on the road. This would lead to reduced traffic congestion, enhanced accessibility between activity centers, as well as reduced air and noise pollution from automobiles. Additionally, enhanced accessibility at transit stations would enable intensification of land uses and thereby encourage more effective land use patterns.

The SCAG HSRT system will ultimately grow to cover over 275 miles of corridors in the SCAG Region, and will move up to 500,000 riders a day. When fully deployed, the HSRT system could complement the regional state highway transportation system. The HSRT program also envisions a longer-term connection to San Diego and other southern airports in the SCAG Region, a connection between San Bernardino and Palmdale via a high desert alignment, an LAX to Orange County route, and a San Bernardino to the Coachella Valley segment, intertwining with the proposed state high-speed rail system.

The California High-Speed Rail Authority (CHSRA) has been commissioned to do preliminary development work on several north-south corridors. SCAG has supported the Antelope and San Joaquin Valley corridors (Resolution #96-357-1-B). The State of California should coordinate all high-speed rail-planning activities with SCAG and other stakeholders within the state, especially with regard to HSRT, aviation, environment, growth, access, finance, and community development. SCAG is supportive of CHSRA's efforts to build a high-speed rail system in Southern California.

Three phases have been developed to implement the HSRT deployment program:

- **Phase 1**, Pre-Deployment Analysis, was completed in October 2003 and includes right-of-way assessment on the freeway system and railroad corridors, assessment of ridership and interaction with other transportation systems, Los Angeles Union Passenger Terminal (LAUPT) capacity analysis, stakeholder outreach, financial feasibility, public-private partnership, technology transfer, and identification of an Initial Operating Segment (IOS).
- **Phase 2**, Preliminary Engineering, was completed in 2006 for the IOS, and focused on defining the project to prepare preliminary engineering for the purpose of environmental assessment and analysis (EIR/EIS) for public-private investment.
- **Phase 3**, Project Deployment Strategy, was initially done via a consultant study completed in 2007. It focused on an extended IOS with a link to the Ports of Los Angeles and Long Beach. The goal was to provide an initial investment quality analysis necessary to take the deployment program to the private market. The next step in this phase (date to be determined) will include an investment-grade ridership and revenue forecast, operation plans, a detailed financial plan, and creation of a public-private consortium for project deployment.

In December 2002, SCAG's Regional Council approved the deployment of a 54-mile IOS of the HSRT system that would connect West Los Angeles via LAUPT to Ontario Airport. It is a component of an 81-mile corridor between LAX and the San Bernardino Airport. In selecting the IOS, SCAG considered the RTP performance measures, stakeholder support and environmental issues. At the same time, SCAG's Regional Council approved the advance planning of the LAX to Palmdale corridor and Los Angeles to Orange County corridor (Orangeline).

The feasibility studies for the four corridors demonstrated that the HSRT system could be constructed and deployed through a public-private partnership

AR0072518

structure administered through a public agency, a joint powers authority (JPA), a public nonprofit (PNP), or a public-private partnership (PPP) format using a number of innovative and traditional funding mechanisms.

A JPA is in the process of being formed for the express purpose of implementing the IOS (West Los Angeles/LAX to Ontario Airport). Voting members of the yet-to-be-named JPA are the City of Los Angeles, the City of West Covina, and the City of Ontario. SCAG would be one of several non-voting members of the JPA.

TABLE 3.8 2008 RTP REGIONAL HSRT MILESTONES

Milestone	Capital Cost (in nominal dollars, billions)	Implementation Schedule*
IOS: Ontario – West Covina-LA Union Station – West LA/LAX	$19	2020
IOS extension to San Bernardino	$3.5	2020
San Pedro Ports to the IOS	$18	2020
Anaheim - Ontario	$6.7	2020
California High-Speed Train (Union Station - Anaheim)	$4.0**	2020

** Represents the network year for which a project was analyzed for the RTP modeling and regional emissions analysis.*
*** Assumes cost covered by state HSRT Bond Act. State bond revenues for HSRT are not included in the regional revenue forecast.*

Implementation and operation of the HSRT is being proposed on the basis of a business plan approach whereby it will be largely self-financed based on the goods movement, aviation, and commuter operations. The use of public rights-of-way is a critical component of the system as is some level of financial commitment from the public sector. The net performance of the HSRT will be further bolstered by related development in real estate property. A business and institutional structure for the movement of goods, movement of people, and associated development patterns has been developed by SCAG to serve as the basis for implementation of the movement systems.

The HSRT would enhance airport access and connections between regional airports by allowing passengers to bypass the congested highway network. It is envisioned that the HSRT would serve as the basis for a regional airport system and aviation system users would become a key component of HSRT passenger ridership.

Next Steps:

- Prepare preliminary engineering for the Ontario – West Covina-LA Union Station – West LA/LAX IOS for the purpose of preparation of the federal Environmental Impact Statement (EIS) and/or State Environmental Impact Report (EIR) to a level necessary for public-private investment.
- Form a Joint Powers Authority (JPA) for the IOS, and market projects to public-private stakeholders.
- Secure federal, state and local funds to supplement private investment to complete deployment of the IOS and coalesce community support
- Seek legislative support at the regional, state and federal levels for the HSRT deployment
- Continue working on public-private partnerships (PPP) to fund HSRT projects and to fast-track institutional issues

Anaheim-Ontario Maglev Segment

The California-Nevada Super Speed Train Commission (CNSSTC) was formed in 1988 to promote the development of, and issue a franchise to build, a superspeed train system connecting Las Vegas with Anaheim and other points in Southern California. In 1991 the Commission selected Transrapid International (TRI) Maglev technology for the corridor.

The critical segment of this route for Southern California is the Anaheim to Ontario Airport link. This would further the airport decentralization strategy for the region and provide a viable transit system to help mitigate transportation congestion/pollution caused by the jobs/housing imbalance between Orange and Riverside Counties.

AR0072519

AR0072520

EXHIBIT 3.8 PROPOSED HIGH-SPEED REGIONAL TRANSPORT SYSTEM

Source: Southern California Association of Governments, ESRI StreetMap USA, TeleAtlas

AR0072521

According to a feasibility study done by CNSSTC in 2000, the Anaheim to Ontario Airport segment will be 32 miles long and take 14.5 minutes with no stops between the two end points and 18 minutes with a station stop mid-route. The capital cost is estimated at $6.7 billion. Annual ridership projections are 13.9 million passengers per year (approximately 38,000 riders per day) with 10-minute headways.

It is not yet determined whether the primary route for this segment will be in the SR-91 corridor or the SR-57. These routes need to be re-examined in future feasibility and planning studies. For modeling purposes, the SR-91 corridor was the selected route.

CNSSTC is seeking funding for future studies and construction of the project from the U.S. federal government.

In 2002, the Western States Maglev Alliance was formed between SCAG and the California-Nevada Super Speed Train Commission and was approved by the Regional Council. As a result of this alliance, the Plan supports continued analysis of the proposed Las Vegas to Anaheim Maglev, especially the segment from Anaheim to Ontario.

California High-Speed Train

Established in 1996, the California High-Speed Rail Authority (CHSRA) is charged with planning, designing, constructing, and operating a high-speed steel wheels on steel rails train system. The financing plan is to pass statewide bonds to pay for the capital infrastructure. The first bond to fund the project is $9.95 billion and is currently on the ballot for November 2008.

The proposed system stretches from San Francisco, Oakland and Sacramento in the north -- with service to the Central Valley -- to Los Angeles and San Diego in the south. With bullet trains operating at speeds up to 220 mph, the express travel time from downtown San Francisco to Los Angeles is just under 2 ½ hours. Intercity travelers (trips between metropolitan regions) along with longer-distance commuters would enjoy the benefits of a system designed to connect with existing rail, air and highway systems.

In the SCAG Region there is a planned 210 miles of rail. One line covers 30 miles from Orange County to Union Station and the other from Union Station veering east to Riverside and then down Interstate 15 (I-15) to San Diego. Northbound from Union Station, the route heads through Burbank to Palmdale and then to the Central Valley. If built out, the state system is planned to connect up with SCAG's HSRT system in Palmdale, Union Station and Ontario. Funding ($7 million) to begin a project-specific EIR/EIS in the Union Station to Orange County segment in the LOSSAN corridor is being provided to CHSRA from OCTA.

SPOTLIGHT ON GOODS MOVEMENT

The goods movement strategies identified in the 2008 RTP merit a focused discussion because of the critical and far-reaching impacts on our region's transportation system, economy, and public health. The goods movement sector of transportation is growing at a tremendous pace and will continue to do so over the time frame of the RTP. The San Pedro Bay Ports (Port of Los Angeles and the Port of Long Beach) forecast that by 2030 container volume could triple. The productivity gains that are realized by Southern California's geographical advantage and the extraordinary logistics network of ports, warehouses and distribution systems are the primary reasons for this growth.

Cross-border trade activity also contributes to the region's international trade growth. The growth in the manufacturing industry in Mexico has increased truck trips through Calexico East in Imperial County by 77 percent between 1994 and 2005. Also, the Port of Hueneme plays an important role in facilitating the movement of goods. Approximately $7 billion in cargo traverses through the Port annually, and trade-related activity generated by the Port contributes significantly to the local economy.

To continue to provide this critical service, a combination of federal, state, local and private investment is needed. The 2008 RTP calls for approximately $13 billion in freight rail investments, nearly $18 billion in a freight HSRT system, and over $5 billion in highway investments to enable the region to handle the dramatic growth in goods movement. Rail investments consist of

AR0072522

additional mainline capacity, grade separations, and locomotive engine upgrades. About half of the rail-related investments are for highway-rail grade separations, which reduce traffic congestion, improve safety, and reduce pollution. Highway investments include the first phase of a dedicated, toll clean technology truck lane system and truck climbing lanes. Additionally, the proposed alternative technology system for freight includes a shared guideway with passenger vehicles. Service would be operating between passenger intervals, effectively utilizing the available capacity of the system (see Exhibit 3.8).

An essential element of improving the region's goods movement system is reducing its current and long-term impacts on public health and the environment. Accordingly, the 2008 RTP includes investments that integrate air quality mitigation into the goods movement system improvements. Substantial air quality benefits can be realized by accelerating fleet modernization with cleaner technologies.

Further, this Plan maximizes the utilization of the scarce land area near the ports, includes the development of inland port capacity, and has dedicated ground access systems that enable the region to protect communities and meet demand. Specific elements of this Plan are described in the following sections.

PORT ACCESS IMPROVEMENTS

Port access improvements include short-term initiatives to improve access to Terminal Island and to remove bottlenecks to truck movements. They include the replacement of the Gerald Desmond Bridge, SR-47 Truck Expressway/Heim Bridge replacement, I-110/SR-47 Connectors Improvement Program, and the SR-47/Navy Way Interchange. These projects are programmed over the short-term in the 2006 RTIP.

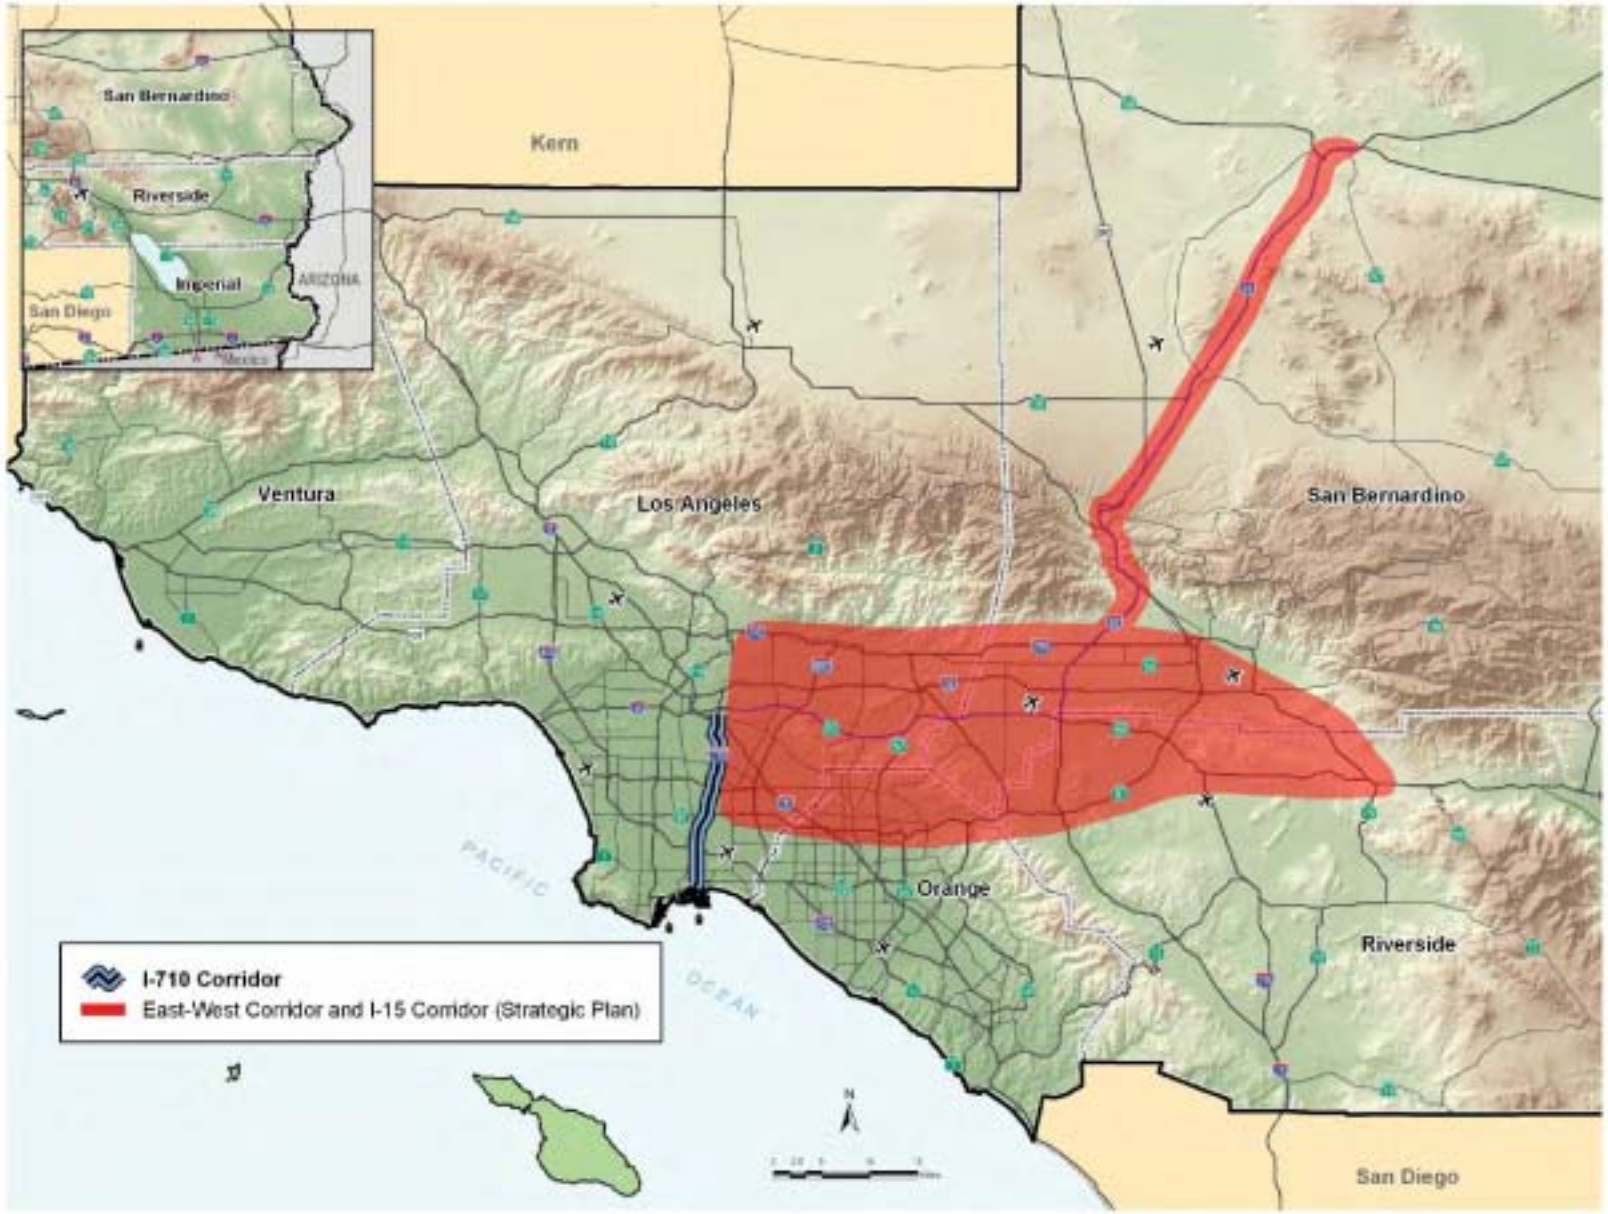
To provide for the landside port access improvements in Imperial County, the 2006 RTIP includes the Brawley Bypass project, which is a four-lane expressway connecting SR-78 and SR-111. The completion of the project will provide continuity between the California/Baja California border to Riverside County, ensuring smooth and reliable movement of goods through the border.

DEDICATED LANES FOR CLEAN TECHNOLOGY TRUCKS

Over the past several RTP updates, the region has been exploring dedicated truck-lane facilities and continues to refine the concept of such user-supported corridors to improve the flow of goods. More recent effort has focused on adding dedicated truck lanes for clean technology vehicles along truck-intensive corridors in Southern California. Operationally, such a corridor would be aligned to connect freight-intensive locations such as the Ports, warehousing/distribution center locations, and manufacturing locations. These dedicated

AR0072523

EXHIBIT 3.9 DEDICATED LANES FOR CLEAN TECHNOLOGY TRUCKS



Source: Southern California Association of Governments, ESRI StreetMap USA, Teleatlas

AR0072524

facilities would have fewer entrance/egress locations than typical urban interstates to smooth the flow of goods.

This proposal has the potential to relieve many of the negative truck impacts in Southern California such as recurrent delay, pavement deterioration, safety, emissions, and design deficiencies. Dedicated truck lanes would also increase reliability in the freeway system. Despite these benefits, substantial financial constraints as well as environmental impact considerations could hinder project implementation. Recognizing these challenges, the 2008 RTP funds the I-710 segment as the first phase of a comprehensive system that addresses truck-related issues in the region (Exhibit 3.9). This segment includes roughly 78 lane-miles (two lanes in each direction) of dedicated lanes for clean technology trucks along alignments extending from Ocean Blvd. in Long Beach to the intermodal railroad yards in Vernon/Commerce. This represents an investment of over $5 billion.

The region's longer-term strategic vision would include an east-west corridor and the I-15 freeway, serving strategic distribution centers in Barstow. Major corridor studies have already been completed for I-710, SR-60, and I-15. An EIR/EIS and preliminary engineering are currently underway for I-710. The technical analysis for the 2008 RTP assumes the implementation of dedicated lanes accommodating clean technology vehicles along the I-710 corridor until a preferred alternative is identified by the EIR/EIS.

REGIONAL FREIGHT RAIL INVESTMENT AND EMISSION REDUCTION PACKAGE

Recent projections included in SCAG's *Inland Empire Railroad Main Line Study* suggest that the number of freight trains on most BNSF and UP lines will more than double between 2000 and 2025 in response to a tripling of container volumes at the San Pedro Bay Ports. Passenger train volumes are expected to experience similar volume growth.

The UP and BNSF mainlines east of downtown Los Angeles will reach capacity before the end of the decade and will need to be triple-tracked or even quadruple-tracked in some segments. Investments in the 2008 RTP include $3.2 billion for mainline rail capacity improvements, $6.0 billion to build an estimated 131 highway-rail grade separations east of downtown Los Angeles, and a total of $3.8 billion for accelerating upgrades to cleaner diesel locomotive engines—namely, Tier 4 engines.

AR0072525

In March of 2007, the US Environmental Protection Agency (EPA) proposed new standards to reduce emissions from diesel locomotives: Tier 3 and Tier 4 exhaust emission standards for newly built engines with high-efficiency catalytic after-treatment technology. Tier 3 engines will be available in 2009 and the associated estimated reduction in emissions is less than 50 percent of current conditions. The reduction in emissions from Tier 4 engines is estimated at 90 percent of current conditions. The 2008 RTP assumes nearly $2 billion in federal EPA funding to accelerate the deployment of Tier 4 engines in the region.

Exhibit 3.10 shows planned projects for regional rail capacity enhancement in Southern California. Most of the BNSF system south and west of Colton Crossing will need additional track by 2025, and several of these segments will require additional track as soon as 2010. By 2025 this line will require grade-separated crossings at junctions where the two railroads have lines crossing. North of Colton Crossing over the Cajon Pass to Barstow substantial additional mainline capacity will be needed by 2010 as well as new connections to the system. In the UP system, most of the Yuma line will require double-tracking by 2025 and the San Gabriel line may require double-tracking over major segments during the same time frame. Also by 2025, UP will require several grade-separated junctions.

Exhibits 3.11, 3.12, 3.13, and 3.14 show the grade separation projects by county planned in the region. Stakeholder agencies throughout the region have identified priority grade separations that were analyzed in the Inland Empire Railroad Main Line Study and it was determined that without additional grade separations, motor vehicle delay at grade crossings will more than triple between 2000 and 2025. Analysis of vehicle delay from high-priority grade separations shows that these could reduce growth in vehicle hours of daily delay (VHDD), cutting delay in half by 2025. This will reduce motor vehicle idling delay and associated idling emissions, and by increasing train speeds, will reduce train emissions through more efficient operations.

ALTERNATIVE TECHNOLOGY-BASED GOODS MOVEMENT/LOGISTICS

The region is also exploring new alternative technology-based systems that can provide greater throughput and reliability with near zero emissions (the emissions would be only those associated with electricity generation). A recent

AR0072531

analysis carried out by the IBI Group considered the application of an HSRT system for the movement of containers (logistics and systems technology) to and from the San Pedro Bay Ports. This container movement system would provide a high-capacity, fast, and efficient method of moving containerized cargo from the Ports to an inland port facility in San Bernardino. The system capitalizes on the inherent savings of multiple uses on a single infrastructure by operating on shared alignments with the HSRT passenger system. The technology permits operation of HSRT freight vehicles on a shared guideway with passenger vehicles even during peak hour service. Freight vehicle trips can be interspersed with passenger trips while still meeting required passenger vehicle headways. Additionally, full utilization of the freight line can be achieved during the passenger system's off-peak hours. The deployment of the HSRT system would create value in associated components which could in turn contribute to the HSRT's total financial performance.

The connection for the HSRT system would begin at the Ports and join up with the IOS2 at a point just east of LAUPT. This alignment runs north-south and is assumed to follow a route parallel to the I-710/Alameda Corridor. After connecting to the IOS and other segments, the freight-only service would be interspersed with passenger service.

As Table 3.9 shows, current estimates indicate that the HSRT container movement system is capable of moving over 9.2 million Twenty-foot Equivalent Units (TEUs) annually. The total freight component is estimated to cost nearly $18 billion in nominal dollars.

For a more detailed discussion of the regional HSRT system and associated documentation on its financial performance, refer to the supplemental HSRT Report. Critical to the implementation of an alternative technology system, such as this HSRT system, the location of inland port facilities and associated costs need to be further evaluated. The development of inland ports served by the system would reduce truck VMT, lower emissions, and encourage efficient patterns of industrial development and land use.

[1] Initial Operating Segment, or IOS, is discussed in further detail in the supplemental HSRT Report and Appendices.

Mitigating Environmental Impacts

California law requires SCAG to prepare and certify a Program Environmental Impact Report (PEIR) prior to adopting the RTP. The PEIR evaluates the environmental impacts of the RTP and proposes specific measures to mitigate impacts to the maximum extent feasible. Although the 2008 RTP, in and of itself, is a plan to mitigate the transportation-related effects of population growth, such as traffic congestion and poor air quality, because the transportation improvements can result in additional growth, the PEIR goes further by recommending additional environmental mitigation at the program level for those resource areas that would be affected by the Plan (and associated growth) such as land use, open space, biological resources, water and energy. The section below summarizes the mitigation program. A list of all the mitigation measures included in the 2008 RTP PEIR will be included in the Environmental Mitigation Report of the Final 2008 RTP.

The general purpose of the mitigation measures included in the PEIR and summarized below, is to identify how to protect the environment, improve air quality, and promote energy efficiency in concert with the proposed transportation improvements and related planning. They provide a framework through which implementing agencies and subregions can address the environmental impacts of RTP projects, while implementing RTP goals and policies. The PEIR provides three different types of mitigation measures. The first type can be implemented by SCAG at the regional level. These measures are generally aimed at gathering additional information that can assist in measuring impacts and determining appropriate mitigation and promoting policies that reduce impacts. The second type of measures are to be implemented at the local level by implementing agencies, and individual cities and counties. These measures can strengthen planning documents to ensure for provision of mitigation in the planning process. The third type of measures are project specific and seek to reduce impacts for the myriad different types of projects anticipated in the region. As a programmatic document, many of the measures in the PEIR refer to performance standards because site-specific conditions are not reasonably evaluated at the programmatic level.

AR0072534

Summary of the Environmental Mitigation Program

As required by SAFETEA-LU, the RTP includes an environmental mitigation program that links transportation planning to the environment. Building on its strong commitment to the environment as demonstrated in the 2004 PEIR, SCAG's mitigation program creates an implementation strategy to show varying levels of authority (state, regional, and local). This mitigation discussion also utilizes documents created by the federal agencies to guide environmental planning for transportation projects.

OPEN SPACE

Section 6001(i) of SAFETEA-LU requires that long-range transportation plans such as the RTP include a discussion of potential environmental mitigation activities along with potential sites to carry out these activities. As a result of this expanded requirement, SCAG enhanced its Open Space Program to evaluate potential sites to mitigate the impacts associated with transportation activities. The RTP includes two regional scale maps (Exhibits 3.15 and 3.16) that identify sensitive environmental resources, such as protected lands and sensitive habitats. As part of the open space planning effort undertaken for the Regional Comprehensive Plan, SCAG completed a comprehensive evaluation of open space resources in the region, including Kern and San Diego Counties. SCAG collected GIS data from existing sources to assist with and inform the evaluation of open space planning issues. SCAG then evaluated and analyzed the data to show the distribution of existing open space resources, levels of existing and planning protection, and areas of key habitat linkages. Concurrent with this mapping effort, and as required under SAFETEA-LU, SCAG reviewed existing plans and programs to determine which areas were covered by conservation strategies.

According to the Federal Highways Administration, there are more than 3.9 million centerlane miles of public roads that span the United States. Each day, an estimated one million animals are killed on roads, making road kill the greatest human cause of wildlife mortality in the country. The open space program seeks to minimize transportation-related impacts on wildlife, and also better integrate transportation infrastructure into the environment.

Locations for Mitigation

Exhibit 3.15 shows the distribution of protected and unprotected lands within the SCAG Region and its vicinity. It also shows the location of county-level conservation efforts such as Habitat Conservation Plans (HCPs) and Natural Communities Conservation Plans (NCCPs). Although portions of these areas fall within the "protected" category, large portions of habitat within these areas remain "unprotected" and therefore should still be considered for mitigation activities. Beyond looking at just protected and unprotected lands, SCAG mapped locations of the protected and unprotected areas in relation to wildlife linkages, linkage design areas, park and recreation areas (from SCAG's 2005 land use inventory), agricultural lands, and developed lands. Together, these form the region's open space infrastructure. Exhibits 3.15 and 3.16 demonstrate areas where project sponsors should consider directing mitigation activities. Specifically, those areas that are "unprotected" could be possible locations for mitigation. Although SCAG does not have the authority to purchase or manage lands, conservation of these areas will be achieved through already-established programs or through compacts facilitated by SCAG.

Types of Mitigation Activities

The mitigation program of the 2008 RTP generally includes strategies to reduce impacts where transportation and sensitive lands intersect and also encourages smart land use strategies that maximize the existing system and eliminate the need for new facilities that might impact open space and habitat. Potential mitigation programs include better planning of transportation projects to avoid or lessen impacts to open space, recreation land, and agricultural lands through information and data sharing, increasing density in developed areas, and minimizing development in previously undeveloped areas that may contain important open space.

AR0072535

The mitigation program also emphasizes the importance of integrating consideration of wildlife and habitat into the design of transportation facilities in those areas where impacts cannot be avoided. SCAG encourages project sponsors to review Ventura County's Wildlife Crossing Guidelines and FHWA's Critter Crossings. Both documents provide examples of context-sensitive solutions (CSS) which is a way of involving all stakeholders to develop transportation facilities that fit their physical setting and preserve scenic, aesthetic, historic and environmental resources, while maintaining safety and mobility. CSS is an approach that considers the total context within which a transportation improvement project will exist. CSS principles include the employment of early, continuous, and meaningful involvement of the public and all stakeholders throughout the project development process. Additional information on CSS is available on FHWA's website at: http://www.fhwa.dot.gov/context/index.cfm

In summary, the open space mitigation programs include the following types of measures:

- Identifying open space areas that can be preserved and developing mitigation measures such as mitigation banking, transfer of development rights (for agricultural lands), and payment in lieu of fees
- Updating General Plan information from cities to provide the most recent land use data to the region
- Coordinating with cities and counties to implement growth strategies that maximize the existing transportation network
- Evaluating project alternatives and alternative route alignments where projects intersect with sensitive habitats
- Integrating the planning of transportation facilities with context-sensitive design elements such as wildlife crossings

ENERGY

As the region continues to add more people, households and jobs, the demand for energy will continue to grow. Every day, the SCAG Region consumes over 23 million gallons of oil and the SCAG Region's vehicle fuel consumption has increased 20 percent over the last ten years.[1] In the face of this growth in energy demand and concerns about future oil supplies, there is the mounting realization that we are living in an energy-constrained world. As such, the 2008 RTP includes strategies to reduce Vehicle Miles Traveled (VMT), and as a result, per capita energy consumption from the transportation sector. The PEIR also includes mitigation measures relating to energy designed to reduce

[1] California Department of Transportation, Division of Transportation System Information. (December 2006.) California Motor Vehicle Stock, Travel and Fuel Forecast.

AR0072536

consumption and increase the use and availability of renewable sources of energy in the region.

The mitigation program in the PEIR generally includes opportunities to reduce petroleum vehicle fuel consumption and increase energy efficiency in the region. Potential mitigation programs include coordinating transportation, land use and air quality planning to reduce VMT, energy use and greenhouse gas emissions as well as increasing automobile fuel efficiency and construction of infrastructure to accommodate increased use of motor vehicles powered by alternative fuels. In California, efforts are underway to reduce petroleum use, reduce emissions from light-duty vehicles, reduce the carbon intensity of fuels, improve transportation energy efficiency, and encourage smart land use and intelligent transportation strategies.

In addition to transportation strategies, building design and housing types also have a strong relationship to energy use and efficiency. The mitigation program generally includes energy-efficient building practices, smarter land use planning with a focus on access to public transportation, and participation in energy efficiency incentive programs. All publicly owned utilities and most municipality-owned utilities that provide electric or natural gas service also administer energy conservation programs. These programs typically include home energy audits; incentives for replacement of existing appliances with new, energy-efficient models; and provision of resources to inform businesses on development and operation of energy-efficient buildings.

In summary, the energy mitigation program includes the following types of measures:

- Considering best practices and technological improvements that can reduce the consumption of fossil fuels such as modernizing older engines and equipment
- Developing programs to reduce single-occupancy vehicle trips such as telecommuting, ridesharing, alternative work schedules, and parking cash-out (offering employees a cash allowance in lieu of a parking space)
- Creating communities where people live closer to work, bike, walk, and take transit as a substitute for personal auto travel
- Integrating green building measures into project design and zoning such as those identified in the U.S. Green Building Council's Leadership in Energy and Environmental Design, Energy Star Homes, Green Point Rated Homes, and the California Green Builder Program

As stated above, energy experts have suggested that there is a potential for energy demand to exceed supply. Recommendations to reduce energy consumption are included in the EIR as mitigation measures. Over the next RTP planning cycle, as technology evolves, SCAG will continue to refine recommendations to reduce regional energy consumption.

AIR QUALITY AND CLIMATE CHANGE

The 2008 RTP includes programs, policies and measures to address air emissions including greenhouse gases. Measures that help mitigate air emissions, including GHG emissions, are comprised of strategies that reduce congestion, increase access to public transportation, improve air quality, and enhance coordination between land use and transportation decisions. SCAG's vision includes the introduction of a high-speed, high-performance regional transport system that may potentially reduce airport and freeway congestion and provide an alternative to the single-occupancy automobile. In order to disclose potential environmental effects of the RTP, SCAG has prepared an estimated inventory of the region's existing GHG emissions, identified mitigation measures, and compared alternatives in the PEIR. The mitigation measures seek to achieve the maximum feasible and cost-effective reductions in emissions. There are difficulties in quantifying reductions in GHG emissions due to insufficient data. During the next RTP cycle, SCAG will focus on refining techniques to better estimate emission reductions associated with identified mitigation measures.

The air quality mitigation program includes, but is not limited to, the following types of measures:

AR0072537

- ARB measures that set new on-road and off-road engine standards and accelerate turnover of higher emitting engines from the in-use fleet;
- Project specific measure to reduce impacts from construction activities such as the use of water and dust suppressants and restrictions on trucks hauling dirt, sand and soil.
- Encouragement of green construction techniques such as using the minimum amounts of GHG emitting construction equipment; and
- Incorporating planting of shade trees into construction projects where feasible

In addition, the RTP includes Transportation Control Measures (TCMs), which are those projects that reduce congestion and improve air quality in the region.

TRANSPORTATION

The 2035 transportation model takes into account the population, households, and employment projected for 2035, and therefore the largest demand on the transportation system expected during the lifetime of the 2008 RTP. In accounting for the effects of regional population growth, the model output provides a regional, long-term and cumulative level of analysis for the impacts of the 2008 RTP on transportation resources. The regional growth and thus cumulative impacts are captured in the VMT, VHT, and heavy-duty truck VHT data.

Implementation of the 2008 RTP would include implementation of a series of projects which are described in the Regional Transportation Plan. The 2035 transportation system performance is compared to the performance of the existing (2008) system for the purpose of determining the significance of impacts.

The transportation mitigation program includes the following types of measures:

- Increasing rideshare and work-at-home opportunities to reduce demand on the transportation system
- Investments in non-motorized transportation and maximizing the benefits of the land use-transportation connection
- Travel Demand Management (TDM) measures
- Goods movement capacity enhancements
- Key transportation investments targeted to reduce heavy-duty truck delay

POPULATION AND HOUSING

Transportation projects including new and expanded infrastructure are necessary to improve travel time and can enhance quality of life for those traveling throughout the region. However, these projects also have the potential to induce population growth in certain areas of the region. Although SCAG does not anticipate that the RTP would affect the total growth in population in the region, the RTP has the ability to affect the distribution of that growth. In addition to induced population growth, transportation projects in the RTP

AR0072538

also have the potential to divide established communities, primarily through acquisition of rights-of-way.

The population and housing mitigation program includes the following types of measures:

- Develop advisory land use policies and strategies that utilize the existing transportation network and enhance mobility while reducing land consumption
- Require project implementation agencies to provide relocation assistance, as required by law, for residences and businesses displaced
- Require project implementation agencies to design new transportation facilities that consider existing communities

LAND USE

The 2008 RTP contains transportation projects to help more efficiently distribute population, housing, and employment growth. These transportation projects are generally consistent with the county- and regional-level general plan data available to SCAG. However, general plans are not updated consistently. In addition, the RTP's horizon year of 2035 is beyond the timeline of even the most recent general plans.

The land use mitigation program includes the following types of measures:

- Encourage cities and counties to update their general plans and provide the most recent plans to SCAG
- Work with member cities to ensure that transportation projects are consistent with the RTP and general plans
- Work with cities and counties to ensure general plans reflect RTP policies

AESTHETICS

The SCAG Region includes several highway segments that are recognized by the State of California as designated scenic highways or are eligible for such designation. Construction and implementation of projects in the RTP could impact designated scenic highways and restrict or obstruct views of scenic resources such as mountains, ocean, rock outcroppings, etc. In addition, some transportation projects could add urban visual elements, such as transportation infrastructure (highways, transit stations) to previously natural areas.

In summary, the aesthetics mitigation program includes the following types of measures:

- Require project implementation agencies to implement design guidelines to protect views of scenic corridors
- Require project implementation agencies to use construction screens and barriers that complement the existing landscape
- Require project implementation agencies to complete design studies for projects in designated or eligible scenic highways
- In visually sensitive areas, require local land use agencies to apply development standards and guidelines that maintain compatibility

PUBLIC SERVICES

Impacts to public services from the 2008 RTP generally include additional demands on fire and police services, schools and landfills. Additional police and fire personnel would be needed to adequately respond to emergencies and routine calls, particularly on new or expanded transportation facilities. The 2008 RTP's influence on growth could contribute to impacts on public schools, requiring additional teachers and educational facilities. Additional population growth could result in a greater demand for solid waste disposal facilities. Furthermore, collecting solid waste and transporting it to an available disposal facility would impact roads and railways.

AR0072539

In summary, the public services mitigation program includes the following types of measures:

- Require the project implementation agencies to identify police protection, fire service, emergency medical service, waste collection and public school needs and coordinate with local officials to ensure that the existing public services would be able to handle the increase in demand for their services
- Require the project implementation agencies to identify the locations of existing utility lines and avoid all known utility lines during construction
- Encourage green building measures to reduce waste generation and reduce the amount of waste sent to landfills
- Encourage the use of fire-resistant materials and vegetation when constructing projects in areas with high fire threat

BIOLOGICAL RESOURCES

Impacts to biological resources generally include displacement of native vegetation and habitat on previously undisturbed land; habitat fragmentation and decrease in habitat connectivity; and displacement and reduction of local, native wildlife including sensitive species. Building new transportation routes and facilities through undisturbed land or expanding facilities and increasing the number of vehicles traveling on existing routes will directly injure wildlife species, cause wildlife fatalities, and disturb natural behaviors such as breeding and nesting. This will result in the direct reduction or elimination of species populations (including sensitive and special-status species) and native vegetation (including special-status species and natural communities) as well as the disruption and impairment of ecosystem services provided by native habitat areas.

The biological resources mitigation program includes the following types of measures:

- Planning transportation routes to avoid/minimize removal of native vegetation, displacement of wildlife, and impacts to regionally and locally significant habitat types such as oak woodlands, vernal pools, estuaries, lagoons, and other riparian areas
- Including provisions for habitat enhancement such as mitigation banking, improving/retaining habitat linkages, preserving wildlife corridors and wildlife crossings to minimize the impact of transportation projects on wildlife species and habitat fragmentation
- Conducting appropriate surveys to ensure no sensitive species' habitat or special-status natural communities is unnecessarily destroyed
- Avoiding and minimizing impacts to wildlife activities (such as breeding, nesting, and other behaviors) during construction of the project by avoiding construction during critical life stages or sensitive seasons
- Avoiding and minimizing impacts to habitat during project construction through actions such as fencing off sensitive habitat, minimizing vehicular accessibility, and salvaging native vegetation and topsoil
- Minimizing further impacts to wildlife and their habitats after project construction by replanting disturbed areas; providing vegetation buffers at heavily trafficked transportation facilities; and restoring local, native vegetation

GEOLOGY, SOILS, AND SEISMICITY

Impacts to geological resources generally include the disturbance of unstable geologic units (rock type) or soils, causing the loss of topsoil and soil erosion, slope failure, subsidence, project-induced seismic activity and structural damage from expansive soils. These activities, in addition to building projects on and around Alquist-Priolo Fault Zones and other local faults, could expose people and/or structures to the risk of loss, injury, or death.

The geological mitigation program includes the following types of measures:

AR0072540

- Employing appropriate grading, construction practices, siting, and design standards, such as adherence to the California Building Code and State of California design standards
- Obtaining site-specific geotechnical data from qualified geotechnical experts
- Complying with all relevant local, state, and federal construction and design requirements for structures located on or across Alquist-Priolo Fault Zones and other local faults

CULTURAL RESOURCES

Impacts to cultural resources generally include substantial adverse changes to historical and archaeological resources and direct or indirect changes to unique paleontological resources or sites or unique geological features. Adverse changes include the destruction of culturally and historically (recent or geologic time) significant and unique historical, archaeological, paleontological, and geological features.

The cultural resources mitigation program includes the following types of measures:

- Obtaining consultations from qualified cultural and paleontological resource experts to identify the need for surveys and preservation of important historical, archaeological, and paleontological resources
- Implementing design and siting measures that avoid disturbance of cultural and paleontological resource areas, such as creating visual buffers/landscaping or capping/filling the site to preserve the contextual setting of the resource
- Monitoring construction activity in areas with moderate to high potential to support paleontological resources and overseeing salvage operations of paleontological resources
- Consulting local tribes and the Native American Heritage Commission for project impacts to sacred lands and burial sites

WATER RESOURCES

Impacts to water resources from the 2008 RTP include potential water quality impairment from increased impervious surfaces. Increased impervious surfaces in water recharge areas potentially impact groundwater recharge and groundwater quality. Cumulative impacts from the projected growth induced by the RTP include increased impervious surfaces; increased development in alluvial fan floodplains; and increased water demand and associated impacts, such as drawdown of groundwater aquifers. Increased output of greenhouse gases from the region's transportation system impacts the security and reliability of the imported water supply.

The water resources mitigation program includes the following types of measures:

- Utilizing advanced water capture and filtration techniques, showing a preference for naturalized systems and designs, to control stormwater at the source
- Avoiding any new construction of impervious surfaces in non-urbanized areas, such as wetlands, habitat areas, parks, and near river systems
- Avoiding any new construction that provides access to flood-prone areas, such as in alluvial fans and slide zones
- Protection and preservation of existing natural flood control systems, such as wetlands and riparian buffers, and expansion of such systems in areas where they do not currently exist
- Constructing projects according to Best Management Practices for water quality protection and water conservation, including low-impact development and green building standards

AR0072541

- Coordinating project development and construction efforts across jurisdictional, agency, and departmental boundaries, to increase project benefits

HAZARDOUS MATERIALS

Implementation of the 2008 RTP would affect the transportation and handling of hazardous materials in the SCAG Region. Expected significant impacts include risk of accidental releases due to an increase in the transportation of hazardous materials and the potential for such releases to reach neighborhoods and communities adjacent to transportation facilities.

The hazardous materials mitigation program aims to minimize the significant hazard to the public or the environment that involves the release of hazardous materials into the environment. Potential mitigation programs include active coordination with regulatory agencies and first responders in order to ensure proper handling and transport of hazardous materials and their containers. Mitigation measures also involve ensuring that the project implementation agency complies with all applicable laws, regulations, and health and safety standards set forth by federal, state, and local authorities that regulate the proper handling of such materials and their containers and that the routine transport, use, and disposal of hazardous materials does not create a significant hazard to the public or the environment.

The hazardous materials mitigation programs include the following types of measures:

- Coordinating with regulatory agencies and first responders in order to continue to govern goods movement and hazardous materials transportation throughout the region
- Considering existing and known planned school locations when determining the alignment of new transportation projects and modifications to existing transportation facilities
- Encouraging project sponsors to consider published lists of contaminated properties, which are continually updated, in order to identify cases where new development would involve the disturbance of contaminated properties
- Developing appropriate mitigation measures to assure that worker and public exposure is minimized to an acceptable level and to prevent any further environmental contamination as a result of construction
- Ensuring that project implementation agencies comply with all applicable laws, regulations, and health and safety standards set forth by federal, state, and local authorities that regulate the proper handling of such materials and their containers and that the routine transport, use, and disposal of hazardous materials does not create a significant hazard to the public or the environment

SAFETY AND SECURITY

The SCAG Region is vulnerable to numerous threats that include both natural and human-caused incidents. A large-scale evacuation would be difficult in the SCAG Region. Impacts to safety and security resulting from the 2008 RTP include: 1) impairment of transportation safety, security, and reliability for all people and goods in the region; 2) prohibiting the prevention, protection, response to, and recovery from major human-caused or natural events that would create a significant hazard to the public, threatening and impacting lives, property, the transportation network and the region; and 3) exposure of people or structures to a significant risk of loss, injury or death involving wildland fires. As such, the mitigation programs for Safety and Security in the 2008 RTP aim for extensive coordination, collaboration and flexibility among all of the agencies and organizations involved in planning, mitigation, response and recovery.

The Safety and Security mitigation programs include the following types of measures:

AR0072542

- Continuing deployment and promotion of intelligent transportation system technologies that enhance transportation security
- Establishing transportation infrastructure practices that promote and enhance security
- Establishing a forum where policy-makers can be educated and regional policy can be developed
- Helping to enhance the region's ability to deter and respond to terrorist incidents, and human-caused or natural disasters by strengthening relationships and coordination with transportation agencies
- Working to enhance emergency preparedness awareness among public agencies and with the public at large

NOISE

Some of the principal noise generators within the SCAG Region are associated with transportation (i.e., airports, freeways, arterial roadways, seaports, and railroads). Additional noise generators include stationary sources, such as industrial manufacturing plants and construction sites. Noise impacts resulting from the 2008 RTP generally include exposure of sensitive receptors to noise in excess of normally acceptable noise levels or substantial increases in noise as a result of the operation of expanded or new transportation facilities. As such, the noise mitigation program includes mitigation measures designed to minimize the impact of noise on sensitive receptors as a result of the implementation of the 2008 RTP.

These mitigation measures include ensuring that project implementing agencies comply with all local sound control and noise level rules, regulations, and ordinances; utilizing the best available noise control techniques (including mufflers, intake silencers, ducts, engine enclosures and acoustically attenuating shields or shrouds) in order to minimize construction noise impacts; and utilizing land use planning measures, such as zoning, restrictions on developments, buffers, etc., to minimize exposure to sensitive receptors.

The noise mitigation programs include the following types of measures:

- Encouraging project implementing agencies to comply with all local sound control and noise level rules, regulations, and ordinances
- Developing the best available noise control techniques in order to minimize construction noise impacts
- Conducting a project-specific noise evaluation as part of the appropriate environmental review of each project
- Encouraging project implementation agencies to maximize the distance between noise-sensitive land uses and new roadway lanes, roadways, rail, transit centers, park-and-ride lots, and other new noise-generating facilities

AR0072543

AR0072544

IV. FINANCIAL PLAN

The financial plan identifies how much money is available to support the region's surface transportation investments including transit, highways, local road improvements, system preservation and demand management goals. It also addresses the need for investment in goods movement infrastructure. Improving ground access in and around major goods movement facilities, and enhancing major highways and railways are critical to maintaining the health of Southern California's economy. The 2008 RTP calls for traditional and non-traditional revenue sources for implementing a program of infrastructure and environmental improvements to keep both freight and people moving.

The 2008 RTP financial plan identifies a number of new revenue sources to provide additional funding beyond existing transportation dollars. The SCAG region's financially constrained plan includes a core revenue forecast of existing local, state, and federal sources along with new funding sources that are reasonably available over the time horizon of the RTP. The plan also includes action steps to obtain the revenues necessary for implementing the region's transportation vision. The region has successfully secured the necessary resources to support transportation investments proposed in past RTPs and this plan will continue to meet the necessary milestones for implementation. Since 2002, three counties within the SCAG region (Riverside, San Bernardino, and Orange) reauthorized their local sales tax measures with overwhelming voter approval. More recently, the general electorate of California approved Proposition 1B, the Highway Safety, Traffic Reduction, Air Quality, and Port Security Bond Act of 2006, which provides $19.9 billion in infrastructure bonds for transportation improvements throughout the state. Additional legislative gains include the protection of Proposition 42 revenues (sales tax on gasoline) for transportation purposes with the passage of Proposition 1A.

In 2006, the State Legislature also reviewed the potential for using public-private partnerships to facilitate project delivery. With the passage of AB 1467 (Nunez, Chapter 32, Statutes of 2006), the state established a framework for moving forward with partnership demonstration projects. Further, AB 521 (Runner, Chapter 542, Statutes of 2006) clarified the State Legislature's role in evaluating partnership proposals, mandating that the Legislature can only disapprove of the proposals. AB 1467 authorizes two public-private partnerships related to goods movement in Southern California. The bill also authorizes the implementation of high-occupancy toll (HOT) lanes, which would allow the region to better utilize its High-Occupancy Vehicle (HOV) lanes and generate toll revenues. Recent passage of AB 1467 and AB 521 provides a sound basis for SCAG's 2008 RTP financial strategies.

In developing the financial plan, SCAG followed a few basic principles to guide its regional financial forecast:

- Incorporate financial planning documents developed by local county transportation commissions and transit operators in the region where available
- Ensure consistency with both local and state planning documents
- Utilize published data sources to evaluate historical trends and augment local forecasts as needed, and
- Recommend new funding sources that target beneficiaries of transportation investments

The rest of the plan outlines our financial strategies and provides documentation of the financial assumptions and methodologies used for forecasting revenues and expenditures.

The Economic Outlook

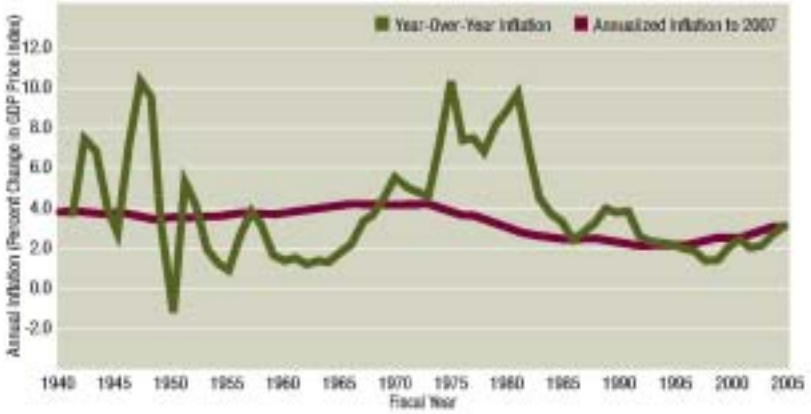
Overall economic conditions play a large role in determining the level of revenues available for transportation. Although it is difficult to predict the future, SCAG's financial model takes a conservative approach in forecasting the latter years of the RTP planning horizon. The approach also includes maintaining historical growth trends for key revenue sources, including locally generated sales tax revenues as well as both state and federal gas tax revenues.

AR0072546

INFLATION

The effect of inflation over a long-range plan is significant, particularly in the last few years when inflation has had nearly 30 years to erode the value of money. This causes both costs and revenues to be higher in nominal dollar terms. Figure 4.1 shows inflation trends since World War II as measured by the Gross Domestic Product (GDP) Price Deflator. Inflation has varied considerably over the long term, but has trended between 2 and 4 percent, as illustrated by the red line. In recent years, inflation has increased. SCAG's revenue model utilizes historical inflation trends as measured by the GDP Price Deflator – an approach consistent with that used by the Federal Office of Management and Budget in preparing the Budget of the United States Government. On the basis of this information, a 3.8 percent inflation rate is used to adjust revenue model data to nominal dollars (year-of-expenditure dollars).

FIGURE 4.1 HISTORICAL INFLATION TRENDS



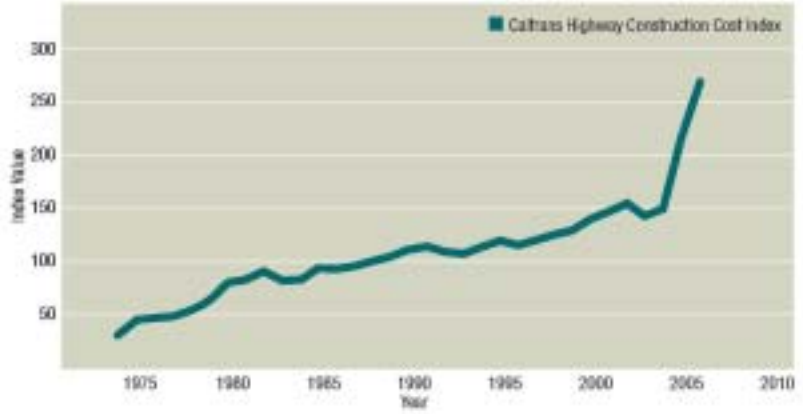
Source: Office of Management and Budget, Budget of the United States Government, Fiscal Year 2008 Budget (FY08).

CONSTRUCTION COST INCREASES

While revenues can be eroded by inflation, construction costs in California and the nation have escalated considerably over the last four years. This has been a major impediment to delivering transportation projects. The recent large increase in construction costs is due to a variety of factors, including a building boom and higher demand for commodities in developing countries, especially China with construction for the 2008 Olympics. Figure 4.2 shows the increase in California highway construction costs. It is unlikely that costs will continue to increase at a such a rapid rate in the future. The increase over the last few years is unprecedented. The financial plan uses a 5.3 percent annual inflation factor to estimate future, nominal costs.

AR0072547

FIGURE 4.2 HIGHWAY PROJECT COSTS



Source: California Department of Transportation

RETAIL SALES GROWTH

Available land, population increases, and new retail locations are the biggest contributors to growth in retail sales. According to statistics from the California Board of Equalization, retail sales grew by 2.3 percent in the SCAG region from FY1978 to FY2004, a period roughly equal in length to the 2008 RTP. Growth was uneven, ranging from 1.3 percent in Los Angeles County to 5.5 percent in Riverside County. The financial plan assumes that uneven growth will continue, with retail sales growth ranging from 1.2 to 4.7 percent.

FUEL CONSUMPTION

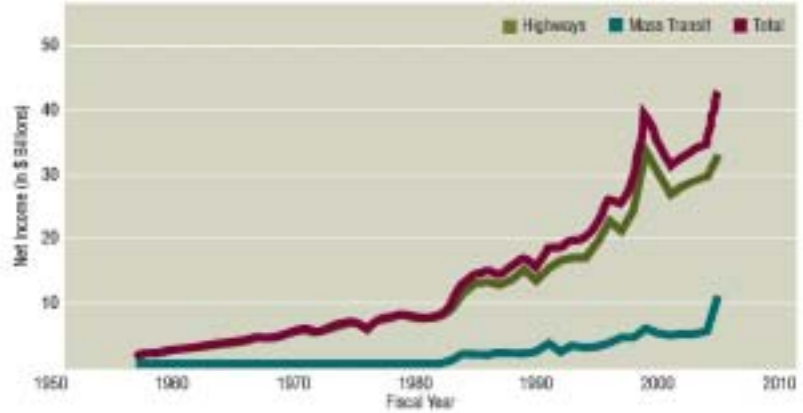
Taxes on gasoline and diesel fuels are the basis of many transportation revenue sources. These types of revenues are solely dependent on fuel consumption. Over the next several decades, fuel consumption will continue to be impacted by increases in vehicle-miles traveled, increases in conventional vehicle fuel economy, and the adoption of alternative fuel vehicles. While Caltrans estimates that fuel consumption statewide will increase by 1.7 percent between 2004 and 2030, the financial plan takes a more conservative approach and assumes that fuel consumption will not increase over the RTP planning horizon.

STATUS OF THE FEDERAL HIGHWAY TRUST FUND

The Federal Highway Trust Fund provides federal highway and transit funding from a nationally imposed 18.3-cent-per-gallon gasoline tax. The Federal Highway Trust Fund has grown by 3.4 percent annually due to historical increases in fuel consumption, but recently, a larger share is being devoted to transit, as shown in Figure 4.3.

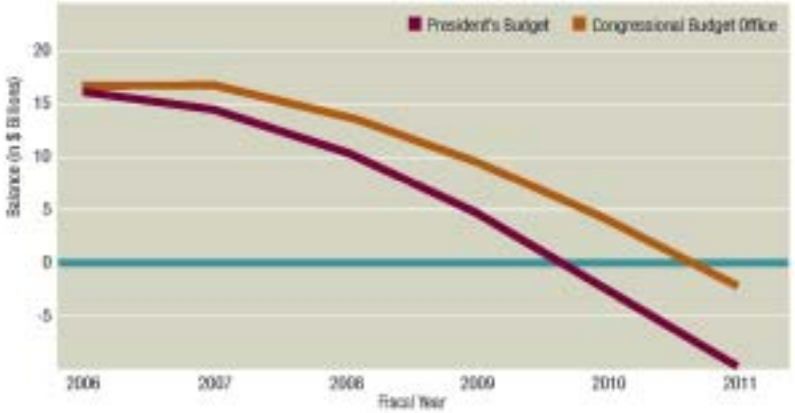
AR0072548

FIGURE 4.3 STATUS OF THE FEDERAL HIGHWAY TRUST FUND



Source: Federal Highway Administration, Federal Highway Statistics 2005

FIGURE 4.4 CURRENT HIGHWAY TRUST FUND YEAR-END BALANCE ESTIMATES



Source: United States Government Accountability Office, Highway Trust Fund: Overview of Highway Trust Fund Estimates, GAO Testimony Before the Subcommittee on Highways, Transit, and Pipelines, Committee on Transportation and Infrastructure, GAO-06-572T

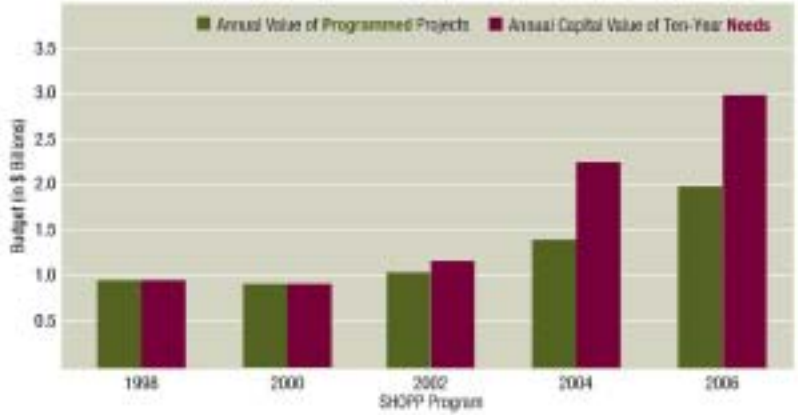
Many public officials and transportation professionals have become concerned about the health of the Federal Highway Trust Fund, as expenditures authorized under Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) have outstripped revenues generated by the tax. Figure 4.4 shows a chart from a recent Government Accountability Office (GAO) analysis of Federal Highway Trust Fund forecasts. Congressional leadership has shown concern over the problem and the SCAG 2008 RTP assumes that Congress will take action to ensure that the Highway Trust Fund maintains current funding levels.

STATUS OF THE STATE HIGHWAY ACCOUNT

The viability of the State Highway Account remains a critical issue. The state's gasoline tax revenues are now exclusively dedicated to funding the State Highway Operation and Protection Program (SHOPP). As shown in Figure 4.5, previous levels of funding have been considerably less than actual needs. Continued under investment in the rehabilitation and maintenance needs of the State Highway System has serious ramifications—rapidly increasing the number of distressed lane-miles on the State Highway System and eroding the condition of the state's bridges.

AR0072549

FIGURE 4.5 STATE HIGHWAY OPERATION AND PROTECTION PROGRAM



Source: California Department of Transportation, 2007 Ten-Year SHOPP Plan

Statewide, the 2007 Ten-Year SHOPP Plan identifies $4.2 billion in annual needs, while fiscally constrained funding plan for the next four years are only $1.9 billion annually. The RTP assumes that the State Legislature will address this need through an adjustment in the state gas excise tax and that other revenues will continue to be available for capital projects.

AIR QUALITY ATTAINMENT

Air quality determines the amount of Congestion Mitigation and Air Quality (CMAQ) funding available to the SCAG region. The 2008 RTP assumes that the region will be in attainment for a number of pollutants. It also assumes the severity level for other pollutants will lessen as of 2020. As a result, CMAQ funding is halved.

LOCAL SALES TAX MEASURES

Most of the counties in the SCAG region impose a local sales tax to fund transportation projects. Ventura County is the only county in the region without a dedicated sales tax. In recent years, several local sales taxes have been renewed and the 2008 RTP reflects these additional revenues:

- San Bernardino County renewed Measure I through 2040.
- Riverside County renewed Measure A through 2039.
- Orange County recently renewed Measure M through 2041.

Los Angeles County levies a permanent 1 percent tax (a combination of two half-cent sales taxes). In Imperial County, Measure D will expire in 2010. However, the 2008 RTP assumes an extension of Measure D as part of new revenue sources.

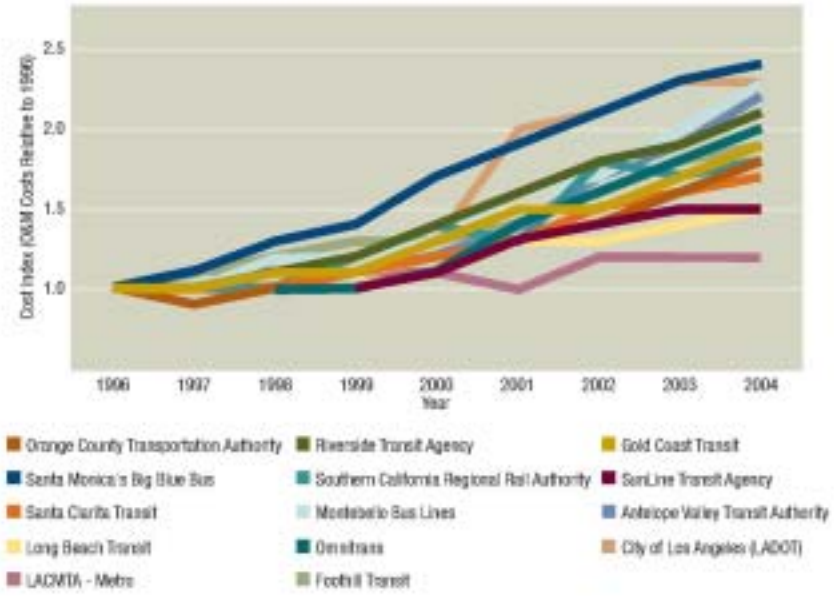
TRANSIT OPERATING AND MAINTENANCE (O&M) COSTS

Future transit O&M costs are difficult to predict because they depend on a variety of factors, such as future revenue-miles of service, labor contracts, and the age of rolling stock. The addition of new transit service and capital proj-

AR0072550

ects, such as the Mid-City/Exposition Corridor Light Rail Transit (LRT), can add to ongoing O&M costs. Over the last decade, these O&M costs grew 1 to 10 percent annually, depending on the transit operator (see Figure 4.6). Some of the differences in O&M growth are due to rapid expansion among the newer operators and outsourcing among the older operators.

FIGURE 4.6 GROWTH IN TRANSIT OPERATING AND MAINTENANCE COSTS



Source: SCAG Analysis of National Transit Database Statistics

For the 2008 RTP, transit O&M costs are estimated based upon historical increases:

- The regional average increase (4 percent) is used for most operators. This assumes that some of the extraordinary increases for individual operators due to rapid expansion will not continue into the future.
- For Los Angeles County, the financial plan relies on detailed forecasts from the county transportation commission. These forecasts are consistent with historical data and take into account large shifts in O&M costs due to major capital projects.

DEBT SERVICE

Local agencies in the SCAG region have historically relied on debt financing to ensure that revenues are available to meet the cash flow requirements of future expenditures. The Los Angeles County Metropolitan Transportation Authority (LACMTA - Metro) has a detailed county financial model that estimates debt service on a project basis. Other county transportation commissions prepare debt service forecasts for rating agencies and report current debt service in their comprehensive annual financial reports (CAFRs). The 2008 RTP includes all outstanding commitments and interest payments on future bonds and commercial paper. Issued debt is expected to remain under debt ceilings. For counties without an established policy, debt service is assumed to be constrained to 50 percent of revenues.

Definition of Revenue Scenarios and Expenditure Categories

CORE AND REASONABLY AVAILABLE REVENUE SCENARIOS

For the 2008 RTP, SCAG prepared two types of revenue forecasts. Both are included in the financially constrained plan:

- Core revenues
- Reasonably available revenues

The *core revenues* identified are those that have been committed or historically available for the building, operations, and maintenance of the current roadway and transit systems in the SCAG region. Essentially, these revenues are existing transportation funding sources projected to FY2036. The core forecast includes neither future increases in tax rates nor extensions of tax

AR0072551

measures beyond their expiration date—unless already approved through ballot initiatives. These revenues provide a benchmark from which additional funding can be identified.

The region's *reasonably available revenues* include new sources of transportation funding likely to materialize within the 2008 RTP time frame. These new sources include adjustments to state and federal gas tax rates based on historical trends, extension of a local option sales tax, localized value capture strategies, container fees, as well as passenger and commercial truck tolls for specified facilities. Reasonably available revenues also include innovative financing strategies, such as private equity participation. In accordance with federal guidelines, the plan includes strategies for ensuring the availability of these sources.

EXPENDITURE CATEGORIES

Transportation expenditures in the SCAG region can be summarized into three main categories:

- Capital costs for state highways, regionally significant arterials, local streets and roads, as well as transit
- Operating and maintenance costs for state highways, regionally significant arterials, local streets and roads, as well as transit
- Debt service payments for current and anticipated bond issuances

Core Revenues

A regional revenue model was developed to forecast the revenues over the entire RTP time horizon. The revenue model is detailed and supports analysis by county or funding source. The basic process for developing the revenue forecast is as follows:

- Build on the revenue forecasts provided by the county transportation commissions
- Add assumptions based on historical data
- Compare historical data to Short-Range Transit Plans and other agency documents
- Work with the transportation commissions to modify assumptions and forecasts as needed

The region's revenue forecast horizon for the 2008 RTP is FY2007 through FY2036. Consistent with federal guidelines, the 2008 RTP takes into account inflation and reports statistics in nominal (year of expenditure) dollars. Table 4.1 shows these core revenues in five-year increments by county.

TABLE 4.1 CORE REVENUE FORECAST FY 2007-2036 (IN NOMINAL DOLLARS, BILLIONS)

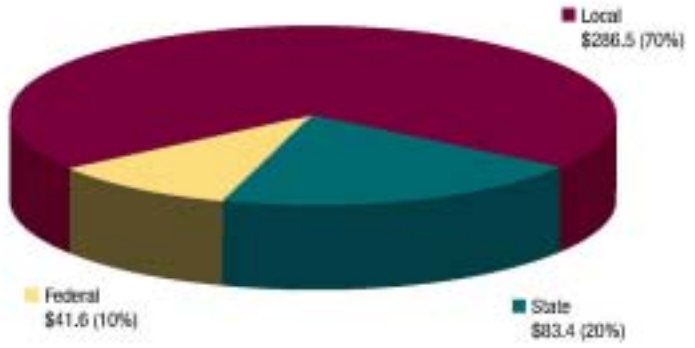
County	FY2007-11	FY2012-16	FY2017-21	FY2022-26	FY2027-31	FY2032-36	Total
Imperial	$0.4	$0.4	$0.3	$0.4	$0.4	$0.4	$2.3
Los Angeles	$29.1	$30.5	$32.8	$39.7	$45.3	$53.2	$230.6
Orange	$6.8	$7.8	$9.2	$11.5	$14.4	$17.9	$67.7
Riverside	$4.3	$5.3	$6.8	$9.0	$12.9	$18.5	$56.8
San Bernardino	$5.2	$5.7	$6.6	$7.1	$8.9	$11.4	$44.9
Ventura	$1.0	$1.1	$1.2	$1.5	$1.9	$2.4	$9.1
Total	**$46.8**	**$50.7**	**$56.9**	**$69.2**	**$83.8**	**$103.9**	**$411.4**

Note: Numbers may not add due to rounding.

As shown in Figure 4.7, the majority of revenues in the SCAG region come from local sources. The share of state sources (20 percent) has increased since the last RTP (15 percent) as a result of two propositions. Proposition 1A protects funding from the state gasoline sales tax, and Proposition 1B authorizes $19.9 billion in bonds over the next several years to fund existing and new statewide transportation-related infrastructure programs.

AR0072552

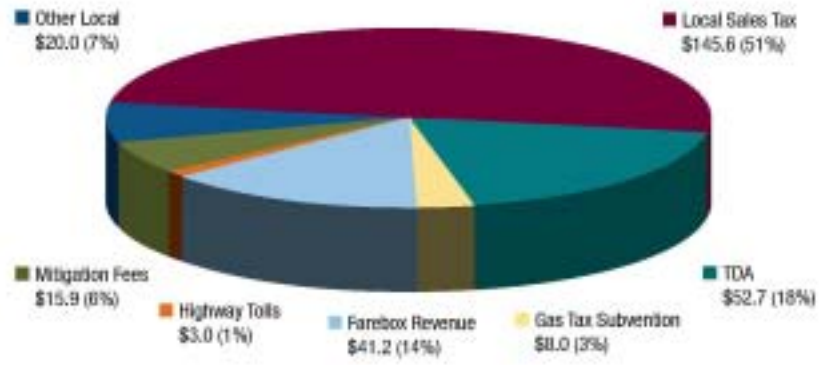
FIGURE 4.7 SCAG REGIONAL REVENUES (IN NOMINAL DOLLARS) $411.4 BILLION TOTAL



Source: SCAG Revenue Model 2007

Note: Numbers may not add due to rounding.

FIGURE 4.8 SCAG REGIONAL REVENUES, LOCAL SOURCES (IN NOMINAL DOLLARS) $286.5 BILLION TOTAL



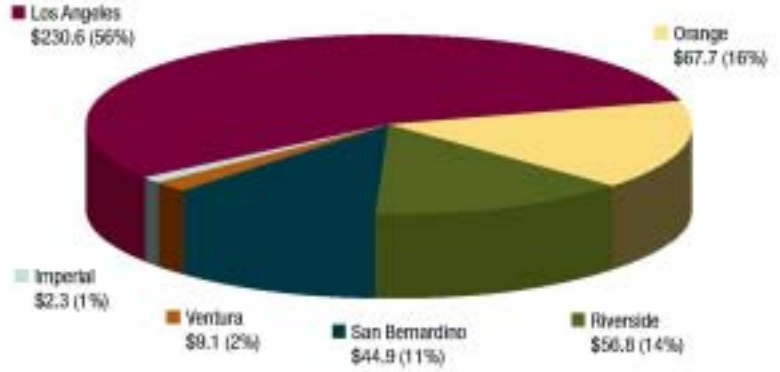
Source: SCAG Revenue Model 2007

Note: Numbers may not add due to rounding.

Local option sales taxes provide the largest single source of local funding as shown in Figure 4.8 and compose roughly a third (35.6 percent) of overall funding for the RTP. Local sales tax revenues have been boosted by the renewal of several local measures.

Specifically, sales tax extensions have significantly increased the funding available in San Bernardino and Riverside Counties and their shares of overall regional transportation revenues. Figure 4.9 shows the breakdown of revenues by county.

FIGURE 4.9 SCAG REGIONAL REVENUES BY COUNTY (IN NOMINAL DOLLARS) $411.4 BILLION TOTAL

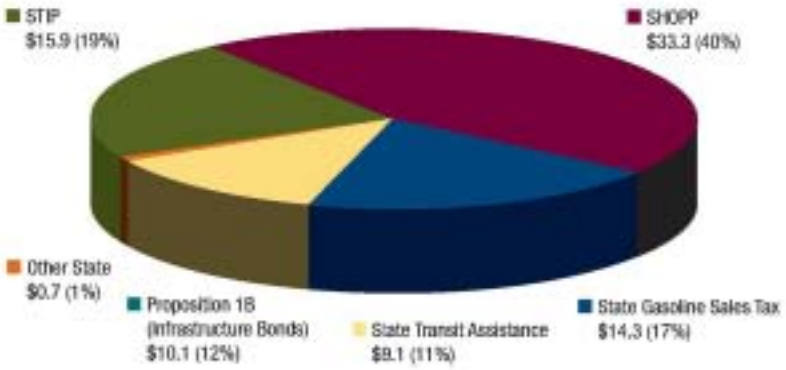


Source: SCAG Revenue Model 2007

AR0072553

State sources generate a larger share of revenues than in the 2004 RTP, mostly due to the infrastructure bonds (Proposition 1B) and state gasoline sales tax protection (Proposition 1A). The infrastructure bonds and state gasoline sales taxes make up roughly 30 percent of the total $83.4 billion in forecasted state revenues (see Figure 4.10).

FIGURE 4.10 SCAG REGIONAL REVENUES, STATE SOURCES (IN NOMINAL DOLLARS) $83.4 BILLION TOTAL

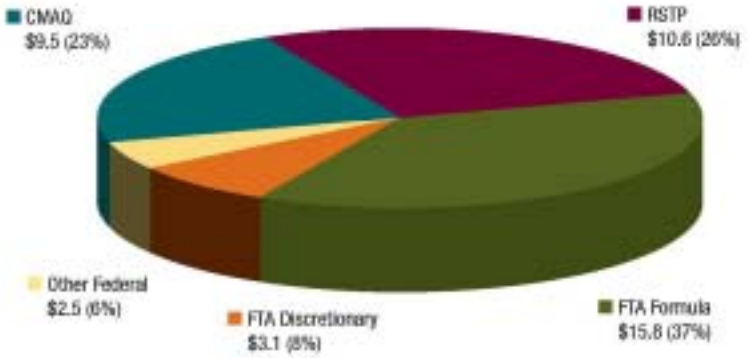


Source: SCAG Revenue Model 2007

Note: Numbers may not add due to rounding.

As shown in Figure 4.11, federal sources are anticipated to remain steady and represent a small portion of overall transportation funds ($41.6 billion). One of the largest declines in federal funding will be due to the region achieving attainment for a number of pollutants by 2020. This will result in less CMAQ funding.

FIGURE 4.11 SCAG REGIONAL REVENUES, FEDERAL SOURCES (IN NOMINAL DOLLARS) $41.6 BILLION TOTAL



Note: Numbers may not add due to rounding.

AR0072554

Reasonably Available Revenues

There are several new funding sources that will increase the revenues available for the 2008 RTP. The region also expects to leverage innovative financing strategies.

Table 4.2 presents twelve categories of funding sources and financing techniques that were evaluated for the RTP. They were selected as a result of their use in other areas of the state, the burgeoning potential, historical precedence and likelihood of implementation within the time frame of the 2008 RTP. These funding sources are reasonably available and are included in the financially constrained plan. For each funding source, SCAG has examined the policy and legal context of implementation and has prepared an estimate of the revenue potential.

AR0072555

TABLE 4.2 NEW REVENUE SOURCES AND INNOVATIVE FINANCING STRATEGIES (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Description	Amount	Actions to Ensure Availability	Responsible Party
Value Capture Strategies	Various techniques assumed: formation of special districts, including Benefit Assessment Districts, Mello-Roos Community Facility Districts, as well as tax increment financing and joint development to provide gap financing for specific transit investments (Gold Line extension, Purple Line extension, and the HSRT system). SCAG also assumes one-time proceeds from the sale of Caltrans-owned property within the SR-710 tunnel vicinity.	$3.7	Pursue necessary approvals for special districts by 2012 (Benefit Assessment Districts require majority approval by property owners; Mello-Roos tax requires two-thirds approval); work with private entities for joint development opportunities; also, work with Caltrans to utilize proceeds from real estate sales to partially fill funding gap for the SR-710 tunnel; pursue legislation to enable sales and to establish escrow account for the proceeds	MPO, transit operators, local jurisdictions, property owners along project corridors, developers, Caltrans
Local Option Sales Tax Extension	Half-cent sales tax measure extension for Imperial County—existing Measure D expires in 2010	$0.8	Local sales tax measure to be placed on ballot by 2010	Imperial County
Highway Tolls (includes toll revenue bond proceeds)	Toll revenues generated from the SR-710 tunnel, I-710 dedicated truck lanes, High Desert Corridor, and CETAP Corridor	$22.0	Region was granted authority under AB 1467 (2006) to impose tolls and work with private entities for the financing of goods movement related facilities including the I-710 dedicated truck lanes; additional state legislative approval needed for the SR-710 tunnel	MPO, local county transportation commissions (LACMTA, SANBAG, RCTC), State Legislature
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	Estimate equivalent to additional ten cent per gallon gasoline tax imposed by the state and federal government starting in 2012—extrapolation of historical trend	$17.0	Congressional and state legislative approval	MPO, State Legislature, Congress
Container Fees (includes container fee bond proceeds)	Charge imposed on containerized cargo moving through the Ports of LA/LB (includes railroad user-fees for rail capacity improvement program); fees are directly linked to specific goods movement projects	$41.5	Negotiated by ports, shipping community, regional stakeholders or state legislative approval (upon passage of SB 974 or other legislative effort)	Ports, shippers, goods movement stakeholders (MPO, railroads, local county transportation commissions), State Legislature
Private Equity Participation	Public Private Partnership arrangement whereby a private entity designs, finances, builds, operates, and maintains a facility under a lease arrangement for a fixed period of time	$4.4	Region was granted authority under AB 1467 (2006) to work with private entities for the financing of freight-related projects; additional state legislative approval needed for the SR-710 tunnel	MPO, local county transportation commissions, private consortium, State Legislature

AR0072556

Revenue Source	Description	Amount	Actions to Ensure Availability	Responsible Party
Private Activity Bonds (PAB)	Interest savings from the issuance of tax-exempt private activity bonds	$0.4 (included in container fees)	Work with railroads and other regional stakeholders to receive federal PAB allocation	MPO, freight railroads, local county transportation commissions, US DOT
U.S. Environmental Protection Agency (EPA) funding for clean freight rail technology	EPA subsidies to help mitigate locomotive emissions per the 2007 State Implementation Plan (SIP)	$1.9	Work with railroads, AQMD, ARB and US EPA for federal clean technology funding allocation	MPO, freight railroads, AQMD, ARB, US EPA
Interest Earnings	Interest earnings from toll bond proceeds (High Desert Corridor, CETAP, SR-710 tunnel, and I-710 truck lanes)	$0.4	See Highway Tolls	See Highway Tolls
Riverside County Measure A (Bond Anticipation Notes)	Short-term debt to help fund the CETAP Corridor in anticipation of the sale of Measure A revenue bonds	$1.5	Issuance of debt subject to RCTC Board policy	RCTC
Transportation Infrastructure Finance and Innovation Act (TIFIA) Loan	The TIFIA loan program provides credit assistance for transportation investments of national/regional significance; TIFIA loan assumed for the CETAP Corridor	$0.9	Work with US DOT and RCTC to evaluate applicability of the TIFIA loan program for the CETAP Corridor; further feasibility work necessary to assess traffic and revenue potential on CETAP Corridor	MPO, RCTC, US DOT TIFIA Office
HSRT Passenger System (Private Contribution & User Fee)	User fee-supported initiative for HSRT system. Assumes private-sector development: design, finance, build, operate and maintain. See HSRT Report for further details	$26.2	For the IOS: form JPA, finalize development of a comprehensive business plan; work with private entity to ensure commitment	MPO, private consortium, local/regional stakeholders

AR0072557

Summary of Revenue Sources and Expenditures

TABLE 4.3.1 CORE AND REASONABLY AVAILABLE REVENUE PROJECTIONS (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Revenue Projection Assumptions	Revenue Estimate
LOCAL REVENUE SOURCES		
Local Option Sales Tax Measures	**Description:** Locally imposed ½ percent sales taxes in four counties (Imperial, Orange, Riverside, and San Bernardino). Permanent 1 percent (combination of two ½ cent sales taxes) in Los Angeles. **Assumptions:** Sales taxes grow consistent with county transportation commission forecasts and historical trends.	$145.6
Transportation Development Act (TDA) – Local Transportation Fund	**Description:** Local Transportation Funds (LTF) are derived from a ¼ cent sales tax on retail sales statewide. Funds are returned to the county of generation and used mostly for transit operations and transit capital expenses. **Assumptions:** Same sales tax growth rate as used for local option sales tax measures	$52.7
Gas Excise Tax Subventions (to Cities and Counties)	**Description:** Subventions to counties and local jurisdictions in region from the California state gas tax. Revenues for the forecast are proportionate to the percentage of streets and roads that are regionally significant. **Assumptions:** Fuel consumption does not grow except in Los Angeles and Orange counties where growth is less than historical trends and consistent with forecasts by local transportation commissions. Regionally significant streets and roads (37 to 50 percent of roads) are classified as either arterials or collectors.	$8.0
Transit Farebox Revenue	**Description:** Transit fares collected by transit operators in the SCAG region. **Assumptions:** Farebox revenues increase consistent with historic trends, planned system expansions, and operator forecasts.	$41.2
Highway Tolls (in core revenue forecast)	**Description:** Revenues generated from toll roads operated by the Transportation Corridor Agencies (TCA). **Assumptions:** Traffic does not grow (compared to historical growth of about 3.8 percent) in core revenue forecast scenario.	$3.0
Mitigation Fees	**Description:** Revenues generated from development impact fees. The revenue forecast includes fees from the Transportation Corridor Agency (TCA) development impact fee program; the Riverside County's Transportation Uniform Mitigation Fee (TUMF) for both the Coachella Valley and Western Riverside County; and the San Bernardino County's Development Impact Fee (DIF) program. **Assumptions:** The financial forecast is consistent with revenue forecasts from Riverside County Transportation Commission (RCTC), and San Bernardino Associated Governments (SANBAG).	$15.9
Local Agency Funds	**Description:** Includes committed local revenue sources, such as transit advertising and auxiliary revenues, lease revenues, and interest and investment earnings from reserve funds. **Assumptions:** Revenues are based on financial data from transit operators and local county transportation commissions.	$20.0
LOCAL SUBTOTAL		**$286.5**

Note: Numbers may not add due to rounding

AR0072558

TABLE 4.3.2 CORE AND REASONABLY AVAILABLE REVENUE PROJECTIONS (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Revenue Projection Assumptions	Revenue Estimate
STATE REVENUE SOURCES		
State Transportation Improvement Program (STIP)	**Description:** The STIP is a five-year capital improvement program that provides funding from the State Highway Account (SHA) for projects that increase the capacity of the transportation system. The SHA is funded through a combination of state gas excise tax, the Federal Highway Trust Fund, and truck weight fees. The STIP may include projects on state highways, local roads, intercity rail, or public transit systems. The Regional Transportation Planning Agencies (RTPAs) propose 75 percent of STIP funding for regional transportation projects in Regional Transportation Improvement Programs (RTIPs). Caltrans proposes 25 percent of STIP funding for interregional transportation projects in the Interregional Transportation Improvement Program (ITIP). **Assumptions:** Funds are based upon the 2006 STIP program of projects. Long-term forecasts assume no growth in fuel consumption..	$15.9
State Highway Operation and Protection Plan (SHOPP)	**Description:** Funds state highway maintenance and operations projects. **Assumptions:** Short-term revenues are based on overlapping 2004, 2006 and 2008 SHOPP programs. Long-term forecasts are consistent with STIP forecasts and assume no growth in the fuel consumption.	$33.3
State Gasoline Sales Tax	**Description:** The state gasoline sales tax funds discretionary projects through the former Traffic Congestion Relief Program (TCRP). Proposition 42, recently restored by Proposition 1A, transfers future revenues to the Transportation Investment Fund, which distributes revenues to the STIP, local streets and roads, and transit. **Assumptions:** The financial forecast assumes that each county receives its fair share of state gasoline sales tax based upon county population. Future revenues are not expected to grow, with the exception of Orange County, which is expected to grow by a modest one percent.	$14.3
State Transit Assistance Fund (STA)	**Description:** STA is funded with 50 percent of State Public Transit Account (PTA) revenues, which come from diesel sales tax and "spillover" in the gasoline sales tax. Funding is distributed 50 percent by population share and 50 percent by revenue share of the transit operators. **Assumptions:** The forecast is based on current funding levels reported by the State Controller., except in Los Angeles and Orange counties, where growth is less than historical trends and consistent with forecasts by local transportation commissions.	$9.1
Highway Safety, Traffic, Air Quality, and Port Security Bond Act of 2006 (Proposition 1B)	**Description:** Proposition 1B authorizes $19.9 billion to be spent statewide over the next several years on existing and new statewide transportation-related infrastructure programs and projects. Several programs are included under Proposition 1B. The California Transportation Commission has not yet established priorities and funding formulas for all categories. **Assumptions:** The forecast assumes that the SCAG region receives its fair share of funding under the categories with established funding formulas. Other categories are assumed to be allocated according to population.	$10.1
Other State Sources	**Description:** Other state sources include Service Authority for Freeways and Expressways (SAFE), Freeway Service Patrol, Air Quality Vehicle Registration Fee (AB 2766), Environmental Enhancement and Mitigation, and other miscellaneous state grants. The Clean Air and Transportation Improvement Act added Proposition 116 to use state general obligation bonds to finance rail infrastructure. **Assumptions:** The RTP uses forecasts provided by LACMTA for Los Angeles County for consistency with the LACMTA long-range transportation plan. These revenues are not estimated for other counties.	$0.7
STATE SUBTOTAL (State STIP funds include FHWA IM and NHS funding categories)		**$83.4**

AR0072559

TABLE 4.3.3 CORE AND REASONABLY AVAILABLE REVENUE PROJECTIONS (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Revenue Projection Assumptions	Revenue Estimate
FEDERAL REVENUE SOURCES		
FHWA Non-Discretionary Congestion Mitigation and Air Quality (CMAQ) Program	**Description:** Program to reduce traffic congestion and improve air quality in non-attainment areas. **Assumptions:** Short-term revenues are based upon the Caltrans apportionment estimates. Long-term revenues assume that the Federal Highway Trust Fund stays solvent, but revenues do not grow. CMAQ funding is assumed to be halved starting in 2020 due to improved air quality.	$9.5
FHWA Non-Discretionary Regional Surface Transportation Program (RSTP)	**Description:** Projects eligible for RSTP funds include rehabilitation and new construction on any highways included in the National Highway System (NHS) and Interstate Highways (including bridges). Also, transit capital projects, as well as intracity and intercity bus terminals and facilities, are eligible. **Assumptions:** Short-term revenues are based upon the Caltrans apportionment estimates. Long-term revenues assume that the Federal Highway Trust Fund stays solvent, but revenues do not grow.	$10.6
FTA Formula Programs 5307 Urbanized Area Formula (Capital), 5310 Elderly and Persons with Disabilities Formula, 5311 Non-Urbanized Area Formula, 5309 Fixed Guideway Program	**Description:** This includes a number of FTA programs that are distributed by formula. 5307 is distributed annually to state urbanized areas with a formula based on population, population density and transit revenue miles of service. Program funds capital projects (and operations expenses in areas under 200,000 in population), preventative maintenance and planning activities. 5310 funds are allocated by formula to states for capital costs of providing services to the elderly and disabled. The 5311 program provides capital and operating expenses for rural and small urban public transportation systems. Section 5309 Fixed Guideway (FG) funds are also distributed to regions on an urbanized area formula. **Assumptions:** Formula funds are assumed to increase in proportion with the Federal Highway Trust Fund. As with the FHWA sources, the Trust Fund is expected to stay solvent, but not grow. For Los Angeles and Orange Counties, the local transportation commissions have estimated formula allocations based on future increases in service and past allocations that yield results consistent with a no-growth assumption.	$15.8
FTA Non-Formula Program 5309 New and Small Starts, 5309 Bus & Bus-Related Grants	**Description:** Capital projects include preliminary engineering, acquisition of real property, final design and construction, initial acquisition of rolling stock for new fixed guideway systems or extensions, including bus rapid transit, light rail, heavy rail, and commuter rail systems. Capital investment grants of less than $75 million are considered "small starts." "Small starts" will have a separate funding category beginning in FY07. Program funds bus acquisition and other rolling stock, ancillary equipment and the construction of bus facilities. Also includes bus rehabilitation and leasing, park-and-ride facilities, parking lots associated with transit facilities and bus passenger shelters. **Assumptions:** Operators are assumed to receive FTA discretionary funds in rough proportion to what they have received historically. The Federal Highway Trust Fund is expected to stay solvent, but not grow. For Los Angeles and Orange counties, the local transportation commissions have estimated discretionary allocations based on future increases in service and past allocations. Los Angeles expects discretionary allocations to remain constant in nominal terms, while Orange County expects discretionary allocations to grow slower than inflation.	$3.1
Other Federal Funds	**Description:** Includes other federal programs, such as Regional Transportation Enhancements, Highway Bridge Replacement and Rehabilitation, Homeland Security Grants, Bus Preferential Signal Systems, Highway Earmarks, Hazard Elimination Safety, and Railroad/Highway Grade Crossing Protection (Section 130). **Assumptions:** LACMTA provided forecasted revenues for these programs, which have been adopted in the RTP for Los Angeles County. For other counties, Highway Bridge Program revenues are estimated in the short term using program allocations provided by the California Department of Transportation through FY2010. Longer-term estimates are based upon the no-growth assumption used for other federal funding sources.	$2.5
FEDERAL SUBTOTAL		**$41.6**

Note: Numbers may not add due to rounding

AR0072560

TABLE 4.3.4 CORE AND REASONABLY AVAILABLE REVENUE PROJECTIONS (IN NOMINAL DOLLARS, BILLIONS)

Revenue Source	Revenue Projection Assumptions	Revenue Estimate
INNOVATIVE FINANCING & NEW REVENUE SOURCES		
Value Capture Strategies	**Description:** This strategy refers to capturing the incremental value generated by transportation investments through formation of special districts, joint development, and tax increment financing. Also includes sale of Caltrans-owned property. **Assumptions:** SCAG assumes the formation of special districts, including Benefit Assessment Districts, Mello-Roos Community Facilities Districts, as well as use of tax increment financing and joint development to provide gap financing for specific transit investments: Gold Line extension, Purple Line extension, and passenger HSRT system. SCAG also assumes one-time proceeds from the sale of Caltrans-owned property within the SR-710 tunnel vicinity.	$3.7
Local Option Sales Tax Extension	**Description:** Locally imposed ½ percent sales tax measure extension for Imperial County—existing Measure D expires in 2010. **Assumptions:** Sales tax grows consistent with historical trends in county retail sales.	$0.8
Highway Tolls	**Description:** Toll revenues generated from SR-710 tunnel. Also, tolls assumed for the I-710 dedicated truck lanes, High Desert Corridor, and CETAP Corridor as well as SR-91. **Assumptions:** Toll revenues based on recent feasibility studies for applicable corridors. Also includes toll revenue bond proceeds.	$22.0
State and Federal Gas Excise Tax Adjustment to Maintain Historical Purchasing Power	**Description:** Equivalent to additional ten cent per gallon gasoline tax imposed by the state and federal government starting in 2012 - based on historical extrapolation. **Assumptions:** Forecast consistent with historical adjustments for both state and federal gas taxes.	$17.0
Container Fees	**Description:** Charge imposed on containerized cargo moving through the Ports of LA/LB and region (includes railroad user fees for rail capacity improvement program) and directly linked to specific goods movement projects. **Assumptions:** Container fees at $30 per Twenty-foot Equivalent Unit (TEU). Revenue total also includes railroad user fees assessed on a TEU basis for the rail capacity improvement program; revenue total includes bond proceeds.	$41.5
Private Equity Participation	**Description:** Public Private Partnership arrangement whereby a private entity designs, finances, builds, operates, and maintains a facility under a lease arrangement for a fixed period of time. **Assumptions:** Private capital is assumed for the financing of a number of projects including the SR-710 tunnel, CETAP Corridor and the HSRT system (freight only component assumed in this total). See separate line-item for passenger HSRT.	$4.4
Private Activity Bonds	**Description:** Title XI Section 11142 of SAFETEA-LU amends Section 142(a) of the IRS Code to allow the issuance of tax exempt private activity bonds for highway and freight transfer facilities. States and local governments are allowed to issue tax-exempt bonds to finance highway and freight transfer facility projects sponsored by the private sector. **Assumptions:** Partial interest savings from the issuance of tax-exempt private activity bonds for freight rail investment package are assumed to offset some of the grade separation costs.	$0.4 (included in container fees)
Federal (EPA) funding for clean freight rail technology	**Description:** Federal funding to mitigate locomotive emissions. **Assumptions:** In accordance with the proposed 2007 State Implementation Plan (SIP), it is assumed that the federal government (US EPA) will provide subsidies to mitigate locomotive emissions; the severity of the region's PM2.5 problem and the attainment deadline make it necessary to mitigate locomotive emissions	$1.9
Interest Earnings	**Description:** Interest earnings from toll bond proceeds. **Assumptions:** Interest earnings are assumed from toll bond proceeds (High Desert Corridor, CETAP, SR-710 tunnel, and I-710 truck lanes.	$0.4

AR0072561

Revenue Source	Revenue Projection Assumptions	Revenue Estimate
Riverside County Measure A (Bond Anticipation Notes)	**Description:** BANs are short-term debt financing strategies often used by local governments. The proceeds of a future issue are expected to cover anticipation notes. **Assumptions:** Short-term debt is assumed in the latter years of the RTP to help fund the CETAP Corridor in anticipation of the sale of Measure A revenue bonds.	$1.5
TIFIA Loan	**Description:** TIFIA loan program provides credit assistance under flexible terms for transportation investments of national or regional significance. **Assumptions:** A TIFIA loan is assumed to facilitate financing of the CETAP Corridor; a direct loan is assumed to be repaid by project generated toll revenue.	$0.9
HSRT Passenger System (Private Contribution & User Fee	**Description:** User-fee supported initiative for HSRT system. **Assumptions:** Assumes private sector development including design, finance, build, operate, and maintain. See HSRT report for further details.	$26.2
NEW REVENUE SOURCE SUBTOTAL		**$120.1**
GRAND TOTAL		**$531.5**

Note: Numbers may not add due to rounding

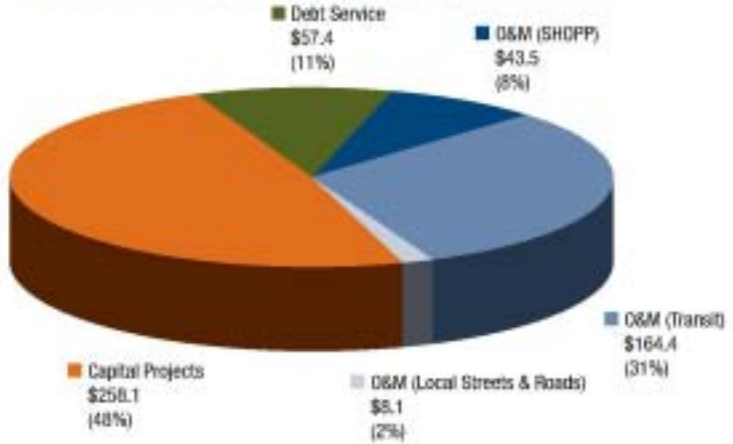
AR0072562

The SCAG region's financially constrained RTP includes revenues from both the core and reasonably available revenue sources. A summary of these forecasted revenues and expenditures is presented in Figures 4.12 and 4.13. As shown in these figures, the SCAG region's budget over the next 30 years totals an estimated $531.5 billion.

FIGURE 4.12 2008 RTP REVENUE SUMMARY
$531.5 BILLION (IN NOMINAL DOLLARS) FY2007-FY2036

Note: Numbers may not add due to rounding.

FIGURE 4.13 2008 RTP EXPENDITURE SUMMARY
$531.5 BILLION (IN NOMINAL DOLLARS) FY2007-2036



As shown in Figure 4.14, transit and highway expenditures are roughly comparable at 41 and 36 percent, respectively, of the RTP costs for each category. About 12 percent of costs are attributable to an "other" category, reflecting proposed investments in HSRT systems as well as freight rail capacity and grade separation improvements. Consistent with historical practice, agencies in the region are expected to bond against future revenues to provide additional funding in the early years of the plan. As a result, debt service equal to historical payments and future bonding needs has been included as part of the RTP. Anticipated debt service payments make up 11 percent of total costs.

AR0072563

AR0072566

V. PLAN PERFORMANCE

This chapter summarizes how well the 2008 RTP performs in meeting its adopted goals and satisfying state and federal requirements. Table 5.1 summarizes goals and their related performance outcomes. One or more performance measures were developed for each of these outcomes to quantify the Plan's performance. These goals and outcomes were used successfully to develop the update to the 2004 RTP.

TABLE 5.1 2008 RTP GOALS AND RELATED PERFORMANCE OUTCOMES

RTP Goals	Mobility	Accessibility	Reliability	Productivity	Safety	Sustainability	Preservation	Cost-Effectiveness	Environmental	Environmental Justice
Maximize mobility and accessibility for all people and goods in the region	✓	✓						✓		✓
Ensure travel safety and reliability for all people and goods in the region	✓		✓		✓					
Preserve and ensure a sustainable regional transportation system						✓	✓			
Maximize the productivity of our transportation system	✓			✓						
Protect the environment, improve air quality and promote energy efficiency									✓	✓
Encourage land use and growth patterns that complement our transportation investments	✓	✓							✓	
Maximize the security of our transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies*										

* SCAG does not yet have an agreed-upon security performance measure; therefore it is not included in this table.

PLAN INVESTMENT PERFORMANCE

This section provides detailed information on each of the performance outcomes and related measures approved by the Regional Council in 2002. The basic concept for each criterion is to compare the performance of the Plan (2035) to both the Base Year (2003) and the Baseline scenario for 2035. The Plan is the selected strategy to guide the region's transportation planning over the next few decades. The Baseline represents "business as usual" and a future condition in which the Plan is not implemented. It assumes only the completion of projects currently under construction or right-of-way acquisition, projects that have completed the National Environmental Policy Act (NEPA) process, or projects that come from the first year of the previous RTP/RTIP. The data for the analysis is based on the SCAG Regional travel demand model results.

MOBILITY

The mobility performance outcome relies on two commonly used measures: speed and delay. Speed and delay were computed using SCAG's regional travel demand model. They are defined as follows:

- Speed is the average speed experienced by travelers regardless of mode in miles per hour (mph).
- Delay is the difference between the actual travel time and travel time that would be experienced if a person traveled at the legal speed limit. This measure is reported as person-hours of delay, which is presented here as a total delay and as delay per capita. The latter measure balances the results with the expected population growth during the Plan period (i.e., through 2035).

Figure 5.1 compares the speeds of the three scenarios. It shows that the Plan improves average daily speeds by eight percent compared to the 2035 Baseline and represents a less than 4-mile-per-hour decline over 2003 Base Year results.

AR0072568

FIGURE 5.1 AVERAGE DAILY SPEED

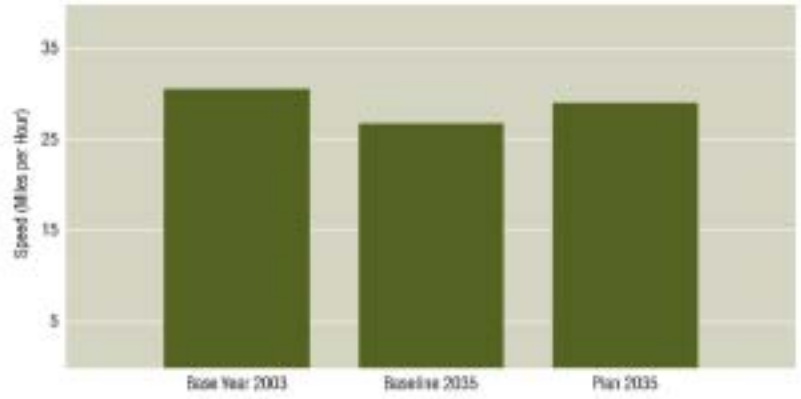

Figure 5.2 compares delay results and shows that the Plan reduces total daily person-hours of delay by 16 percent compared to the Baseline, but also represents an increase of 76 percent over Base Year conditions. This increase reflects the growth in the region and the resulting incremental travel.

FIGURE 5.2 DAILY PERSON-HOURS OF DELAY

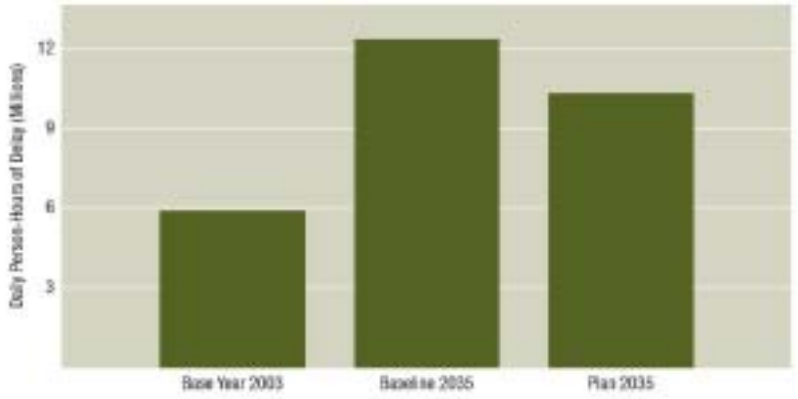

Figure 5.3 compares average daily delay per capita, which is a measure that takes into account that there will be more people traveling on the Region's transportation system by 2035. The results tell a different story. Whereas total person delay for the Plan increases by 76 percent over Base Year conditions, each person in the region experiences only a 29 percent increase - less than six minutes per day on a per-capita basis.

AR0072569

FIGURE 5.3 AVERAGE DAILY DELAY PER CAPITA

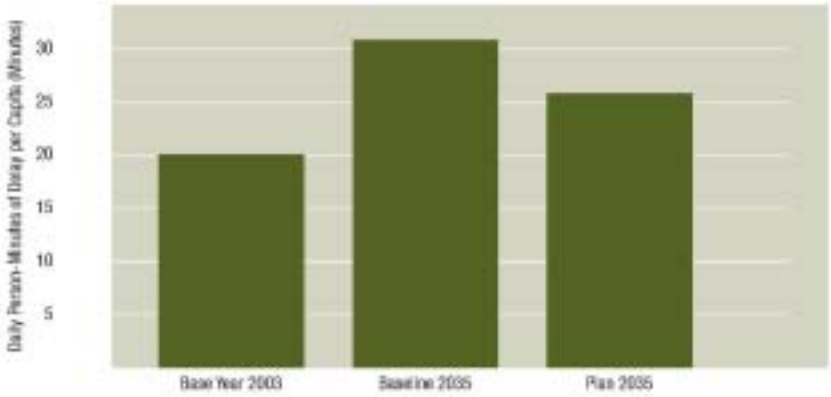

FIGURE 5.4 AVERAGE DAILY HEAVY-DUTY TRUCK DELAY

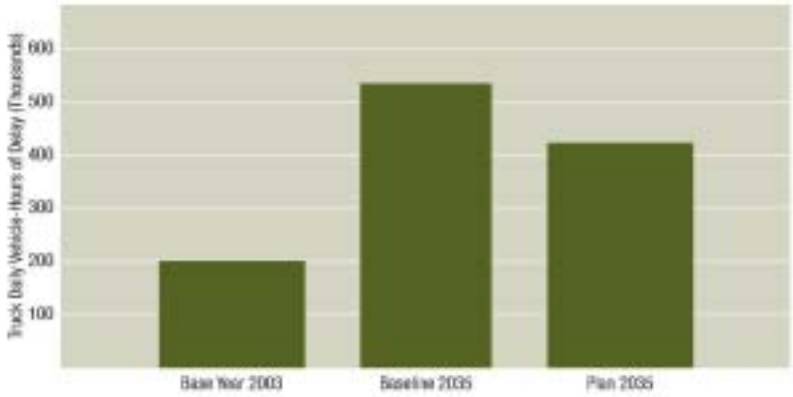

Finally, Figure 5.4 compares average daily Heavy Duty Truck delays, which shows an improvement of nearly 21 percent compared to the Baseline. This is an important statistic given the Plan's emphasis on the logistics industry and its importance to the regional economy.

Exhibits 5.1, 5.2, and 5.3 depict regional PM peak (3 p.m. to 7 p.m.) freeway speeds for Base Year 2003, Baseline in 2035, and Plan in 2035, respectively.

ACCESSIBILITY

Accessibility measures how well the transportation system provides people access to opportunities. Opportunities can include jobs, education, medical care, recreation, shopping, or other activities that help improve people's lives. For the 2008 RTP, accessibility is defined as the percentage of the population who can travel between work and home within 45 minutes during the peak period. Access to employment is used as a reasonable proxy for access to all opportunities, since work trips make up a large percentage of total trips during commute periods. For people traveling by automobiles, this is defined as those who travel during the afternoon commute period, and for transit users, both the AM and PM commute periods are included to facilitate the modeling of transit trips.

AR0072570

AR0072571

EXHIBIT 5.2 BASELINE 2035 FREEWAY SPEED | PM PEAK

Source: Southern California Association of Governments, ESRI StreetMap USA, Tele Atlas

AR0072572

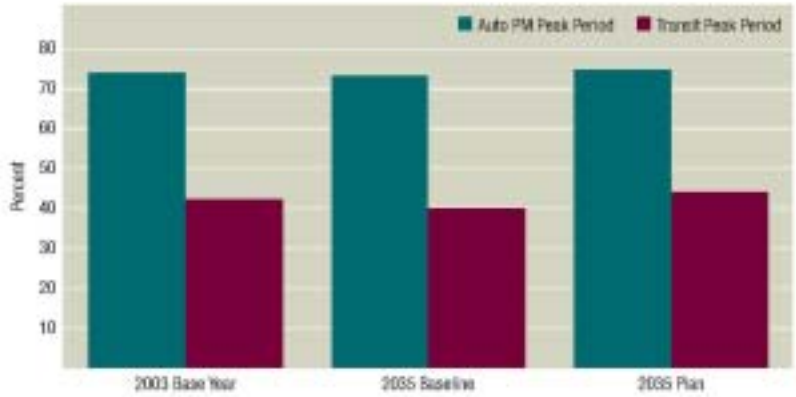
EXHIBIT 5.3 PLAN 2035 FREEWAY SPEED | PM PEAK

Source: Southern California Association of Governments, ESRI StreetMap USA, Teleatlas

AR0072573

Figure 5.5 compares the Plan to Base Year and Baseline, and presents the percent of work trips completed within 45 minutes for both automobiles and transit. The figure shows that automobile accessibility stays relatively constant over the 2035 Baseline period at around 77 percent, but the Plan improves automobile accessibility slightly to 79 percent. Transit accessibility is projected to decline from 43 percent currently to around 42 percent under the 2035 Baseline scenario. However, it will improve to 45 percent under the Plan.

FIGURE 5.5 AUTO AND TRANSIT ACCESSIBILITY



RELIABILITY

The reliability outcome reflects the degree to which travelers experience variations in their trip times from day to day. As such, it captures the relative predictability of the public's travel time. Unlike mobility (which measures how quickly the transportation system is moving people) and accessibility (which addresses how well the system provides access to opportunities, primarily jobs), reliability focuses on how much mobility and accessibility vary from day to day.

The reliability measure is calculated by using the statistical concept of standard deviation. The indicator is computed by dividing the standard deviation of travel time for a given trip by the average travel time of that trip, measured over many days and weeks. Table 5.2 shows how a traveler can use this indicator depending on the importance of arriving on time. For example, if a person's morning commute takes on average 26 minutes, but varies 15 percent from day to day, then he or she must plan the trip to account for additional time. Table 5.2 also shows that if this person wants to be 99 percent confident that he or she arrives on time, he or she must plan for 38 minutes of travel instead of 26.

TABLE 5.2 VARIABILITY OF TRAVEL TIME: HYPOTHETICAL ILLUSTRATION

Trip	Time Period	Average Travel Time	Variability of Travel Time	Travel Time Based on Level of Confidence of Arriving on Time		
				70%	95%	99%
Hypothetical Commute Trip	AM Peak	26 min.	15%	30 min.	34 min.	38 min.
	PM Peak	32 min.	25%	40 min.	48 min.	56 min.
	Off Peak	20 min.	10%	22 min.	24 min.	26 min.

This indicator is relatively new in transportation planning and operations, and exact models to compute and forecast it are not available. However, by using existing travel time data and research results, it is possible to estimate the Plan's impact on reliability. Table 5.3 presents these results, which reflect the benefits derived from the investments that help respond more quickly and effectively to traffic accidents or provide traveler information. These improvements are conservatively projected in the 10 percent range. However, it is critical to continue to monitor this measure and improve the tools to forecast the impacts of such investments in future SCAG planning cycles.

AR0072574

TABLE 5.3 ESTIMATED IMPROVEMENTS IN TRAVEL TIME RELIABILITY

Peak Period	Hour	Base Year 2005 Average Percent Variability of Travel Time	Plan 2035 Average Percent Variability of Travel Time
Morning Peak Period (6 am to 9 am)	6 am to 7 am	16%	14%
	7 am to 8 am	22%	20%
	8 am to 9 am	23%	21%
Afternoon Peak Period (3 pm to 7 pm)	3 pm to 4 pm	25%	23%
	4 pm to 5 pm	26%	23%
	5 pm to 6 pm	28%	25%
	6 pm to 7 pm	25%	23%

Source: Caltrans

PRODUCTIVITY

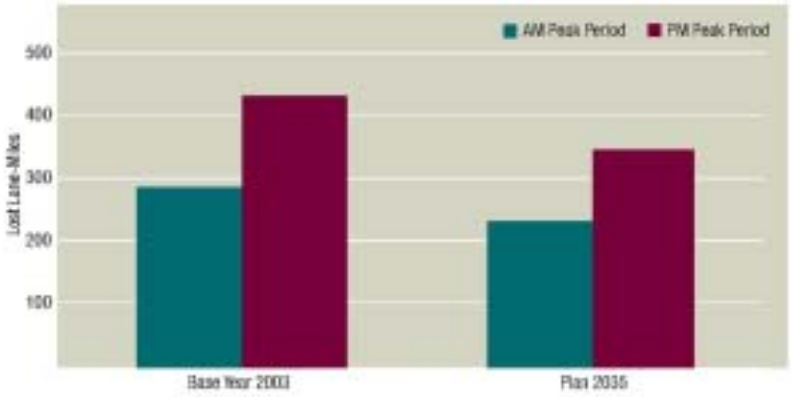
The productivity outcome reflects the degree to which the transportation system performs during peak demand conditions. It is a system efficiency measure. The productivity indicator is defined as the percent utilization during peak demand conditions.

As an example, freeways are typically designed to carry 2,000 vehicles per lane per hour. However, in many locations on the region's freeway system, vehicles weaving and merging in and out of traffic cause bottlenecks, which lead to significant reductions in capacity utilization. Again, using freeways as an example, the carrying capacity of a freeway lane can drop by as much as 50 percent, allowing only 1,000 vehicles per hour to pass. In effect, the system "loses" capacity, which can be estimated in terms of lost lane-miles.

Figure 5.6 summarizes the current estimate for productivity losses on the region's freeway system and the expected improvements due to Plan investments. Maximizing the system's productivity is a critical goal of this RTP, and the overall system management approach aims to recapture lost productivity. The incremental investment of over $2 billion to implement advanced operational strategies on our freeways and arterials is projected to recapture 20 percent of the lost productivity. These projections are based on recent studies indicating that investments in ramp metering, arterial signal coordination, traveler information, and incident management can achieve such improvements.

The Plan improves productivity by committing to investments in state highway operations discussed in Chapter IV. Transit productivity will also improve through increased ridership, which maximizes the number of seats occupied during peak demand conditions.

FIGURE 5.6 HIGHWAY SYSTEM PRODUCTIVITY (LOST LANE-MILES)



AR0072575

SAFETY

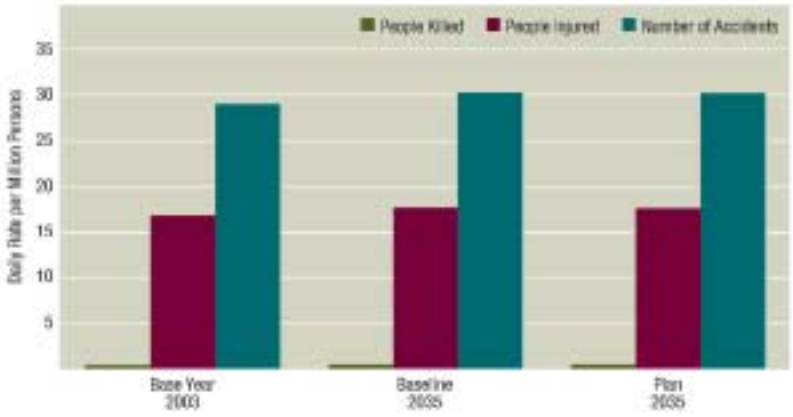
Improving safety by minimizing accidents is a critical outcome of the RTP. The safety indicators used to measure and track safety-related performance are:

- Fatalities per million persons
- Injuries per million persons
- Property damage accidents per million persons

State and regional transportation agencies dedicate funds to projects that specifically address safety deficiencies. However, it is not possible to predict the reduction in accident rates resulting from these investments. Hence, the safety results presented here are estimated based on current accident rate trends for the different modes applied to projected levels of system use by mode. They represent a conservative estimate for safety benefits.

Figure 5.7 compares safety indicators for the Base Year, Baseline, and Plan scenarios. The overall improvement is estimated based on overall accident rates by mode (e.g., auto, bus, and rail) and facility (e.g., freeways and principal arterials).

FIGURE 5.7 ACCIDENT RATES



SUSTAINABILITY

A transportation system is sustainable if it maintains its overall performance over time with the same costs for its users. Sustainability, therefore, reflects how our decisions today affect future generations. The indicator for sustainability is the total inflation-adjusted cost per capita to maintain overall system performance at current conditions.

The performance measures presented in this chapter show that the planned transportation system in 2035 will perform better in some cases (e.g., safety, preservation) and worse in others (e.g., delay per capita) compared to today. Moreover, the overall cost of the Plan represents a significant increase in nominal costs based on increased taxes to fund additional regional projects discussed in Chapter III as well as incremental preservation and operations investments.

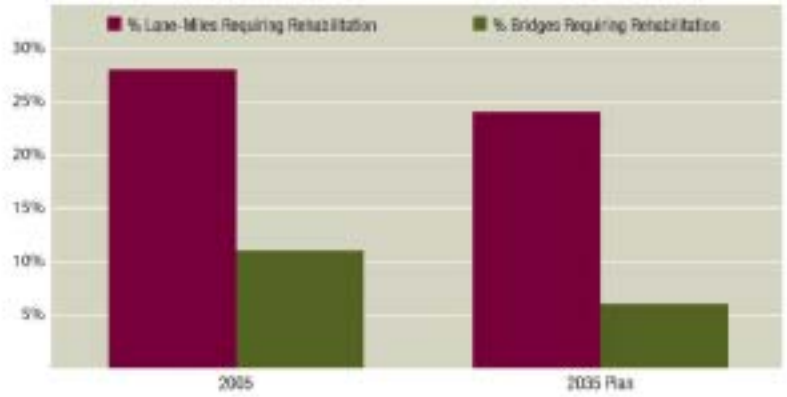
PRESERVATION

The preservation outcome reflects how well the region is taking care of its multimodal transportation infrastructure. As discussed in Chapter II of this document, deferred maintenance investments end up costing much more in the future as the conditions of our assets (e.g., pavement) deteriorate.

Figure 5.8 shows the benefits of the additional expenditures dedicated in this RTP over and beyond the historical trends. As of 2005, 28 and 11 percent of the SCAG Region's roadways and bridges required rehabilitation, which are more intensive and expensive projects. As a result of the incremental investments, these percentages are projected to fall to 24 percent for roadways and 6 percent for bridges. Similar improvements are expected for regional arterials as well.

AR0072576

FIGURE 5.8 PRESERVATION IMPROVEMENTS



COST-EFFECTIVENESS

Cost-effectiveness reflects the degree to which transportation expenditures in the Plan yield benefits that the transportation users experience. It attempts to measure how much "bang for the buck" is received from the Plan. The indicator for cost-effectiveness is the benefit-cost ratio. Benefits are divided into several categories as follows:

- Delay savings
- Safety improvements
- Air quality improvements
- Reductions in vehicle operating costs

For each of these categories, models are used to estimate the benefits of the Plan compared to Baseline. The benefits are converted into dollars, added together, and divided by the total incremental costs of the Plan's transportation improvements. Table 5.4 summarizes the results of the benefit-cost analysis.

TABLE 5.4 SCAG REGIONAL PERFORMANCE ANALYSIS BENEFIT/COST RESULTS

Project	Value of $1 Invested
2008 RTP	$2.21

SCAG's 2008 RTP provides a $2.21 return for every dollar invested. For this analysis, all benefits and costs are expressed in year 2007 dollars. Benefits are estimated through the year 2035. The user benefits are estimated using methodologies consistent with the Cal B/C model adjusted to incorporate SCAG's regional travel demand model output. Costs include incremental public expenditures over the RTP time period.

While $2.21 return on every dollar invested is an excellent return on investment, it is lower than the $3.08 reported in the 2004 RTP. Several factors influence this outcome. First, project costs have skyrocketed over the past several years, negatively impacting the rate of return. Second, this Plan proposes significant investment increases in strategies that do not easily translate into readily quantifiable benefits based on currently available tools, namely SCAG's transportation demand model. Such investment categories include system preservation, system operation and management, and investments that are not captured in SCAG's demand model, such as rail improvements associated with goods movement.

Transportation Conformity Analysis

Transportation conformity is required under the federal Clean Air Act (CAA) to ensure that federally supported highway and transit project activities conform to the purpose of the State Implementation Plan (SIP).[1] Conformity to the purpose of the SIP means that transportation activities will not cause new

[1] To comply with the CAA in achieving the NAAQS, the ARB develops SIPs for federal nonattainment and maintenance areas. In California, SIP development is a joint effort of the local air agencies and ARB working with federal, state, and local agencies (including the MPOs). Local Air Quality Management Plans (AQMPs) are prepared in response to federal and state requirements.

AR0072577

air quality violations, worsen existing violations, or delay timely attainment of the relevant National Ambient Air Quality Standards (NAAQS). Conformity applies to areas that are designated non-attainment, and those re-designated to attainment after 1990 ("maintenance areas") for the following transportation-related criteria pollutants: ozone, particulate matter (PM2.5 and PM10), carbon monoxide (CO), and nitrogen dioxide (NO2).

NON-ATTAINMENT/MAINTENANCE AREAS

The boundaries of the federal non-attainment/maintenance areas in the SCAG Region are:

- Ventura County portion of the South Central Coast Air Basin (SCCAB) — The entire county is a non-attainment area for ozone.
- South Coast Air Basin (SCAB) — The entire basin is a non-attainment or maintenance area for NO2, CO, PM10, PM2.5, and ozone.
- Western MDAB (Antelope Valley portion of Los Angeles County and San Bernardino County portion of MDAB excluding Searles Valley) — This is a non-attainment area for ozone.
- San Bernardino County portion of MDAB.
  - Searles Valley (situated in the NW part of the county) is a non-attainment area for PM10.
  - San Bernardino County (excluding the Searles Valley area) portion of MDAB is a non-attainment area for PM10.
- Riverside County portion of Salton Sea Air Basin (SSAB) — The entire Riverside County portion of SSAB (Coachella Valley) is a non-attainment area for PM10 and ozone.
- Imperial County portion of SSAB - The entire Imperial County portion of SSAB is designated as a non-attainment area for ozone and PM10.

CONFORMITY TESTS

The 2008 RTP must pass the following tests and analyses to meet the requirements for a positive conformity finding:

- Regional Emission Analysis
- Timely Implementation of Transportation Control Measures (TCMs) Analysis
- Financial Constraint Analysis
- Interagency Consultation and Public Involvement Analysis

REGIONAL EMISSIONS ANALYSIS

Regional emissions analyses, by non-attainment area and by pollutant, compare on-road emissions to the applicable on-road emissions budgets in the SIPs for the SCAG Region. The applicable emissions budgets are those found to be adequate for conformity determination by the U.S. EPA. In the absence of applicable emissions budgets, the regional emission tests for conformity finding are based on either a build/no-build or less-than-Base-Year scenario.

Due to recent litigation relative to U.S. EPA's Eight-Hour Ozone Phase 2 Rule, EPA has instructed ARB to revise the established method of demonstrating Reasonable Further Progress (RFP) in ozone non-attainment areas that utilize reductions from other areas to demonstrate attainment (e.g., upwind areas). In the SCAG Region, these areas are the Ventura County portion of the SCCAB, the Western MDAB, and the Coachella Valley portion of the SSAB. Therefore, at this time, there are no AQMPs or SIPs and, thus, no 8-hour ozone transportation emission budgets for these areas. SCAG has worked closely with the ARB and EPA to resolve this issue. As agreed upon by ARB and EPA, ARB has adopted Early Progress Plans (i.e., emissions inventories and transportation emission budgets) for areas that need upwind reductions to show RFP. The Early Progress Plans establish the transportation emission budgets while EPA decides how to respond to the RFP issue raised by the litigation. EPA found these emission budgets adequate in April 2008.

AR0072578

In addition, EPA's review of the South Coast ozone and PM2.5 emission budgets raised concerns such that the ARB was required to revise and resubmit the emission budgets to EPA. This requirement dictated that SCAG make appropriate revisions to the conformity analysis to reflect the new emission budgets and rerelease the Draft Conformity Report. SCAG staff worked closely with the federal reviewing agencies regarding the emission budget adequacy and conformity approval review process timeline. From these efforts, all agencies confirmed they will expedite their respective reviews to allow for approval of SCAG's conformity finding before the current (2004) RTP conformity finding expires on June 7, 2008.

TIMELY IMPLEMENTATION OF TCMS ANALYSIS

This conformity test requires Transportation Control Measures (TCM) projects subject to reporting be fully funded and on schedule. In the SCAG Region, there are two areas for which SIPs contain TCMs: the ozone AQMPs/SIPs for the SCAB, and for the Ventura County portion of SCCAB. SCAG works with the CTCs to ensure TCMs are on schedule or that steps are being taken to overcome obstacles.

FINANCIAL CONSTRAINT ANALYSIS

The 2008 RTP is financially constrained and is financed by federal, state, local and private sources. Detailed information on the financial analysis is included in Chapter IV.

INTERAGENCY CONSULTATION AND PUBLIC INVOLVEMENT

Throughout its development, the 2008 RTP has been discussed at meetings of various policy committees, working groups (including the Transportation Conformity Working Group), task forces, and technical advisory committees. SCAG's Transportation Conformity Working Group has served as a forum for interagency consultation, and additionally, there were many ad hoc meetings held between the involved agencies for this purpose. SCAG's RTP public outreach effort is documented in a separate Public Participation report. Continued interagency consultation and public involvement will occur throughout the public review process.

CONFORMITY FINDING

The conformity analysis indicates a positive conformity finding for the 2008 RTP. The detailed transportation conformity analyses for the 2008 RTP are included in the 2008 RTP Conformity Report.

Environmental Justice

The environmental justice movement stems from Title VI of the Civil Rights Act of 1964. This title declares it to be the policy of the United States that discrimination on the grounds of race, color, or national origin shall not occur in connection with programs and activities receiving federal financial assistance,

AR0072579

and authorizes and directs the appropriate federal departments and agencies to take action to carry out this policy. Title VI of the Civil Rights Act of 1964 provides a significant means by which the public can seek greater accountability from transportation agencies. Title VI bars intentional discrimination, but also unjustified disparate impact discrimination.[2]

SCAG'S ENVIRONMENTAL JUSTICE POLICY & PROGRAM

Environmental Justice is an integral part of the planning process, which must be considered in all phases of planning. SCAG's environmental justice program includes two main elements: public outreach and technical analysis.

ENVIRONMENTAL JUSTICE PUBLIC OUTREACH

Public outreach efforts are intended to ensure that all members of the public have an opportunity to participate meaningfully in the planning process. SCAG's public outreach efforts include the following:

- Compliance Procedure for Environmental Justice in the Transportation Planning Process — In October 2000, SCAG released the Compliance Procedure for Environmental Justice in the Transportation Planning Process, which provided a detailed description of SCAG's public outreach activities. Since its publication, SCAG staff has utilized this guidance document to ensure that it 1) includes traditionally unrepresented groups early and throughout the planning process; 2) carefully examines performance measures to determine any inequities of the RTP on any group; 3) and follows the self-evaluation procedure for public outreach and environmental justice analysis programs.
- Public Workshops — SCAG holds workshops throughout the planning process and targets minority and low-income communities throughout the region. Follow-up workshops are held with groups that want to stay involved throughout the planning cycle.
- Presentations — SCAG conducts presentations upon request to a variety of groups. These include Chambers of Commerce, community-based organizations, nonprofit groups, etc. Generally, these presentations provide an overview of SCAG and its function as an MPO.
- Website Dissemination — SCAG utilizes its website to provide information on the RTP. SCAG works to ensure that the information available is timely, easy to understand and accessible, and that the website is compliant with the 1990 Americans with Disabilities Act. SCAG's RTP and the EJ program have individual webpages dedicated to each.[3]
- Documentation — Following each contact with the public, every comment and concern is recorded in writing regardless of source. Each comment is logged, categorized, and submitted to SCAG planning staff for review and consideration.

TECHNICAL ANALYSIS

The goal of the 2008 RTP environmental justice analysis is to ensure that when transportation decisions are made, low-income and minority communities have ample opportunity to participate in the decision-making process and receive an equitable distribution of benefits and not a disproportionate share of burdens.[4]

Identifying Demographic Groups

Executive Order 12898 and the DOT and FHWA Orders on Environmental Justice define "minority" as persons belonging to any of the following groups, as well as "other" categories that are based on self-identification of individuals in the U.S. Census[5]: Black, Hispanic, Asian, American Indian and Alaskan Native, and Native Hawaiian or Other Pacific Islander. SCAG bases its analyses on the latest census data for ethnic/racial groups in the SCAG Region, by census tract and by transportation analysis zone (TAZ).

[5] http://www.fhwa.dot.gov/environment/ej2000.htm

AR0072580

Identifying low-income and minority populations is necessary both for conducting effective public participation and for assessing the distribution of benefits and burdens of transportation plans and projects. For the purposes of this analysis, SCAG focused on all low-income groups and minority populations. The minority population in the SCAG Region comprises over 70 percent of the population. The predominant minority groups are Hispanics and Asian/Pacific Islanders, which combine to account for 66 percent of the total minority population within the SCAG Region. Poverty level is a federally established income guideline used to define persons who are economically disadvantaged, as defined by the U.S. Department of Health & Human Services guidelines.* The poverty level applicable to the SCAG Region is chosen on the basis of regional average household size for the census year. For example, for a regional mean of 2.98 persons—rounded to 3—per household, the threshold would consist of the sum of the value for the first person plus two additional people. The household counts in each income range are then used to determine the number and percentage of households in each census tract below the poverty level. In 2007, a family of three earning less than $17,170 was classified as living in poverty.

In addition to complying with federal guidance, SCAG also conducts income equity analyses based on five income quintiles. A quintile, by definition, is a category into which 20 percent of the ranked population falls. For each new analysis, SCAG defines regional income quintiles based on the most recent census data on household income. Once the income quintiles are established, the incidence of benefits and costs can be estimated and compared across these income categories. Table 5.5 lists the demographic categories used in SCAG's EJ analysis.

TABLE 5.5 DEMOGRAPHIC CATEGORIES USED IN SCAG ENVIRONMENTAL JUSTICE ANALYSIS

Ethnic/Racial/Other Categories (persons)	Income Categories (households)
White (Non-Hispanic)	Below Poverty Level
African-American	100%–150% of Poverty Level
American Indian	150%–200% of Poverty Level
Asian/Pacific Islander	Income Quintile 1 (lowest)
Hispanic (Latino)	Income Quintile 2
Other	Income Quintile 3
Disabled/Mobility Limited	Income Quintile 4
Age 65 and Above	Income Quintile 5

The 2008 RTP Plan versus Baseline

The comparison of the Plan versus Baseline is the primary focus of the environmental justice analysis for the 2008 Regional Transportation Plan. The basic concept is to compare the performance of the Plan (2035) to the Baseline scenario for 2035. For the purposes of this analysis, the Plan represents the selected strategy to guide the Region's transportation planning over the next three decades and Baseline is defined as the set of all projects and investments currently underway or for which funds are already committed. Baseline represents "business as usual" and assumes current land use trends and the completion of projects currently under construction or with funding available for construction over the next few years. The data for the analysis is based on the SCAG Regional travel demand model results.

* White House Council on Environmental Quality (CEQ). Environmental Justice Guidance Under the National Environmental Policy Act, December 1997.

AR0072581

Performance Measures

In the development of the Plan, SCAG utilized a number of performance measures designed to assess the overall equity.

- Accessibility (Employment Services and Parks)
- Distribution of Plan Expenditures (Investments)
- Taxes Paid
- Auto Travel Time Savings
- Auto Travel Distance Reductions
- Environmental Impact Analyses (Air Emissions and Noise)

These performance measures were intended to evaluate how low-income and minority communities fared under RTP investments. The performance measures and the results of the analysis are described in detail below.

ACCESSIBILITY TO EMPLOYMENT SERVICES

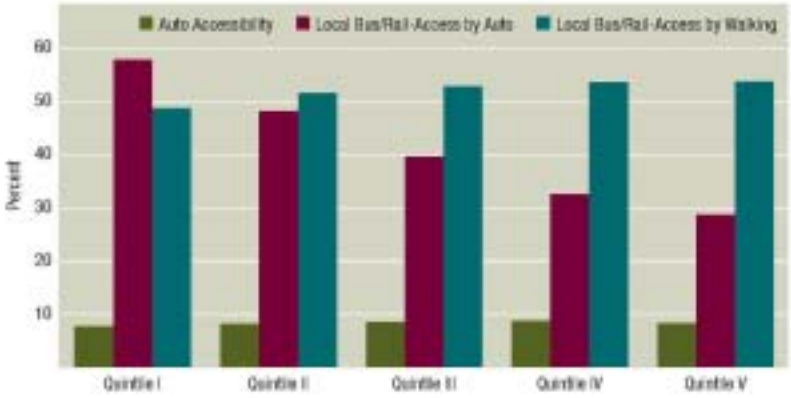
Accessibility is a foundation for social and economic interactions. As an indicator, accessibility is measured by the spatial distribution of potential destinations; the ease of reaching each destination; and the magnitude, quality and character of the activities at the destination sites. Travel costs are central: The lower the costs of travel, in terms of time and money, the more places that can be reached within a certain budget and, thus, the greater the accessibility. Destination choice is equally crucial: The more destinations and the more varied the destinations, the higher the level of accessibility.[7]

Employment accessibility evaluates how well the transportation system is providing access to jobs for underrepresented populations. In this analysis, employment accessibility is defined as the percentage of total employment opportunities that can be reached within 30 minutes during the PM peak period.

[7] CommunityLink 21, Regional Transportation Plan: Equity and Accessibility Performance Indicators: http://www.fhwa.dot.gov/environment/ejustice/case/case4.htm

Figure 5.9: Comparison of Employment Accessibility Improvements by Travel Mode and Income Category shows the percentage improvement between the Plan versus Baseline. It is projected that low-income communities in the region will have better access to employment via local bus and rail compared to higher-income groups. This can be attributed to the number of system expansion projects proposed in the 2008 RTP, which includes a number of commuter/light/heavy rail improvements and bus rapid transit expansion projects. Additionally, improvements in accessibility via automobile are expected to be lower than improvements via transit for any quintile group. The results indicate that on a regional scale, no disproportionate impacts are anticipated between income groups as a result of the Plan.

FIGURE 5.9 COMPARISON OF EMPLOYMENT ACCESSIBILITY IMPROVEMENTS BY TRAVEL MODE AND INCOME CATEGORY (PLAN VS. BASELINE, 2035)



ACCESSIBILITY TO PARKS

Numerous national parks, state parks, and local parks are all found within the SCAG Region. However, not all neighborhoods and people have equal access to these public resources. For the purposes of this analysis, three types of

AR0072582

parks were considered: 1) local parks; 2) state parks; and 3) national parks. The acreage of each park type in all TAZs was identified. Similar to the method in measuring job accessibility, park accessibility is defined as the percentage of park acreage reachable within a 30-minute off-peak travel time period via 1) automobile; 2) local bus/urban rail via automobile; and 3) local bus/urban rail via walking. Without a weekend regional transportation model system, the existing typical weekday model was utilized for the analysis. Because visits to parks are, by nature, leisure trips, off-peak travel time is used instead of peak travel time. For transit travel time, both the waiting time and the on-board time are included.

FIGURE 5.10 PARK ACCESSIBILITY BY TRAVEL MODE AND INCOME CATEGORY (BASELINE 2035)

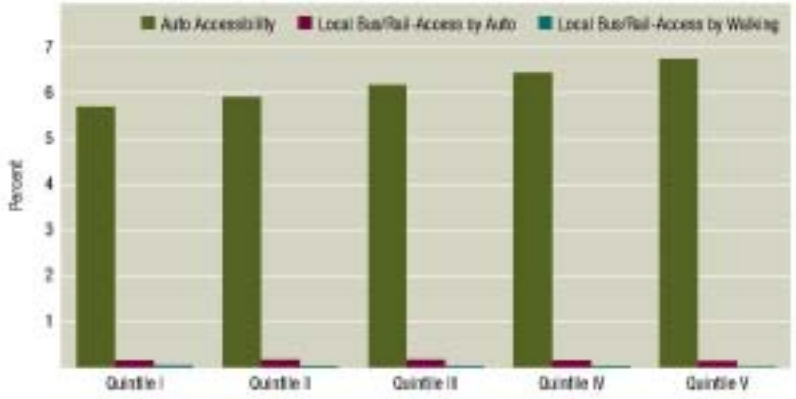


Figure 5.10: Park Accessibility by Travel Mode and Income Category shows the access to parks in the Baseline scenario. Park accessibility by transit is much lower than that by automobile for all income groups. However, Quintiles IV and V will have moderately higher access to parks in the region via automobile.

FIGURE 5.11 NATIONAL PARK ACCESSIBILITY BY TRAVEL MODE AND INCOME CATEGORY (BASELINE 2035)

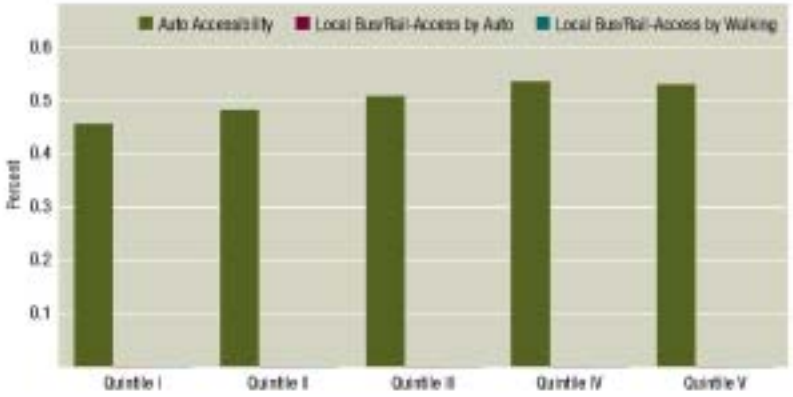

FIGURE 5.12 STATE PARK ACCESSIBILITY BY TRAVEL MODE AND INCOME CATEGORY (BASELINE 2035)

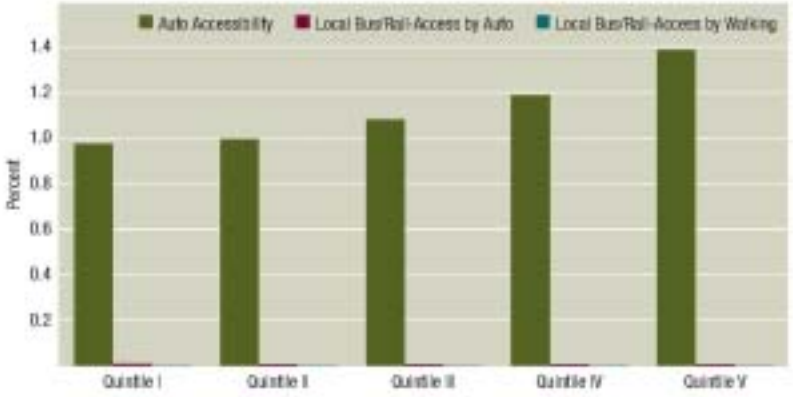


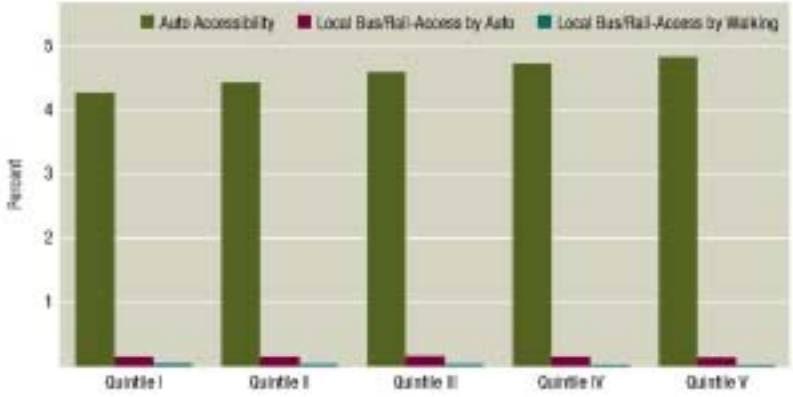
Research has found a complete lack of public transportation services into national parks,[8] but this also appears true for state parks. There is almost no

[8] Frescas, Ron, Chris Martin, and Christine Steenken. Public Transportation to Local National Forests. April 15, 2004.

AR0072583

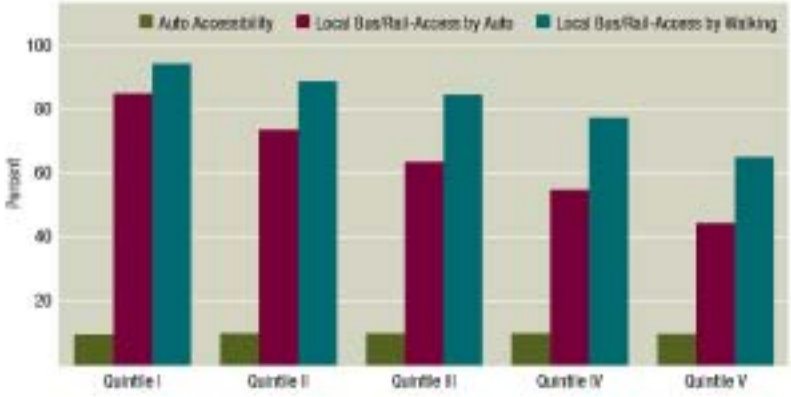
access to national parks and very limited access to state parks by transit across all income groups in the Baseline scenario (see Figure 5.11: National Park Accessibility by Travel Mode and Income Category, and Figure 5.12: State Park Accessibility by Travel Mode and Income Category).

FIGURE 5.13 LOCAL PARK ACCESSIBILITY BY TRAVEL MODE AND INCOME CATEGORY (BASELINE 2035)



The analysis also concluded that local parks are mostly accessible via the automobile. Figure 5.13: Local Park Accessibility by Travel Mode and Income Category reveals that there is limited transit service that accommodates local parks and, regionwide, there is a marginal difference in accessibility between all income groups.

FIGURE 5.14 COMPARISON OF PARK ACCESSIBILITY IMPROVEMENTS BY TRAVEL MODE AND INCOME CATEGORY (PLAN VS. BASELINE, 2035)



As shown in Figure 5.14: Comparison of Park Accessibility Improvements by Travel Mode and Income Category, park accessibility for all income groups by three travel modes is expected to improve under the Plan scenario.

AR0072584

FIGURE 5.15 COMPARISON OF PARK ACCESSIBILITY IMPROVEMENTS BY PARK TYPE AND TRAVEL MODE (PLAN VS. BASELINE, 2035)

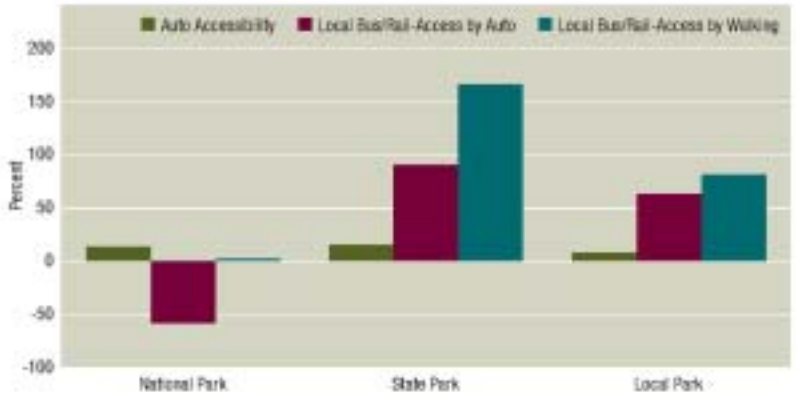


Figure 5.15: Comparison of Park Accessibility Improvements by Park Type and Travel Mode displays the improvement of park accessibility by park type: national park, state park and local parks. The results reveal that there will be significant improvements in accessibility to both state and local parks by all three travel modes. However, the accessibility to the national parks shows minor improvement, and even decreases for the mode of local bus/rail-access by auto.

PLAN EXPENDITURES/INVESTMENTS

SCAG reports expenditure distribution in several ways. First, SCAG estimates the share of total RTP expenditures allocated to each category of household income. This is done by totaling expenditures on each type of mode (bus, HOV lanes, commuter/high-speed rail, highways/arterials, and light/heavy rail). These expenditures are then allocated to income categories based on each income group's tendency to use these modes.[9]

[9] Caltrans. Desktop Guide: Environmental Justice in Transportation Planning Investments. January 2003.

SCAG analyzed the distribution of Plan expenditures based on mode usage information by income quintile. As illustrated in Figure 5.16: Distribution of Plan Expenditures by Income Category, approximately 28 percent of Plan investments will be invested in modes predominantly used by the lowest quintile group, while 16 percent will be invested in modes used by the highest-income category (Quintile V). A total of 68 percent of transportation investments would go to modes likeliest to be used by the lower-three-income households in the 2008 RTP.

FIGURE 5.16 DISTRIBUTION OF PLAN EXPENDITURES BY INCOME CATEGORY

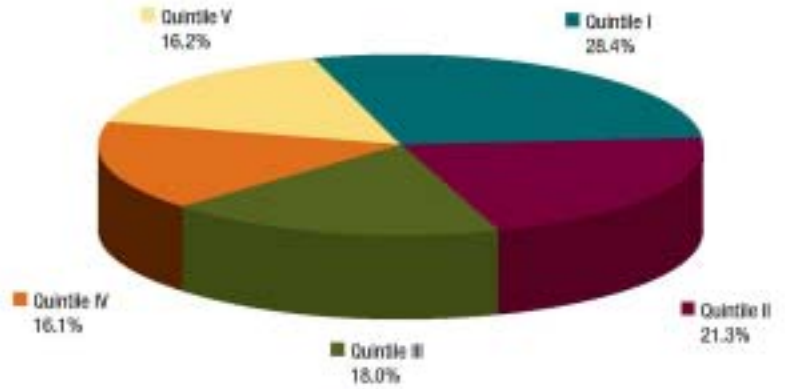

Figure 5.17: Distribution of Plan Expenditures by Ethnic/Racial Category evaluates the allocation of transportation investments in modes used by various ethnic/racial categories. The current analysis reveals that under the 2008 RTP, Plan investments will be distributed more equitably on the basis of system usage by ethnic/racial groups.

AR0072585

FIGURE 5.17 DISTRIBUTION OF PLAN EXPENDITURES BY ETHNIC/RACIAL CATEGORY

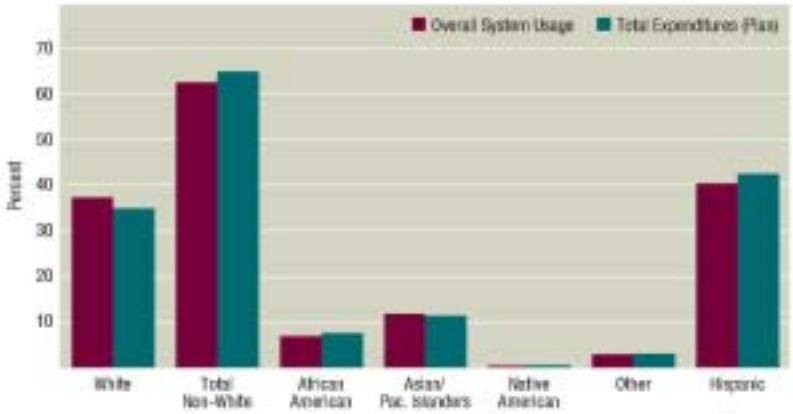

FIGURE 5.18 SHARE OF TAXES PAID BY INCOME CATEGORY*

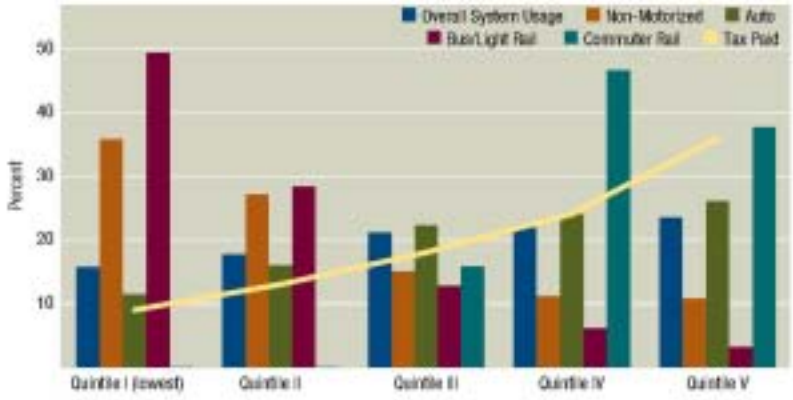


* The contents in this chart use both work and non-work trips; rail capacity uses only work trip data.
* Share of Tax Paid includes sales and gasoline taxes.

TAXES PAID

The 2008 RTP environmental justice analysis performed a comparative analysis of the amount of taxes (sales, gasoline, and income) paid by five income groups. Figure 5.18: Share of Taxes Paid by Income Category, indicates that tax burdens are expected to fall heavily on higher-income groups. The lower-income groups (Quintile I and Quintile II), which use bus and light rail as their primary modes of travel, are anticipated to pay 22 percent of taxes.

DISTRIBUTION OF TRAVEL TIME SAVINGS

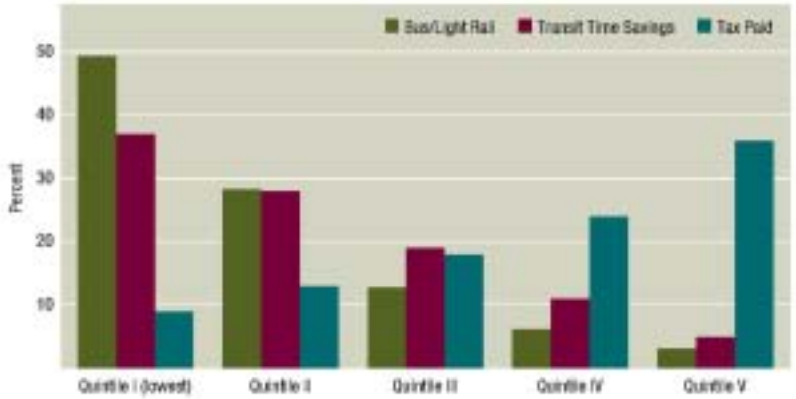
This analysis involved measuring the average travel time for both work trips and non-work trips. SCAG assesses the distribution of travel time savings that are expected to result from the Plan's implementation. SCAG conducted this analysis for transit (i.e. bus and light rail) and automobile. These travel time savings were reported as a proportion of the total travel time savings for each mode.

Figure 5.19: Share of Transit System Usage, Transit Travel Time Savings, and Taxes Paid, shows the results for low-cost transit modes, such as local bus and light rail, for the five income groups. According to the 2008 RTP analysis, the two lowest-income quintiles will pay just over 20 percent of total taxes collected in the region, but will enjoy 65 percent of the transit time savings. The two highest-income quintiles share of taxes (60 percent) will exceed the benefits they receive in local transit time savings (16 percent) and account for only 9 percent of total bus and light rail usage. The findings indicate that

AR0072586

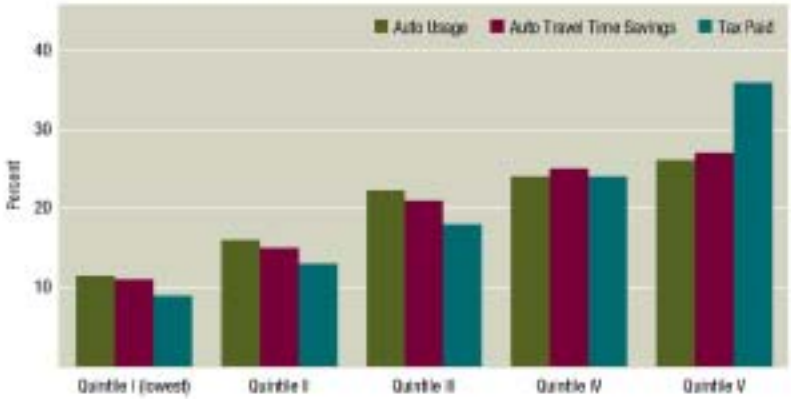
transit travel times for lower-income groups for both work and non-work trips are expected to decrease due to the number of new bus and rail improvements proposed in the 2008 RTP.

FIGURE 5.19 SHARE OF TRANSIT SYSTEM USAGE, TRANSIT TRAVEL TIME SAVINGS, AND TAXES PAID



Results are also shown for trips made by automobile. Figure 5.20: Share of Auto Usage, Auto Travel Time Savings, and Taxes Paid, illustrates that the share of benefits is proportionate to the share of taxes paid. Higher-income groups are anticipated to have the most benefit in auto travel time savings, but will also incur the highest taxes. This can be attributed to the fact that higher-income groups (Quintiles IV and V) have higher access to private automobiles and will use this as their primary mode of travel. However, that benefit comes at a steep price, as the two highest-income quintiles pay for 60 percent of total taxes.

FIGURE 5.20 SHARE OF AUTO USAGE, AUTO TRAVEL TIME SAVINGS, AND TAXES PAID



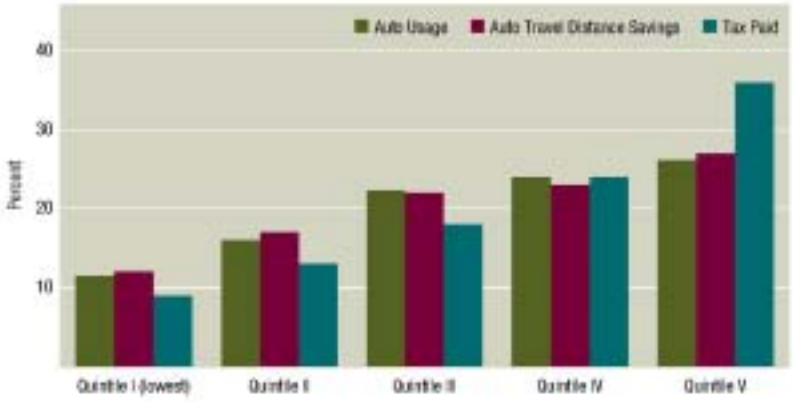
TRAVEL DISTANCE REDUCTIONS

Another way of estimating benefits is to calculate savings in terms of person-miles traveled (PMT). These results indicate that the share of auto travel distance savings, like that for time savings, generally resembles the share of usage and taxes paid.

The underlying assumption for Figure 5.21: Share of Auto Usage, Auto Travel Distance Savings and Taxes Paid, is that the share of auto travel distance savings is generally proportionate to the share of taxes paid and transportation system usage between all income groups. The taxes paid by the highest,income group (36 percent) are anticipated to exceed their share of benefits (27 percent). The lowest,quintile group is expected to have the least amount of benefits, accounting for 12 percent of auto usage and travel distance savings. They will also pay the least amount of taxes at 9 percent. Higher,income groups are anticipated to have the most benefits because their primary mode of travel will be the automobile.

AR0072587

FIGURE 5.21 SHARE OF AUTO USAGE, AUTO TRAVEL DISTANCE SAVINGS AND TAXES PAID



ENVIRONMENTAL IMPACTS

Transportation projects can have both a positive or negative impact on the environment. On the one hand, investments can cause travelers to shift to less-polluting modes (e.g., bus, train, carpooling, or commuter rail). On the other hand, investments that increase traffic on a particular facility usually degrade air quality in the immediate vicinity of that facility.[10]

Air Pollutant Emissions

Minorities and low-income groups may be particularly vulnerable to the effects of air pollution. SCAG's analysis is based on emissions estimates for pollutants that have localized health effects: carbon monoxide (CO) and particulate matter (PM). Analysis was also conducted for PM exhaust emissions from heavy-duty vehicles, an indicator for diesel toxic air contaminants. The results were computed based on the average emissions at the TAZ level and weighted according to the population of each ethnic or income group in that TAZ. This analysis focuses on air emissions and noise impacts generated from aviation and highway activity.

It is important to note that total emissions of all pollutants in the region will decrease compared to existing conditions with or without the Plan, due to the combination of measures being taken to meet air quality standards. Since the Plan must demonstrate conformity with regional air quality management plans that call for reductions in emissions of air pollutants, the Plan itself will likewise result in reductions of pollutant emissions. This is generally because the Plan investments will alleviate roadway congestion and provide a greater range of alternatives to the use of a car. The following analysis, however, is based on a comparison of Plan to Baseline conditions, rather than a comparison of Plan to current conditions.

Since ambient pollutant concentration levels that are directly linked to localized emissions could not be easily estimated, the geographic emissions distribution analysis presented here focuses on pollutants that tend to have localized effects which are generally proportionate to emissions—carbon monoxide (CO) and fine particulate matter (PM10). The analysis does not cover pollutants that do not have localized effects proportionate to emissions, but are regionally distributed as a result of chemical interactions, photochemical reactions and meteorology (VOC, NOx, and SOx).

In addition, this methodology assumes that all residents in a given TAZ are equally exposed. Generally, both CO and PM10 tend to impact those located closest to the source of emissions. Thus, in a TAZ containing a roadway, those closest to the roadway would experience greater emissions and potential health impacts than those located further away. This differential as it might exist within TAZs is not addressed by this analysis; only differences between the aggregate demographic totals of different TAZs are addressed. Notwithstanding these assumptions, the methodology presents a reasonable gross measure of air quality impacts of mobile sources in the region.

[10] Caltrans. Desktop Guide: Environmental Justice in Transportation Planning Investments. January 2003.

AR0072588

FIGURE 5.22 DECREASE IN AIR POLLUTANT EMISSIONS BY INCOME CATEGORY (PLAN VS. BASELINE, 2035)

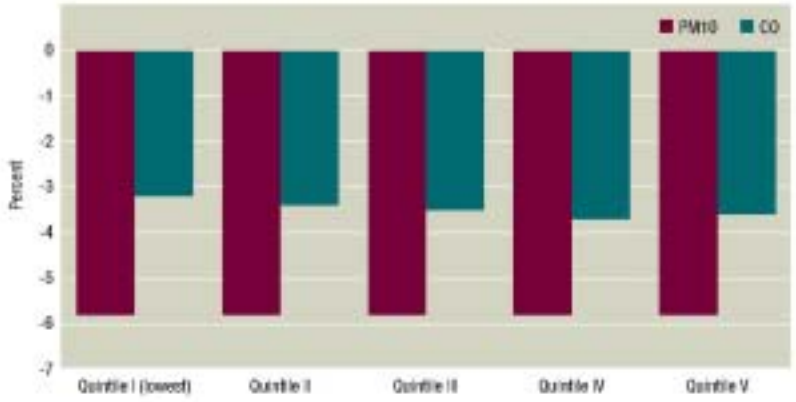


FIGURE 5.23 DECREASE IN AIR POLLUTANT EMISSIONS BY ETHNIC/ RACIAL CATEGORY (PLAN VS. BASELINE, 2035)

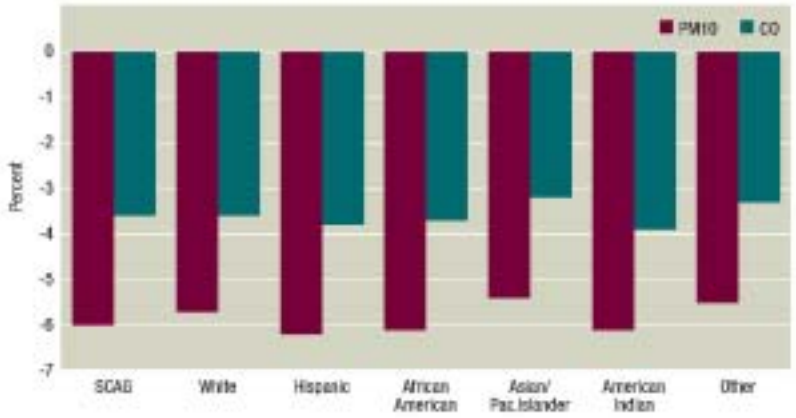

Overall, the region as a whole will generally experience an improvement in air quality via reductions in transportation-related emissions. As illustrated by Figure 5.22: Decrease in Air Pollutant Emissions by Income Category, and Figure 5.23: Decrease in Air Pollutant Emissions by Ethnic/Racial Category, on a regional scale, all income and ethnic groups will experience reductions in PM10 and CO under the Plan.

Aviation Noise Impacts

The SCAG Region supports the nation's largest regional airport system in terms of number of airports and aircraft operations, operating in a very complex airspace environment. One significant challenge is striking a balance between aviation capacity needs of Southern California with local quality-of-life constraints for the affected populations.

Projected noise impacts from aircraft operations at the region's airports in 2035 were modeled for inclusion in the PEIR for the RTP. For each airport, modeling produced a contour or isoline for the 65 dB Community Noise Equivalent Level (CNEL), a measure of noise that takes into account both the number and the timing of flights, as well as the mix of aircraft types. The Federal Aviation Administration (FAA) considers residences to be an "incompatible land use" with noise at or above 65dB this CNEL level.

To identify potentially impacted populations, the anticipated population within the 65 dB CNEL contour was calculated by the following steps:

1. Calculating the percentage of TAZs that would lie within a 65 dB CNEL contour
2. Assigning the SCAG projected population to the TAZ
3. Applying the demographic breakdown of the TAZ as a whole to the population within the 65 dB CNEL contour

For the purposes of this study, Aviation Noise Areas are defined as areas that are adversely affected by aircraft and airport noise. Figure 5.24: Distribution of Households in Aviation Noise Areas by Income Category, demonstrates that there is a marginal disproportionate impact between each income group in the 2008 RTP, which is similar to the findings in the 2004 RTP. The disparity between the lowest and highest quintile groups is approximately 7 percent. Each income quintile (by definition) contains 20 percent of the region's

AR0072589

households in 2035. Under the 2008 RTP, the lowest-income group (Quintile 1) will represent 23 percent of the households impacted by noise above the 65 dB CNEL.

FIGURE 5.24 DISTRIBUTION OF HOUSEHOLDS IN AVIATION NOISE AREAS BY INCOME CATEGORY (PLAN VS. BASELINE, 2035)

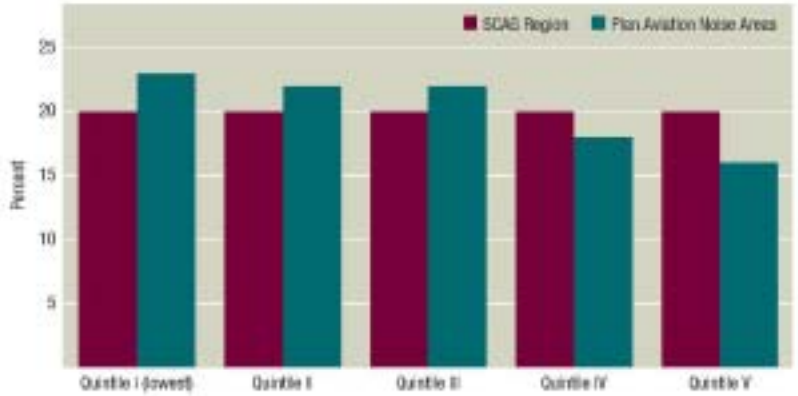

FIGURE 5.25 DISTRIBUTION OF HOUSEHOLDS IN AVIATION NOISE AREAS BY ETHNIC/RACIAL CATEGORY (PLAN VS. BASELINE, 2035)

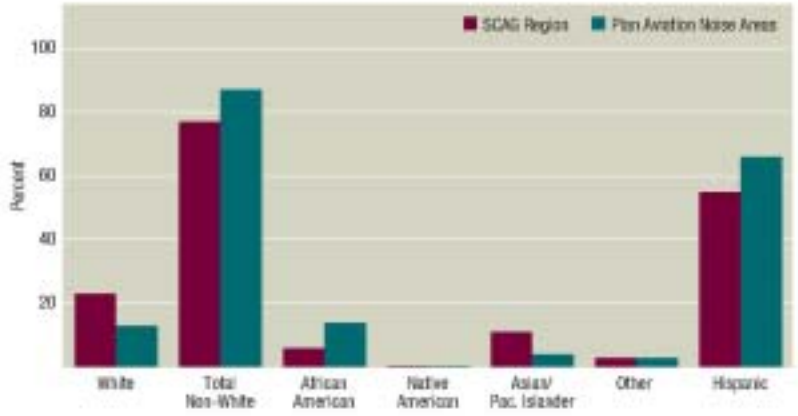

Figure 5.25: Distribution of Households in Aviation Noise Areas by Ethnic/Racial Category, indicates that the 2008 RTP is projected to have a disproportionate aviation noise impact on minority groups. Although non-whites will comprise 77 percent of the region's population in 2035, they will make up 87 percent of those affected by the 65 dB CNEL contour. In particular, 66 percent of the impacted population will be Hispanics, which is a 20 percent increase from the 2004 RTP.

Although the gap between the income groups is projected to be a marginal difference, the environmental justice analysis results demonstrate that lower-income and minority residents still bear a disproportionate burden from aviation noise pollution with the 2008 RTP.

Highway Noise Impacts

Noise associated with highway traffic depends on a number of factors that include traffic volumes, vehicle speed, vehicle fleet mix (cars, trucks), as well as the location of the highway with respect to sensitive receptors. According to Federal Highway Administration (FHWA) guidance, noise impacts occur when noise levels increase substantially when compared to existing noise levels. For the purposes of this analysis, noise increases of 3 dB along highways, where noise levels are currently, or would be in the future above 66 dB, are considered to be significant, regardless of adjacent land use.

The demographic characteristics of each impacted TAZ portion were aggregated and compared with the regional demographics to determine if there would be any disproportionate impacts to any of the demographic groups identified. This approach identified a marginal disproportionate impact between each income group (see Figure 5.26: Distribution of Households in Highway Noise Areas by Income Category). The lowest-income group will account for 22 percent of the affected population in 2035. There is a 6 percent difference between the lowest- and the highest-income quintiles.

AR0072590

FIGURE 5.26 DISTRIBUTION OF HOUSEHOLDS IN HIGHWAY NOISE AREAS BY INCOME CATEGORY (PLAN VS. BASELINE, 2035)

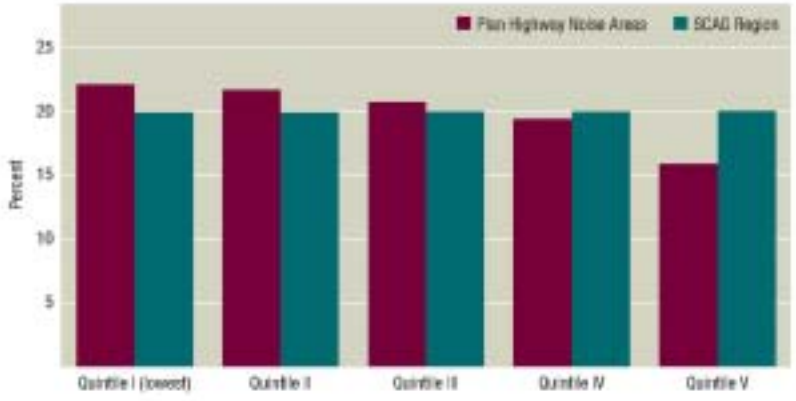

FIGURE 5.27 DISTRIBUTION OF HOUSEHOLDS IN HIGHWAY NOISE AREAS BY ETHNIC/RACIAL CATEGORY (PLAN VS. BASELINE, 2035)

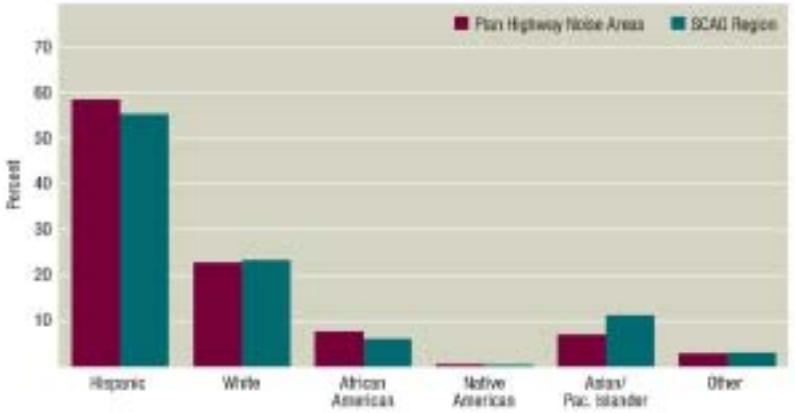


The 2008 RTP also found that minority populations were primarily affected by highway noise impacts. Figure 5.27: Distribution of Households in Highway Noise Areas by Ethnic/Racial Category, indicates that minority populations, specifically Hispanics, would be disproportionately impacted by highway noise. Approximately 59 percent of Hispanics would be residing in highway noise areas by 2035.

The identification of these disparate highway noise impacts at the regional level can be attributed to the issue of incompatible land use, where high-polluting transportation projects, such as freeway construction, airport expansions, or rail extension projects, are located in minority-populated neighborhoods. Corridor-level analysis should be conducted for proposed projects in areas where burdens are concentrated. In addition, the 2008 RTP proposes mitigating these impacts to the extent possible, for example, by requiring new soundwalls where freeway expansions are proposed. Furthermore, the RTP also proposes grade crossings, new technologies, and other clean technologies for goods movement corridors.

AR0072591

NEW SOCIAL EQUITY ELEMENTS

In addition to the performance measures analyzed above, the 2008 RTP environmental justice analysis has undertaken new components. Summarized below are the new initiatives that have either directly or indirectly resulted from the previous environmental justice discussions and comments received.

- Accessibility: In the 2004 RTP environmental justice analysis, SCAG analyzed the percentage of jobs accessible within 45 minutes. The 2008 RTP analysis instead used 30 minutes to calculate accessibility. SCAG determined that the 30-minute travel-time criterion was more indicative of accessibility to the locations of employment services.
- Trips: In the 2008 RTP, both work and non-work trips were analyzed. Previous RTP environmental justice analysis included only work trips. In this analysis, both work and non-work trips were calculated for each TAZ. Incorporating non-work trips into the analysis provides a more accurate determination of allocation of benefits and burdens for each of the performance measures.
- Access to Parks: In response to the comments on the draft 2008 RTP Environmental Justice analysis, SCAG conducted additional and new analysis on accessibility to parks from the perspective of the long-range regional transportation plan.
- County Data: In response to the comments received on the draft 2008 RTP Environmental Justice analysis, SCAG prepared additional and new analysis on a countywide level. This information is included as supplementary information. (See Environmental Justice Report, pages 26 through 28.)

CONCLUSION

The 2008 RTP seeks to identify and address Title VI of the Civil Rights Act and any environmental justice implications of the planning processes and investment decisions. It is critical for SCAG and policy-makers alike to ensure that their transportation programs, policies, and activities serve all segments of the region without generating disproportionately strong and adverse effects.

Economic Impact Analysis

DECLINE IN EMPLOYMENT GROWTH RATE

As revealed in current and previous RTP growth forecasts, the region's employment growth will slow down considerably after 2010, compared with historical trends. This sharp and unprecedented decline in job growth as well as underlying changes in the makeup of the labor force in the region are due primarily to a large number of "Baby Boomers" starting to reach the age of retirement. The share of total population and households of elderly and retired persons in the region is projected to double from today. These households are more likely to be headed by minorities (i.e., non-Hispanic White householders).

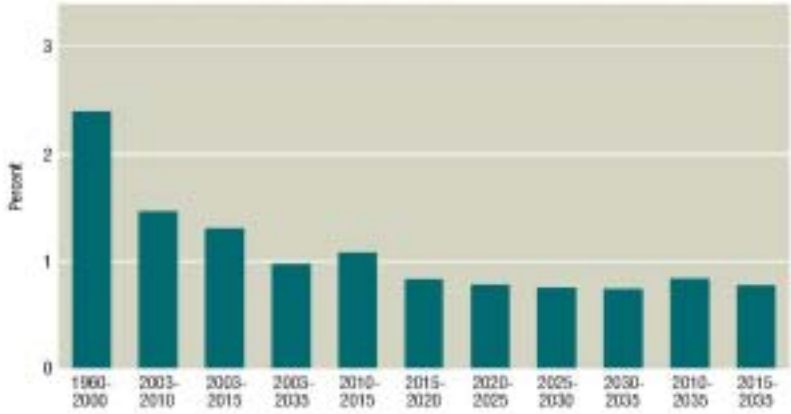
Unlike the 1960–2000 period, the region will not have a large labor force to support a relatively small retired population. Instead, the region will experience a situation in which a smaller labor force made up of minority households will be supporting a relatively large retired population made up of non-minority households. Increased by immigration, these minority households will be larger, consist of multiple generations, and be headed by younger individuals in the workforce. The size of our labor force as well as employment growth will be sensitive to these changes in demographics.

AR0072592

During the 2003–2035 forecast period, employment growth will be constrained by the size of the anticipated labor force. A major challenge for the region will be to prepare and match younger workers with future jobs. Matching needed skills and education levels with new and especially better-paying future jobs will affect migration trends and immigration levels. These impacts will be felt the most after 2010. During the last 40 years (1960–2000), while the region expanded its job base at an annual compound growth rate of 2.4 percent, the region's job growth rate is now projected to be only 0.84 percent during the 25-year period between 2010 and 2035 (Figure 5.28).

This is about one-third of what was achieved in prior decades. The projected employment growth trends after 2010 suggest an imbalance between the size of the labor force, the retired population that employed workers must support, and the amount of job growth that can be achieved. As a result, the regional economy is expected to face tremendous downward pressure and may not be able to produce the jobs, wealth, and prosperity that it did in prior decades. The economic health of the region is tied to job growth, particularly the creation of high-paying jobs that match the skills and education level of the region's future workforce made up primarily of households headed by minority populations.

FIGURE 5.28 HISTORICAL AND PROJECTED SCAG REGION EMPLOYMENT GROWTH RATES



PUBLIC- AND PRIVATE-SECTOR INVESTMENTS

The 2008 RTP proposes investing $234 billion in 2007 constant dollars (or $412 billion) from public funding sources between 2007 and 2035. In addition, consistent with strategies laid out in previous SCAG RTPs, the 2008 RTP continues to emphasize using innovative financing tools, such as user-based fees and direct investment from the private sector to address challenges limiting transportation revenue growth, constraining transportation investments, and enlarging gaps in unmet transportation demand. The innovative funding revenues which are deemed reasonably available for the 2008 RTP planning horizon are projected to be around $75.6 billion in 2007 constant dollars (or $125 billion in nominal dollars)[11] between 2007 and 2035.

The economic impacts from private-sector-funded projects are different from those funded by tax dollars. Since transportation projects funded by retail sales and gasoline tax revenues are simply extensions of past economic trends, most of their economic impacts are reflected either in the existing employ-

[11] Including additional gas tax and sales tax of $12 billion in 2007 constant dollars

AR0072593

ment base, or in the baseline employment growth forecast. However, enabling private sector engagement in transportation investments through innovative financial arrangements will generate and create new economic activities not experienced before and not captured by past historical trends. As a result, private-sector investments in transportation infrastructure will work to boost regional economic and job growth above the Baseline growth forecast (Economic Impact Analyses for the 1998, 2001, and 2004 RTPs).

The impacts of the RTP expenditures were estimated using the economic input/output model (IMPLAN) and are presented in Table 5.6. The implementation of public-sector-funded infrastructure projects recommended in the 2008 RTP is projected to account for almost 120,000 jobs annually, while projects proposed in the RTP funded through innovative financing would create a net additional 32,800 jobs annually during the planning period.

TABLE 5.6 AVERAGE ANNUAL ECONOMIC IMPACTS FOR 2008 RTP (DIRECT, INDIRECT AND INDUCED IMPACTS)

	Average Annual Investment (Millions $2007)	Employment (No. of Jobs)	Output (Millions $2007)	Income (Millions $2007)
Public Sector	$8,540	119,600	$15,300	$4,200
Private Sector	$2,700	32,800	$4,890	$1,220

AR0072594

VI. IMPLEMENTATION AND MONITORING

This section discusses how SCAG, as the MPO for the six-county region, monitors the implementation of the 2008 RTP and monitors its progress in achieving its stated goals and system performance.

As discussed in Chapter II, the 2008 RTP comes at a time of great challenges. SCAG and its partners believe they have addressed these challenges from a planning perspective. However, as with any plan, its success or failure depends on the execution.

SCAG intends to continue its longstanding role as the monitoring agency for Plan implementation in all its facets.

Implementing the RTP

REGIONAL TRANSPORTATION IMPROVEMENT PROGRAM (RTIP)

The RTIP is the tool for the Metropolitan Planning Organizations (MPOs) to monitor and implement their RTP. The RTIP is updated every two years, the most recent being in 2006.

The RTIP provides a listing of projects proposed for implementation in the Region during the six-year period covered by the document. The RTIP projects are described in detail, including the funding amounts allocated by source and fiscal year. RTIP projects are categorized according to the transportation system to which they apply: state highways, local highways, or transit.

The passage of SAFETEA-LU in 2005 has created additional requirements for the RTP and RTIP, including an expanded public participation plan with expanded consultation requirements, the use of visualization techniques, publication of an annual list of obligated projects and the requirement that all regionally significant projects be listed individually.

One of the first steps in RTP implementation is that during each RTIP development cycle, SCAG provides the county transportation commissions (CTCs) and Imperial Valley Association of Governments (IVAG) with RTIP Guidelines. The RTIP Guidelines are used by the counties in the development of their county transportation improvement programs (TIPs). These Guidelines are consistent with SAFETEA-LU and the Metropolitan Transportation Programming final rule: 23 CFR Parts 450 and 500, and 49 CFR Part 613.

The RTP non-motorized, rideshare, ITS, and TDM investments were developed in consultation with the county transportation commissions and the IVAG. These investments are annualized in the RTIP Guidelines in order to provide the county transportation commissions and IVAG with average yearly investments. The investments are reflected in the RTIP Guidelines by category in order to facilitate monitoring and ensure RTP implementation.

The RTIP Guidelines also contain the RTP constrained project listing. The counties need to program these projects for initiation within an appropriate time frame to ensure that they become operational during the time frame indicated in the RTP.

The projects identified within the RTP and RTIP must be financially constrained. The RTIP Guidelines provide the RTP funding forecasts for the programming years associated with the RTIP cycle under development. The CTCs and IVAG should program within the RTP forecasts. If a county programs more in project costs than can be accommodated by the RTP financial forecasts, then appropriate justification must accompany the county TIP documentation and be accepted by SCAG prior to TIP approval.

CONGESTION MANAGEMENT PROCESS

The Congestion Management Process as implemented in the SCAG region provides for a comprehensive and integrated transportation planning process that links together the RTP, RTIP, and county-level Congestion Management Programs.

BACKGROUND

The United States Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) requires the development, establish-

AR0072596

ment and implementation of a Congestion Management Process which is fully integrated into the regional planning process.

The Federal Highway Administration defines the congestion management process as a "systematic approach required in transportation management areas (TMAs) that provides for effective management and operation, based on a cooperatively developed and implemented metropolitan-wide strategy, of new and existing transportation facilities eligible for funding under Title 23 U.S.C. and Title 49 U.S.C., through the use of operational management strategies."

SCAG's Congestion Management Process is a comprehensive strategy designed to relieve traffic congestion and maintain high levels of service on roadways within the Southern California region. SCAG has facilitated efforts by counties and subregions to develop County-level Congestion Management Programs (CMPs) in cooperation with regional and subregional transportation providers, local governments, Caltrans, and the South Coast Air Quality Management District.

In the SCAG region, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties are contained within Transportation Management Areas (TMAs). The Federal Highway Administration (FHWA) defines TMAs as the following:

1. All urbanized areas over 200,000 in population, and any other area that requests such designation
2. An urbanized area with a population over 200,000 (as determined by the latest decennial census) or other area when TMA designation is requested by the governor and the MPO (or affected local officials), and officially designated by the administrators of the FHWA and the FTA. The TMA designation applies to the entire metropolitan planning area(s) (23CFR500)

The County Transportation Commission in each county also functions as a Congestion Management Agency (CMA) under California regulations. To meet the federal Congestion Management Process requirements, SCAG and the county CMAs have come together to develop a Congestion Management Process for the region. Under California law, the Congestion Management Programs (CMPs) are prepared and maintained by the respective CMAs:

- The Los Angeles County Metropolitan Transportation Authority (LACMTA)
- The Orange County Transportation Authority (OCTA)
- The Riverside County Transportation Commission (RCTC)
- The San Bernardino Associated Governments (SANBAG)
- The Ventura County Transportation Commission (VCTC)

AR0072597

With the exception of small portions of Riverside and San Bernardino Counties, all counties within the TMA are designated as ozone non-attainment areas. SCAB covers the urbanized portions of Los Angeles, Orange, Riverside, and San Bernardino Counties.

Federal funds may not be programmed in the carbon monoxide and ozone non-attainment areas of the Transportation Management Areas (TMAs) for any project that will result in a significant increase in single-occupant vehicle (SOV) capacity unless that project is addressed through a CMP.

The CMPs work in collaboration with the AQMP in several areas, but most significantly through the TCMs. Most TCM projects identified in the RTIP are designed to help relieve congestion at the local level. Thus, implementation of the AQMP helps local governments tackle congestion, which, in turn, reduces emissions from idling vehicles or the number of vehicles traveling on congested roadways, and also helps maintain service level standards. At the same time, the CMP process provides local governments with a mechanism to contribute to the regional effort toward attaining the NAAQS.

REGIONAL CONGESTION MANAGEMENT ELEMENTS

In compliance with the sections of the Metropolitan Planning Regulations [23 U.S.C. 134 and 49 U.S.C. 5303- 5305], SCAG's Congestion Management Process comprises the following Regional Congestion Management Elements:

- The Regional Transportation Plan (RTP)
- The counties' Congestion Management Programs (CMPs)
- The Regional Transportation Improvement Program (RTIP)

The functionality of each element is described in the following sections.

Regional Transportation Plan (RTP)

SCAG's RTP establishes overall long-term mobility policies for the movement of people and goods, including congestion relief strategies for all regionally significant facilities and activities (projects and programs).

Congestion Management Program (CMP)

There are five CMAs in the SCAG region and each develops a CMP for their respective county. The degree of urbanization varies from one county to another and consequently the magnitude of congestion will also vary. The CMPs' efforts have been brought together on a regionwide basis and integrated into the SCAG regional planning process.

SCAG's Regional Council and the Regional Transportation Agencies Coalition ensure consistency between the county CMPs and SCAG's RTP and RTIP, through project implementation.

In 1995, SCAG and the CMAs developed the following criteria to ensure consistency and compatibility between the regional transportation planning process and the county congestion management process:

- CMP consistency with the current RTP
- Interregional (inter-county) coordination between the CMPs' goals and objectives
- Consistency between countywide model/database and SCAG's model/database
- All regionally significant CMP projects are to be modeled and incorporated into SCAG's Regional Transportation Modeling System (network)

The purpose of these criteria is to hold each county CMP responsible for the goals and objectives of SCAG's RTP. Compliance with the above criteria is essential, particularly for CMP projects that are going to be programmed into the SCAG RTIP.

AR0072598

TABLE 6.1 CMPS IN THE SCAG REGION

County	Congestion Management Agency (CMA)	Congestion Management Program
Los Angeles	Los Angeles County Metropolitan Transportation Authority (LACMTA)	2004 Congestion Management Program for Los Angeles County (Updated Statement of Conformity issued in 2007)
Orange	Orange County Transportation Authority (OCTA)	2007 Orange County Congestion Management Program (November 2007)
Riverside	Riverside County Transportation Commission (RCTC)	2006 Riverside County Congestion Management Program
San Bernardino	San Bernardino Associated Governments (SANBAG)	2005 Congestion Management Program for San Bernardino County
Ventura	Ventura County Transportation Commission (VCTC)	2005 Ventura County Congestion Management Program

All county CMPs share the same goal of reducing congestion and applying congestion relief strategies. However, there are different priorities in the selection of related strategies based on the needs of each county. Therefore, each county CMP differs in form and local procedure. By state statute, all CMPs must perform the same functions outlined below and must be consistent with the federal requirements.

Highway Performance - Each CMA monitors the performance of an identified highway system. This allows each county to track how their systems, and their individual components, are performing in comparison to established standards, and how performance changes take place over time.

MultiModal Performance - In addition to highway performance, each CMP contains an element to evaluate the performance of other transportation modes, including transit.

Transportation Demand Management (TDM) - Each CMP contains a TDM component geared to reducing travel demand and promoting alternative transportation methods.

Land-Use Programs and Analysis - Each CMP incorporates a program to analyze the impacts of local land-use decisions on the regional transportation system.

Capital Improvement Program (CIP) - Using data and performance measures developed through the activities identified above, each CMP develops a CIP. This becomes the first step in developing the County TIP. Under state law, projects funded through the Regional Transportation Improvement Program (RTIP) must first be contained in the CMP.

Deficiency Plan – Despite the above-stated efforts, when unacceptable levels of congestion occur, the respective CMP contains a set of "deficiency plan"

AR0072599

provisions to address the problems. Deficiency plans may be developed for specific problem areas or on a countywide-system basis. Projects implemented through the deficiency plan must, by statute, include both mobility and air quality benefits. In many cases, the deficiency plan captures the benefits of the transportation projects beyond the SCAG RTIP such as non-federally funded/non-regionally significant projects.

Information on the CMP activities and resulting data are updated on a biennial basis by each CMA and supplied to SCAG and the respective air quality management district.

Regional Transportation Improvement Program (RTIP)

All federally funded congestion relief strategies (projects and programs) are programmed into the RTIP in the SCAG region. Under state law, the CMP projects must be incorporated into the RTIP in order to receive federal and state funds. Under federal law, the RTIP must be updated every four years for funding. Note that the CMP documents list additional projects which are 100% locally funded and not regionally significant, such as the transportation demand management (TDM) and bike lane projects, as these also cumulatively help mitigate congestion.

In non-attainment and maintenance areas, the RTIP projects as a whole, including congestion relief projects, must fulfill the Transportation Conformity requirements. In project-level analysis, the projects requiring federal action (funding or approval) are subject to Environmental Impact Study (EIS) through the National Environmental Policy Act (NEPA). This is an evaluation and analysis of the alternatives. The selected alternative will then be incorporated into the RTP and RTIP for implementation.

Regionally Significant Transportation Investment Studies

Within the context of regional transportation planning, the first step toward strategy or program development is the Regionally Significant Transportation

Investment Study (RSTIS), or a corridor feasibility study of alternatives including a National Environmental Policy Act (NEPA) "purpose and need" statement and preliminary environmental documentation.

SCAG, in cooperation with other stakeholders, will approve the initiation and scope of an RSTIS. Before a project may be included in the RTIP for construction, the project must be one of the alternatives in a completed RSTIS, and must have a completed project initiation document and cleared environmental documents.

Regionally significant alternatives must be evaluated by the RTP performance measures in order to be considered for incorporation in the RTP. RSTIS analyses are currently being performed for corridors in the region, including the South Orange County Major Investment Study and the Orange County/Los Angeles Intercounty Transportation Study. The 2008 RTP includes alternative modes and technologies (intelligent transportation vehicle and highway systems), general alignment, number of lanes, the degree of demand manage-

AR0072600

ment and operating characteristics. Furthermore, an RSTIS is required to evaluate the effectiveness and cost-effectiveness of alternatives in attaining local, regional, state and national goals and objectives. This analysis considers the direct and indirect costs (of capital, operating and maintenance, and rights-of-way) of alternatives; benefits or impacts of mobility improvements; air quality requirements; social, economic and environmental impacts, including environmental justice; safety, operating efficiencies; financing (federal, state and private sources); energy consumption; and public outreach. The results of the RSTIS help shape decisions by SCAG, in cooperation with participating public and private organizations, on the design and scope of the investment for the RTP. The preferred alternative of an RSTIS must meet the performance and financial criteria established by the RTP, and it must be approved by the Regional Council before being included in the RTP and RTIP.

An RSTIS is eligible for funds authorized under Sections 8, 9 and 26 of the Federal Transit Act, state planning funds, as well as planning and capital funds appropriated under Title 23, United States Code.

RSTIS or other analyses are appropriate when regionally significant investments in the RTP have not developed sufficient environmental analysis, design concept and scope (mode and alignment not fully determined). In cases requiring further analysis, the RTP may stipulate either a set of assumptions concerning the proposed improvement or a no-build condition pending the completion of a corridor or sub-area analysis. In either case, the RTP provides enough detail to provide a plan conformity determination.

Monitoring Our Progress

As the designated MPO for the six-county region, SCAG monitors transportation plans, projects and programs for consistency with regional plans. SCAG also monitors the performance of the transportation system. This performance monitoring is especially important to the planning process for future RTPs. It is impossible to solve our regional transportation problems unless we are able to identify and measure them effectively.

SCAG prepares the RTP using performance-based measures that help public officials to better analyze transportation options and trade-offs and make informed decisions. By examining the performance of existing systems over time, SCAG monitors trends and identifies regional transportation needs that may be considered in the RTP. Performance measurements help clarify the link between transportation decisions and eventual outcomes, thereby improving the discussion of planning options and communication with the public. This also helps determine which improvements provide the best opportunities for maximizing the system's performance within the defined constraints.

SCAG has developed performance measures (see Chapters I and V) for the regional transportation system. New tools are also being developed that will help SCAG monitor system performance over time. The Freeway Performance Measurement System (PeMS), developed by UC Berkeley, Caltrans, and the California Partners for Advanced Transit and Highways (PATH), has the ability to measure freeway speeds, delay, and reliability for the regional freeway system. SCAG monitors a number of performance measures through a benchmarking process in the annual State of the Region report.

AR0072601

Transportation planning for the region requires continually improved information on the condition and utilization of the transportation system. Special reports are required periodically from SCAG to show the condition of the highway infrastructure and to monitor the region's overall traffic. The Highway Performance Monitoring System (HPMS) is a federally mandated program designed by the Federal Highway Administration (FHWA) to assess the performance of the nation's highway system. Under the Clean Air Act, SCAG is also required to report periodically on vehicle miles traveled in each air basin to determine whether traffic growth is consistent with the projections on which the State Implementation Plans (SIPs) are based.

The HPMS is one of the components of an Internet-based transportation system currently under development, the Regional Transportation Monitoring Information System (RTMIS). RTMIS is the source for real-time and historical transportation data collected from different local and regional transportation agencies as well as from private data sources. Based on a GIS mapping system, RTMS will be the main monitoring system for collection and distribution of highway and transit data, local and regional traffic information and activities, as well as hosting the subregional transportation monitoring programs.

The following sections outline several of the significant tools used by SCAG to monitor regional progress in advancing the 2008 RTP.

RTIP DATABASE MANAGEMENT

To manage the RTIP process efficiently, SCAG has developed a web-based RTIP database. The new RTIP database serves as a listing for projects in the RTIP, as well as a mechanism for monitoring implementation of these projects. The new database includes a mapping component that allows the CTCs to view all the RTIP projects that have been modeled. The new database will play a pivotal role in the creation of an audit trail for programmed projects. Moreover, it will also make it easier to submit the draft and final RTIP lists to Caltrans and the California Transportation Commission for their review and approval. The CTCs, Imperial Valley Association of Governments and SCAG staff are responsible for inputting this data into the RTIP database. Once the SCAG Regional Council has approved the RTIP, the data is then transmitted to Caltrans for incorporation into the statewide database, or California Transportation Improvement Program System (CTIPS).

CONFORMITY

In federally designated non-attainment or maintenance areas, specific monitoring procedures and tests for conformity are required under the federal Transportation Conformity Rule. At the time of conformity determination, the RTIP must be consistent with the RTP. At any given time, there is only one federally approved and conforming RTP and RTIP in place as the operating documents. During project implementation, sponsor agencies must implement only those projects that are consistent with the conforming RTIP and RTP. The project design concept and scope also must be consistent with those reflected in the conforming RTIP.

SCAG must be informed of any projects that are regionally significant and modeled, regardless of their funding sources. Project sponsors must also inform SCAG (as the region's MPO) of any delay in implementing any TCM projects that are included in an approved SIP. In association with the CTCs and the TCWG, SCAG must report on the timely implementation of TCMs. The Timely Implementation Report is provided in the 2008 RTP Conformity Report. If a project cannot be implemented, the sponsor agency must officially substitute or replace the affected TCM project.

Additionally, SCAG monitors legal, legislative, and election processes that may impact the transportation conformity requirements, the implementation of any TCM or regionally significant projects. SCAG informs the sponsor agency of required actions to address any changes that may have been made.

SCAG's TCWG and Modeling Task Force are two official forums used for interagency consultation. There may be additional ad hoc forums, if needed, to facilitate the required course of action.

AR0072602

HIGHWAY PERFORMANCE MONITORING SYSTEM (HPMS)

HPMS is used as a transportation monitoring and management tool to determine the allocation of federal aid funds, to assist in setting policies and to forecast future transportation needs as it analyzes the transportation systems' length, condition and performance. Additionally, HPMS is used to provide data to the Environmental Protection Agency (EPA) to assist in monitoring air quality conformity, and its data is used in support of the Biennial Report to Congress on the Status of the Nation's Highways. In California, Caltrans implements the program annually. SCAG's responsibility is to assist Caltrans in collecting data from local jurisdictions, and in the distribution, collection and administration of all HPMS survey packages in the six-county region.

VMT, EMISSION AND CONGESTION REPORT

Six years after the enactment of the Clean Air Act Amendments of 1990, any state that contains serious and worse ozone non-attainment areas, or moderate and/or serious carbon monoxide non-attainment areas, is required to demonstrate whether current aggregate VMT, aggregate vehicle emissions, congestion levels and other relevant parameters are consistent with those used for the area's demonstration of attainment. As the region's MPO, SCAG is responsible for forecasting and tracking VMT, emissions and congestion, and submitting these reports to the ARB. VMT reports for ozone non-attainment areas are submitted every three years.

TRANSIT SYSTEM PERFORMANCE ASSESSMENT

Implementation of the RTP requires changes in the operating practices of transit agencies and the integration of the three tiers of transit into a single functioning system. The process of integration is the responsibility of the operators. SCAG will be evaluating the performance of selected operators to provide feedback and to transfer applicable lessons to other operators in the region. The application of advanced transportation technologies applied to the scheduling and routing of transit will be evaluated.

INTERGOVERNMENTAL REVIEW

Under federal law, SCAG is designated as the Regional Clearinghouse for review of all submitted plans, plan changes, projects and programs for consistency with adopted regional plans and policies. Regionally significant transportation projects reviewed for consistency with regional plans are defined as: construction or expansion of freeways; state highways; principal arterials; routes that provide primary access to major activity centers, such as amusement parks, regional shopping centers, military bases, airports and ports; goods movement routes, including both truck routes and rail lines; intermodal transfer facilities, such as transit centers, rail stations, airports and ports; and fixed transit routes, such as light and heavy rail and commuter rail. Any project involving transportation improvements is reviewed to determine whether such improvements are included in the RTIP.

THE STATE OF THE REGION

SCAG develops and publishes the annual State of the Region Report, which monitors the primary economic and transportation trends in Southern California and compares them to other major metropolitan regions in the country. The report helps to set goals for future RTP updates and provides indicators of regional progress from previous RTPs.

Each report presents the major socioeconomic trends in the region, including population, employment, wages, and ethnic composition. It then presents a Report Card for a number of critical indicators, including air quality, modal share, transit ridership, congestion, and income based upon the actual trend and comparison results. The latest update of the Report will be released by the Regional Council in December 2007 and can be accessed via the SCAG website.

AR0072603

OTHER RELATED EFFORTS

There are other efforts that SCAG partner agencies undertake that provide assistance with the overall monitoring of the RTP implementation. Data collected through these efforts can be used by agencies to make more informed decisions. These efforts include:

Caltrans Highway Congestion Monitoring Program (HICOMP) – Caltrans compiles congestion information in an annual report that illustrates the trends in congestion in each Caltrans District. The report includes congestion magnitude, extent, and duration for the peak travel periods.

Caltrans State Highway Operations and Protection Program (SHOPP) 10-Year Plan – Caltrans updates their 10-year SHOPP Plan periodically, focusing on pavement conditions, safety, and operations. The Plan includes the programmed portion of the SHOPP as well as planned investments over a ten-year horizon.

County-Level Congestion Management Program (CMP) Monitoring – County Transportation Commissions monitor cities' performances regarding service levels on CMP systems and opportunities to mitigate the impacts of new development on the transportation system.

County Long-Range Plans – Several County Transportation Commissions have developed 20-year Long-Range Plans that serve as input to the subsequent RTP update. These plans are the blueprints for investments and expected performance for the county.

Transit Operator Short-Range Transit Plans – Transit operators also develop and publish short-range transit plans that define strategies and actions over the short term.

Transit Operators' Performance Reports – Transit operators compile various performance data and submit their reports to the Federal Transit Administration (FTA) annually. The FTA then compiles all the data provided by transit operators and stores them in the National Transit Database (NTD). The NTD provides a wealth of data that can be used to compare trends over time and among operators throughout the United States.

Transit Operators' Triennial Audits – Transit operators undergo an audit every three years to ensure that they comply with state and federal regulations. The audit findings and recommendations are published and reviewed by Caltrans and other agencies.

Regionally Significant Transportation Improvement Studies (RSTIS) (formerly Major Investment Studies) Project sponsors develop these studies. SCAG monitors and assists the projects to ensure communication between the sponsors and SCAG, and to assure compliance with the RTP.

AR0072604

VII. FUTURE CONNECTIONS: THE STRATEGIC PLAN

The RTP strategies discussed in Chapter III represent the region's collective vision for addressing our transportation needs within the constraints of committed, available, or reasonably available revenue sources. Despite the substantial commitments contained in the RTP, this level of investment does not meet the overall needs identified through the RTP development process. If we truly want to address the needs set forth in this RTP, then we must look toward additional strategies and investments to get us there. Often this will entail controversial and difficult choices that will push the envelope and test the boundaries of what is politically acceptable. For now, these elements are contained in the Strategic Plan with the recognition that they merit further study and that, over time and with further consensus building, these programs and policies may move forward into the constrained RTP.

This chapter provides a brief illustrative overview of the additional strategies and investments that the region would pursue if additional funding were to become available, and after further consensus building to solidify commitment around specific projects and policies. It is envisioned that future updates or amendments to the RTP would draw from the projects contained in the Strategic Plan; exceptions would be handled on a case-by-case basis. While there is no funding strategy attached to the Strategic Plan, this chapter discusses additional potential funding sources that merit further study and evaluation.

Unfunded System Preservation and Operations Needs

Beyond the investments proposed in the 2008 RTP, there is a shortfall of $24 billion in highway system preservation, and a shortfall of $8 billion in arterial and transit system preservation, through 2035. With the recognition that the costs of deferred maintenance could grow exponentially over time, investment in preservation should be given priority for new funding sources beyond those identified in the 2008 RTP.

Additionally, SCAG identified a shortfall of approximately $6.7 billion in highway operations needs, and $1.3 billion in regionally significant arterial and transit operations needs, through 2035. SCAG, Caltrans, and our transportation planning partners will continue to evaluate corridor-level performance, develop corridor system management plans, and incorporate the resulting recommendations into future Plans and Programs.

Unfunded Capital Improvements

There are approximately $273 billion in additional capital investment needs above what are identified in the financially constrained RTP. These projects address important transportation corridor needs in the region, but still face significant challenges in terms of local consensus on a preferred strategy, funding priority, or both, before potential inclusion in the RTP. For example, the proposed Orangeline project faces significant challenges in terms of right-of-way availability, funding commitment, and stakeholder consensus. In recognition of the regional benefits the project may provide, it is being included in the Strategic Plan until such issues have been resolved.

Regionally significant major corridor improvements in the Strategic Plan are identified in Table 7.1. A more complete list is contained in the RTP Project List report available at www.scag.ca.gov/rtp2008.

Strategic Finance

Recognizing that new sources of revenue over and above those already identified in the RTP are required to help fund these unmet needs, SCAG will initiate a comprehensive study of congestion pricing strategies over the next year. A regionwide congestion pricing strategy can be structured to help the region meet its transportation demand management and air quality goals while providing a reliable and dedicated revenue source. The pricing mechanism could allow users of the transportation system to know the true cost of their travel, resulting in informed decision-making and more efficient use of the system. Potential pricing strategies can include a regional vehicle-miles-traveled fee

AR0072606

and/or a regional high-occupancy toll lane network. While promising, these strategies still face a number of significant hurdles—there is currently no legislative authority to implement such strategies, and there is no regional entity that exists to administer or implement such a comprehensive program. SCAG's study will attempt to address some of these hurdles by evaluating the feasibility of these strategies and coalescing regional consensus for potential input into the next update of the RTP.

In addition to SCAG's regional congestion pricing initiative, a number of local efforts to study additional transportation revenues are underway or may be in the near future. The Los Angeles County Metropolitan Transportation Authority (MTA) is evaluating the feasibility of a Congestion Mitigation Fee as part of a proposed restructuring of its Congestion Management Program (CMP). If enacted, the fee would be imposed on new development and would generate new revenue to assist MTA in addressing congestion caused by growth. In 2004, the voters in Ventura County were asked to approve a local sales tax measure for transportation. While the voters did not approve the sales tax increase, it remains a popular option for the region's counties to generate a significant amount of revenues dedicated to transportation. All of the other counties in the SCAG region have a local sales tax measure dedicated to transportation.

TABLE 7.1 MAJOR STRATEGIC PLAN PROJECTS

Strategic Plan Project Description
• Dedicated Lanes for Clean-Technology Trucks on an East-West Corridor connecting the Ports of LA/LB to and through the Inland Empire (I-710 to I-15)
• Dedicated Lanes for Clean-Technology Trucks on I-15 (East-West Corridor to Barstow)
• US-101 HOT Lanes (SR-23 to SR-134/SR-170)
• CETAP Riverside County to Orange County (Corridor B from I-15/Mid-County Pkwy to SR-133/SR-241)
• Purple Line Extension to Century City and Santa Monica
• Gold Line Extension to Ontario Airport
• Metrolink and LOSSAN Strategic Plans
• Santa Paula Branch Line
• High-Speed Regional Transport - system extensions to Palmdale, Victorville, Coachella Valley, Imperial, Orange County, San Diego
• High-Speed Regional Transport - California High-Speed Rail Authority (serving the SCAG region beyond the Union Station-Anaheim segment in the financially constrained RTP)
• High-Speed Regional Transport - California-Nevada Maglev - Ontario Airport to Nevada State Line
• Orangeline High-Speed Transit (Orange County - Union Station - Santa Clarita - Palmdale)

Corridor Preservation

For those corridor projects identified in the Strategic Plan, right-of-way preservation should be undertaken to begin laying the groundwork for advancing these long-range improvements. The SCAG Region is pursuing an innovative, environmentally sensitive approach to considering future development and transportation projects. This approach envisions that transportation options

AR0072607

will be developed with consideration for environmentally sensitive land uses and habitat issues as part of the planning and design criteria. It would involve early and active involvement by all stakeholders at the local, state, and federal levels.

This approach draws on the Community and Environmental Transportation Acceptability Process (CETAP) undertaken in Riverside County, which serves as a template for other agencies and jurisdictions seeking to preserve rights-of-way for long-range transportation needs. The four CETAP corridors, two intra-county corridors—the Mid-County Parkway and the Winchester-Temecula Corridor—and two inter-county corridors—the Riverside County-Orange County Corridor (Corridor A) and the Moreno Valley-San Bernardino Corridor—are included in the financially constrained RTP.

As Riverside County has shown, it is important to identify and preserve transportation corridors needed to expand or enhance transportation for future generations. Local governments will find it difficult to obtain optimal locations for these corridors unless efforts to preserve them are made early. The American Association of State Highway and Transportation Officials (AASHTO) Report on Corridor Preservation states that early efforts provide the following benefits:

- prevent inconsistent development
- minimize or avoid environmental, social and economic impacts
- prevent the loss of desirable corridor locations
- allow for the orderly assessment of impacts
- permit orderly project development, and
- reduce costs

Planners and policy-makers should start preparing strategies for preserving corridors now to prevent losing rights-of-way needed for transportation beyond the year 2035. Rights-of-way preservation is a reasonable concern, particularly in areas where development may block a long-range corridor. More opportunities to capitalize on preservation are available in less-urban areas,

where local governments have an opportunity to obtain available land for new transportation facilities.

The first step in this kind of planning is to identify potential long-range corridors and determine if there is a need to preserve them. This will require intergovernmental coordination and should include a funding component. Next, criteria to evaluate and prioritize the selected corridors must be developed. Once a corridor is selected, environmental studies will be needed. Traditional preservation techniques include purchasing land or using government statutes to place a corridor alignment on a general plan land-use map. Other state and federal funds can be used to assist in acquiring land for long-range corridors.

AR0072608

AASHTO American Association of State Highway and Transportation Officials – A nonprofit, nonpartisan association representing highway and transportation departments in the 50 states, the District of Columbia and Puerto Rico.

AB 32 Assembly Bill 32 – Signed into law on September 26, 2006, it requires that the state's global warming emissions be reduced to 1990 levels by 2020. This reduction will be accomplished through an enforceable statewide cap on global warming emissions that will be phased in starting in 2012. In order to effectively implement the cap, AB 32 directs the California Air Resources Board (CARB) to develop appropriate regulations and establish a mandatory reporting system to track and monitor global warming emissions levels.

AB 169 Assembly Bill 169 – Provides for the sixteen federally recognized tribes in the SCAG Region to join the SCAG Joint Powers Authority (JPA) to participate in the Southern California Association of Governments by voting at the SCAG General Assembly.

ACE Alameda Corridor East – A 35-mile corridor extending through the San Gabriel Valley between East Los Angeles and Pomona and connecting the Alameda Corridor to the transcontinental railroad network.

ADA Americans with Disabilities Act of 1990 – Guarantees equal opportunity for individuals with disabilities in public accommodations, employment, transportation, state and local government services, and telecommunications. It prescribes federal transportation requirements for transportation providers.

AJR Assembly Joint Resolution No. 40 – Introduced on August 23, 2007, the Resolution calls upon the governor to declare a state of emergency in respect to the air quality health crisis in the South Coast Air Quality Basin related to emissions of PM2.5, and to direct steps necessary to address the emergency.

ANCA Federal Airport Noise and Capacity Act of 1990 – Establishes a national aviation noise policy that reviews airport noise and access restrictions on operations for Stage 2 and Stage 3 aircraft.

Antelope Valley AQMD Antelope Valley Air Quality Management District – The air pollution control agency for the portion of Los Angeles County north of the San Gabriel Mountains.

AQMP Air Quality Management Plan – Regional plan for air quality improvement in compliance with federal and state requirements.

ARB Air Resources Board – Refer to CARB, California Air Resources Board.

ATIS Advanced Traveler Information Systems – Technology used to provide travelers with information, both pre-trip and in-vehicle, so they can better utilize the transportation system.

ATMS Advanced Transportation Management Systems – Technology used to improve the operations of the transportation network.

AVO Average Vehicle Occupancy – Calculated by dividing the total number of travelers by the total number of vehicles.

Base Year The year 2003, used in the RTP performance analysis as a reference point for current conditions.

Baseline Future scenario which includes only those projects that are: existing, undergoing right-of-way acquisition or construction, come from the first year of the previous RTP or RTIP, or have completed the NEPA process. The Baseline is based upon the adopted 2006 RTIP. The Baseline functions as the "No Project" alternative used in the RTP Program EIR.

BLS Bureau of Labor Statistics – The principal fact-finding agency for the federal government in the broad field of labor economics and statistics.

BNSF Burlington Northern and Santa Fe Railway Company.

BRT Bus Rapid Transit – Bus transit service that seeks to reduce travel time through measures such as traffic signal priority, automatic vehicle location, dedicated bus lanes, limited-stop service, and faster fare collection policies.

AR0072609

BTA Bicycle Transportation Account – Provides state funds for city and county projects that improve safety and convenience for bicycle commuters.

CAA Clean Air Act (CAA) – 1970 federal act that authorized EPA to establish air quality standards to limit levels of pollutants in the air. EPA has promulgated such standards (or NAAQS) for six criteria pollutants: sulfur dioxide (SO2), nitrogen dioxide (NO2), carbon monoxide (CO), ozone, lead, and particulate matter (PM10). All areas of the United States must maintain ambient levels of these pollutants below the ceilings established by the NAAQS; any area that does not meet these standards is a "non-attainment" area. States must develop SIPs to explain how they will comply with the CAA. The act was amended in 1977 and again in 1990.

CAFR Comprehensive Annual Financial Report – Official annual financial report that encompasses all funds and financial components associated with any given organization.

Cal B/C Model California Life-Cycle Benefit/Cost Analysis Model (Cal-B/C) – Was developed for the California Department of Transportation (Caltrans) as a tool for benefit-cost analysis of highway and transit projects. It is an Excel (spreadsheet) application structured to analyze several types of transportation improvement projects in a corridor where there already exists a highway facility or a transit service (the base case).

Caltrans California Department of Transportation – State agency responsible for the design, construction, maintenance, and operation of the California State Highway System, as well as that portion of the Interstate Highway System within the state's boundaries.

CARB California Air Resources Board – State agency responsible for attaining and maintaining healthy air quality through setting and enforcing emissions standards, conducting research, monitoring air quality, providing education and outreach, and overseeing/assisting local air quality districts.

Catalytic Demand Additional aviation demand that is created by companies that locate in the proximity of expanding airports with developable land around them, to reduce airport ground access time and costs for their employees and clients. Catalytic demand is greatest for large hub airports, particularly international airports.

CEHD Community, Economic and Human Development Committee – A SCAG committee that studies the problems, programs and other matters which pertain to the regional issues of community, economic and human development and growth. This committee reviews projects, plans and programs of regional significance for consistency and conformity with applicable regional plans.

CEQA California Environmental Quality Act – State law providing certain environmental protections that apply to all transportation projects funded with state funds.

CETAP Community Environmental and Transportation Acceptability Process – Part of the Riverside County Integrated Project that is examining where to locate possible major new multimodal transportation facilities to serve the current and future transportation needs of Western Riverside County, while minimizing impacts on communities and the environment.

CHSR California High-Speed Rail Authority – Agency responsible for planning, designing, constructing and operating a state-of-the-art high-speed train system in California.

CIP Capital Improvement Program – Long-range strategic plan that identifies capital projects; provides a planning schedule and financing options.

CMAQ Congestion Mitigation and Air Quality Program – Federal program initiated by ISTEA to provide funding for surface transportation and other related projects that contribute to air quality improvements and reduce congestion.

AR0072610

CMIA Corridor Mobility Improvement Account – These funds would be allocated by the California Transportation Commission to highly congested travel corridors in the state. Projects in this category must be a high priority; be able to start construction by 2012; improve mobility in a highly congested corridor by improving travel times and reducing vehicle hours of delay; connect the State Highway System; and improve access to jobs, housing, markets and commerce.

CMP Congestion Management Program – Established by Proposition 111 in 1990, requires each county to develop and adopt a CMP that includes highway and roadway system monitoring, multimodal system performance analysis, transportation demand management program, land-use analysis program and local conformance.

CNSSTC California-Nevada Super Speed Train Commission – Public-private Partnership developed to promote a high-speed link between California and Nevada.

CO Carbon monoxide – A colorless, odorless, poisonous gas formed when carbon in fuels is not burned completely. It is a byproduct of highway vehicle exhaust, which contributes about 60 percent of all CO emissions nationwide.

COG Council of Governments – Under state law, a single or multicounty council created by a joint powers agreement.

COMPASS/Growth Visioning A planning process guided by input from the public and initiated by SCAG to develop a regional strategy for addressing future growth in Southern California.

Congestion Management Process Congestion Management Process – Systematic approach required in transportation management areas (TMAs) that provides for effective management and operation, based on a cooperatively developed and implemented metropolitan-wide strategy, of new and existing transportation facilities eligible for funding under title 23 U.S.C. and title 49 U.S.C., through the use of operational management strategies.

Congestion Pricing User fee imposed on vehicles during peak demand periods on congested roadways.

Constant Dollars Dollars expended/received in a specific year adjusted for inflation/deflation relative to another time period.

Corridor In planning, a broad geographical band that follows a general directional flow or connects major sources of trips. It may contain a number of streets and highways, and transit lines and routes.

CTC California Transportation Commission – A nine-member board appointed by the governor to oversee and administer state and federal transportation funds and provide oversight on project delivery.

CTIPS California Transportation Improvement Program System – A project programming database system used to efficiently and effectively develop and manage various transportation programming documents as required under state and federal law.

CTP California Transportation Plan – A statewide, long-range transportation policy plan that provides for the movement of people, goods, services, and information. The CTP offers a blueprint to guide future transportation decisions and investments that will ensure California's ability to compete globally, provide safe and effective mobility for all persons, better link transportation and land-use decisions, improve air quality, and reduce petroleum energy consumption.

CVO Commercial Vehicle Operations – Management of commercial vehicle activities through ITS.

Deficiency Plan Set of provisions contained in a Congestion Management Plan to address congestion, when unacceptable levels of congestion occur. Projects implemented through the Deficiency Plan must, by statute, have both mobility and air quality benefits.

DTIM Direct Travel Impact Model – A vehicle emissions forecasting model.

EDF Environmental Defense Fund – A national nonprofit organization that seeks to protect the environmental rights of all people, including future generations.

AR0072611

EIR Environmental Impact Report – An informational document, required under CEQA, which will inform public agency decision-makers and the public generally of the significant environmental effects of a project, possible ways to minimize significant effects, and reasonable alternatives to the project.

EIS Environmental Impact Statement (federal) – National Environmental Policy Act (NEPA) requirement for assessing the environmental impacts of federal actions that may have a significant impact on the human environment.

EMFAC Emission Factor – Model that estimates on-road motor vehicle emission rates for current year as well as backcasted and forecasted inventories.

EPA Environmental Protection Agency – Federal agency established to develop and enforce regulations that implement environmental laws enacted by Congress to protect human health and safeguard the natural environment.

FAA Federal Aviation Administration – Federal agency responsible for issuing and enforcing safety regulations and minimum standards, managing air space and air traffic, and building and maintaining air navigation facilities.

FHWA Federal Highway Administration – Federal agency responsible for administering the Federal-Aid Highway Program, which provides federal financial assistance to the states to construct and improve the National Highway System, urban and rural roads, and bridges.

Financially Constrained Expenditures are said to be financially constrained if they are within limits of anticipated revenues.

FRA Federal Railroad Administration – Federal agency created to promulgate and enforce rail safety regulations, administer railroad assistance programs, conduct research and development in support of improved railroad safety and national rail transportation policy, and consolidate government support of rail transportation activities.

FTA Federal Transit Administration – The federal agency responsible for administering federal transit funds and assisting in the planning and establishment of areawide urban mass transportation systems. As opposed to FHWA funding, most FTA funds are allocated directly to local agencies, rather than Caltrans.

FTIP Federal Transportation Improvement Program – A three-year list of all transportation projects proposed for federal transportation funding within the planning area of an MPO. (Note: The FTIP is locally referred to as the 2006 RTIP.)

FY Fiscal Year – The twelve-month period on which the budget is planned. The state fiscal year begins July 1 and ends June 30 of the following year. The federal fiscal year begins October 1 and ends September 30 of the following year.

GAO Government Accountability Office – Congressional agency responsible for examining matters related to the receipt and payment of public funds.

GARVEE Grant Anticipation Revenue Vehicles – A debt financing instrument authorized to receive federal reimbursement of debt service and related financing costs under Section 122 of Title 23, United States Code. GARVEEs can be issued by a state, a political subdivision of a state, or a public authority.

GHG Greenhouse Gases – Components of the atmosphere that contribute to the greenhouse effect. The principal greenhouse gases that enter the atmosphere because of human activities are carbon dioxide, methane, nitrous oxide, and fluorinated gases.

GIS Geographic Information System – Powerful mapping software that links information about where things are with information about what things are like. GIS allows users to examine relationships between features distributed unevenly over space, seeking patterns that may not be apparent without using advanced techniques of query, selection, analysis, and display.

GNP Gross National Product – An estimate of the total value of goods and services produced in any specified country in a given year. GNP can be measured as a total amount or an amount per capita.

AR0072612

Grade Crossing A crossing or intersection of highways, railroad tracks, other guideways, or pedestrian walks, or combinations of these at the same level or grade.

HCP Habitat Conservation Plan – Established under Section 10 of the Endangered Species Act to allow development to proceed while protecting endangered species.

HDT Heavy-Duty Truck – Truck with a gross vehicle weight of 8,500 pounds or more.

HICOMP Highway Congestion Monitoring Program (Caltrans) – A report that measures the congestion that occurs on urban area freeways in California.

Home-based work trips Trips that go between home and work, either directly or with an intermediate stop. Home-based work trips include telecommuting, working at home and non-motorized transportation work trips.

HOT Lane High-Occupancy Toll Lane – An HOV lane that single-occupant drivers can pay to drive in.

HOV Lane High-Occupancy Vehicle Lane – A lane restricted to vehicles with two (and in some cases three) or more occupants to encourage carpooling. Vehicles include automobiles, vans, buses and taxis.

HPMS Highway Performance Monitoring System – A federally mandated program designed by FHWA to assess the performance of the nation's highway system.

HSRT High-Speed Regional Transport – Transportation system that operates at very high speeds on an exclusive right-of-way.

HUD U.S. Department of Housing and Urban Development – Federal agency charged with increasing homeownership, supporting community development, and increasing access to affordable housing free from discrimination.

ICAPCD Imperial County Air Pollution Control District – Local air pollution control agency mandated by state and federal regulations to implement and enforce air pollution rules and regulations.

IGR Intergovernmental Review Process – The review of documents by several governmental agencies to ensure consistency of regionally significant local plans, projects, and programs with SCAG's adopted regional plans.

Infrastructure The basic facilities, equipment, services and installations needed for the growth and functioning of a community.

IOS Initial Operating Segment.

ISTEA Intermodal Surface Transportation Efficiency Act – Signed into federal law on December 18, 1991, it provided authorization for highways, highway safety and mass transportation for FYs 1991–1997 and served as the legislative vehicle for defining federal surface transportation policy.

ITIP Interregional Transportation Improvement Program – The portion of the STIP that includes projects selected by Caltrans (25 percent of STIP funds).

ITS Intelligent Transportation Systems – Systems that use modern detection, communications and computing technology to collect data on system operations and performance, communicate that information to system managers and users, and use that information to manage and adjust the transportation system to respond to changing operating conditions, congestion or accidents. ITS technology can be applied to arterials, freeways, transit, trucks and private vehicles. ITS include Advanced Traveler Information Systems (ATIS), Advanced Public Transit Systems (APTS), Advanced Traffic Management Systems (ATMS), Advanced Vehicle Control Systems (AVCS) and Commercial Vehicle Operations (CVO).

IVAG Imperial Valley Association of Governments – Council of Governments for Imperial County. IVAG is responsible for short-range transportation planning, including all projects utilizing federal and state highway and transit funds.

JPA Joint Powers Authority – Two or more agencies that enter into a cooperative agreement to jointly wield powers that are common to them. JPAs are a vehicle for the cooperative use of existing governmental powers to finance and provide infrastructure and/or services in a cost-efficient manner.

AR0072613

LACMTA Los Angeles County Metropolitan Transportation Authority, more commonly referred to as the MTA – Agency responsible for planning and funding countywide transportation improvements, administering the county's transportation sales tax revenues, and operating bus and rail transit service.

LAUPT Los Angeles Union Passenger Terminal, also known as Union Station.

LAWA Los Angeles World Airports – Aviation authority of the City of Los Angeles. LAWA owns and operates Los Angeles International (LAX), Ontario International, Van Nuys, and Palmdale Airports.

LCVs Longer-Combination Vehicles – Includes tractor-trailer combinations with two or more trailers that weigh more than 80,000 pounds.

LEM Location Efficient Mortgage – Allows people to qualify for larger loan amounts if they choose a home in a densely populated community that is well served by public transit, and where destinations are located close together so that they can also walk and bike instead of driving everywhere.

Livable Communities Any location in which people choose may be viewed as "livable." However, communities that contain a healthy mix of homes, shops, work places, schools, parks, and civic institutions coupled with a variety of transportation choices, give residents greater access to life's daily essentials and offer higher quality of life to a wider range of residents.

LRT Light Rail Transit – A mode of transit that operates on steel rails and obtains its power from overhead electrical wires. LRT may operate in single or multiple cars on separate rights-of-way or in mixed traffic.

LTF Local Transportation Fund – A fund which receives TDA revenues.

MAGLEV Magnetic Levitation high-speed transportation system.

MAP Million Annual Passengers – Used to quantify airport activity.

Market Incentives Measures designed to encourage certain actions or behaviors. These include inducements for the use of carpools, buses and other HOVs in place of single-occupant automobile travel. Examples include HOV lanes, preferential parking, and financial incentives.

MDAB Mojave Desert Air Basin – Area defined by state law as comprising the desert portions of Los Angeles, Kern, Riverside, and San Bernardino Counties.

MDAQMD Mojave Desert Air Quality Management District – Local air agency mandated by state and federal regulations to implement and enforce air pollution rules and regulations; encompasses the desert portion of San Bernardino County from the summit of the Cajon Pass north to the Inyo County line, as well as the Palo Verde Valley portion of Riverside County.

Measure A Revenues generated from Riverside County's local half-cent sales tax.

Measure I Revenues generated from San Bernardino County's local half-cent sales tax.

Metrolink Regional commuter rail system connecting Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties and operated by SCRRA.

MIS Major Investment Study – The preliminary study, including preliminary environmental documentation, for choosing alternative transportation projects for federal transportation funding. An MIS is a requirement, which is conducted cooperatively by the study sponsor and the MPO.

Mixed Flow Traffic movement having autos, trucks, buses and motorcycles sharing traffic lanes.

Mode A particular form of travel (e.g., walking, traveling by automobile, traveling by bus or traveling by train).

Mode Split The proportion of total person trips using various specified modes of transportation.

Model A mathematical description of a real-life situation that uses data on past and present conditions to make a projection.

AR0072614

MPO Metropolitan Planning Organization – A federally required planning body responsible for transportation planning and project selection in a region.

MTS Metropolitan Transportation System – Regional network of roadways and transit corridors.

Multimodal A mixture of the several modes of transportation, such as transit, highways, non-motorized, etc.

NAAQS National Ambient Air Quality Standards – Targets established by the U.S. Environmental Protection Agency (EPA) for the maximum contribution of a specific pollutant in the air.

NAFTA North American Free Trade Agreement – An agreement between the governments of Canada, Mexico, and the United States to eliminate barriers to trade and facilitate the cross-border movement of goods and services.

NCCP Natural Communities Conservation Plan – Program under the Department of Fish and Game that uses a broad-based ecosystem approach toward planning for the protection of plants, animals and their habitats, while allowing compatible and appropriate economic activity.

NEPA National Environmental Protection Act – Federal environmental law that applies to all projects funded with federal funds or requiring review by a federal agency.

NIMS National Incident Management System – Nationwide template that enables all government, private-sector and non-governmental organizations to work together during a domestic incident.

Nominal dollars Actual dollars expended/received in a specific year without adjustments for inflation/deflation.

NOx Nitrogen oxides – A group of highly reactive gases, all of which contain nitrogen and oxygen in varying amounts. NOx are a major component of ozone and smog, and they are one of six principal air pollutants tracked by the EPA.

NTD National Transit Database – The Federal Transit Administration's (FTA) national database for transit statistics.

O&M Operations and Maintenance – The range of activities and services provided by the transportation system and the upkeep and preservation of the existing system.

OCTA Orange County Transportation Authority – Agency responsible for planning and funding countywide transportation improvements, administering the county's transportation sales tax revenues, and operating bus transit service.

OLDA Orangeline Development Authority – Joint exercise of powers authority developed by the cities located along the Orangeline corridor.

OnTrac Orange-North America Trade Rail Access Corridor – Formed in April of 2000 to build and support the Orangethorpe Avenue Grade Separation and Trade Corridor project, a 5-mile-long railroad-lowering project that will completely grade separate 11 rail crossings in the cities of Placentia and Anaheim.

OWP Overall Work Program – SCAG develops an OWP annually, describing proposed transportation planning activities for the upcoming fiscal year, including those required by federal and state law.

PATH Partners for Advanced Transit and Highways – Joint venture of Caltrans which includes the University of California, and other public and private academic institutions and industries.

PEIR Program Environmental Impact Report – Environmental review process used to evaluate the potential environmental effects of large-scale plans or programs.

PeMS Freeway Performance Measurement System – A service provided by the University of California, Berkeley, to collect historical and real-time freeway data from freeways in the state of California in order to compute freeway performance measures.

Person Trip A trip made by a person by any mode or combination of modes for any purpose.

AR0072615

PM10 Particulate Matter – A mixture of solid particles and liquid droplets found in the air, 10 micrometers or less in size (a micrometer is one-millionth of a meter). These coarse particles are generally emitted from sources such as vehicles traveling on unpaved roads, materials handling, and crushing and grinding operations, as well as windblown dust.

PM2.5 Particulate Matter – A mixture of solid particles and liquid droplets found in the air, 2.5 micrometers or less in size (a micrometer is one-millionth of a meter). These fine particles result from fuel combustion from motor vehicles, power generation, and industrial facilities, as well as from residential fireplaces and wood stoves.

PMD LA/Palmdale Regional Airport – Regional airport located in Palmdale.

PPP Public-Private Partnership – Contractual agreements formed between a public agency and private sector entity that allow for greater private sector participation in the delivery of transportation projects.

PRC Peer Review Committee – An "informal" committee of technical experts usually organized and invited to review and comment on various technical issues and processes used in the planning process.

Proposition 1A Passed by voters in 2006, Proposition 1A protects transportation funding for traffic congestion relief projects, safety improvements, and local streets and roads. It also prohibits the state sales tax on motor vehicle fuels from being used for any purpose other than transportation improvements, and authorizes loans of these funds only in the case of severe state fiscal hardship.

Proposition 1B Highway Safety, Traffic Reduction, Air Quality, and Port Security State of California – Passed in November 2006, Proposition 1B provides $19.9 billion to fund state and local transportation improvement projects to relieve congestion, improve movement of goods, improve air quality, and enhance safety and security of the transportation system.

Proposition 42 As of March 2002, placed in the State Constitution those provisions of current law requiring the use of state gasoline sales tax revenues for state and local transportation purposes.

Proposition A Revenues generated from Los Angeles County's local half-cent sales tax. Los Angeles County has two permanent local sales taxes (Propositions C and A).

Proposition C Revenues generated from Los Angeles County's local half-cent sales tax. Los Angeles County has two permanent local sales taxes (Propositions C and A).

PSR Project Study Report – Defines and justifies the project's scope, cost, and schedule. PSRs are prepared for state highway projects and PSR equivalents are prepared for projects not on the State Highway System. Under state law, a PSR or PSR equivalent is required for STIP programming.

PTA Public Transportation Account – The major state transportation account for mass transportation purposes. Revenues include a portion of the sales tax on gasoline and diesel fuels.

PUC Public Utilities Commission – Regulates privately owned telecommunications, electric, natural gas, water, railroad, rail transit, and passenger transportation companies.

Railroad Siding A short stretch of railroad track used to store rolling stock or enable trains on the same line to pass; also called sidetrack.

RC Regional Council – Conducts the affairs of SCAG; implements the General Assembly's policy decisions; acts upon policy recommendations from SCAG policy committees and external agencies; appoints committees to study specific problems; and amends, decreases or increases the proposed budget to be reported to the General Assembly.

RCP Regional Comprehensive Plan (RCP) – Developed by SCAG, the RCP is a vision of how Southern California can balance resource conservation, economic vitality, and quality of life. It will serve as a blueprint to approach growth and infrastructure challenges in an integrated and comprehensive way.

AR0072616

RCTC Riverside County Transportation Commission – Agency responsible for planning and funding countywide transportation improvements and administering the county's transportation sales tax revenues.

RHNA Regional Housing Needs Assessment – Quantifies the need for housing within each jurisdiction of the SCAG Region based on population growth projections. Communities then address this need through the process of completing the housing elements of their general plans.

Robust Flight Portfolio Providing a range of flight offerings in different haul length categories including short-haul, medium-haul, long-haul and international flights.

ROG Reactive organic gas – Organic compounds assumed to be reactive at urban/regional scales. Those organic compounds that are regulated because they lead to ozone formation.

RSTIS Regionally Significant Transportation Investment Study – Involves identifying all reasonable transportation options, their costs, and their environmental impacts. RSTIS projects are generally highway or transit improvements that have a significant impact on the capacity, traffic flow, level of service or mode share at the transportation corridor or sub-area level.

RSTP Regional Surface Transportation Program – Established by the California state statute utilizing federal Surface Transportation Program funds. Approximately 76 percent of the state's RSTP funds must be obligated on projects located within the 11 urbanized areas of California with populations of 200,000 or more.

RTIP Regional Transportation Improvement Program – Refers to the share of capital outlay improvement funds controlled by regional agencies (75 percent of STIP funds). (Note: The FTIP is locally referred to as the 2006 RTIP.)

RTMS Regional Transportation Monitoring System – Internet-based transportation monitoring system. The RTMS will be the source for real-time and historical transportation data collected from local, regional and private data sources.

RTP Regional Transportation Plan (RTP) – Federally required 20-year plan prepared by metropolitan planning organizations and updated every four years. Includes projections of population growth and travel demand, along with a specific list of proposed projects to be funded.

RTSS Regional Transit Security Strategy – Strategy for the region with specific goals and objectives related to the prevention, detection, response and recovery of transit security issues.

SAFETEA-LU Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users – Signed into law by President Bush on August 10, 2005, it authorized the federal surface transportation programs for highways, highway safety, and transit for the 5-year period of 2005-2009.

SANBAG San Bernardino Associated Governments – The council of governments and transportation planning agency for San Bernardino County. SANBAG is responsible for cooperative regional planning and developing an efficient multimodal transportation system countywide.

SANDAG San Diego Association of Governments.

SB 45 Senate Bill 45 (Chapter 622, Statutes of 1997, Kopp) – Established the current STIP process and shifted control of decision-making from the state to the regional level.

SB 79 Senate Bill 79 Transportation Trailer Bill – Provides transportation funds on an ongoing basis to help the General Fund beyond Fiscal Year 2008

SB 974 Senate Bill 974 – Introduced by Senator Alan Lowenthal, SB 974 would impose a $30 fee on each shipping container processed at the Ports of Los Angeles, Long Beach, and Oakland for congestion management and air quality improvements related to ports.

SBD San Bernardino International Airport – International airport located in San Bernardino.

AR0072617

SCAB South Coast Air Basin – Comprises the non–Antelope Valley portion of Los Angeles County, Orange County, Riverside County, and the non-desert portion of San Bernardino County.

SCAG Southern California Association of Governments – The metropolitan planning organization (MPO) for six counties including Los Angeles, Orange, San Bernardino, Riverside, Ventura, and Imperial.

SCAQMD South Coast Air Quality Management District – The air pollution control agency for Orange County and major portions of Los Angeles, San Bernardino and Riverside Counties in Southern California.

SCCAB South Central Coast Air Basin – Comprises San Luis Obispo, Santa Barbara, and Ventura Counties.

SCRIFA Southern California Railroad Infrastructure Financing Authority.

SED Socioeconomic Data – Population, employment and housing forecast.

SHA State Highway Account – The major state transportation account for highway purposes. Revenues include the state excise taxes on gasoline and diesel fuel and truck weight fees.

SHOPP State Highway Operation and Protection Program – A four-year capital improvement program for rehabilitation, safety, and operational improvements on state highways.

SIP State Implementation Plan – State air quality plan to ensure compliance with state and federal air quality standards. In order to be eligible for federal funding, projects must demonstrate conformity with the SIP.

SOV Single–Occupant Vehicle – Privately operated vehicle that contains only one driver or occupant.

SOX Sulfur oxide – Any of several compounds of sulfur and oxygen, formed from burning fuels such as coal and oil.

SSAB Salton Sea Air Basin – Comprises the Coachella Valley portion of Riverside County and all of Imperial County.

STA State Transit Assistance – State funding program for mass transit operations and capital projects. Current law requires that STA receive 50 percent of PTA revenues.

STIP State Transportation Improvement Program – A four-year capital outlay plan that includes the cost and schedule estimates for all transportation projects funded with any amount of state funds. The STIP is approved and adopted by the CTC and is the combined result of the ITIP and the RTIP.

STP Surface Transportation Program – Provides flexible funding that may be used by states and localities for projects on any federal-aid highway, bridge projects on any public road, transit capital projects, and intracity and intercity bus terminals and facilities. A portion of funds reserved for rural areas may be spent on rural minor collectors.

TAC Technical Advisory Committee – A SCAG committee that provides ideas and feedback on the technical integrity of the Regional Transportation Plan.

TANN Traveler Advisory News Network – Provides real-time traffic and transportation information content to communications service providers and consumer media channels both nationally and internationally.

TAZ Traffic Analysis Zone – Zone system used in travel demand forecasting.

TCC Transportation and Communications Committee (SCAG) – Committee used to study problems, programs and other matters related to regional issues of mobility, air quality, transportation control measures and communications.

TCM Transportation Control Measure – A project or program that is designed to reduce emissions or concentrations of air pollutants from transportation sources. TCMs are referenced in the state Implementation Plan (SIP) for the applicable air basin and have priority for programming and implementation ahead of non-TCMs.

AR0072618

TCRP Traffic Congestion Relief Program – Enacted by state legislation in 2000 to provide additional funding for transportation over a six-year period (later extended to eight years). The program is funded by a combination of General Fund revenues (one-time) and ongoing revenues from the state sales tax on gasoline. In March 2002 voters passed Proposition 42, which permanently dedicated gasoline sales tax revenues to transportation purposes.

TCWG Transportation Conformity Working Group – Forum used to support interagency coordination to help improve air quality and maintain transportation conformity.

TDA Transportation Development Act – State law enacted in 1971 that provided a 0.25 percent sales tax on all retail sales in each county for transit, bicycle, and pedestrian purposes. In non-urban areas, funds may be used for streets and roads under certain conditions.

TDM Transportation Demand Management – Strategies that result in more efficient use of transportation resources, such as ridesharing, telecommuting, park-and-ride programs, pedestrian improvements, and alternative work schedules.

TEA-21 Transportation Equity Act for the 21st Century – The predecessor to SAFETEA-LU, it was signed into federal law on June 9, 1998. TEA-21 authorized the federal surface transportation programs for highways, highway safety, and transit for the six-year period 1998–2003. TEA-21 builds upon the initiatives established in ISTEA.

TEU Twenty-foot Equivalent Unit, a measure of shipping container capacity.

TIFIA Transportation Infrastructure Finance and Innovation Act of 1998 – Established a new federal credit program under which the US DOT may provide three forms of credit assistance—secured (direct) loans, loan guarantees, and standby lines of credit—for surface transportation projects of national or regional significance. The program's fundamental goal is to leverage federal funds by attracting substantial private and other non-federal co-investment in critical improvements to the nation's surface transportation system. Sponsors may include state departments of transportation, transit operators, special authorities, local governments, and private entities.

TOD Transit-Oriented Development – A planning strategy that explicitly links land-use and transportation by focusing mixed housing, employment and commercial growth around bus and rail stations (usually within ½ mile). TODs can reduce the number and length of vehicle trips by encouraging more bicycle/pedestrian and transit use, and can support transit investments by creating the density around stations to boost ridership.

TP&D Transportation Planning and Development Account – A state transit trust fund that is the funding source for the STA program.

Trantrak RTIP database management system.

TSWG Transportation Security Working Group – Advises the operating organizations on transportation safety matters associated with the transfer or shipment of hazardous materials.

TUMF Transportation Uniform Mitigation Fee – Ordinance enacted by the Riverside County Board of Supervisors and cities to impose a fee on new development to fund related transportation improvements.

UP Union Pacific Railroad.

AR0072619

US DOT U.S. Department of Transportation – Federal agency responsible for the development of transportation policies and programs that contribute to providing fast, safe, efficient, and convenient transportation at the lowest cost consistent with those and other national objectives, including the efficient use and conservation of the resources of the United States. US DOT is comprised of ten operating administrations, including FHWA, FTA, FAA, and FRA.

VCTC Ventura County Transportation Commission – Agency responsible for planning and funding countywide transportation improvements.

Vehicle Hours of Delay The travel time spent on the highway due to congestion. Delay is estimated as the difference between vehicle hours traveled at a specified free-flow speed and vehicle hours traveled at a congested speed.

VHDD Vehicle Hours of Daily Delay – Hours of delay attributed to congestion for vehicles each day.

VMT Vehicle Miles Traveled – On highways, a measurement of the total miles traveled by all vehicles in the area for a specified time period. It is calculated by the number of vehicles times the miles traveled in a given area or on a given highway during the time period. In transit, the number of vehicle miles operated on a given route or line or network during a specified time period.

VOC Volatile Organic Compounds – Organic gases emitted from a variety of sources, including motor vehicles, chemical plants, refineries, factories, consumer and commercial products, and other industrial sources. Ozone, the main component of smog, is formed from the reaction of VOCs and NOx in the presence of heat and sunlight.

A Growth Vision for Southern California

Southern California is a diverse region in a variety of ways – including in its physical, cultural and economic landscapes. The region boasts an enviable setting: a moderate climate with varied terrain that ranges from sandy beaches to rolling hills, to snow-capped mountains to captivating deserts. Its diverse cultural mix offers residents and visitors alike a haven for community, entertainment and enrichment. As the 12th most productive economy in the world and one of the largest concentrations of employment, income, business, industry and finance, Southern California offers the potential for prosperity to everyone.

Because of these, and many other reasons, millions of people continue to recognize Southern California as a very desirable place to live.

As the region continues to grow, it's important to move forward in preserving and enhancing the area's land, culture and economy.

The Southern California Association of Governments (SCAG) has taken the first steps in that stewardship. SCAG has embarked on a process that will create a vision of the future for the Southern California region. In an effort to maintain the region's prosperity, continue to expand its economy, house its residents affordably, and protect its environmental setting as a whole, SCAG has brought together the ideas, hopes and dreams of interdependent sub-regions, counties, cities, communities and neighborhoods.

This process is called Southern California Compass, and the result is a shared Growth Vision for Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura Counties. SCAG began Compass in 2002, spearheaded by the Growth Visioning Subcommittee, which consists of civic leaders from throughout the region. Creating a shared regional vision is an effective way to begin addressing issues, such as congestion and housing availability, which may threaten the region's livability.

By definition, a successful Growth Vision must be driven by a wide array of input from the public and from various stakeholder groups. Such a process involves gathering a broad range of participants and stakeholders to gradually sculpt a consensus vision for the region. This includes administering a region-wide citizen survey, developing and refining a series of principles to guide the vision and the process, crafting growth scenarios based on the principles and on detailed public input, evaluating each scenario based on objective benchmarks, developing a preferred growth scenario, and gaining acceptance and endorsement of the preferred growth vision.

In the short term, SCAG's growth visioning process has found common ground in a preferred vision for growth and has incorporated it into immediate housing allocation and transportation planning decisions. In the long term, the Growth Vision is a framework that will help local jurisdictions address growth management cooperatively and will help coordinate regional land use and transportation planning.

A Growth Vision is important to preserve the quality of life for future generations.

AR0072628

The Role of This Report

This Growth Vision Report presents the comprehensive Growth Vision for the six-county SCAG region as well as the achievements of the Compass process. It details the evolution of the draft vision, from the study of emerging growth trends to the effects of different growth patterns on transportation systems, land consumption and other factors.

This report begins with a general discussion of the challenges facing Southern California as it prepares to accommodate an estimated 6.3 million additional people by 2030. It studies historical trends in demographics, housing, jobs and other key aspects essential to understanding how the region will evolve and grow. Looking forward, the report explores how emerging trends and conditions will affect future growth in the region. It also discusses the challenges of continuously developing and refining the Growth Vision.

The Growth Vision report then turns to the public and to the stakeholders within each sub-region. This section emphasizes the close connection between the Growth Vision and the public input that shaped it. The results of a comprehensive regional survey and focus groups also are presented. A detailed discussion of the Compass regional visioning workshops follows, including the major themes gleaned from the public workshops held throughout the region. Descriptions and findings of the ensuing sub-regional review sessions and policy dialogues then summarize how the Compass public process continued to refine the elements of the Growth Vision.

In the next step, the report outlines the PILUT (Planning for Integrated Land Use and Transportation) test scenarios and the Growth Vision scenario. The PILUT scenarios, along with other regional development scenarios in SCAG's Regional Transportation Plan (RTP) process, present essential lessons and challenges for coordinating development and transportation in the final Growth Vision. The major themes and organizing principles of the Growth Vision are then presented. The section concludes with an analysis of the Growth Vision scenario and discusses the modeled impacts and effects the Growth Vision scenario is likely to have on Southern California.

The Growth Vision report concludes with a series of implementation steps – including tools for each guiding principle as well as overarching implementation strategies – that will guide Southern California toward its envisioned future.

It should be noted that this report concentrates on the physical aspects of regional growth – where people and jobs locate, the type and quantity of buildings that may be constructed, and how people and goods move in the region. To truly address all of the Growth Visioning principles, SCAG, sub-regions and cities should continue to refine the social, economic and other components that are also crucial to the Vision's success, including: workforce housing, job training and education, prosperity that reaches everyone, and protection of key open spaces.

A vision is not static but is constantly evolving. One goal of this report is that it will foster additional progress toward a vision of truly shared values – a vision that will evolve through well informed and wide debate about the direction the Southern California region should take as it embarks on a new era of challenges, growth and prosperity.

DEVELOPING A VISION

The Compass project develops a vision for the future of the region using the following components:

Public Participation– receive input from residents and community leaders through region-wide surveys, innovative workshops, and forums.

Scenarios – build and evaluate scenarios to understand future possibilities and the strategies that seem to work best in them.

Testing & Evaluation – apply innovative modeling techniques to evaluate each scenario on objective benchmarks of success.

The Growth Vision – describe an attainable vision of the future that is the best achievable based on the shared values of the region.

Strategies – outline the strategies that are key in attaining the vision, and build an implementation strategy around those main strategies.

Benchmarks – establish key benchmarks, and develop a monitoring system so progress can be measured and adjustments made.

AR0072629

The Need for a Regional Vision

The Southern California region is the second largest metropolis in the country and one of the most diverse. While it contains one of the world's most dynamic economies, it also "boasts" some dubious titles, such as the most congested region in the country. At times it is also the national leader for air pollution. In addition, the SCAG region is challenged by both a high growth rate and substantial physical constraints. Part of the reason the region is so appealing is the proximity of beaches and mountains, yet the Los Angeles Basin is also confined by these same geographical barriers. What is not already developed is often regarded as a precious and scarce open space resource. Examples include the agricultural lands of Ventura County, the foothills that surround the Coastal Plain, and the unique habitats areas in the High Desert.

Nevertheless, the region will grow and change during the next 30 years, facing daunting challenges due to its physical land constraints. Some of these challenges can be solved by community action – the people of this region acting together in their own enlightened self-interest. When a country or a state faces these kinds of challenges, there is a democratic government through which these solutions can be debated and implemented. But regions have no common forum or process for debating and implementing these types of issues; instead, they rely on a patchwork of local and regional governments. This approach can work when issues are fundamentally local in their impact and solution, or when a specific regional problem is addressed by an entity with the necessary skills and authority.

Increasingly, however, most regional challenges are complex, with causes and solutions intertwined across political authorities and jurisdictions. Cooperation and coordination on a much wider scale than has been practiced in the past is required to address this complexity.

The solution is for Southern Californians to debate solutions, propose ideas and cooperate on important initiatives at both regional and sub-regional scales. Compass was begun for this reason – to develop a vision for the future that embodies the shared values of the Southland and details the actions necessary to preserve the livability of this region.

The SCAG region incorporates six diverse counties and covers 38,000 square miles.

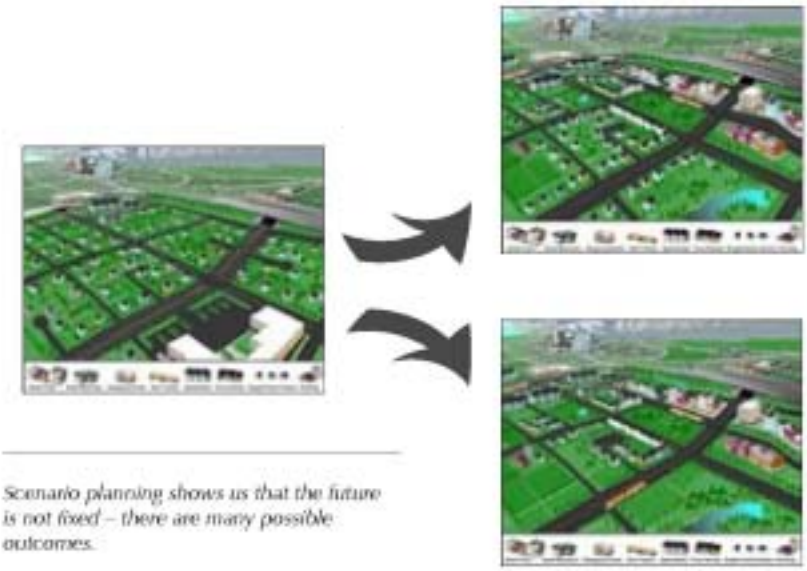
AR0072630

The Purpose of a Regional Vision

The word vision conjures up some ethereal images – of saints and mystics but not practical people. However, the word also represents the ability of people to imagine a reality that is not apparent in the immediate present. It refers to explorers of distant lands and of inventors who can envision how their new machines will work. In fact, the presence of this kind of vision is essential for most creative and innovative work – if visions did not exist, nothing new or untried would ever be pursued, except by fortuitous accident.

A regional vision is a special kind of practical vision – it is a shared vision. This is when a future is defined and agreed upon by a group of people. This kind of vision led the original colonists to fight for the independent democracy that became the United States. Their vision was described by authors such as Thomas Paine in the Common Sense pamphlets and Thomas Jefferson in The Declaration of Independence. These documents pointed the way and set out key guiding principles. The future did not turn out precisely as envisioned, but the principles were used to adjust to new realities as they came to pass. The documents had the ability to inspire large numbers of people to work toward the same cause, to adhere to the same principles, and to express the purpose of their struggle.

The regional Growth Vision is an attempt to develop the same kind of vision – one that expresses the common interests of multiple stakeholders as well as the desired end point: a sustainable Southern California with a high quality of life for everyone.



Scenario planning shows us that the future is not fixed – there are many possible outcomes.

Scenario Planning: A New Approach

The way governments have converted visions into reality in the past has been through a fairly simple planning process. In part because city planning has its roots in architecture, landscape architecture, and engineering, the concept of laying out a plan for a city or town was an easy leap – if one can build a building or bridge, why not a town? This model often works well at the small scale, where there is a fair degree of control over key variables. However, regions, especially regions as large as Southern California, have millions of actors and countless variables that interact to produce the resulting metropolis. A better approach in this type of situation is to use a model called scenario planning

Scenario planning is widely used in business and military settings. Given the complexity of issues faced in today's environment, the number of variables that have to be considered, and the 20 or 30-year time frame, it's apparent that getting the right prediction isn't really possible or even necessary. The better approach is to develop a method for outlining possible future scenarios.

Scenarios are really stories about what might be. They are not forecasts, and they are not predictions. They are possible futures that are based on what already exists, on trends that are evident, and on the values and preferences of a region and on decisions that might shape future outcomes. Scenarios are fed by input received from the combination of public workshops, surveys and stakeholder meetings. The essential requirement of any scenario is that it be plausible – within the realm of what exists and what is now known. Usually three or four scenarios are built as a way to compare outcomes and learn about the forces that are shaping the future. The point of this is to find out which strategies work in which scenarios. If a strategy works in any scenario, it's deemed robust – or a safe bet. If a strategy works in only one scenario, it is fragile and should be approached cautiously, with a good knowledge of the possible downsides.

AR0072631

The scenarios for the SCAG region were developed from several sources, but they are all feasible. The purpose of this growth visioning process is to find out how to achieve our shared regional vision with strategies that are as robust as possible.

Models

Models were used extensively in developing these scenarios. Models are representations of reality that are used to learn, teach and explore new possibilities. Architects build scale models of their projects to see how it might look before the real thing is built. A scale model of an airline cockpit, outfitted with a computer model of different flight scenarios, can be used to teach pilots how to fly.

For Compass, three sophisticated computer models were used in preparing and evaluating the scenarios.

The first is the SCAG forecasting model. This develops future demographic and economic projections based on national and international inputs and factors such as birth rates. It gives an internally consistent total for each scenario.

The second is a land use model, developed at a very fine level of detail for the 38,000- square-mile area of the SCAG region. This model not only maps existing conditions but also allocates future growth using various assumptions. The land use model keeps a running inventory of how land resources are used and where people live and work.

Modeling is more than processing numbers in an equation. It is an iterative process with many feedback loops and complex cause-and-effect relationships.

The third model is SCAG's transportation model, which is used to design future transportation systems and evaluate the consequences of these systems in terms of traffic congestion, pollution, time spent in traffic, trade-offs between cars and public transportation, and much more. The transportation model used by SCAG is one of the most progressive in the country – sensitive to the impacts land use changes have on transportation and capable of considering separately the effect freight movement has on congestion.

These models were used to evaluate the scenarios created for the SCAG region, allowing the use of objective measurements to understand the scenarios and determine which would be best for the region.

AR0072632

Growth Visioning Principles

The underlying goal of the growth visioning effort is to make the SCAG region a better place to live, work, and play for all residents regardless of race, ethnicity or income. To organize the strategies for improving the quality of life in the SCAG region, a series of principles was established by the Growth Vision Subcommittee. The four principles are intended to promote and maximize regional mobility, livability, prosperity and sustainability. Decisions regarding growth, transportation, land use and economic development should support and be guided by these principles. Specific policy and planning strategies also are provided as a way to achieve each of the principles.

PRINCIPLE #1

*Improve **mobility** for all residents*

- Encourage transportation investments and land use decisions that are mutually supportive
- Locate new housing near existing jobs and new jobs near existing housing
- Encourage transit-oriented development
- Promote a variety of travel choices

Providing transit options is a way to improve mobility for residents within the region.

PRINCIPLE #2

*Foster **livability** in all communities*

Walkable communities help improve livability and promote a mix of uses.

- Promote infill development and redevelopment to revitalize existing communities
- Promote developments that provide a mix of uses
- Promote "people-scaled," pedestrian-friendly communities
- Support the preservation of stable, single-family neighborhoods

AR0072633

PRINCIPLE #3

*Enable **prosperity** for all people*

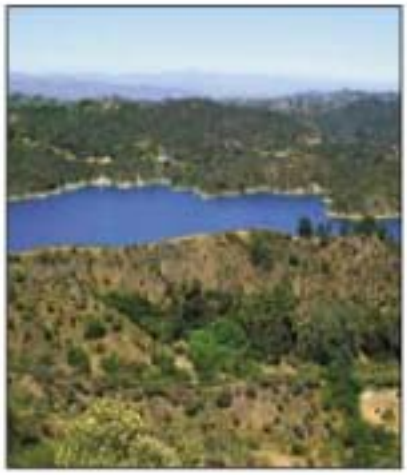
A variety of housing types enables prosperity for all people.

- Provide a variety of housing types in each community to meet the housing needs of all income levels
- Support educational opportunities that promote balanced growth
- Ensure environmental justice regardless of race, ethnicity or income class
- Support local and state fiscal policies that encourage balanced growth
- Encourage civic engagement

PRINCIPLE #4

*Promote **sustainability** for future generations*

- Preserve rural, agricultural, recreational and environmentally sensitive areas
- Focus development in urban centers and existing cities
- Develop strategies to accommodate growth that use resources efficiently, eliminate pollution, and significantly reduce waste
- Utilize "green" development techniques



Open space is integral to the health of communities.

GROWTH VISIONING SUBCOMMITTEE

SCAG's Growth Visioning Subcommittee consists of elected officials from around the region. It serves as the regional leadership body and is charged with leading the visioning process. The interaction between the regional leadership and SCAG's sub-regions form the foundation of the visioning process. Local jurisdictions and other local stakeholders provide input into the process at the sub-regional level. Regional stakeholders and the Compass Advisory Committee – which consists of participants from varied disciplines who generously donate their time and viewpoints – provide input into the process through the Growth Visioning Subcommittee. All results from surveys and focus groups are presented to the Subcommittee for review and feedback.

AR0072634

AR0072635

Regional Challenges

To develop a common vision for the future, it's important to understand the challenges facing the Southern California region. Because the past often provides an indication of what is to come, this section summarizes the recent trends of the Southern California region – those issues that historically have been a struggle for the region. Then the section looks forward to 2030 to paint a picture of the challenges the region will encounter in the coming decades. It is precisely these challenges that a successful regional vision must address.

California's biggest challenge is the extraordinary growth that it has experienced and will continue to experience. In recent years, Southern California has faced some of the most dramatic growth seen anywhere in the world for decades. The U.S. Census reports that between 1980 and 2000 the overall population in the region grew by 5 million people, from 11.5 million to 16.5 million. Projections indicate that 6.3 million more people will be added to the region between 2000 and 2030, bringing the total population to 22.9 million.

The dynamic interplay between immigration, out-migration, and natural increase (births minus deaths) accounts for the complexity of the population change. Immigrants – from around the world, but dominantly from Mexico, Central America and Asia – will continue to come to the region. But although immigration will continue to play a major role in the population change, the greatest portion of new growth is expected to come from natural increase – the children of people who are already here. At the same time, out-migration of various segments of the population will continue to rearrange the make-up of the region. The future will require planning and preparation for a more culturally diverse and varied population.

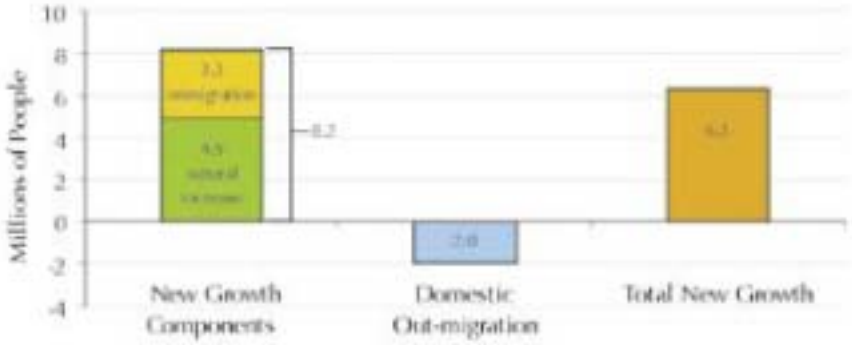
Looking Back

Demographics

The SCAG region has experienced dynamic population change in the last decade. Primarily due to the recession that struck the SCAG region from 1990-1993, 1.5 million people moved out of the region during the 1990s. Most of the population loss was in Los Angeles County. However, this loss was part of a bigger picture of turnover. During the same period, many people were born or moved into the region, resulting in a net population increase of nearly 1.9 million people. Most of the population increase was attributable to natural increase (more births than deaths in the existing population). A higher rate of births among the foreign-born population in the region is a contributing factor.

The population remains relatively young. The average age of the population in the SCAG region, between 1990 and 2000, increased at a slower rate than that of the state of California or the U.S. Overall, the region has a younger population than the state. The distribution, however, is varied. In San Bernardino County, the median age is 30, while in Ventura it is 34. All counties in the region have a younger median age than the nation; only Ventura has an older median age than the state. Compared to the nine largest metropolitan regions in the country, Southern California is the second youngest in terms of median age.

Components of Forecasted Population Growth in the SCAG Region, 2000-2030



AR0072636

From 1990 to 2000, the region's senior population (aged 65 years or over) increased slightly to 10 percent, which is below the national rate but slightly higher than that of the state. In 2000, a total of 1.7 million seniors were counted in the region, up by nearly 220,000 from 1990. Only Riverside County had a higher senior population than the rest of the nation in 2000, while San Bernardino County had the lowest number of seniors in the region.

The ethnic makeup of the population also changed significantly during the last decade. The region continues to be a magnet for immigrants. Between 1980 and 2000, the region's foreign-born population increased by 3 million, from 2.1 million to 5.1 million. In 2000, one out of every three Southern Californians (31 percent) was born in a foreign country. In this regard it is now comparable to other immigrant destinations such as New York; Vancouver, B.C.; and Toronto, Ontario.

The age and ethnic diversity of citizens in the SCAG region drives the demand for critical public services such as schools, job training, public transportation and senior housing. Consequently, the study of current and future trends in demographics is important to any long-range planning effort.

Percent Hispanic Population

1990

2000

Red and dark purple represent a higher percent of Hispanic population in the census tract.

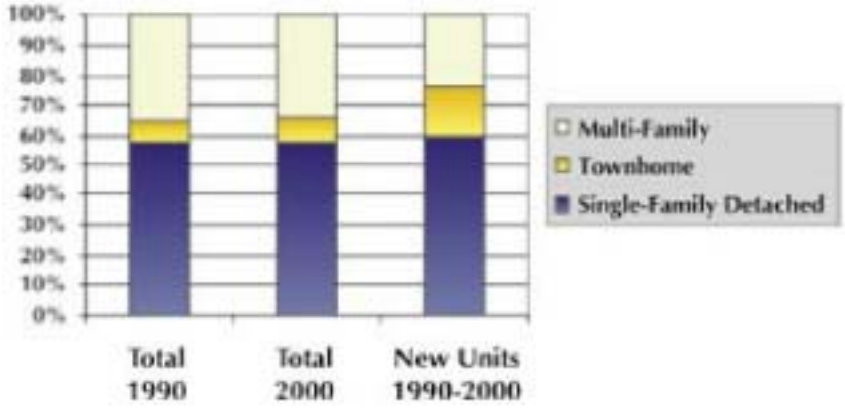
Housing

Recent trends and existing housing conditions point to an unmet demand for a greater diversity of housing throughout the six-county region. During the 1990s, the overall supply of housing did not match increasing demand in the SCAG region. Even as the population continued to grow, home construction lagged behind. The number of annual building permits decreased by 20 percent between 1990 and 2000. Further, those units built were out of sync with the demand for a broader array of housing choices from an increasingly diverse Southern California.

Single-family detached homes account for about 60 percent of housing in the region, according to the U.S. Census Bureau, mirroring the proportion of single-family units constructed during the last decade. And while multi-family units account for a significant proportion of the overall supply at about 40 percent, there were fewer multi-family building permits issued in 2000 than in 1990.

As a result, as populations in need of multi-family housing increase the demand for such housing is outpacing production. Immigrant populations and the 20-29 year-old and senior populations – those most likely to want multi-family housing – are increasing faster than the multi-family housing supply.

Housing Split



AR0072637

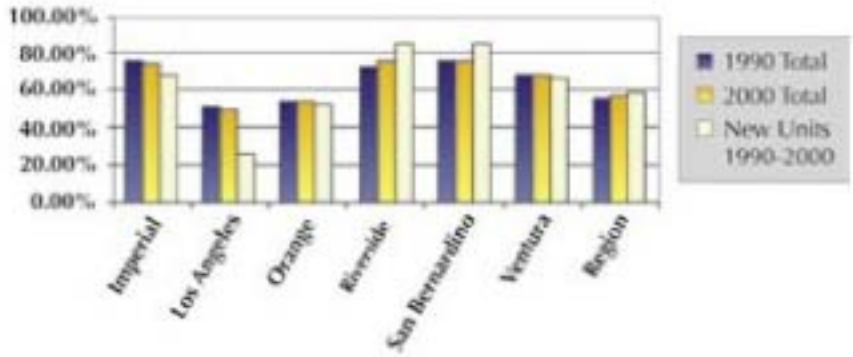
The cost of living has soared across the region, causing an affordability crisis for low-income households and increasingly for middle-income families wanting single-family homes. This is especially true in the coastal and jobs-rich areas of the region where vacancy rates are low, housing costs are high, and new housing typically consists of single-family homes for people in upper-income brackets. Earning the median household income no longer qualifies families for the median mortgage payment. Households earning the Area Median Income (AMI) in Los Angeles, Orange, and Ventura Counties, for example, spend more than 50 percent of their income on housing.

The increase in construction of townhomes also suggests that there are housing types that are becoming more in demand. While townhomes account for only 18 percent of the region's multi-family units, they accounted for more than 40 percent of the growth in multi-family housing built from 1990 and 2000.

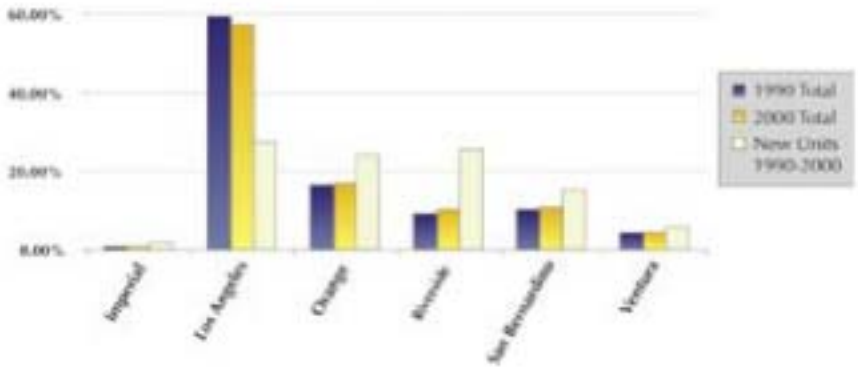
Although Los Angeles County still retains the bulk of the region's housing (approximately 60 percent), Census data show that the new housing is being constructed in equal proportions across Los Angeles, Orange and Riverside Counties. Between 1990 and 2000, about 25 percent of housing in the region was built in each of these counties, with another 15 percent of the new housing in San Bernardino County. And while multi-family housing construction has increased in Los Angeles and Orange Counties in the last couple of years, it still has not kept up with population growth, a situation exacerbated by the slump in multi-family housing construction in the 1990s. At the same time, Riverside and San Bernardino Counties are building single-family homes in greater proportion (85 percent are single-family) than what currently exists (75 percent). This shift in population away from existing job centers can compound the lack of housing near jobs in the counties that already have the longest commutes in the region.

The gap in unmet demand for greater housing diversity will continue to grow without a regional long-term planning effort. In particular, the housing need for new employees entering the workforce and senior housing must be addressed if the region is going to sustain economically viable and healthy communities.

Single-Family Housing Split



Share of Regional Housing



AR0072638

CURRENT TRENDS IN INFILL

When housing is built on land that is already developed, or on scattered small sites of undeveloped land, the process is called infill. The images to the right show where redevelopment and infill occurred in the 1990s. The fuchsia represents Census tracts in which all the development in the 1990s was through infill and redevelopment, while the lavender shows tracts in which some of the development in the 1990s occurred through infill and redevelopment. In the 1990s, 35 percent of the new housing developed in the region was built on already developed land. Most of the redevelopment occurred in the Los Angeles basin. This high redevelopment rate is a testament to the limited land supply and continuing strong demand for housing in the basin.

Jobs

The recession in the early 1990s hit the Southland hard. The employment growth rate in the SCAG region between 1990 and 2000 was only 8 percent, about half of the 16 percent job growth experienced in California, and well below the national rate of 20 percent. During the second half of the decade, however, the region's employment grew faster than the nation, at 14 percent. During the 1990s, certain counties fared better than others. The Inland Empire experienced an explosive growth rate of 37 percent, followed by Ventura and Orange Counties at 19 percent and 18 percent respectively. Los Angeles County had a net loss of 67,000 jobs during the 1990s.

In the 1980s the manufacturing sector accounted for nearly one-quarter of the jobs in the region, but during the past two decades manufacturing jobs have declined and now represent only 14 percent of the employment mix. Service sector jobs, on the other hand, have skyrocketed from 22 percent in 1980 to 31 percent. Jobs were also added in government, trade, transportation and public utilities, and construction and mining between 1990 and 2000.

Most of the manufacturing decline occurred in Los Angeles County and was defense or aerospace related. While Orange County also experienced a net loss of manufacturing jobs from 1990 to 2000, Riverside and San Bernardino gained about 39,000 manufacturing jobs.

Since a healthy economy is the driving force behind a healthy community, it's important to plan for an equitable dispersion of employment opportunities throughout the region. Job location affects public services such as transportation, education and housing, making a regional coordinated planning effort key.

AR0072639

Transportation

In the 1990s, the region experienced an infusion of transit infrastructure investment. Most notably, the Los Angeles County Metropolitan Transportation Authority (MTA) embarked on an ambitious process to improve existing systems, while also developing new light, heavy and commuter rail systems. The improved system has helped spawn development around major transit stations, contributing to increased ridership along the lines.

The Wilshire Boulevard rapid transit bus has improved service along this busy corridor.

The region still depends heavily on the freeways to move people and goods.

The MTA has also recently introduced "Metro Rapid" – a form of bus rapid transit – along two major transit corridors. Additionally, many municipalities in the region have upgraded bus service. Worth mentioning is the Santa Monica Big Blue Bus, one of the most successful transit systems in the country. In the year 1998-1999, according to the Center for Neighborhood Technology, the Big Blue Bus moved more than 20 million passengers.

Other transit agencies made big strides in the 1990s as well. Orange County Transportation Authority increased ridership by nearly 10 million trips between 1990 and 1999. In the seven-year period from 1992 to 1999, 100 percent more transit trips were taken on Foothill Transit, while ridership in Antelope Valley increased by more than 200 percent in the 1990s.

During the 1990s, transit use in Southern California increased more than vehicle miles traveled.

The Santa Monica Big Blue Bus moved over 20 million passengers from 1998-1999.

Across the Southern California region as a whole, transit use increased by 20 percent in 2000 – outpacing both the 13 percent growth in population and the 15 percent growth in the Vehicle Miles Traveled (VMT).

In 2000, total unlinked transit trips in the region increased by more than 40 million, or 7 percent since 1999. However, even in a time of increasingly improved transit access, the region is still encountering a number of transportation-related challenges.

AR0072640

The mode choice to work in the region remained essentially unchanged in the 1990s, contrary to the national trend. In 2000 the area had the highest share of workers that carpooled among the nine largest metropolitan regions and maintained a higher level of carpooling than the rest of the nation.

Despite the fact that in 2000 23 percent of commuters found alternatives to driving alone to work, congestion continues to be a problem in the Southern California region. In 2000, the Los Angeles metropolitan area (Los Angeles and Orange Counties) remained the most congested metropolitan area in the country in terms of hours of delay and congestion cost per person.

From 1980 to 2000, VMT nearly doubled. The good news, though, is that VMT growth has slowed down considerably. Whereas between 1980 and 1990 VMT increased three times faster than population growth, in the 1990s persistent congestion played a factor in slowing VMT growth to nearly the same rate as the region's population growth.

Between 1990 and 2000, the average time it took to commute to work increased in every county in the region. The region's average travel time to work increased from about 26 to 29 minutes and continued to be higher than the state and national averages but significantly lower than other large regions.

Transportation behavior is greatly affected by household, employment and service location. An aging population will change transportation mode choice, travel time and location. These changes affect future transportation decisions.

The dynamic interplay between past and current challenges will shape any vision for the Southland's future. A shared vision must anticipate the needs of a population that is simultaneously younger, older and more diverse.

Reduction in the wage-earning population will affect revenue for public services, yet more public services will be demanded. The growing senior population will require more housing options close to shopping and health care services, as well as alternatives to getting around by automobile.

In addition, the limited land supply in the basin will require new strategies for accommodating housing and employment.

The knowledge gained through observing these trends will enable the region to respond to these challenges and provide a range of options for accommodating the housing, transportation and employment changes that will help the region grow and prosper.

Looking Forward

Changing Ethnicity

In the next several decades, recent trends will persist, and the Southland will continue to become more diverse. While all ethnicities and races will experience an increase in numbers, the most dramatic gains will be among the Hispanic and Asian populations. By 2030 there will no longer be one race or ethnicity in the majority; the region will be truly international.

These changing demographics will provide the driving force for much of how the region will evolve. New housing markets will be opened as families look for cost-effective housing near jobs. Many people in the region will place a greater value on living close to family members and on proximity and quality of schools. These preferences will encourage the creation of a wide variety of housing products aimed toward the different needs and wishes that occur throughout this diverse region.

The increase in diversity also will fuel the natural progression of the "international city." With a broad range of customs, languages and international ties, Southern California will serve as the gateway for the majority of the country's commerce with Asia and Latin America. The ability to have a base in the prosperous and stable United States – but also tap into a workforce that is fluent in Spanish, Mandarin, Cantonese, Korean and other languages – will be a tremendous advantage in a global marketplace.

The future population will demand more entry-level and mid-priced housing. It will place a premium on location and good access to work opportunities, services and family. It will be important to place a high priority on locating new housing and job opportunities in areas that meet these criteria. Reinvesting in the region's corridors as mixed-use areas and opening up housing opportunities through infill and redevelopment will provide needed options in communities that are well served by transportation infrastructure and ripe with urban amenities.

SCAG Region Projections of Population Distribution by Ethnicity

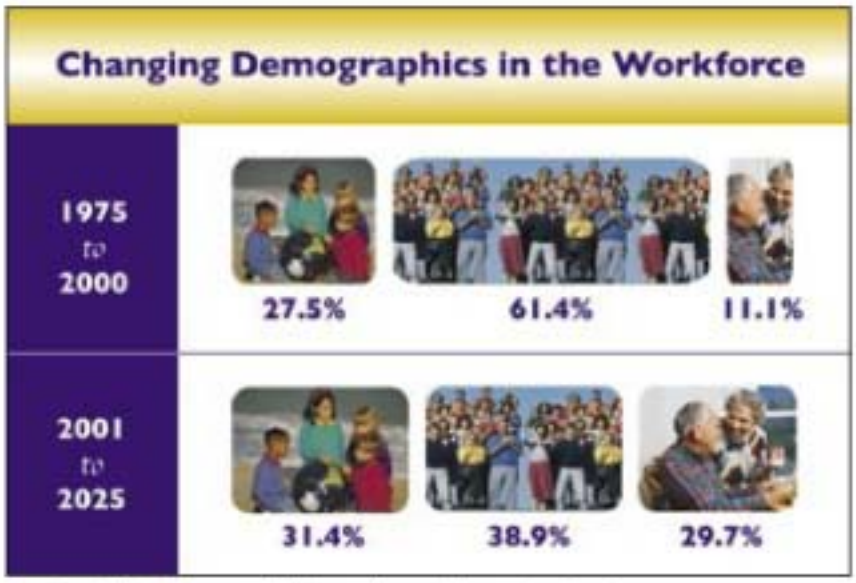
AR0072642

Changing Workforce

One of the greatest scientific achievements in the last several decades is the dramatic increase in an individual's lifespan. Many news segments, however, have depicted some of the worrisome aspects of an aging population – namely a growing number of people who are cared for through programs such as Medicare and Social Security. The Southland faces another daunting challenge. As our population ages and leaves the workforce, there will be a delay in filling their jobs until enough younger people become of working age. Currently, roughly two-thirds of the population in Southern California is of working age – the demographic generating the tax revenue that pays for public services that everyone uses. During the next 25 years, it is expected that the number of people over age 55 will increase by six times, while the number of children will also increase modestly. These two factors will interact to produce a situation in which the non-working population will increase from a mere 11 percent today to nearly one-third of the population. In 25 years, it is projected that less than 40 percent of the population will be in the wage-earning workforce.



Southern California faces a shrinking workforce in the coming decades.

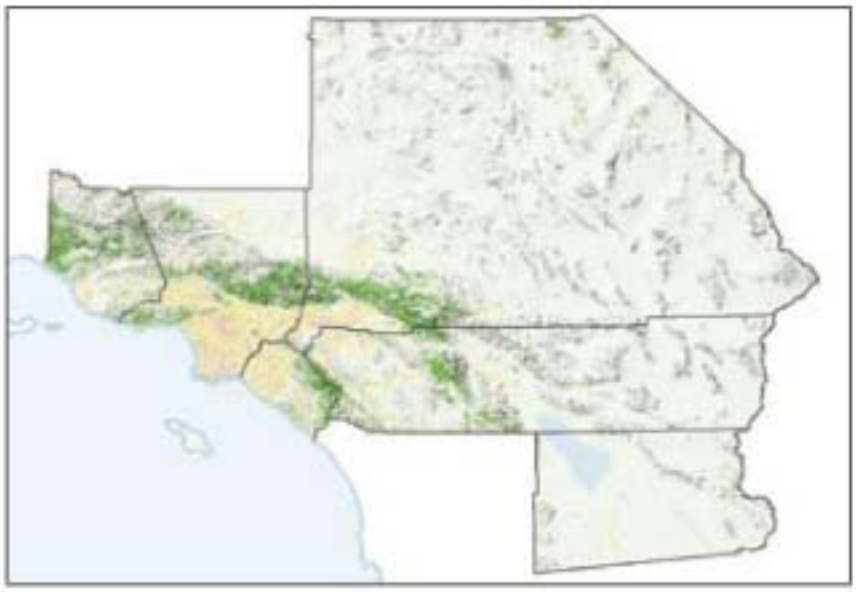
Change in Job Types

The region, as well as the nation, has seen a general decline in the manufacturing sector in recent years, resulting in the loss of a large number of living wage jobs. At the same time, the region is increasingly becoming dependent on the service sector. Service jobs are not as lucrative as union manufacturing jobs of past generations and often do not require a highly educated workforce. In many cases service jobs are located within communities whose home prices exclude service workers from living close to their workplaces. The shift to a service economy therefore intensifies the need for workforce housing close to jobs. To create prosperity for everyone and to diminish the impacts of long commutes, housing diversity and affordability will become increasingly important.

AR0072643

Land Supply

Since the SCAG region covers more than 38,000 square miles, few would imagine the area could be short of undeveloped land. But the region does in fact face a severe limit on the amount of undeveloped land suitable for development, which hinders its ability to accommodate new housing and jobs. The Coastal Basin of Los Angeles and Orange Counties, along with the San Fernando Valley, is home to 77 percent of the region's jobs and 71 percent of its population. Under current general plans, capacity on vacant land accommodates only 238,000 new households. That means that only 29 percent of the SCAG 2030 growth projection for this area could be accommodated through new development on vacant land.



Geography and the highly urbanized Coastal Basin constrain development opportunities.

Accommodating growth through infill housing is one way of dealing with the limited land supply in the Coastal Basin.

With limited undeveloped land, developed land will become increasingly important in accommodating growth. Infill, or new development in already developed areas, will be the method used to construct nearly half of the new housing region wide. In the city of Los Angeles, infill development could accommodate up to 80 percent of the projection for this area.

Another factor adding to the issue of a constrained land supply is the cost in time, money, and community building that is incurred by long commutes between the region's job centers and areas with plentiful land.

AR0072644

Provision Of Open Space

While some communities in the Southland provide an exceptional amount and quality of open space, other areas provide few opportunities for experiencing the outdoors. As the hillsides, once considered too steep for development, are now sprouting houses, there is a growing concern about natural areas that are not preserved by public or protective ownership. As the population grows, the pressure to develop environmental assets will only increase. Likewise, with a growing population there will be more demand to save these areas and to create more recreational opportunities. All the region's general plans address open space in some fashion. Additionally, several innovative and progressive projects are currently under way. Some of these programs, such as the Coachella Valley Habitat Conservation Plan, are taking place at the sub-regional level. Other notable efforts, such as the Ventura County SOAR initiative (Save Open Space and Agricultural Resources) and the Riverside County Integrated Project (RCIP), are being implemented through general plans at the county level. Too numerous to list are the varied efforts taking place among the many cities of the Southland.

These green hills of Ventura County are a natural feature worth preserving.

Congestion

Congestion will continue to pose a problem for the Southland. The increasing population in the region will cause vehicle miles of travel to rise. Without significant changes in the way land uses are integrated with transportation, congestion is predicted to worsen. If current trends continue, estimates are that congestion, in terms of regional daily vehicle hours of delay, will more than double from 1.6 million to 3.6 million in 2030. In Riverside County alone, vehicle hours of delay could more than triple.

In a survey conducted by Compass, residents rated congestion as one of their top concerns.

AR0072645

Pollution

Despite significant air quality improvements in the region in the last 30 years, the Southern California region is still, and will continue to be, challenged with air pollution. Maximum pollutant concentrations in the region still exceed the federal standards for ozone, carbon monoxide and particulate matter (PM10 and PM2.5) significantly. In the last several years the downward trend of pollution production has reversed. Despite improved emission standards for passenger automobiles, big trucks and sport utility vehicles, which are exempt from fuel efficiency standards, have increasingly become the vehicle of choice.

Daily vehicle miles of travel also are still very high, despite a slower rate of increase in recent years. Additionally, emissions from ships, locomotives, buses, trucks, other large vehicles, as well as many household chemical products, remain unregulated. Thus, the combination of increased emissions, the regional geography, and the hot climate encourages ideal conditions (temperature inversions) for increased pollutant buildup and reaction. As a result of these factors, the air quality in the region could continue to worsen unless measures are taken and policy is introduced to reduce pollution production.

Managing freight efficiently is a crucial part of maintaining a healthy Southern California economy.

Although technological advances have helped curb pollution in Southern California, it is still a big challenge for the region.

Freight Management

Freight operation in the Los Angeles region originated next to the Port of Los Angeles at Long Beach in the early 20th Century, when these ports were separate from other development in the region. Subsequent growth has surrounded the original industrial lands and is currently constraining the expansion of operations needed to keep pace with increases in freight volume. Truck access directly to the ports contributes to severe congestion on the freeway system and to poor air quality in the region. The Alameda Corridor was built to alleviate some of the problems associated with truck access to the port.

In addition to rail and truck freight, the Southern California region is experiencing astonishing increases in air freight volume. During the next 30 years, conservative projections indicate that this market of high value shipments will triple in volume, despite the dramatic growth anticipated in other freight sectors.

And because air freight shipments intended for the local market must be transferred to trucks for delivery, air freight relies upon the surface transportation network, in the same way that other types of freight do.

Even when air or rail networks are used for freight, trucks are still needed for collection and distribution.

AR0072646

AR0072647

Public Input & Involvement

The Compass process has defined a shared vision that can guide regional and local land use decisions, transportation improvements and housing development for the next 30 years. The Growth Vision creates a goal toward which objectives and implementation strategies can strive. Arriving at the goal consisted of an extensive public outreach and input process. The Growth Vision was formed and refined through public surveys, focus groups, public workshops, sub-regional review sessions and policy dialogues held throughout Southern California. This section summarizes the process and findings of each of these components of public involvement and discusses how the results are incorporated into the Growth Vision.

Survey Findings

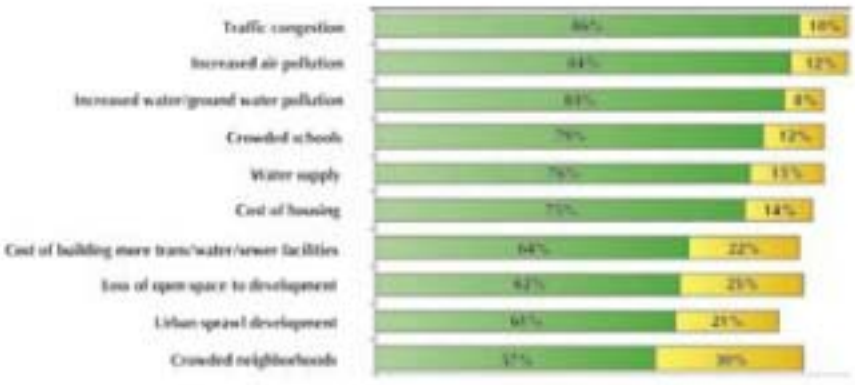
At the beginning of the Compass process, SCAG conducted a survey that asked Southern Californians them about the region's "biggest problems," perceived impacts of population growth, and transportation priorities.

Overall, the survey shows that while the results are diverse, Southern Californians hold collective concerns and hopes for growth in their region. The respondents want a balanced approach to managing growth. Respondents support allocating tax money to a variety of transportation improvements, from freeways to transit to bike paths. They were receptive to higher density development and redevelopment as long as it is coupled with preserving open space. And they believe that environmental protection must be balanced with economic growth. The summaries below provide a better understanding of why respondents are concerned with growth and their openness to solutions to growth-related challenges.

The Role of Planning

The survey results indicate that the respondents are very concerned that growth and its impacts will erode quality of life. In fact, 46 percent of respondents in the region agree that "my local government should try to slow growth down." When respondents prioritized their top four growth-related concerns, overcrowding of schools, at 46 percent, was of greatest concern. Traffic congestion was second, with 38 percent of respondents identifying it as their first or second most significant concern. Housing costs and increased air pollution were next on respondents' list of concerns.

Despite the concern about growth, wide support for planning solutions to growth exists throughout the region: 78 percent of the survey participants believe planning is necessary to maintain livability. The strongest support for planning exists among the most active voting population of citizens 55 and older. These survey results validate findings from previous focus groups. Balanced approaches to managing growth are also important. Respondents supported both transit and freeway expansion, allocating tax money to a variety of infrastructure (from freeways to bike paths), and they believe that environmental protection must balance economic growth. This search for balance and varied solutions means that any strategic policy or funding initiative is not likely to be widely supported if it focuses on just a single answer. Respondents also thought that it was both likely (78 percent) and desirable (61 percent) that Southern California will become more ethnically diverse.



The green bars show the proportion of survey respondents who were Somewhat or Very Concerned with each topic.

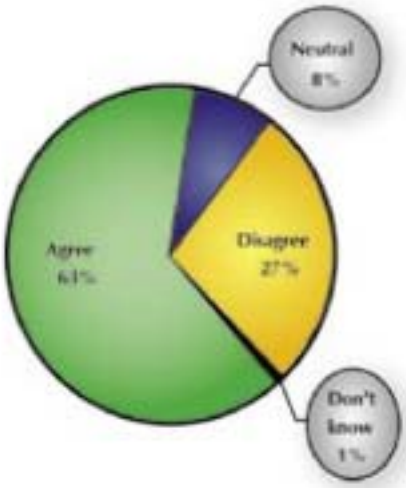
AR0072648

Transportation

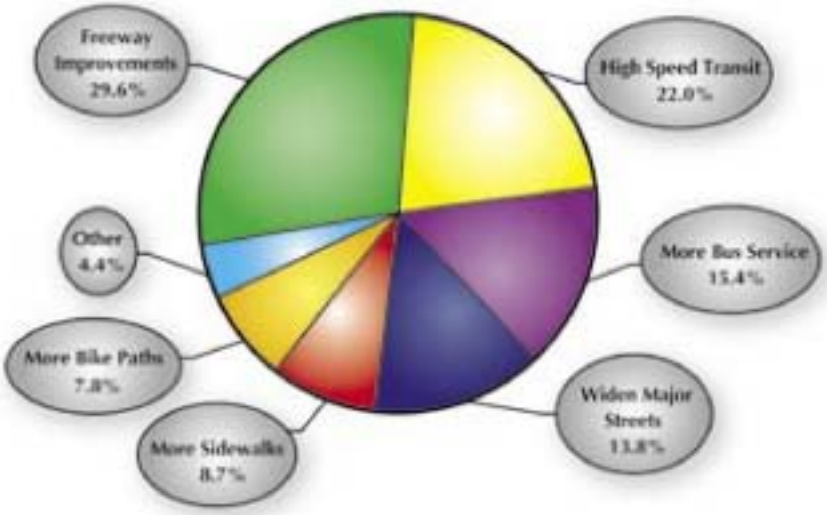
The survey, as well as web surveys and earlier focus groups, reflected a strong desire among residents for balanced approaches to managing transportation. The results indicated that citizens view freeways as an integral part of the region's future and dislike the current congested state of these roads. When asked how future tax money should be spent on the transportation system in the Southern California region, nearly 30 percent of respondents mentioned freeway improvements.

Yet more than two-thirds of the survey respondents believe transit is part of the solution to traffic congestion. Nearly 3 out of 5 found it desirable that transit trips would replace more and more automobile trips, and a large minority (34 percent) thought that it was likely as well. Survey respondents would allocate 37 percent of transportation funds to public transit (high-speed and bus) on average. They would allocate 30 percent to freeway improvements and 14 percent to surface streets. In total, respondents would allocate 54 percent of transportation funding to non-automobile modes of travel. These allocations hold true across all the counties in the region, with the exception of San Bernardino and Riverside, where residents allocated more funds to street-widening than bus service. Imperial County, despite its distance from the major employers of the Coastal Basin, gave highest priority to transit.

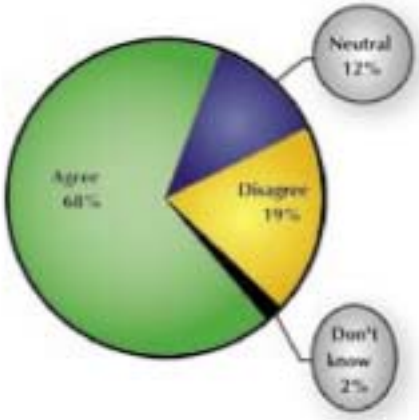
"We should widen congested freeways and build new ones."



Survey respondents' mean allocation of tax funds to transportation projects



"Building more high quality, high speed transit is part of the solution to the traffic congestion problem."

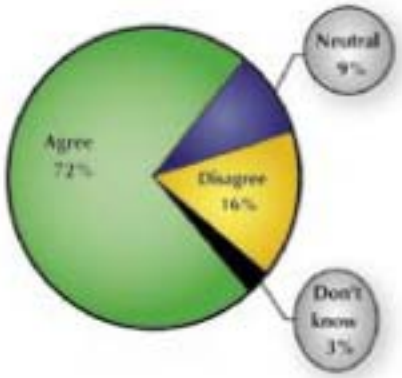


AR0072649

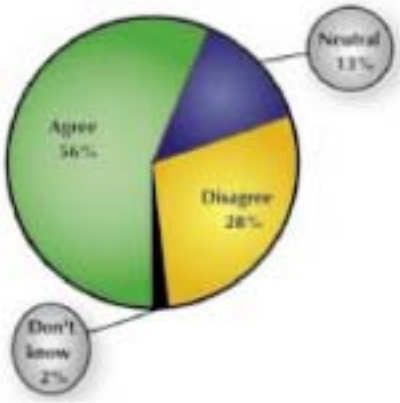
Land Use

Survey respondents showed a general concern for open space. More than 60 percent of respondents were somewhat or very concerned with urban sprawl and the loss of open space. And 56 percent of the respondents found it somewhat or very desirable that environmental protection will become more important than economic growth. Almost half (49 percent) of those surveyed believe this is likely to occur. The public was also receptive to the ideas of higher density development and redevelopment as long as they were combined with preserving open space. However, the same respondents were less amenable to higher density development or to new residents in their own neighborhoods. Overall, there was a general awareness of land use issues and little willingness "to not plan" or "to believe that somehow there is enough space to accommodate unfettered development." On the issue of infill, only 25 percent thought that growth will be concentrated in existing cities in the future, while 43 percent thought that this concentration would be positive.

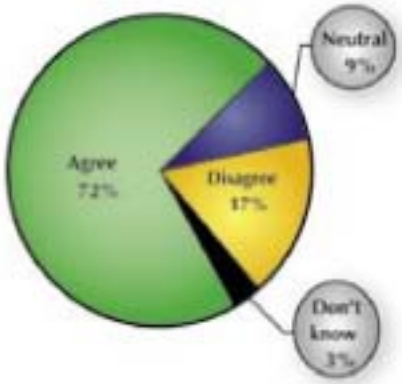
"New neighborhoods with higher density development are OK if they are carefully designed and provide open space."



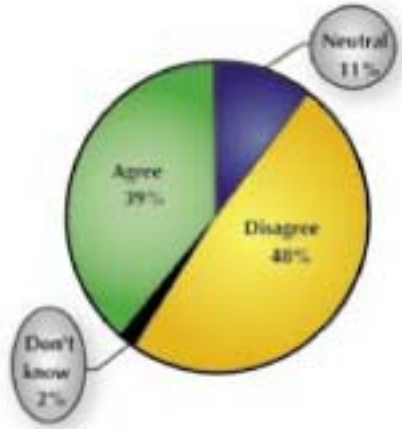
"Higher density development in my neighborhood is OK if it is carefully designed and provides open spaces."



"Areas of existing neighborhoods/business districts should be redeveloped instead of using up farm land or open space for development."



"I am willing to have more people live in my neighborhood so that less open space will have to be developed."



AR0072650

SOUTHERN CALIFORNIANS ARE MORE ALIKE THAN DIFFERENT

Southern Californians in different Counties showed that they are more alike than different. For example, between 84 and 90 percent of respondents in each of the Counties except Imperial were very or somewhat concerned with traffic congestion. Each County's survey respondents would allocate 18 - 24 percent of transportation funds to high-speed transit, while the proportion for freeway improvements was 28 - 36 percent. Their prioritization of transportation fund allocations was the same across all Counties, with one small exception in Riverside and San Bernardino Counties. Respondents from Los Angeles, Orange, and Ventura Counties put greater priority on bus service than on widening major streets, while residents in Riverside and San Bernardino Counties preferred the reverse. The overall distribution of funds fell into three categories in the following order of priority: (1) freeway and high-speed transit, (2) increased bus service and wider streets, and (3) more sidewalks and bike paths.

Respondents showed similarities toward general land use and planning issues as well. At least 70 percent of respondents in all Counties strongly or somewhat agreed that planning is necessary to keep the region livable. Nearly 80 percent agreed in five of the six Counties (70 percent agreed in Orange County). At least 70 percent of all Counties also agreed with the idea of higher density neighborhoods that are carefully designed and provide open space.

While it is often said that the sub-regions of Southern California are very different – and in many respects they are – this survey reveals that when it comes to picking strategies and investments, people across the region are remarkably consistent in their preferences. This similarity is a key asset to building a shared regional vision and to implementing positive long-range strategies.

Participants placed "chips" representing growth on this regional base map.

WORKSHOPS

The Compass workshops allowed Southern Californians to explore ideas about what the region will look like in the next 25 to 30 years. The workshops specifically asked the public how and where to accommodate the region's next 6 million people and 3 million jobs. Nearly 1,300 members of the public attended 13 Compass workshops. Using maps of the entire region, Southern Californians experienced firsthand the interdependence of regional land use, transportation, economics, and environmental issues across political boundaries.

The workshop participants came up with countless ideas, solutions, and plans, as well as more than 100 maps – each a unique vision of the future. While land use, transportation, and development issues are often approached at a local level, each Compass workshop map created solutions to these regional challenges. The workshop results support both the survey findings and the Growth Vision principles. They reflect the need for balance and planning, with consistent concern for environmental protection as well as economic growth, for multi-family and single-family housing types, and for mixed-use centers as well as single-use districts.

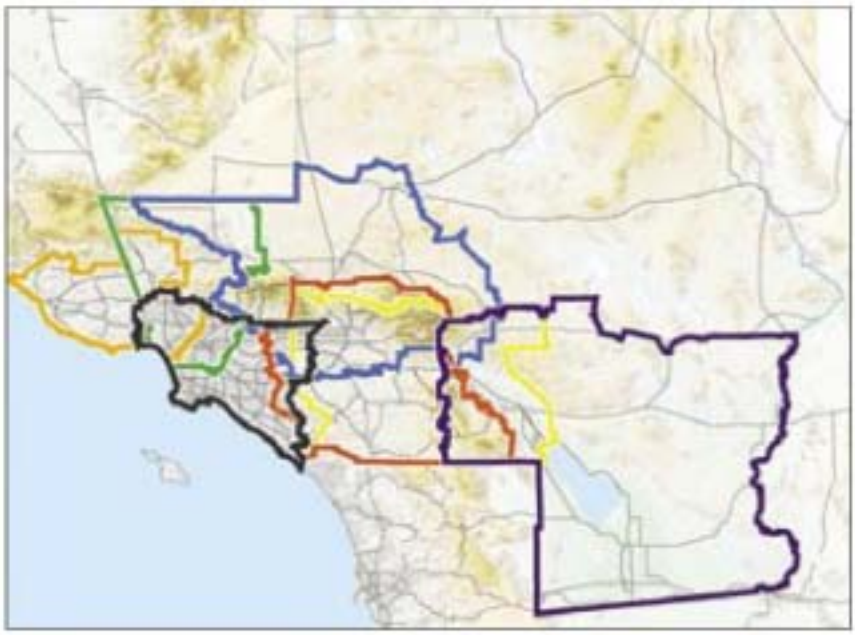
Workshop participants assess growth options.

AR0072651

Workshop Process

Compass used workshop maps of three different scales to gather the greatest diversity of citizen input. At the kickoff workshop Southern Californians from around the region worked on the entire six-county SCAG region. The majority of workshops were conducted at the sub-area scale – smaller than the entire region but incorporating multiple counties. Different sub-areas overlapped so participants had a choice of workshops. They were also formed based on commuting patterns, urbanized land and other geographic factors – not jurisdictional boundaries. Sub-area workshop participants were given the opportunity to work at the regional scale as well. The final two workshops allowed participants to work at an even finer level of detail in the South Bay/Gateway Cities and the Four Corners/Inland Empire Focus Areas. Also, as a result of public input the latter workshops allowed participants to select from a menu of transportation improvement options – allowing them to coordinate regional land use and transportation while considering the costs of transportation infrastructure.

Workshop participants sat at tables of eight to 12 people with people from diverse backgrounds. The diversity of each table allowed the participants to experience alternative points of view. Environmentalists and developers, students and seniors, immigrants and California natives often sat at the same table. They frequently found that they agreed more often than they disagreed – despite their different backgrounds. Other times, they negotiated trade-offs and developed successful compromises.

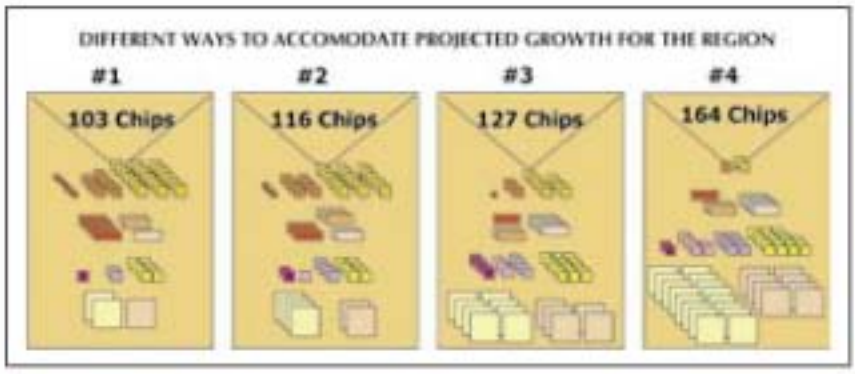


So that participants could work on a more meaningful scale, the entire region was broken into seven overlapping subareas.

Each workshop group was given a base map that included existing land uses, existing and planned highways and transit lines, and environmental constraints (steep slopes, floodplains, and wetlands). The participants were also given regional transportation, topographical, and endangered habitat maps – vital information that showed a regional context and with more detail than feasible on a workshop base map.

Participants first identified areas where they felt growth should not occur. These areas included stream and trail corridors, environmentally sensitive areas, and other significant natural features they thought should be preserved. The participants were then challenged to accommodate the base map area's projected growth in housing and jobs using various combinations of development-type game pieces, or chips. The development types represent a range of ways in which jobs and housing could be accommodated. Each development type has a unique development pattern (from auto-oriented to pedestrian-friendly), number of households and jobs, density, and combination of retail, office, and residential space. They were modeled after communities and places in Southern California (See Appendix I: Workshop Development Types).

AR0072652



The workshop groups were given three to four "starter" sets of chips. Each chip set consisted of a different combination of 14 development types. The development types were either separate-use, auto-oriented or they were mixed-use, pedestrian-oriented. They also included different levels of redevelopment. By choosing a starter chip set, groups indicated the quality of development (auto-oriented vs. pedestrian-oriented) and the general quantity of redevelopment they wanted on their map.

To accommodate the same growth increment, a chip set consisting solely of low-density, auto-oriented chips would consume more land than a set consisting of mixed-use, pedestrian-friendly chips. The workshops allowed participants to grapple with these tradeoffs. Each workshop group had to reach consensus on tradeoffs of low-density versus compact growth, redevelopment versus greenfield development, and other important development issues facing the region. As the exercise progressed, groups were allowed to trade chips if their preferences changed. In order to accommodate the region's projected growth, however, the final number of households and jobs had to remain constant after trading.

In conjunction with land use decisions made by placing chips, workshop groups marked ideal improvements and additions to the regional transportation system. This task serves as one example of how the workshops responded to the demands of its participants. As more and more workshop groups were eager to plan transportation improvements and modes, the final workshops provided participants with various colors of tape to delineate planned transportation improvements. Since the transportation options were described in detail *(see Appendix I)*, participants could then coordinate development with appropriate transportation service and even calculate the costs of the transportation improvements.

At the end of each workshop, the groups had the opportunity to present their own visions and ideas about growth. This exchange proved valuable, informative and enjoyable for the participants.

A woman presents the results of her group's work to the rest of the workshop participants.

Workshop Results

The workshop maps were compiled into a Geographic Information System (GIS) database that identified and analyzed the location, type and number of chips placed on each workshop map. Composite maps also were made of the transportation networks and open space corridors envisioned by each workshop group. The composite maps then formed the basis of the draft Growth Vision scenario – an alternative for future regional growth shaped by the visions and wishes of Southern California residents. The following summaries outline the common land use and transportation characteristics among workshop maps, as well as key differences between the various workshops.

Land Use

Whether or not the criticism of Southern California as an area of sprawl is true, there is a limited amount of easily developable land left in the region. That means there will be little opportunity to sprawl in the future. With this truth in mind, most of the workshop groups opted for higher degrees of infill development.

The workshop participants showed a strong preference for development in mixed-use centers and corridors. A surprising majority of workshop participants chose the most intense, mixed-use starter chip set (Chip Set 1). Chip Set 4 often approximated development trends from the 1990s or was slightly more compact. In most sub-areas, this chip set consumed all remaining undeveloped land. Of all the sub-area workshop groups, not one chose Chip Set 4.

AR0072653

The vast majority chose either Chip Set 1 or 2, both of which contained a majority of mixed-use, pedestrian-oriented development types. Through their chip selection, workshop participants indicated that they do not prefer one style of development over another. Instead, they seek choices and a wider array of options in building their future.

In nearly every workshop, participants demonstrated the importance of the region's transportation corridors. Through the placement of high intensity land uses and improved transit and auto service, participants assured a place in any scenario for these important corridors.

Conservation of existing parks and mountains was a high priority for many workshop groups. These groups sought to enhance networks of green corridors through mountain ranges and along rivers, particularly the Los Angeles and San Gabriel rivers, and worked to incorporate wildlife habitat corridors in their plans.

Tranportation

Consistent with the surveys, the workshops illustrate that transportation networks are indeed on the public' mind. Workshop groups often complained of congested freeways and routes, but they also proposed many solutions to the problem. While many participants advocated expanded capacity or new alignments, the majority used land use decisions and alternative means of transportation in addition to the more conventional manners of addressing congestion. This again illustrates that people want a wider range of options in their quest to achieve better mobility.

Workshop maps and comments also called for better access to transit and more comprehensive transit systems that approximate commute flows rather than remaining within political boundaries – most often with connections between Orange and Los Angeles Counties. Even residents who do not use transit supported upgrading transit networks. Many called for greater access to local bus routes for students and seniors.

Compilation map representing the sum of all land set aside for conservation by the more than 100 workshop groups.

Workshop Variation

The development types that participants typically chose to accommodate growth were heavily influenced by where they lived. For example, participants in the Downey workshop were much more likely to emphasize corridor reinvestment and intense, mixed-use centers than were participants in Palmdale, or even in built-out areas such as Garden Grove and the San Fernando Valley.

While many of the workshop groups opted for redevelopment over greenfield development, the workshop exercise exposed the difficulty of redevelopment in accommodating projected growth in nearly built-out areas such as the Los Angeles Basin and San Fernando Valley. While a strong desire to reinvest in the historic downtowns of San Bernardino and Orange Counties remained, interest in redevelopment was generally low in these counties compared to Los Angeles County. The High Desert cities incorporated more single-use development and fewer mixed-use centers than most other parts of the region. However, workshop participants continued to locate mixed-use development in High Desert city and town centers.

AR0072654

Residents in the Coachella Valley, the High Desert and other, more remote communities created more roads than other places. This is most likely due to the available land, recent growth, and the prevalence of automobile travel in these areas. While new roads mean more travel options, they also hamper conservation measures envisioned by many participants. Imperial County generally prioritized transportation connections to San Diego over connections to Riverside or Orange Counties.

The workshop participants encountered challenges in thinking regionally. Many were concerned with the effect of a regional scheme on other cities or neighborhoods on their maps. Similarly, others focused growth and improvements in areas they knew best – their own cities or neighborhoods – and did not attempt to change other areas. This stands in contrast to experience in other similar exercises where locals shun the idea of growth in their own neighborhoods and place disproportionate amounts of development in other communities.

Web-based Outreach

Compass also has used the world-wide web extensively to maximize outreach to Southern Californians. The award-winning Compass website offers a range of valuable resources, including news articles and reports related to regional planning and growth. It also offered several ways to get involved in the Compass process. Since not everyone could attend a workshop, web-based access to workshop information was made available. A web-based survey also was conducted so that people could respond to the issues of regional growth at a convenient time and place for them. The web survey was consistent with the phone survey. The Southern California Compass website was the recipient of an American Planning Association award of excellence.

AR0072655

Coordinating Land Use With the Regional Transportion Plan

As a metropolitan planning organization, SCAG is required by federal law to create a Regional Transportation Plan (RTP) that determines the needs of the transportation system and prioritizes proposed transportation projects. The RTP is also necessary to obtain and allocate federal funding for regional transportation projects. The RTP must be updated every three years to ensure that the plan adequately addresses future travel needs and is consistent with the federal Clean Air Act. While the Compass workshops were taking place, SCAG staff was working to update the 2004 RTP.

In keeping with the philosophy of scenario planning, a research project was undertaken in partnership with the SCAG RTP team to examine the effects of land use on regional transportation performance. Various regional development scenarios – alternative snapshots of land use 30 years into the future – were created to measure the various impacts of land use on congestion, vehicle trips, transit use and air pollution. The research was undertaken with the understanding that the scenario analysis would inform both the RTP and the Growth Vision. Incorporating land use into a regional transportation model is nothing short of a paradigm shift in the way regions plan transportation. The outcome of this scenario analysis will have tremendous implications for future RTP cycles in Southern California and regions nationwide.

To study the effect of alternative land use designs on regional transportation performance, multiple regional development scenarios were created through SCAG's Planning for Integrated Land Use and Transportation (PILUT). Two "bookend" PILUT land-use scenarios were developed to compare variations on regional trend scenarios and the draft Growth Vision scenario. One bookend, PILUT 1, focused on infill development in existing cities while the PILUT 2 distributed growth over a broader area in newer cities. Comparing these two extremes to the Trend Scenario provided valuable lessons for the Growth Vision principles and the Growth Vision scenario. Below is a summary of the PILUT scenario analysis process and its findings.

PILUT Scenario Analysis

How the Scenarios Were Modeled

A detailed land use model can help create scenarios that more fully test the integration of land use and transportation than regional transportation models can alone. Through the use of robust computer planning tools, development types were combined to create the two PILUT scenarios. These scenarios were designed to test two possible future outcomes. The PILUT scenarios were engineered not as draft visions but as studies that could help create a draft vision. Measures of the effects of the PILUT scenarios were then compared to the same measures of various baseline or trend-based scenarios.

Both the PILUT 1 and 2 scenarios consist of the same population as the total projected by SCAG for the trend scenarios and approximately the same distribution among the counties. In defining the scenarios, SCAG provided a mix of housing and jobs for each of the seven modeling zones within the region. This allocation was broken down to include population, households and three categories of employment.

The PILUT methodology incorporated many datasets from a variety of sources. The primary reference layers were from SCAG (regional land use 1993), satellite data (1992 and 2001), and Census data (1990 and 2000). Additional data included general plans for each of the counties, environmental layers, and derived layers from a digital elevation model. These layers were combined to create a database that could be queried to provide the most accurate land use information available.

The overall strategy in developing the map layers was to identify developed, environmentally constrained, and committed (publicly owned or tax exempt) land. The model assumes that publicly owned land is not available for either development or redevelopment, and removes it from developed and vacant inventories. Environmentally constrained land was also removed from the vacant land inventories in order to leave it in its natural state as much as possible. The resulting inventories of vacant and developed land are assessed for suitability for development and redevelopment, taking into account the land's proposed density and connection to infrastructure.

AR0072656

In addition to the detailed land use models that are used to both establish scenarios and monitor crucial themes (such as types of jobs and housing and the amount of vacant land versus infill development), SCAG maintains transportation models that use these scenarios as inputs. These models are capable of measuring the changes in land use, and in conjunction with current and planned infrastructure, of determining how the region's travel will be affected by the future growth.

The Trend Projection

As part of the RTP update, SCAG performed a detailed analysis of the region's existing conditions. This inventory counted the location and variety of the region's jobs, households and people. The modelers at SCAG then integrated this inventory with the transportation system and behavioral patterns to understand impacts on travel. Finally, the modelers developed a series of alternative land use scenarios.

One scenario, known as the Baseline alternative, represents what is likely to happen given the continuation of existing trends. Scenario planning relies on the idea of a Baseline alternative because it serves as a point of comparison for other alternatives. The Baseline is a prediction of where the future jobs and people will locate within the region if policies remain the same. It represents the continuation of current development trends, with adjustments made based on local input. The Baseline scenario for the Compass project is known as the 2030 No Project scenario. In the RTP process, several trend-based scenarios were created.

The Trend Projection

The process used to create the PILUT scenarios is very similar to the process participants in the workshops used to create their plans for the region's future. The scenarios were built by placing development types, representing a mix of land uses, throughout the region. The 17 development types (See Appendix II: Scenario Allocation Development Types.) used to create the scenarios are more detailed and refined than the ones used in the workshops, but they are similar in that they are based on places experienced by residents and workers alike.

The components of the development types are "building types," which were established based on real world examples found within the Southland. The building types represent a wealth of data – from jobs and housing types to the mix of land uses to building height and parking requirements – applied at the smallest level of geography available (about five acres). Each development type represents a unique grouping of building types.

At their most basic level, development types represent households and employees for a given amount of land. In addition to this simple representation of density, information can be associated with these development types indicating many factors, such as the amount of impervious surface, percentage of rental units, single-family and multi-family mix, infrastructure costs, and other derived assumptions. Scenarios were populated using development types, allowing for direct comparisons between them via evaluation criteria such as land consumption, comparative infrastructure costs, and housing and job profiles.

The scenarios themselves also are host to a wealth of data that can be used for further modeling or analysis. The following is a description of the two PILUT scenarios and the results of the scenario analysis.

Developed Land

Vacant Land

Environmental Constraints

In order to develop a land use model, developed and vacant land must be identified and environmental constraints removed.

AR0072657

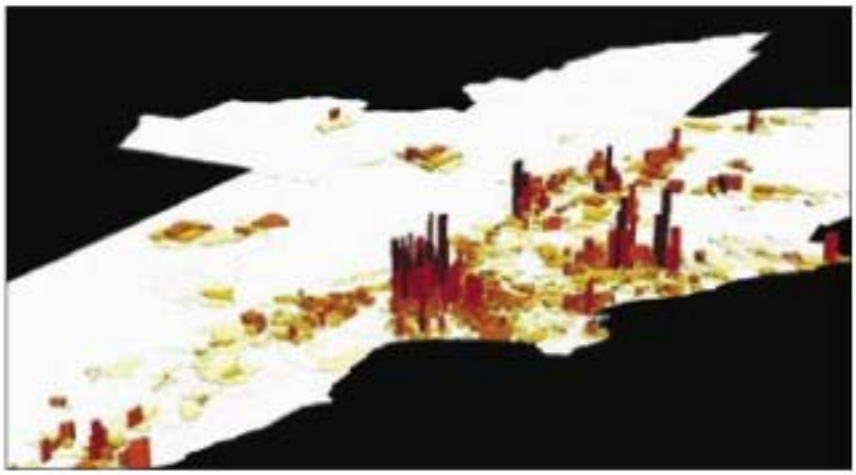
PILOT Scenario Analysis Results

PILUT 1

This alternative is often referred to as the "infill" scenario. It's based on an intense realization of the growth potential of the Coastal Basin of Los Angeles and Orange Counties and the San Fernando Valley. In PILUT 1, both jobs and housing growth would be focused on existing centers and corridors throughout the region. The majority of the workshop maps used similar strategies for accommodating growth.

In this scenario the city of Los Angeles, building upon its growing multi-ethnic population, will be transformed into an international city rivaling any in the world. Los Angeles would be home to significant amounts of growth, with most of it occurring through infill development. The intensive network of transportation corridors would be the target of significant reinvestment, creating highly desirable places to live and work in the central city that are near excellent transit service.

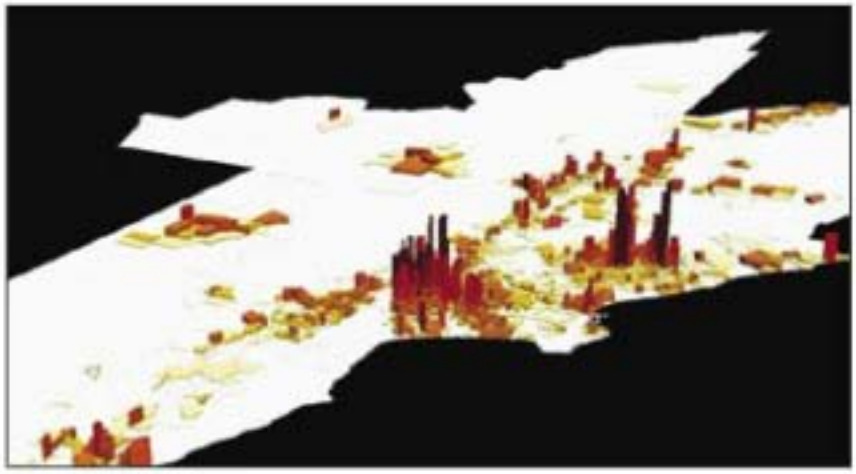
Beyond the Coastal Basin, cities would experience a significant amount of investment. To reduce trips and make transit more widely available, development that might currently locate along interchanges instead would be focused on the combination of existing well-connected road networks, transit access and services. This development would be mixed use, with close proximity to goods and services for new households.



A geographic representation of PILUT 1 shows intensity of development by TAZ.

PILUT 2

This alternative is often referred to as the "Fifth Ring" scenario. It is based on a broad distribution of future growth in the region. While the basin is still popular, an increasing share of growth will locate in newer cities. Places such as Palmdale and Ontario would become regional centers, with growth similar to that experienced by Orange County in the 1960s and 70s. Because most of the development occurs at the edge of what is current development, many towns and cities that today are separate from one another will grow together. The growth of the outer ring cities will transform the region, bringing economic growth to areas that have seen mostly housing development over the last decade. The region will become even more polycentric, with Palmdale, San Bernardino/Riverside, and Los Angeles operating as the three large centers from which growth extends.



In PILUT 2, outlying areas are a focus for growth.

AR0072658

With the outward expansion in business growth, Los Angeles will not see the extent of growth seen in PILUT 1. With job growth focused around the Ontario airport, San Bernardino and Riverside will merge to become one unified job destination. Palmdale will grow at a rate and density similar to Las Vegas during the last decade – minus the casinos.

There will be a significant number of new jobs coming to these emerging areas as manufacturing finds its place among the new investments in airports and centers. Accompanying all of these jobs are thousands of new homes, ensuring a balanced mix of jobs and housing that will allow the transportation system to work most efficiently.

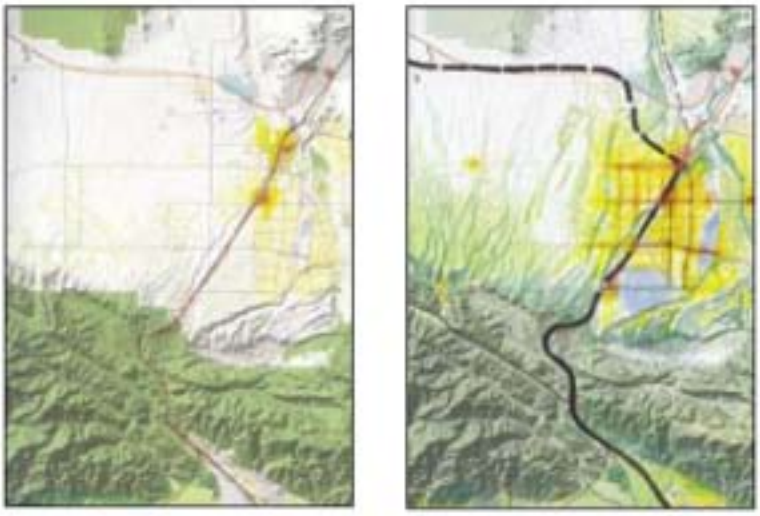
Within the centers themselves, housing will play a smaller role, since commerce is more predominant. These areas will, however, be home to a significant number of homes, primarily multi-family with some small-lot, single-family housing at the edge. Redevelopment and infill will continue to play a role in the development of new housing, likely continuing at about the same pace as today.

PILUT Performance

The two PILUT scenarios, using land use integrated with transportation, modeled significantly better than the conventionally created scenarios, the projected trend, and the composite of local plans. Specifically, with the same amount of investment, there was significantly less congestion and slightly more transit and walking than unaided. When the results are taken in whole, it is clear that either of the PILUT land use scenarios would be superior to the trend scenarios – and that they would achieve benefits equivalent to billions of dollars of transportation investments. Clearly, smart land use choices are one of the best potential strategies that can be used today. It is interesting to note that while PILUT 1 and 2 have very different distributions, they have similar development patterns that were developed by SCAG's Growth Visioning Subcommittee. When these principles are implemented, transportation improves to some extent, regardless of the specific location of development in the region. This is a robust strategy – it works well in many scenarios.

Toward the Growth Vision

Both PILUT 1 and PILUT 2 are plausible scenarios in the long term. But because they are "bookends," neither scenario represents a story about growth that is readily feasible in the short term. Both require significant and immediate policy changes. PILUT 1 requires policy changes at the local level to focus infill in existing centers, in transportation corridors, and around areas with high quality transit service. While PILUT 2 also would require significant policy changes to achieve its compact form, it also requires intensive investment in transportation facilities to spur the employment growth required in the High Desert. Based on results of the PILUT scenario modeling and the workshops, the team began to create the Growth Vision alternative.



PILUT 2 (right) places more growth in high desert areas such as Victorville compared with PILUT 1 (left).

Putting it Together: The Growth Vision

The foundation of the Growth Vision is built on lessons learned from surveys, workshops, scenario modeling sub-regional review sessions and policy dialogues.

Fundamental among the "lessons learned" from the PILUT scenarios is that the physical limits on developable land, from mountains and streams to existing development, will require finding new ways for the region to grow. Unable to rely on a never-ending supply of usable vacant land, cities and developers will need to focus on mixed-use development and on locating new jobs and houses in developed areas that are capable of supporting additional growth.

The network of transportation corridors provides a strong backbone for future land use in the Growth Vision alternative.

The region is rich with efficient and well-connected centers and corridors. These are prime areas where investment in infrastructure can act as a catalyst to focus growth. Development in these areas provides residents with many options for travel – from foot to bus to car – and minimizes reliance on scarce vacant land. Modeling has shown that more intense development, along with a mix of uses in these areas, has a great effect on reducing regional congestion.

Residents of the Southland can be open to higher-density development, especially when it brings investment to areas in need or preserves the region's open space. There is increasing evidence that new forms of higher density housing, when combined with the proper amenities and urban environment, are successful in the marketplace.

The amount of land that the region might consume does not depend on differing policy choices as much as it depends on the many smaller regions surrounded by rural land. Because there is such a limited supply of available land near infrastructure, the amount of land consumed in the future is less important than how the land is used.

The strategy of combining compact, mixed-use development with housing and jobs near major transportation infrastructure proved to be of enormous benefit in accommodating future growth. There is much evidence that a reduction in vehicle driving occurs in areas where land use and transportation are integrated and densities are higher. In a congested region such as the Southland, integration of land use and transportation has an even greater effect.

Higher density housing along the Wilshire Boulevard corridor.

AR0072662

Foundation of a Vision

The lessons outlined in the last section provide the basis for crafting a vision that uses the four Growth Visioning principles.

Again, the foundational principles for developing the Vision are:

- ✔ Improve ***mobility*** for all residents
- ✔ Foster ***livability*** in all communities
- ✔ Enable ***prosperity*** for all people
- ✔ Promote ***sustainability*** for future generations

The Growth Vision is based on a combination of inputs, namely:

- The Growth Visioning principles
- Composite of local government general plans and input to SCAG
- Pojected demand for jobs and households
- Compass workshops and survey results
- Lessons learned from the PILUT research
- Sub-regional review sessions
- Policy dialogues

Creating the Growth Vision alternative is one way to combine these principles into a viable and realistic alternative. It is important to note that there are many ways to configure the Growth Vision alternative and still achieve the same (or better) results. The important decisions are the principles, strategies and performance of the results. In crafting a practical Growth Vision for the region, the goal should be to achieve high performance and beneficial results – while tailoring the land use and investments to local needs and wishes.

Short-term Issues

It was important to include SCAG's projections for 2010 into the Growth Vision process so that the two projects can be folded into each effectively. While many of the policy changes depicted by the Growth Vision scenarios were positive, it may take some time to incorporate them into local ordinances and local development practices. By building the Growth Vision alternative on top of the 2010 projections, a full six years is incorporated for "ramp-up," or adoption of new policies and acceptance of new building styles. Further, the alternative was designed to recognize the local input received by SCAG during the RTP process. While the locations of jobs and housing are significantly different than in the conventional models, for the most part the total projection is very close to that requested by the member jurisdictions of SCAG.

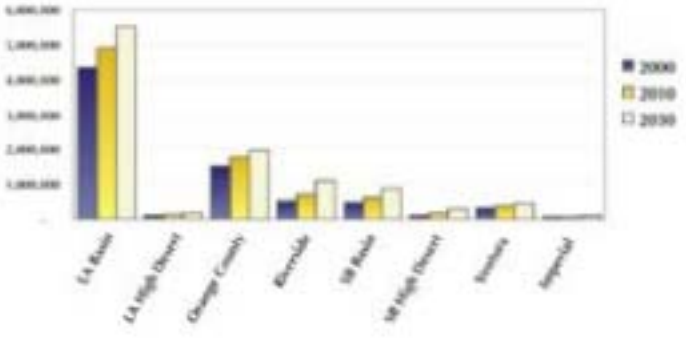
Employment by Year



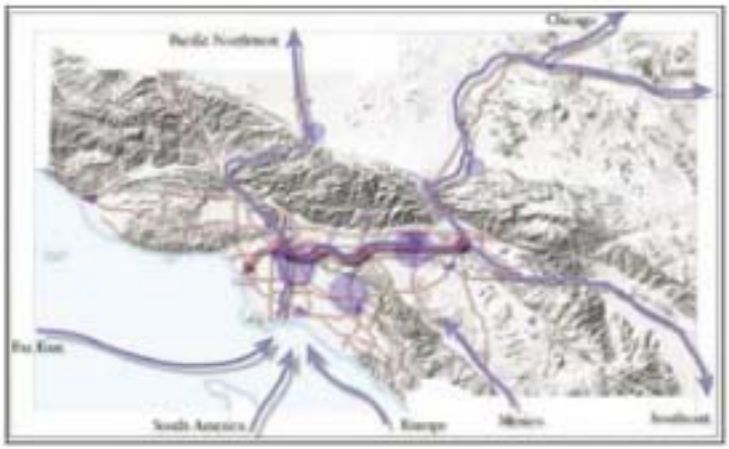
AR0072663

Prosperity: Economic Drivers

Southern California is an international center for freight, manufacturing, services and artistic production. These traditional sources of job growth will be reinforced in the regional vision through investments and strategies that bolster the local economy.

Southern California will continue to be both the cultural and financial center of the western United States, with major markets in Asia and Latin America. With increased opportunities for work and significant reinvestment, the motto will surely be "place matters." Major employers and corporate headquarters, along with start-up and creative-class businesses, all will be drawn to the region's core.

In addition to a commercial and cultural core, the region depends on the free flow of goods from its ports to maintain a healthy economy. The Growth Vision will help ensure the movement of freight flows efficiently through the region. Its aim is to reinvigorate the economy in the short term with road and rail improvements and to carry on long-term prosperity via the free flow of goods. The Growth Vision calls for upgrading much of the region's freight movement infrastructure. Dedicated truckways would be built along many sections of busy freeways to improve the movement of freight truck traffic. Railway improvements along specific corridors would move freight more efficiently. A MAGLEV train would offer an alternative mode for regional travel, to reinforce the larger business centers, and to improve the connections between the region's airports.



Prosperity will depend on efficient movement of goods into, through, and out of the region.

The success of the Alameda Corridor has spawned numerous proposals for improvements that will benefit freight movement. An inland port in San Bernardino County, which capitalizes on the regional interface between trucking, rail, and air is key among these enhancements. The ultimate vision is to provide direct rail access between the port and this major intermodal facility that will intercept through-region shipments for repackaging before distribution. Shipments for local markets still will be distributed from Long Beach but will cause less congestion.

The inland port intermodal facility will become a regionally significant employer, cementing the area's role as both a job and distribution center. In the process, a large number of currently underutilized industrial sites in the City of Los Angeles will become available for new uses.

The Growth Vision will improve freight distribution from the port of Los Angeles.

Air Cargo Demand
(Thousands of tons of Air Cargo)

Airport	2002 Tons x 000	2002 Percent of total	2030 Tons x 000	2030 Percent of total
Burbank	41	1.6%	87	1.0%
John Wayne	11	0.4%	41	0.5%
Los Angeles	1,950	74.7%	2,340	26.8%
Long Beach	58	2.2%	137	1.6%
March	0	0.0%	1,117	12.8%
Ontario	547	20.9%	2,252	25.8%
Palm Springs	0.8	0.0%	128	1.5%
Palmdale	0	0.0%	1,024	11.7%
San Bernardino	0	0.0%	1,092	12.5%
Victorville	0	0.0%	504	5.8%
Total	2,622	100%	8,724	100%

Air freight plays a significant role in the region's economy. While Los Angeles International Airport (LAX) currently handles the majority of air freight in the region, the Growth Vision proposes shifting more cargo movement to Ontario International Airport to free LAX for passenger travel. Ontario International Airport has already become a major facility for United Parcel Service, handling most shipments arriving or departing from the West Coast. With the acceleration of Internet commerce, special delivery services can be expected to increase at a higher rate than traditional shipping. Ontario Airport is planning an additional runway to increase capacity.

AR0072664

Employment in proximity to Ontario Airport.

These strategies carry the potential to increase the hum of the region's economy. Investing in freight movement infrastructure will keep the region's ports healthy. Ports – the beginning points for trade and commerce – are at the heart of this region's economy. Ensuring free-flowing movement of goods is imperative to the region's economic prosperity.

The Growth Vision depicts a region of many centers. The centers, in conjunction with the high intensity corridors that contain a significant amount of the region's commerce, will be filled with the vibrancy that comes from investment and additional people and jobs. While growth will be shared, variety will be intensified. These centers and corridors will continue to specialize, providing a home to unique business and cultural elements. The critical mass that can be attained through clustering of these uses will help cement the identities of places such as Burbank with the film industry, Los Angeles as a cultural center, and job centers such as the harbor or inland port as centers of industry.

Beyond the Coastal Plain, the shape of new development will undergo change. Auto-oriented commercial uses, from stores to offices, will find vacant land with good auto access difficult to obtain. While there will continue to be areas that are dominated by auto-oriented business, redevelopment and its higher densities will become more common. Existing city centers and the remarkable network of corridors will become the choice location for new jobs, combining with existing employment to strengthen the centers. These areas are locations with well-connected street systems, a pedestrian-friendly street environment, efficient freeway access and many transit options.

The cities and towns of the High Desert will make a name for themselves as they grow into unique new places. With a large supply of available raw land and a rapid rate of growth, these areas will have the unique opportunity to go from the planning stage to realization of a vision quickly.

Ventura County will continue to embrace the value placed on agriculture and open space. The SOAR boundaries, drawn for preservation, will demonstrate their power in bringing land uses together and lessening the impact on the transportation system. As long as Ventura County can accommodate sufficient workforce housing to match its employment growth, the SOAR boundaries will have a beneficial impact on transportation – if the boundaries cause long commutes because of a lack of housing, they could exacerbate congestion. Communities in this area will grow in popularity, capitalizing on the scenic beauty and quality of life.

Farthest from the Coastal Basin, Imperial County also will retain its strong agricultural heritage. Existing towns such as El Centro will evolve as even more important commercial and cultural centers. Strong preservation of agricultural land will keep the cities from unnecessarily growing outward. Building on a compact urban form, residents will have ready access to jobs, goods, services, and cultural activities within a very short distance of their front doors.

Livable Communities

Along with the Basin's increase in employment, Los Angeles and Orange Counties will become significant magnets for housing growth. Long commutes to outlying areas will be discouraged by rising congestion and the availability of nearby jobs and services. With many new residents from areas with high urban densities, the new population will be more adapted to urban living. The new availability of old industrial sites within the Basin will provide a much needed increase in land available for housing. These areas will be transformed into new neighborhoods, complete with a range of housing options and excellent accessibility to the Basin's

AR0072665

Open space protected by general plans, government ownership, or other conservation management efforts.

jobs, entertainment, and cultural opportunities. New housing will sprout at a rapid rate along the transportation corridors that define the area. This resurgence will provide housing for thousands of people through infill and redevelopment.

Throughout the region, existing centers also will become the focus for new housing. Like the Basin, but on a smaller scale, these areas will to some extent replace the demand for today's subdivisions. People will choose to live closer to work, shopping and transit. Local businesses will prosper as people enjoy shopping close to home. For areas such as Ventura and El Centro, as well as much of the region, this will mean a plethora of fresh local foods and quality local products. People living in the bustling urban core will find daily needs and cultural opportunities easily accessible. With a great variety of transportation choices as well, people living in commuter suburbs will also reap the rewards of a livable region.

Suitable housing will be available to everyone, regardless of where they live in the region. There will be a wide variety of housing choices – from public housing to multi-family housing and single-family homes – that are within the means of the majority of the labor force. Although many affordable housing units will be built through infill development, a fair share of workforce units will be located throughout the region, not just in the inner urban areas.

The same growth strategy that helps the Growth Vision perform so well on transportation models also makes the Growth Vision more equitable. The Growth Vision's focus on balanced development – ensuring that workforce housing is built near job rich areas, and that both are served by good transit services – shortens commute trips and makes jobs and housing more accessible to people without cars.

The Growth Vision also depends on investment in important regional infrastructure and transit services that satisfy the transportation needs of the labor force throughout the region. Transit services that serve low-income residents are enhanced and upgraded in the Growth Vision.

Sustainability

Sustainable cities pay close attention to their environment – recognizing correctly that it contributes significantly to an area's quality of life and that it creates a sense of place and character. Humankind has always modified the environment to meet its needs, but throughout most of history these changes have been, by modern standards, relatively modest adjustments to the landscape. It is only recently that such monumental attempts to control the landscape, as are commonly seen in American cities, have been made to develop land. Steep slopes, flood plains and wetlands are persistent features in the environment that have historically shaped development. Disregarding the risks involved in urbanizing them is potentially an enormous community liability, both financially and in terms of predictable community disruption.

The Growth Vision seeks to accommodate growth while avoiding the development of sensitive open space resources. In developing the scenario, development was avoided on steep hillsides, areas designated as open space in local plans, protected agriculture, and areas identified as potential future open space. Actually, the avoidance of these areas increased the beneficial transportation results by concentrating new housing and jobs closer together, and by providing access and views of the natural areas of the region to its urban inhabitants.

AR0072666

A depiction of the transportation network for the Growth Vision with Imperial subarea as the inset.

Mobility

The vast network of transportation corridors that help to define the Los Angeles Basin will undergo a transformation. Fueled by demand from new residents, the boulevards, with their high quality transit, will play a dominant role in people's daily lives. They will shine as a signature to the health and vitality of the Basin. Transit will play an even greater role in serving people's daily needs.

A combination of increased separate lane – or fixed guideway – bus and rail transit, along with growth in traditional buses, will enable quick and easy travel throughout the Basin. Los Angeles and Orange Counties will become part of a seamless transit network. For longer distances, high-speed trains and MAGLEV (trains that can go more than 240 miles per hour because they use magnets to hover over the guideway) will fill a role of ever increasing importance. This high-speed system will easily serve center-to-center regional travel as well as longer in-state trips.

The Ontario Airport will experience a unique type of growth as it is developed to an international standard. And by largely eliminating short distance flights, Los Angeles International Airport can shift to become more of a national and international airport without expanding the number of planes using it as a destination. These two airports will ensure Southern California's connection to the world and will further cement the region's position in the global marketplace.

Smaller airports around the region will absorb the demand for some of the flights from the rest of California and other nearby states, while the majority of the short-haul trips will occur by rail.

One of the keys to this strategy is promoting the use of freeways for long trips and local streets for short trips. The Southern California region has a good system of arterial streets that can replace the need to use freeways for short trips. In the Vision, many arterials are converted to boulevards, which are laid out in a web-like network or grid so that convenient access is provided to the greatest number of locations and multiple routes are available in times of congestion. The arterials will emphasize capacity and good design rather than speed, somewhat redefining the goals of mobility and accessibility. Only a small fraction of total daily trips in the region are longer than 15 miles, so the arterials are designed to serve trips of moderate length (up to 30 minutes) at moderate speeds (30 mph). The Growth Vision emphasizes good transportation facilities closer in, connecting our existing communities with an arterial network and planning future growth areas near existing transportation infrastructure.

Bus Rapid Transit

Ontario Airport

Maglev

AR0072667

Arterials Strategy

To reduce congestion on key streets and make them a viable alternative to freeways for medium distance travel, the Growth Vision proposes community-friendly arterials. They are designed to be safe and convenient for pedestrians as well as cars, to promote a pedestrian-friendly pattern of land uses, and to encourage alternative modes of travel.

Open spaces, landscaping, and sidewalks help make a safe walking environment.

The Purpose of A Street

Conventional highway and road planning and design has focused on efficient car movement, often at the expense of the adjacent business environment, community interaction, pedestrians, bicyclists, and others not in cars. Because of this, the word "arterial" often conjures up an image of wide roads, grit, traffic signals, and ugly roadside development. They are generally designed to have uniform speeds throughout their length, resulting in places that tend to look the same.

Multimodal streets focus on moving people, not just automobiles.

Streets for Multiple Modes

The Growth Vision views most roadways, from local streets to intra-regional arterials, as places that add to the quality of life of adjacent neighborhoods. Roads are not simply routes to move people and goods from place to place but have the potential to be quality places themselves. The focus of a roadway should be the people using it, not the cars and trucks moving through it. Roads have the potential to be many things and to accommodate a variety of travel modes. Seen in this light, a road can accommodate pedestrians as well as bikes and cars, while simultaneously serving as a community gathering place.

Arterials should be multi-modal, or multi-purpose, balancing the needs of all types of travel, including walking, bicycling, and transit, so that people have choices in how they get from one place to another. This is important for at least two reasons. To start with, a roadway with a fixed width can move more people and goods – which will improve regional mobility – if forms of travel such as walking, bicycling, and transit are used in addition to automotive vehicles. These means of travel simply take up less space per person.

An additional advantage is that walking, bicycling, and transit produce many positive qualities – they produce less pollution and noise, promote exercise and physical fitness, and spur development that is geared toward pedestrians.

Consider Streets And Buildings Together

The characteristics of each type of road suit some forms of development better than others. To take advantage of pedestrian-oriented land uses envisioned in the SCAG Growth Vision, a new circulation pattern to match these land uses must be developed – one that accommodates the car and transit and that reinforces pedestrian locations rather than isolating them. Instead of designing roads to be most convenient for cars and drivers, without regard to the resulting land use implications, it is important to consider the type of communities desired and to design roads to fit in and foster these communities.

Strong arterial design also focuses on how the adjacent buildings are designed and used. Arterial streets should not be considered by themselves, because they are defined in part by the adjacent buildings and land uses. Streets are made up of the area where vehicles move, the area where pedestrians move, and the areas where buildings interface with the rest of the street. The Growth Vision calls for street design that considers the entire right of way – travel lanes, parking, bike lanes, medians, sidewalks, and street trees – and ensures it is appropriate for and complements the adjacent buildings.

Since every trip begins and ends with walking, the pedestrian system is the primary transportation element that connects all travel modes. An arterial's pedestrian environment should move people and provide them access to adjacent land uses. A safe, comfortable and attractive environment includes a continuous system of sidewalks, wider sidewalks at congested locations, visible crosswalks, pedestrian signals, landscape buffers between sidewalks and streets, and a variety of public open spaces.

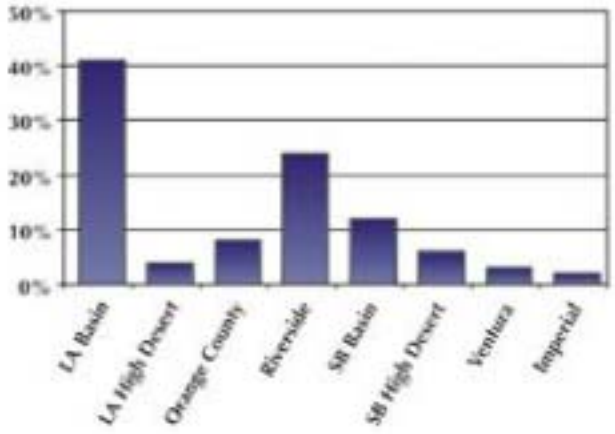
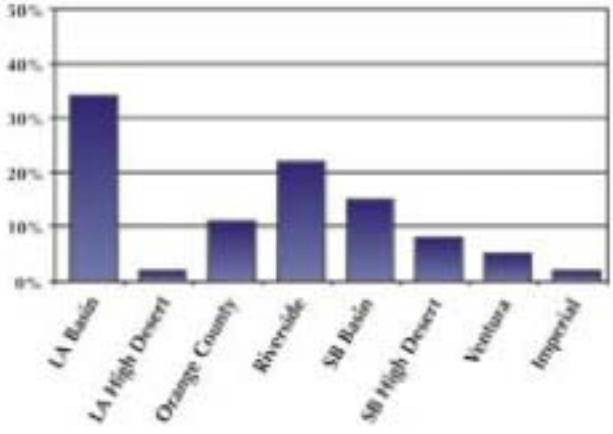
Results

The Growth Vision alternative places most growth in the Los Angeles Basin, Riverside County, and the San Bernardino Basin. These modeling zones have existing infrastructure, particularly transportation related, that allows growth to be absorbed with minimum adverse effects.

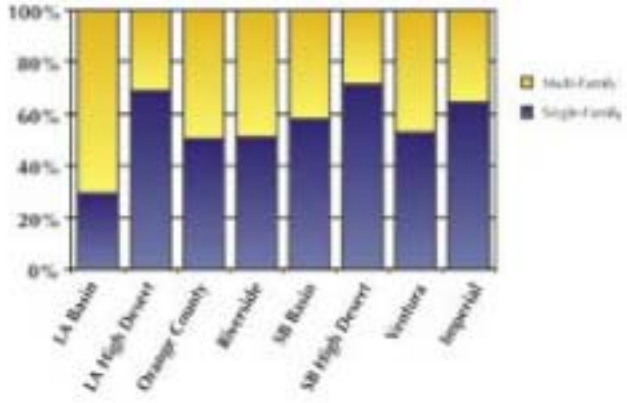
Incremental Household Distribution



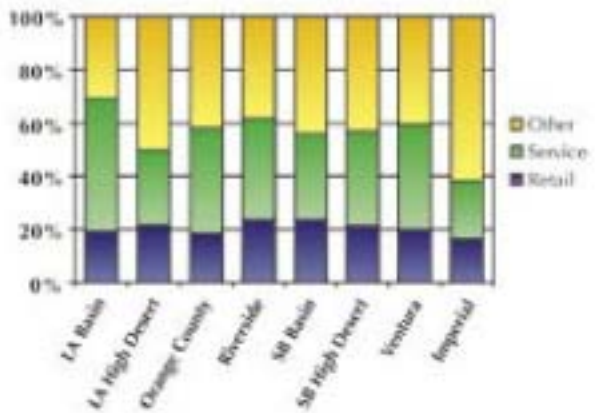
Incremental Employment Distribution



Incremental Households by Type



Incremental Employment by Type



In the Growth Vision alternative, the Riverside and San Bernardino High Desert modeling zones absorb the most greenfield development – new development on vacant land. Ventura and Orange Counties have the least development on vacant land. Los Angeles Basin absorbs the most growth – both in households and employees – through infill, far more than any other modeling zone. Orange County also absorbs almost half of its households through infill.

The eight transportation modeling zones.

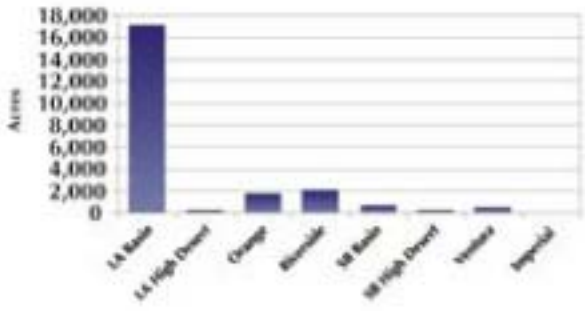
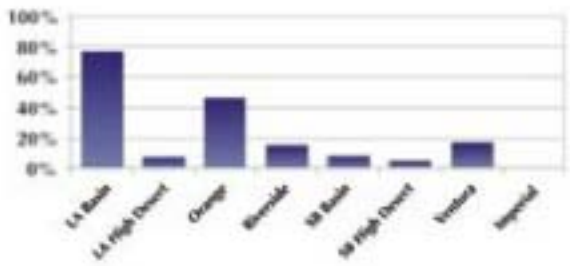
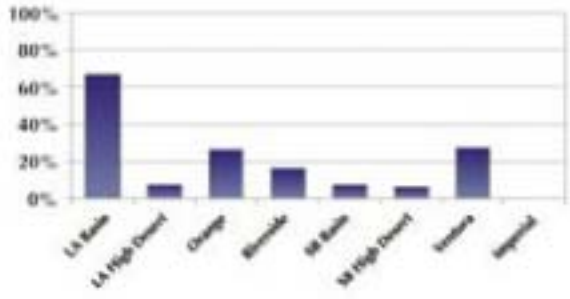
New Development through Infill



Percent of New Households through Infill



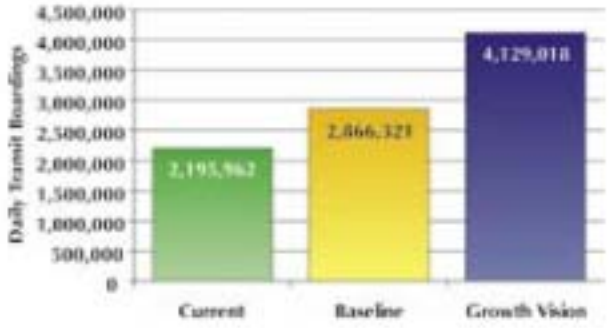
Percent of New Jobs through Infill



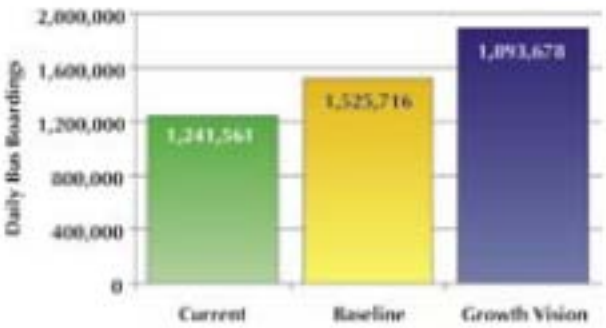
AR0072672

The Growth Vision alternative has much higher transit ridership than the Baseline alternative. Total daily transit boardings increase 44 percent in the Growth Vision alternative over the Baseline. MTA bus boardings increase 24 percent over the Baseline and 53 percent over the current level. The Baseline increases only 23 percent over the current level.

Total Daily Transit Boardings, 2030

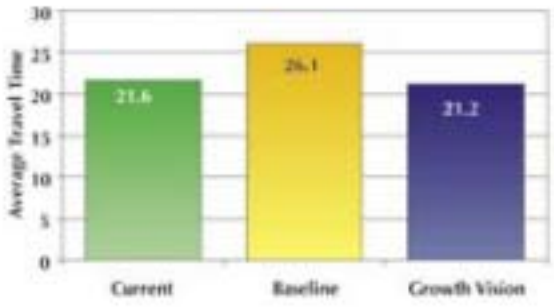


MTA Bus Daily Transit Boardings, 2030

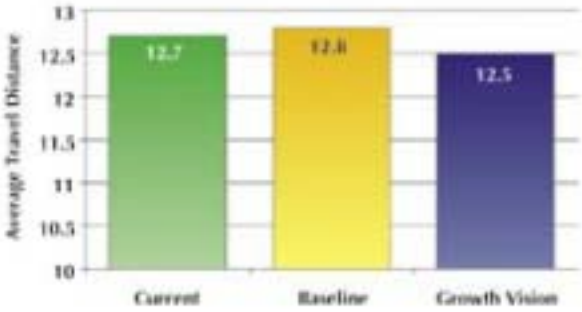


While the Baseline increases the current average travel time to work by 21 percent, the Growth Vision alternative actually decreases the average travel time by 2 percent. The Growth Vision alternative also decreases the average travel distance to work, while the Baseline increases average travel distance. The Growth Vision alternative decreases average travel distance to work by 2 percent as compared to the Baseline.

Home to Work Trips –Daily Travel Time per Person, 2030



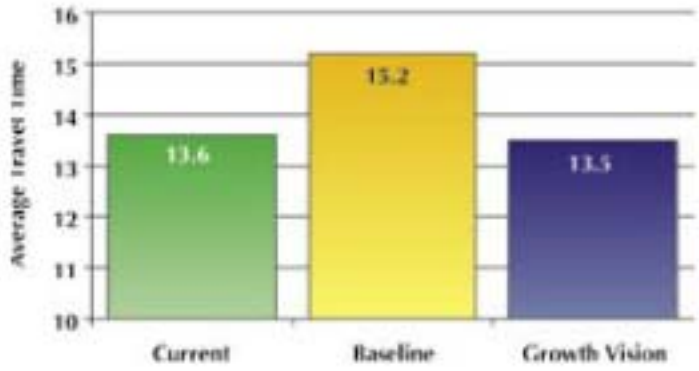
Home to Work Trips –Daily Travel Distance per Person, 2030



AR0072673

The Growth Vision alternative decreases the average travel time for all trips by 7.5 percent, while the Baseline increases the average travel time by 12 percent, from 13.6 minutes to 15.2 minutes. The Growth Vision alternative decreases average travel time by 11 percent over the Baseline.

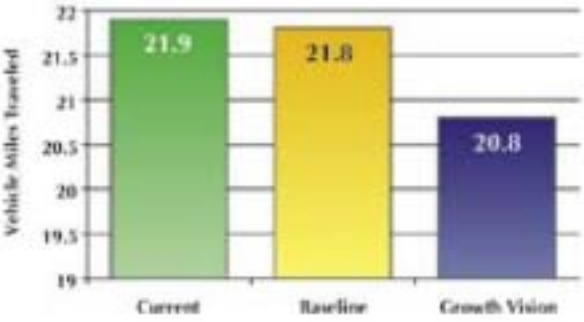
All Trips –Daily Travel Time per Person, 2030



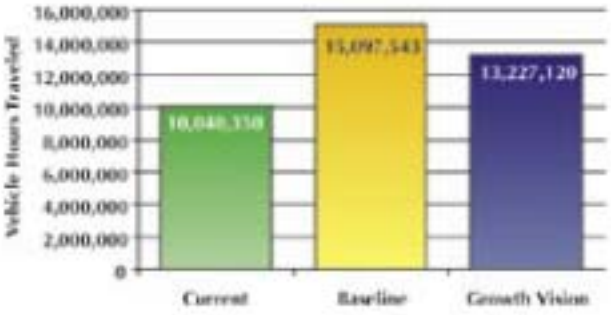
In both the Baseline as well as the Growth Vision alternatives, vehicle miles traveled per capita in the region decrease from the current level. However, the Growth Vision alternative represents a much greater decline – a 5 percent decrease compared to the decrease of less than 1 percent seen in the Baseline.

The Growth Vision alternative performs even better when considering total vehicle hours of travel. While the Baseline increases hours of travel by 50 percent compared to the current level, the Growth Vision alternative only increases the hours of travel by 32 percent compared to the current level – reducing the hours of travel by 12 percent compared to the Baseline.

Daily Vehicle Miles of Travel per Person, 2030



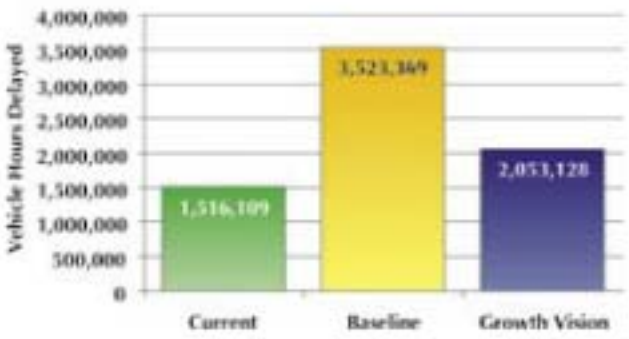
Total Daily Vehicle Hours of Travel, 2030



AR0072674

Vehicle hours of delay increase by 132 percent from the current level in the Baseline alternative. The Growth Vision alternative represents a reduction of 42 percent from the Baseline, limiting the increase from the current to 35 percent.

Total Daily Vehicle Hours of Delay, 2030



While the rate of people driving alone decreases significantly in both the Baseline and the Growth Vision alternatives, the Growth Vision alternative shows a greater increase in the transit mode split. The percentage of people using transit to get from home to work or school increases from less than 5 percent currently and in the Baseline to 7.4 percent in the Growth Vision alternative. This represents an increase of 54 percent.

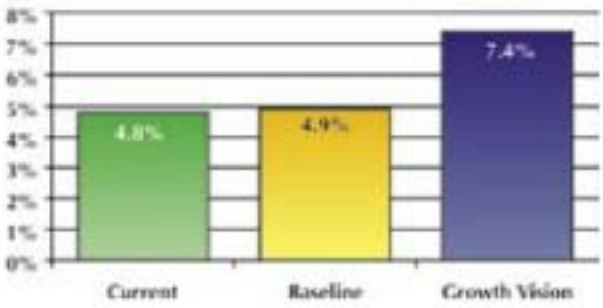
Home to Work/University Trips – Transit Mode Choice, 2030



AR0072675

Strategies & Performance

The transportation model results of the previous section indicate that the Growth Vision performed better than any other scenario. Transit mode split is increased while travel distance and time, vehicle miles of travel, and vehicle hours of delay all decrease. The obvious question is why: What makes the Growth Vision perform better than the Baseline scenario? What strategies contributed to the superior performance of the Growth Vision?

The Growth Vision alternative was created by thoughtfully locating a mix of land uses around the region, while taking into account current development, vacant land, the current and proposed road and transit network, and environmentally constrained areas. In this way, certain guidelines could be followed:

- Locate growth in areas with robust existing transportation infrastructure (plenty of streets)
- Locate growth in centers and along transportation corridors
- Locate growth near transit corridors/stations
- Locate jobs near housing and vice versa
- Locate heavy trip-generating development in areas with robust existing transportation infrastructure
- Avoid sensitive environmental features such as steep slopes, wetlands and stream corridors

DEVELOPMENT PATTERNS MAKE THE DIFFERENCE

Adhering to the guidelines listed to the left resulted in the following development patterns, which the Compass team believes to be the reason for the excellent performance of the Growth Vision:

Compact, Corridors- and Centers-Focused Development

The Growth Vision is much more compact than the Baseline Scenario. In the Growth Vision alternative, growth was located, as much as possible, in centers and along corridors. Growth was primarily located in existing centers and corridors, but if none existed, new centers and corridors were created.

Locating growth in centers improves transportation performance in several ways. First, the centers themselves usually have a good street network. There are many streets, options, and routes for getting where you want to go, so that not everyone will need to use the same road at the same time. Secondly, centers usually are easy to access. They are usually near freeway exits or at the intersection of other important roadways. Finally, centers are usually accessible by transit, and transit may provide mobility within the center as well. These factors allow centers to absorb growth without as much strain on the transportation system.

In addition, when employment and housing are located in centers and along corridors, trips become shorter. Housing, shopping, errands, recreation, entertainment and employment are more likely to be nearby. Even if housing or employment is elsewhere, the center or corridor encourages trip chaining for other needs such as shopping and errands.

Mixed use development

The Growth Vision employs mixed-use development, which ensures a mix of jobs and housing. Similar to the centers-focused strategy, mixed-use development brings daily errands within reach, shortening the two-thirds of trips that are non-commute trips.

Transit-oriented development

The Growth Vision located as much growth as possible near transit corridors and stations. In some cases, transit stations grow into mixed use, pedestrian-oriented centers, designed so that people can access them via transit and then walk to all other destinations.

Centers-based, transit-oriented development is particularly important for employment. Dispersed employment is almost impossible to serve via transit, because it is too expensive and takes too long. For commuting by transit to be feasible, employment density is even more important than housing density. Dispersed housing can be served by park-and-ride facilities, but dispersed employment cannot. Destinations (employment) must be close to transit stations. In the Growth Vision, employment density near transit corridors/stations was very high, in order to locate as many jobs as possible near transit and to make transit a viable commute option.

AR0072676

Sub-Regional Review

Southern California Compass conducted review sessions with city planners, public officials and local experts in an effort to refine the Growth Vision scenario that arose from the PILUT scenarios and workshop results. The SCAG region consists of 14 sub-regions, each of which operate as councils of governments in their own right. In an unprecedented effort to include sub-regional input and refine the draft Growth Vision based on local commentary, SCAG hosted review sessions in nearly every sub-region – often more than once. Through reviewing the Growth Vision scenario maps with SCAG, with neighboring jurisdictions and with sub-regional coordinators, local planners, officials and experts refined the public's ideas in finer detail and shaped the draft Growth Vision scenario to make it more consistent with sub-regional growth visioning efforts. In most cases the sub-regional review sessions confirmed the concepts behind the vision and tailored the scenario to a level of detail that only local knowledge and experience could provide.

The sessions showed consistencies and differences between sub-regions and the draft Growth Vision scenario. Open space provisions were consistent between the Growth Vision and much of the local planning initiatives in the region. Yet they also showed differing expectations concerning future housing, jobs and development. Local planners were concerned that entitled and recently constructed projects were sometimes not shown in the Growth Vision scenario. Since the draft Growth Vision scenario was based on public and regional input at the time of the review, local representatives were aware of new and pipeline projects that may not have been known by others. Other comments sought to better coordinate mixed-use centers with existing commercial developments.

The sub-regional review sessions shed light on existing growth visions and opportunities for future collaborative visioning efforts. Just looking at the maps of the Growth Vision and local plans made apparent the local competition for commercial development and opportunities for better land use and transportation coordination between cities. At the same time, the sessions created the opportunity to coordinate the Compass Growth Vision with sub-regional visions already under way. Such visioning efforts have been a great success and, as shown later in the implementation section, local officials and Compass agree that sub-regional visioning is key to achieving the goals of the Growth Vision and a sustainable Southland. *(Individual subregional review sessions are summarized in Appendix.)* The Growth Vision and sub-regional review sessions also serve as valuable input to the Regional Transportation Plan (RTP) and are further discussed in the Coordination With the Regional Transportation Plan section below.

AR0072677

Next Steps: Implementation

Southland Policy Dialogues

After the ideas from the public workshops were refined into the Growth Vision and the Growth Vision scenario was vetted in the sub-regional review sessions, Compass returned to the sub-areas where the map-based workshops were held to conduct five Southland policy dialogues in March 2004. By exploring the tools to make the vision a future reality, the dialogues represented an opportunity to "close the circle" from the map-based workshops. The dialogues aimed to achieve the following:

- Familiarize leaders across the region with the draft Growth Vision
- Help leaders to understand its implications for growth-related decisions within Southern California's sub-regions
- Identify barriers (regional and local) to effective implementation of the Growth Vision
- Develop priorities on key implementation strategies for SCAG, local governments and other decision-makers

At the dialogues, a diverse array of public and private sector community leaders explored implementation strategies, with a particular emphasis on the programs and policies needed to achieve the Growth Vision. Attendees at the dialogues included local civic leaders, government officials, business owners, developers and representatives of state agencies. Nearly 200 local community leaders participated in the five dialogue sessions.

The dialogue participants were asked a series of questions within each of the Growth Vision's four categories of guiding principles: mobility, livability, prosperity and sustainability. The questions were:

1.) What changes in local, regional and state decisions will need to be made in order to achieve the Vision?

2.) What are the barriers to those changes taking place?

3.) What policy and program strategies would help overcome those barriers?

4.) Given the near-term state budget crisis and its implication for transportation and conservation funding (as well as local government services) what needs to be defended to ensure that the longer-term policy and program strategies are not impeded by near-term policy and funding decisions?

Leadership Southern California Class XIV (a diverse group of 48 leaders from across the region) assisted in organizing and executing the dialogues. In addition to the five dialogues held throughout Southern California, a "pilot" Southland policy dialogue was convened with the participation of the 48-member Leadership Southern California (LSC) Class XIV. This group provided invaluable feedback about the Dialogue presentation and discussion format. In addition, many LSC Class members and alumni attended the dialogue sessions.

Policy Dialogue Findings

Key themes emerged from the dialogues in all sub-regions. *(Summaries of the policy dialogues can be found in Appendix IV.)*

Dialogue participants agreed that the region is likely to reach the population growth projected by SCAG for the Compass project (6 million additional people), though when that will occur was debated. To achieve the goals of the Growth Vision in accommodating such growth, policy dialogue participants came to some conclusions, disagreed on other issues, and asked more questions. While each of the policy dialogues produced unique ideas, three broad categories of ideas encompass the majority of the input. The first is the need for better collaboration and coordination of planning. The second theme is recognizing the importance of, and creating incentives for, the private sector and local decision-makers. Finally, there was significant call for sustained education and consensus building.

AR0072678

Better Collaboration and Coordination of Planning:

A primary theme of policy dialogue comments and ideas was better collaboration and coordination. Participants felt that SCAG and sub-regional agencies need to foster better coordination and collaboration among different levels of government, among the various agencies that affect land use, and between land use and transportation planning.

The idea that "sub-regions matter" was a resounding message at the dialogues. Participants emphasized the importance of planning that is tailored to the particular needs of a sub-region. Through the collaboration of sub-regional visioning efforts and the Growth Vision, Compass has acknowledged this need and taken the first step to making the vision a reality at the sub-regional scale. The diversity of the Growth Vision Subcommittee and the multiple public workshops have also helped Compass address the diversity of issues inherent to such a large and variegated region.

To continue along this path, better collaboration of the multiple scales of government and land use planning entities is necessary, according to dialogue participants. The principles need to be acknowledged and acted upon at the state, regional, sub-regional, local and community levels. For example, state agencies and regional agencies have tremendous impact on transportation infrastructure, while local entities have greater control over land use. With this understanding, participants expressed a desire for greater partnership with state agencies. At the same time, SCAG sub-regions are increasingly creating their own visions of growth to coordinate between their cities. Community planning initiatives also shape the design of open space, main streets and local districts. Participants recognized that these various jurisdictions exist and each has a unique role in land use and transportation planning. Achieving the Growth Vision therefore means relying upon and coordinating between each of these entities and levels of government.

The policy dialogue participants also stressed the need for collaboration among the many local public agencies that make land-use decisions. Transportation agencies, school districts, utility districts, redevelopment authorities and others agencies all have an impact on land use and, consequently, transportation. Coordinating decisions between these public bodies is another essential step in the direction of the Growth Vision.

As the Growth Vision principles are recognized locally and regionally, better coordination of land use and transportation planning is necessary. The Growth Vision analyses showed the benefits the coordination of land use and transportation will have on congestion, air pollution and commute times. To ensure these benefits, dialogue participants called for linking land use plans and project approval with transportation investments.

The Importance of the Private Sector

The policy dialogue participants recognize the importance of business location decisions in achieving a better jobs-housing balance and making jobs more accessible to employees. However, many questions remain about how to influence such private sector decisions. Beyond the traditional strategies of shaping infrastructure and using the project-approval process to influence business development and location decisions, participants could not agree on how to best influence private sector decisions. However, acknowledging these "traditional strategies" while increasing collaboration between public entities will guide business location decisions while removing impediments to market forces – market forces such as the trend toward transit-oriented development or pedestrian-friendly main streets. In the end, local and regional agencies need to maximize choice through incentives for the private sector. By creating development incentives and making them clear to the private sector, Southern California can achieve the Growth Vision by enabling businesses to make their own decisions and by increasing choice in the marketplace.

AR0072679

Sustained Education and Consensus Building

The final theme that emerged from the policy dialogues is the need for sustained efforts in public education and consensus-building related to the Growth Vision.

The participants agreed that a major step is to encourage local and regional officials to approve the Growth Vision principles and use them as guidance for local development and planning. Through this Growth Visioning process, Compass has taken the first step to listen, acknowledge and act upon the diverse ideas of elected officials, planners and citizens from throughout the region.

At the same time, participants recognized the need to acknowledge differing opinions. Not everyone agrees on redevelopment, on solutions to congestion, and on what to create as incentives and how. Achieving the Growth Vision will require broad public understanding and the alignment of thousands of individual decisions made in both the public and private sectors over many years. Thus, participants said, achieving the Growth Vision is as much a "cultural" shift as it is a technical or policy challenge.

In this sense, participants agreed it is necessary to sustain extensive public outreach and education campaigns to achieve the Growth Vision. Education curricula and worker training can encourage new and local ways to achieve vision goals. SCAG and sub-regions should promote exemplary projects and innovative policies that support and complement the Growth Vision. With examples, discussion and popular support, the communities, developers and businesses that make land use decisions will be enabled to set the region on track toward the Growth Vision.

Implementing the Vision

As a result of the policy dialogues, sub-regional input, and a look at best practices around the country, Compass compiled the following implementation framework to turn the Growth Vision into a reality for Southern California. While Compass has succeeded in garnering citizens, planners and officials to create a shared regional vision, its true success will be measured over the time. Southern California can achieve maximum mobility, livability, prosperity and sustainability through a series of agreed upon and feasible implementation tools. What follows, therefore, is a framework for implementing the Compass Growth Vision at the regional, sub-regional and local levels.

The Compass Growth Vision relies primarily on the four principles for a more livable future -- mobility, livability, prosperity and sustainability -- that were adopted by the Growth Visioning Subcommittee. These principles serve as the foundation for both the vision itself and for the strategies that will implement that vision and make it a reality. There are a number of implementation strategies that could be used, including some that are broad and overarching, thus applying to all the principles. Other implementation strategies are narrower and apply specifically to an individual principle.

General Strategies

Develop a monitoring system to gauge local and regional success of the elements within the Growth Vision

What gets measured gets done. One of the key advantages of a scenario planning approach is the reliance on monitoring, evaluation and adjustment of strategies based on success or failure. Without quality monitoring systems in place it can be difficult, even impossible, to accurately gauge the success of planning efforts. The RTP and Growth Vision both lend themselves well to detailed monitoring. The statements and policies about the future that will result from actions made today, tomorrow and the next few years can only be ensured if we can continually verify that we are on track. It is vital to measure our actions objectively to determine the level of performance being reached. This monitoring can provide an early warning system if things are not going according to plan. On the other hand, it can also alert us to early successes that provide valuable lessons and that further the plan's goals.

AR0072680

Of utmost importance in developing a monitoring system for the Growth Vision is that the measures and techniques to be used are developed through a collaborative process where all participating jurisdictions can agree on both the purpose and the method of monitoring. Once developed, this monitoring system should be used on a regular basis, resulting in a report that is shared with all member jurisdictions, which will help everyone understand how their policies and actions affect the collective goals of the vision.

SCAG should begin by incorporating the Growth Visioning monitoring system into the annual *State of the Region Report*. The report should include benchmarks and indicators, which evaluate progress toward quantifiable goals derived from the Vision. This monitoring system also should be used to compare the differences between the 2001 and 2004 Regional Transportation Plans to learn more about the effects of land use on transportation measures, such as reductions in congestion and emissions

Develop a legislative agenda to aid in the realization of the Vision

Coordinate this agenda with the other regional governments in the state, such as ABAG/MTC, SACOG, and SANDAG, to change state law that hinders the a common regional approach. State policy affects a wide variety of issues including transportation policy, housing and even labor laws that may weaken the Southland's potential to attract manufacturing firms.

Issues to be addressed at the state level include:

- Establishing priorities based on the Vision that can leverage funds for local governments.
- Using housing allocation funds and discretional decisions at the state and federal level to reinforce and support the Vision.
- Complying with a regional vision of tangible benefit, such as shifting the burden of proof for EIR compliance from the city and developer to the plaintiff, once compliance with objective measures of a growth management strategy are attained.

Use the Regional Comprehensive Plan as a tool to coordinate local plans and embrace the Southland's many unique local identities

Experience suggests that SCAG, the sub-regions, and local jurisdictions can more easily achieve their collective goals by actively encouraging and empowering sub-regional planning and coordination within the context of a regional comprehensive plan. The Vision should be built on this type of cooperative partnership. The Vision will be implemented through everyday decisions made at the local level and will therefore only succeed if it helps to accomplish local desires. The effort required to implement the Vision will not fall on any one jurisdiction. Cities, counties, transportation authorities and SCAG are partners, sharing the responsibility for making the Vision a reality for the residents of the Southland.

AR0072681

Create a targeted public relations strategy that emphasizes regional leadership and builds a sense of common interests among Southern Californians. Begin to develop a deeper respect for SCAG by the sub-regions and local jurisdictions

Sub-regional groups have discussed the critical importance and lasting potential of a good public relations strategy. This outreach should take a variety of forms. Publicizing the regional planning activities under way with SCAG's partners and the public is the primary goal of a regional PR strategy. This could involve a speaker's bureaus, planning assistance, and various mediastrategies. Other regions have also found great success by preparing handbooks or tools to assist their member cities in achieving a shared vision.

Education also is a key component of this outreach strategy. Education opportunities exist both in and out of the classroom. Conferences or symposia are an excellent way to bring important regional lessons to groups of elected officials, planners, and even students – our future leaders. Introducing regional planning into the schools themselves has also been a successful strategy. A first strategy might involve university-level course work through some of the many planning schools in the Southland. Further down the road, a program could be developed to educate high-school age students. For years Chicago had a mandatory class that taught children about their famed Burnham Plan of 1909. Getting children involved in the importance and quality-of-life benefits of planning at an early age helps to ensure that it will remain a topic of interest and concern as they become adults.

Establish a method to convene representatives from government, civic leaders and members of the development community to work together on issues and challenges that are shared by communities within the Southland

Setting up periodic forums to bring these groups together can be extremely valuable in helping everyone understand different perspectives and goals. Solutions are more easily derived from a common understanding. This coordination will allow the private sector to build the type of products that jurisdictions and their citizens want.

AR0072682

Implementation Tools by Principle

PRINCIPLE #1

*Improve **mobility** for all residents*

- Encourage transportation investments and land use decisions that are mutually supportive
- Locate new housing near existing jobs and new jobs near existing housing
- Encourage transit-oriented development
- Promote a variety of travel choices

Providing transit options is a way to improve mobility for residents within the region.

The 2004 RTP benefited from the land use element that came out of the Compass process. SCAG should begin each RTP process with scenarios based on land use to inform projections and transportation modeling

The 2004 RTP benefited from the land use element that evolved from the Compass process. This "bottom-up" approach has met with success during the Compass process. This includes incorporating input received locally from the sub-region and city review of the Growth Vision into a "starter Compass scenario" for the 2007 model runs, informed by the monitoring of key indicators in the interim.

There is no reason to wait to model these virtual futures. Iterative scenario modeling coupled with a detailed monitoring system will allow SCAG and local jurisdictions to stay continually informed regarding the benefits of the various growth strategies they are employing.

The Regional Transportation Plan is now aligned with the principles of the Growth Vision. SCAG should prioritize transportation improvements so that they parallel goals within the Vision

Projects funded by the RTP could be evaluated using the Vision, and the Vision could provide incentives for implementation of key policies in the RTP. The corridors described in the Vision and on the map are one of several items to explore. Corridors are the easiest places to make a case for using federal and state dollars to help cities with planning. Fully using the corridors will help focus the necessary land use changes into areas where change is both wanted and needed, protecting stable neighborhoods from significant impact. Increasing the housing and jobs in these corridors was one of the leading components of the Vision and led to many of the modeled transportation efficiencies of the 2004 RTP.

AR0072683

Develop a diverse set of pilot corridor projects that show the Growth Vision in action

Successful pilot projects can demonstrate progress in implementing some of the key principles of the Vision. These studies can help in understanding market and regulatory barriers that inhibit both economic growth and the provision of needed housing. Further, they can act as a catalyst, showing other developers, lenders, and jurisdictions the potential that can be achieved.

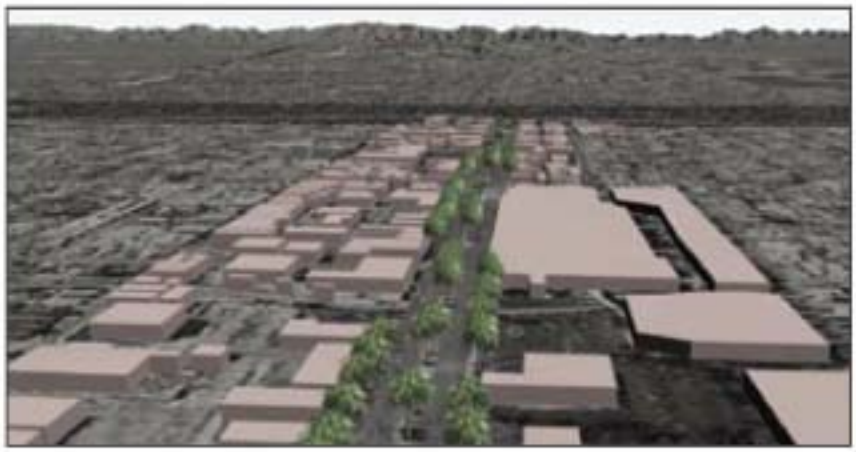
POSSIBLE PILOT PROJECTS

Below is an initial list of possible pilot projects for implementing the vision.

- Gold Line Extension
- Exposition Line
- Valley Bus Way
- Maglev IOS
- San Jacinto Line
- Highway 30
- 101 Corridor HOT lanes
- CenterLine
- North Los Angeles County to the High Desert
- Other corridors with significant transportation and land use interaction

For each of the corridor pilot projects, the parties involved should engage in a full land use and transportation study. Strategies would include

- Combining land use and transportation strategies, rather than holding land use constant and changing transportation investments on a case-by-case basis.
- Using scenario planning to investigate options and develop feasible strategies that allow the region to "plan without boundaries."
- Using a wide-ranging public awareness program, including workshops or charrettes to engage the public in developing scenarios and strategies.
- Developing a set of measurable criteria to evaluate different scenarios and using a consistent set of criteria to select a final strategy.
- Using this process to help define options for developing the Environmental Impact Review.



Work with county transportation commissions to help coordinate inter-regional transit travel

A recurring theme at the many Compass workshops was the difficulty many people face in using transit to travel across the region. Concerns ranged from varying fares, to headways, and most importantly gaps in service that seem to correspond to jurisdictional boundaries. The needs of residents of the Southland transcend city and county borders. These boundaries must be removed from the thought process in planning for seamless travel.

AR0072684

PRINCIPLE #2

*Foster **livability** in all communities*

Walkable communities help improve livability and promote a mix of uses.

- Promote infill development and redevelopment to revitalize existing communities
- Promote developments that provide a mix of uses
- Promote "people-scaled," pedestrian-friendly communities
- Support the preservation of stable, single-family neighborhoods

The Regional Housing Needs Assessment process should be coordinated with visioning and planning at the regional level to identify areas of common interest and mutual benefit

The Compass process should be used as a means of collaboration and compromise to revise the RHNA process to one that is less adversarial and more creative. As creator of the RTP, SCAG has the ability to bring about this change by facilitating a common understanding among local jurisdictions – one based on the demographic needs of the region. Building the process on top of a commonly held vision of the future can help focus the discussions on both regional and local needs while bringing consistency to the regional planning effort.

Endow the sub-regions with greater responsibility in conducting their own visioning

Use sub-regional efforts to guide the shape of regional plans and recognize that sub-regional, county and local collaboration is the cornerstone of implementation. SCAG's role would be to facilitate sub-regional efforts and help coordinate inter-jurisdictional planning projects. Building the Growth Vision from local planning efforts resonated well with the sub-regions and local jurisdictions that participated in Compass workshops, policy dialogues and scenario review sessions.

Establish elements of the Growth Vision scenario, such as centers and corridors and a well-defined open space system, with clear objectives for development, preservation and social equity

Agencies may use these objectives in providing assistance to developers who want to further city goals with their projects. SCAG can work to ensure that the Vision and its concept map evolve to recognize the local implementation efforts and priorities that are discovered during the process.

Offer planning assistance and cooperatively develop recommended model ordinances for those who wish to implement specific parts of the regional Vision

Model ordinances can make development that supports the vision the rule, rather than the exception. Through pilot projects, handbooks and partnerships, cities in the region have many resources at their fingertips to assist in planning and achieving the Vision. Research of pilot projects during the Compass project alone has shown that policies such as allowing for flexible building height standards and reductions in parking requirements for pedestrian-friendly areas can reduce costs by as much as 30 percent. Continued exploration and ongoing projects will provide the region with the tools necessary to properly use land use, specifically infill to enhance the transportation corridor efficiency.

AR0072685

PRINCIPLE #3

*Enable **prosperity** for all people*

A variety of housing types enables prosperity for all people.

- Provide a variety of housing types in each community to meet the housing needs of all income levels
- Support educational opportunities that promote balanced growth
- Ensure environmental justice regardless of race, ethnicity or income class
- Support local and state fiscal policies that encourage balanced growth
- Encourage civic engagement

Create a rich, comprehensive regional database for planning and economic development

SCAG should assemble and keep current a quality GIS inventory of: vacant and reuse opportunity sites, local and regional open space plans and information that will help companies find locations within the Southland near their desired employees. This data should be shared with jurisdictions and the development community. Such data sharing promotes jobs-housing balance, open space preservation and infill development and investment in areas that are largely developed.

Foster greater cooperation between business, government and community organizations through training in public-private partnerships

This effort opens the door to the creation of important partnerships with the development community, learning from them how policies and practices both help and hinder the creation of products that support the vision. These developers will benefit as they work with the cities and counties and will be able to act as ambassadors to their colleagues.

Accelerate employment balance throughout the region

The natural progression of growth in the Southland during the past several decades has been to initially develop an area as a place for people to live who have either been priced out of the market where they work or are willing to commute farther in exchange for other housing or neighborhood amenities. This of course leads to an imbalance of too many households versus available jobs in the area. In the years that follow, manufacturing and professional jobs often move to these areas in response to both land price and the availability of workers.

During the next 25 years freight coming into the Southland is expected to nearly triple – threatening further congestion. A goods movement strategy that addresses this tremendous growth can play a vital role in enabling employers to locate in these housing rich areas. It is therefore important when planning for the region's transit and highway corridors to also focus on logistics and goods movement. Southern California is multi-centric. Creating efficient access and goods movement allows these centers to develop in a balanced fashion. Being locations for people to live, they also have the basic elements for prosperous job centers.

AR0072686

Implement the techniques outlined in the 2004 Regional Transportation Plan's privately funded projects

Jobs for people in the middle class are not as available as they should be. State policies and changing demands on infrastructure from the increases in distribution are hindering the region's competitive advantage for manufacturing jobs. Addressing the infrastructure and location needs of the manufacturing and distribution sectors would allow more people to have access to these jobs. This would enable people in that cohort to more readily afford homes.

Discussion has been initiated at the state level about a manufacturing tax credit. SCAG could help increase economic security by using the Vision to create empowerment zones where employers would reap benefits for providing family wage jobs to people living locally. This can also be an assistance tool for areas that historically have been overlooked by new investment.

Engage a study to look at how public investment such as transit facilities increase land value and what options may exist to use newly created wealth to increase opportunities for others and create more transit-oriented developments

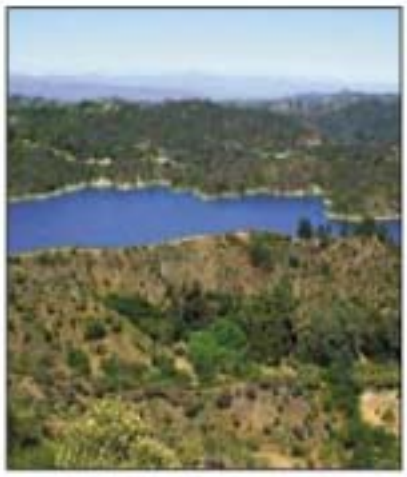
The increased value that comes with reinvestment in a specific area can often mean existing families are priced out of housing, or that it is not feasible for the market to produce the needed affordable housing. Cities are further trapped in that funds provided by the developers for city creation of affordable housing have diminishing purchase power with the success of the nearby developments. There may be avenues to explore in which the public could benefit from land value increases that occur because of new publicly-funded projects related to transit.

AR0072687

PRINCIPLE #4

Promote ***sustainability*** *for future generations*

- Preserve rural, agricultural, recreational and environmentally sensitive areas
- Focus development in urban centers and existing cities
- Develop strategies to accommodate growth that use resources efficiently, eliminate pollution, and significantly reduce waste
- Utilize "green" development techniques



Open space is integral to the health of communities.

Integrate the many open space and habitat plans under way throughout the region into an open space element for the Growth Vision

Much significant work in this arena has been completed or is under way throughout the region. The open space component of the Vision should be considered as important as urban centers and infrastructure. Through collaboration, SCAG should assemble the many planning efforts into a standardized inventory that can both inform the Vision and provide lessons to other jurisdictions interested in performing similar analysis. This green infrastructure should in no way hinder a jurisdiction's ability to accommodate needed housing or jobs. Instead, they should be rewarded for the extra effort of ensuring sustainability for the Southland. This inventory should be used to monitor sustainability and livability goals and help neighbor cities plan for open spaces in a coordinated fashion.

Offer training for elected leaders, planning officials, and the development community in green planning and design

As with planning for infill, handbooks, symposiums, and other education tools should be used to enable cities and counties to embrace the sustainable practices of green building. SCAG should act as a coordinating body to help the region determine a standard set of approaches. With SCAG helping to create these standards, the region's cities may face much less uncertainty at the state level as they work to implement the various techniques.

Identify or adopt a conflict resolution mechanism to assist with open space protection agreements already in place and work to enhance additional open space needs

SCAG can use its position as a regional leader to bring together the many interests that have a stake in protection or enhancement of open space. During regional planning activities, SCAG should factor in the need for preservation of open space and natural areas when determining growth projections and housing needs.

AR0072688

Cities and counties with a well-defined open space system or urban limit lines have a reputation for becoming desirable and expensive. Offer planning assistance and model ordinances that will help preserve the environment and enable inclusionary housing practices and housing choice

Cities throughout the region grapple with deciding how to appropriately address growth for their community while preserving their cherished open space and productive agricultural areas. Some cities and counties, for example, have adopted urban limit lines or growth boundaries. These tools can be very successful; however, they can also lead to unintended consequences. As a coordinating body, SCAG can help to share the best practices and lessons learned by cities that have employed these sprawl preventive measures. These tools can help ensure that the jurisdiction's goals are met and reduce the likelihood of problems arising. Cities across the country that have employed these preservation techniques have had to learn a few hard lessons before finally tuning the regulations to work as intended. By helping with these lessons learned, SCAG can help jurisdictions achieve their goals without facing the pitfalls that invariably come from trying something for the first time.

Calculate demand for water based on the Growth Vision projections and distribution

SCAG can bring the cities, counties and water providers together to better coordinate the availability of water with projections and capacity calculations for housing and jobs throughout the region.

AR0072689

SCAG Compass Regional Vision: Within Our Reach

Public spaces will continue to be enjoyed by future generations.

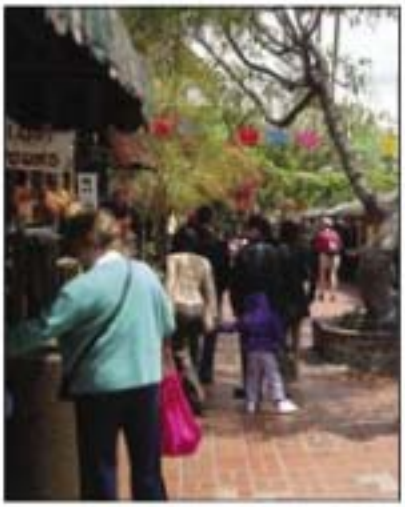
Fifty years ago, Southern California had a common vision of its future. The vision was based on a common set of values as well as the strategies to achieve that vision. In today's world, the problems and their solutions are much more complex. However, there are many efforts under way in the Southland to craft a viable solution that matches the values of the region today. Compass is only one such effort. All are working to identify solutions that will help the Southern California region move into the future with confidence and optimism.

While the solutions remain elusive, it is clear that there are common values in this region that can form the basis of a common vision. Most people want a plan for the future that adheres to the principles adopted as the SCAG Growth Visioning principles.

SCAG cannot implement this Growth Vision alone. It will require the efforts and collaboration of hundreds of groups and thousands of leaders. However, SCAG brings a unique, region-wide perspective, as well as the energy and the vision needed to solve regional problems that require a large-scale view. Conversations with residents of the region reveal what many other groups have found – some anxiety and some dissatisfaction, but more importantly, a common core of support for ideas that will actually work.

The sense of place in many areas will strengthened.

The key to success now is the most difficult – discovering the specific actions Southern Californians can agree on to make the region of their dreams come true. To this end, SCAG, its member governments, and the hundreds of other organizations must contribute and work together in a true regional partnership. SCAG stands ready to contribute to this important effort.



Southern Californians will maintain a high quality of life.

AR0072690

AR0072691

Appendix I: Workshop Development Types

URBAN CENTER

The Urban Center development type incorporates households, offices, retail, and civic uses into a walkable and mixed-use environment. This type is modeled on downtown Los Angeles and serves as a commercial destination and employment center. The Urban Center development type also contains a diverse array of multi-family homes and townhouses. The building types range from mid-rise residential buildings to mixed residential towers and commercial high-rise buildings. Interconnected street networks and a variety of amenities within walking distance make Urban Centers accessible by automobile, transit, bicycle and foot. Civic and open spaces lend to the walkability and diversity of uses in Urban Centers, they are lively throughout the day and evening. This development type is especially apt for infill in downtown Los Angeles.

Urban Center	
Acres per Chip	160
Households per Acre	110
Employees per Acre	320

AR0072692

CITY

The City development type incorporates a diverse mix of residential and employment uses, though at a lower density than the Urban Center. The City still serves as a significant source of employment. Like Pasadena or Santa Monica, this development type has a walkable center at its core. It may require structured parking and is accessible via multiple modes of transportation. Cities include a greater proportion and diversity of housing than downtowns, including multi-family homes, single-family homes and townhouses.

City	
Acres per Chip	640
Households per Acre	35
Employees per Acre	70

AR0072693

TOWN

As with the Urban Center and City, Towns are also walkable because of their mix of uses and interconnected street network, but at a lower density. Towns primarily function as service destinations with a central Main Street rather than centers of employment. Surface parking lots provide parking in Towns. Buildings on the Main Street typically stand two to four stories tall and include townhouses or apartments above storefronts. Most homes in a Town are detached single-family residences that are oriented towards the street, commercial areas and open space.

Town	
Acres per Chip	640
Households per Acre	20
Employees per Acre	20

AR0072694

High Intensity Corridor

HIGH-INTENSITY CORRIDOR

Similar to an Urban Center, High Intensity Corridors incorporate households, offices, and retail uses at a high density. However, High Intensity Corridors are stretched along one central Boulevard without the street connectivity and accessibility experienced in Urban Cores. Considered a high employment area, building types range from mid-rise residential to office high-rise tower, with less mixed-use than in other high-density development types. Wilshire Boulevard is considered a High Intensity Corridor.

High Intensity Corridor	
Acres per Chip	480
Households per Acre	65
Employees per Acre	95

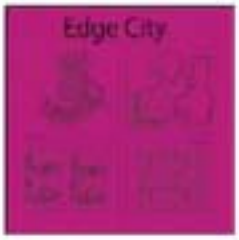
Medium
Intensity Corridor

MEDIUM-INTENSITY CORRIDOR

Like a High-Intensity Corridor, Medium-Intensity Corridors are also stretched along one single Boulevard but experience less dense building types. Households, offices and retail uses are accommodated with a few high-rise towers but are primarily comprised of mid-rise building types. Pedestrian access is limited with transit generally only available along the Boulevard. The Medium-Intensity development type is patterned after Ventura and Sepulveda Boulevard.

Medium Intensity Corridor	
Acres per Chip	480
Households per Acre	25
Employees per Acre	30

AR0072696



EDGE CITY

An Edge City, such as Warner Center, is a central location for offices, retail uses and multi-family housing. Building types range from high-rise office towers to low to mid-rise residential. As an auto-oriented environment, surface parking lots are plentiful and transit options limited. Retail centers are located in strip malls with minimal walkability. Multi-family residential units are located on streets that lack connectivity and promote auto usage.

Edge City	
Acres per Chip	640
Households per Acre	30
Employees per Acre	100

AR0072697

ACTIVITY CENTER

An Activity Center is an agglomeration of large-scale retail buildings, offices and multi-family housing such as South Coast Plaza and Ontario Mills. The Activity Center development type contains a relatively dense mix of uses, comparable to a City. But, unlike the City, it is not pedestrian-friendly. Land uses are separated from each other by parking areas, freeways or arterials. Activity Centers are usually positioned at intersections of highways or arterials, sometimes along major transit corridors.

Activity Center	
Acres per Chip	640
Households per Acre	15
Employees per Acre	15

AR0072698

Highway Commercial

HIGHWAY COMMERCIAL

This type is modeled after highway-oriented development. Like the Activity Center, it contains many residential units. But rather than being agglomerated at a highway intersection, Highway Commercial development takes a linear form along both sides of the highway. Connections in this development type consist mostly of highways and frontage roads. Housing is either in the form of multi-family apartments or residential subdivisions; both are typically auto-oriented.

Highway Commercial	
Acres per Chip	480
Households per Acre	10
Employees per Acre	10

AR0072699

EMPLOYMENT DISTRICT

Often considered to be an Office Park, Employment Districts are comprised of low to medium density office buildings surrounding by surface parking. Generally located near highways for easy auto-access, transit and walking options are limited. Employment districts lack residential or retail uses, thus increasing the number of auto trips needed.

Employment District	
Acres per Chip	640
Households per Acre	0
Employees per Acre	40

AR0072700

INDUSTRIAL

The Industrial development type is made up of a mix of low and medium density industrial buildings. They often consist of industrial yards and campuses separate from other uses due to the nature of industrial use. This development type is often near highways and accessed via automobiles with large surface parking for autos and trucks. Walking and transit options are severely limited.

Industrial	
Acres per Chip	640
Households per Acre	0
Employees per Acre	20

AR0072701

CITY NEIGHBORHOOD

City Neighborhoods are comprised of mid to low-rise multi-family, townhouses and small lot single-family dwellings. With the same number of residential units per acre as the Town development type, City Neighborhoods are medium-high density residential areas with a small number of service or office jobs. Street connectivity is favorable, allowing for a high degree of walkabililty and transit options.

City Neighborhood	
Acres per Chip	640
Households per Acre	20
Employees per Acre	6

AR0072702

RESIDENTIAL SUBDIVISION

Residential Subdivisions are comprised of single-family, detached homes and duplexes. Street networks are typical of post -World War II suburbs. Residential Subdivisions are designed for automobile travel. Due to the extensive use of cul-de-sacs, street connectivity and walkability are generally low. Examples include Santa Clarita and parts of San Bernardino and Riverside Counties.

Residential Subdivision	
Acres per Chip	640
Households per Acre	10
Employees per Acre	0

AR0072703

LARGE-LOT SUBDIVISION

Large-Lot Subdivisions consist entirely of single-family, detached homes. This development type can be found in Orange and Ventura Counties as well as outlining areas. Large-Lot Subdivisions are typically isolated or far from employment and retail services. Averaging two units per acre, this development type is characterized by very large residences without sidewalks. Street connectivity is low and travel to and from the Large-Lot Subdivision development type is usually by automobile.

Large-Lot Subdivision	
Acres per Chip	5,760
Households per Acre	2
Employees per Acre	0

AR0072704

RURAL HOUSING

The Rural Housing development type consists of estate lots that amount to one unit per five acres. Rural Housing development provides residents with access to rural areas while being within reach of urban amenities. This development type consumes greater amounts of open space and tends to be farther from employment than Large-Lot Subdivisions. Street connectivity is also generally low among estate lots.

Rural Housing	
Acres per Chip	5,760
Households per Acre	0.2
Employees per Acre	0

AR0072705

Appendix II: Scenario Allocation Development Types

Place3s methodology

Planning for Community Energy, Economic and Environmental Sustainability (Place3s) is a GIS ArcView3.2 extension used to simulate land-use patterns for scenarios. A geographic representation of each scenario is created in Place3s by locating different development types on vacant and developed land while limiting development in environmentally constrained areas. The geographic representation of development types for each scenario is the foundation for calculating benchmarks. The benchmarks are then used to evaluate the viability of each growth scenario.

Similar to the workshop development type chip sets, the series of development types for Place3s are created from a set of building types that represent residential, employment and mixed-use alternatives. Each building type has an associated employee and household density. The households and employees per acre for each building type is multiplied by the percentage each building type represents within the development type to determine the employees and households per acre for each development type.

Because the development type densities are based on vacant land, a set of standards is used to calculate the propensity of a certain development type to redevelop. Areas such as Downtown are more likely to redevelop than Towns, while Centers are more likely to redevelop than Residential land. The redevelopment percent is then multiplied by the employees and households per acre for vacant land to obtain a redevelopment density.

	Vacant Land		Redevelopment		
	Emp/acre	HH/acre	Emp/acre	HH/acre	Redev %
Downtown Center	367.88	30.64	91.97	7.66	25%

APPENDIX III: BENCHMARKS

AVERAGE TRAVEL DISTANCE

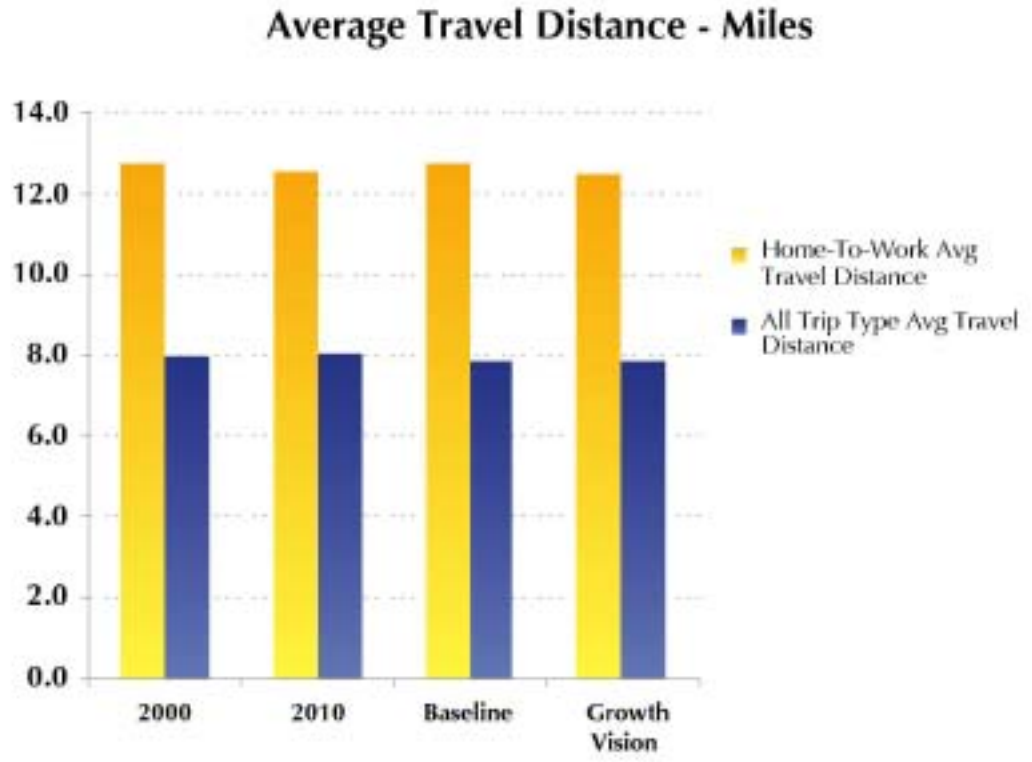
What does it mean?

The average travel distance is a measure of how well the transportation network in each scenario is performing in conjunction with the placement of land uses. Travel distance is dependent on the locations of jobs, housing and services, which in turn influence the total distance traveled. If the jobs and housing balance is not favorable, distance traveled for each alternative increases. However, if jobs and housing are within close proximity, then the home-to-work average distance decreases.

How was it measured?

The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input to calculate the travel distance for each type of trip based on the transportation network. The trip types are summed to determine average distance traveled by category.

Average Travel Distance - Miles				
	2000	2010	Baseline	Growth Vision
Home-To-Work Avg Travel Distance	12.72	12.57	12.77	12.50
All Trip Type Avg Travel Distance	8.00	8.04	7.85	7.88



AR0072708

AVERAGE TRAVEL TIME

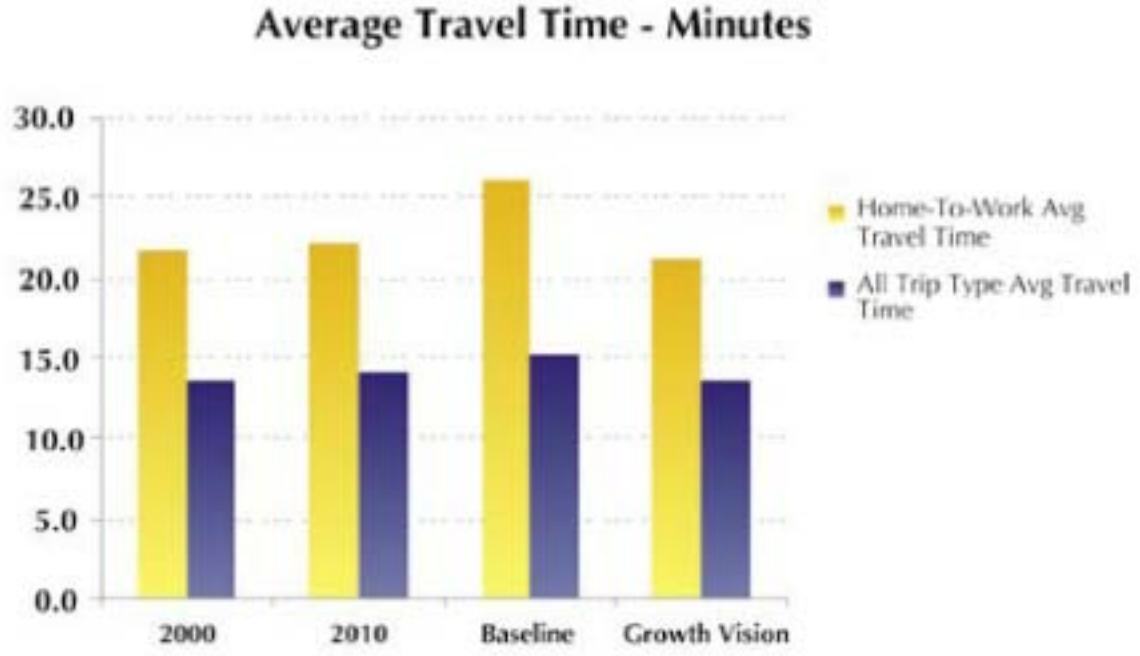
What does it mean?

The average travel time is a measure of how well the transportation network in each scenario is performing as well as a measure of the effectiveness of designated land uses for each scenario. Travel time is dependent on the locations of jobs, housing, and services that influence the total distance traveled; shorter distances require less time spent for each trip.

How was it measured?

For each link in the transportation network, the model generates the amount of time it takes to travel that link given the average road conditions in each scenario. The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input to calculate the travel time based on the transportation network.

Average Travel Time - Minutes				
	2000	2010	Baseline	Growth Vision
Home-To-Work Avg Travel Time	21.6	22.1	26.1	21.2
All Trip Type Avg Travel Time	13.6	14.0	15.2	13.5



AR0072709

DAILY TRANSIT BOARDINGS

What does it mean?

Daily transit boardings is a measure of the number of trips made on an average day by each type of transit service. The higher the transit ridership, the more capacity the roads will have to carry people and goods. Transit trips consolidate many travelers to a single vehicle with specific capacities depending on each transit mode.

How was it measured?

The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input. The travel demand model uses these inputs, including the service characteristics of each mode, to calculate a probability of a trip choosing each type of transit. Choices are summed to determine the total probability of use by mode.

Average Daily Transit Boardings

	2000	2010	Baseline	Growth Vision
Metrolink	32,615	45,315	92,904	98,258
MTA Bus	1,241,561	1,429,990	1,525,716	1,893,678
MTA Rail	211,327	266,275	325,698	608,896
Others	710,459	844,675	922,003	1,062,540

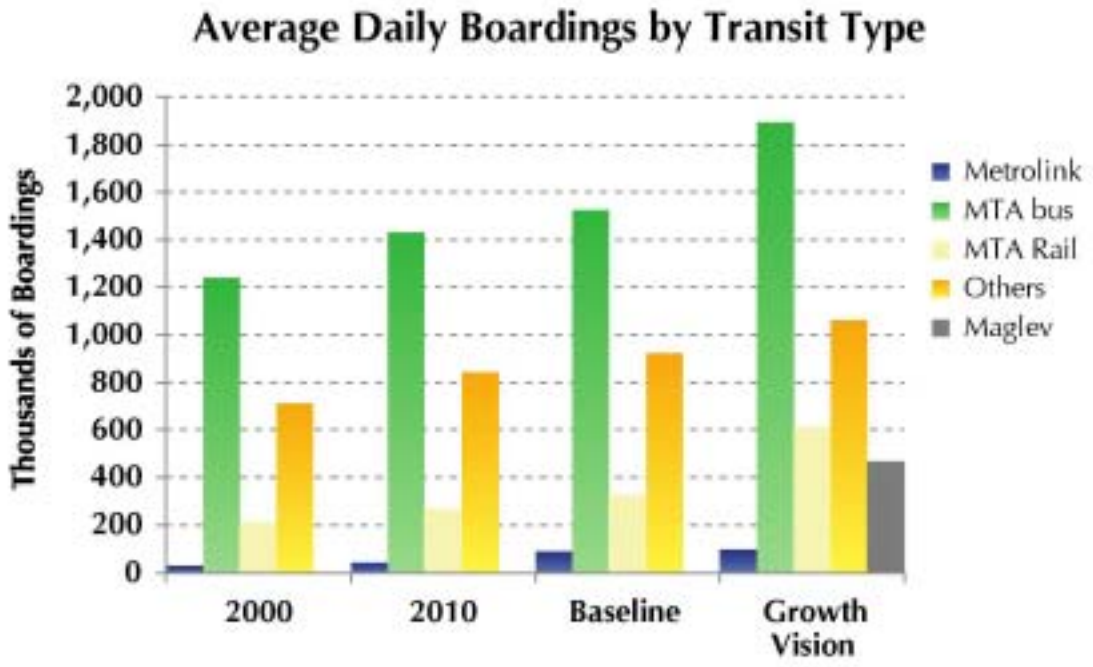
TOTAL	2,195,962	2,586,255	2,866,321	4,129,018



AR0072710

EMPLOYMENT MIX & DISTRIBUTION

What does it mean?

The mix and distribution of employment types—retail, service, and other—is an indicator of the land use pattern of an area, and can have great effect on the efficiency of the transportation system. For example, an area with high service and retail employment may serve shopping, entertainment, and recreational trips, while an area with a concentration of other type employment may only serve commute trips. Transit use as well as trip-chaining—the term for combining many trips needs into one outing—work best when there is a mix of employment types concentrated in one area.

How was it measured?

The forecasting department at SCAG provided control totals for the number of retail, service, and other employees in each subregion. For the Growth Vision alternative, these employment numbers were then distributed across each modeling zone by association with development types.

	Retail Employees		Service Employees		Other Employees		Total Employees
2000	1,256,917	17%	2,751,322	37%	3,456,683	46%	7,464,922
2010	1,487,324	17%	3,492,229	40%	3,773,413	43%	8,752,966
Baseline	1,781,332	18%	4,057,286	40%	4,295,510	42%	10,134,128
Growth Vision	1,856,491	18%	4,203,640	40%	4,442,696	42%	10,502,827
2000-2010	230,407	18%	740,907	58%	316,731	25%	1,288,045
Baseline Increment	294,008	21%	565,057	41%	522,097	38%	1,381,162
Growth Vision Inc.	369,167	21%	711,411	41%	669,283	38%	1,749,861

AR0072711

HOUSING MIX

What does it mean?

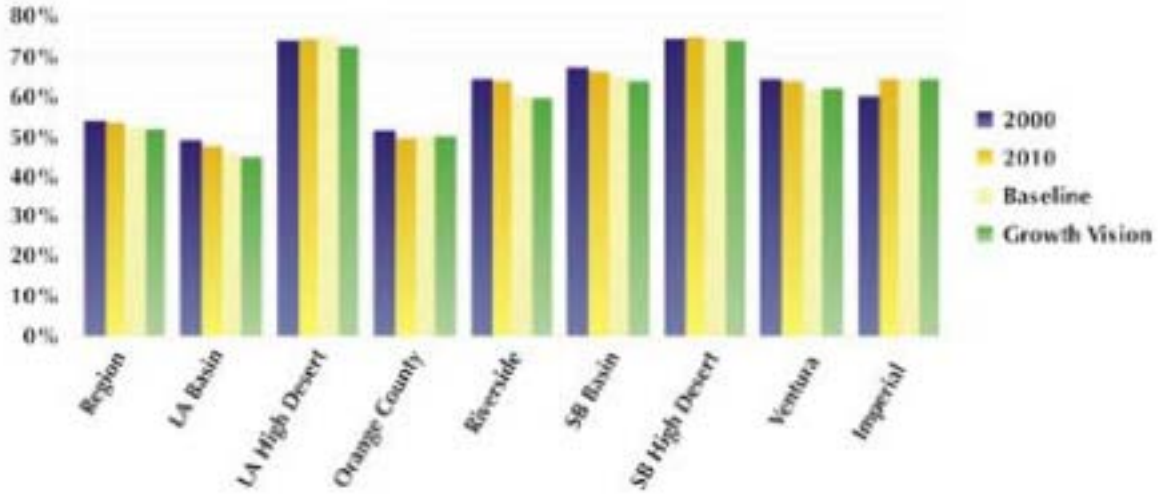
Housing mix indicates whether the housing in an area is single-family or multi-family. This measures the variety of housing types provided, as well as the density typical of new housing types. The 2000 and 2010 projection data allow for comparison.

How was it measured?

Each scenario contains a different mix of development types. Each development type is defined as a certain mix of building types. Therefore, each development type contains a certain mix of single-family homes and multi-family homes. The number of acres of each development type in each scenario were multiplied by the single-family and multi-family percentages in each development type to come up with the number of single-family and multi-family households in each scenario.

Scenario	Single-family Households		Multi-family Households	
2000	2,898,175	54%	2,487,372	46%
2010	3,219,676	53%	2,836,204	47%
Baseline	3,895,169	52%	3,558,562	48%
Growth Vision	3,935,985	52%	3,701,470	48%
2000-2010	369,101	51%	348,831	49%
Baseline Increment	675,493	48%	722,358	52%
Growth Vision Increment	716,309	45%	865,266	55%

Percent Single-family Household by Modeling Zones



AR0072712

NEW DEVELOPMENT OCCURRING THROUGH INFILL DEVELOPMENT OR REDEVELOPMENT

What does it mean?

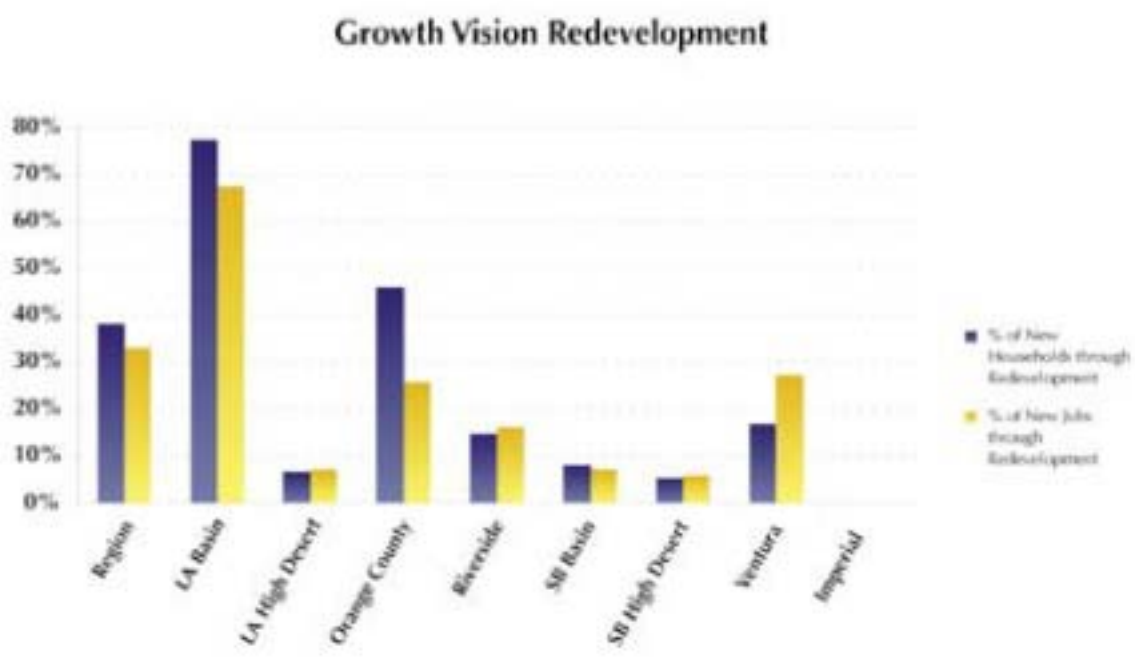
Infill development or redevelopment indicates the extent to which a city is renewed on an ongoing basis. It indicates that older parts of the city are attracting new housing and investment. High percentages of infill development indicate that a larger proportion of growth is occurring where development has already occurred before, through recycling of older buildings.

How was it measured?

For each scenario, a raster format map is made showing new development by development type. A raster map with the location of vacant land and one with developed land are also made, and the grid cells of each development type that fall on the vacant land can be summarized separately from those that fall on developed land. The number of redeveloped acres of each development type is multiplied by the number of households and employees per redeveloped acre to get new households and employees on developed land.

Growth Vision Redevelopment

	% of New Households through Redevelopment	% of New Jobs through Redevelopment
Region	38%	33%
LA Basin	77%	67%
LA High Desert	7%	7%
Orange County	46%	26%
Riverside	15%	16%
SB Basin	8%	7%
SB High Desert	5%	6%
Ventura	17%	27%
Imperial	0%	0%



AR0072713

JOBS-HOUSING BALANCE

What does it mean?

The ratio of jobs to households in each modeling zone can be an important indicator of the health of a region. If there exists a large mismatch between employment and housing in one or more modeling zones, then significant incommuting and outcommuting will occur, putting pressure on the transportation system.

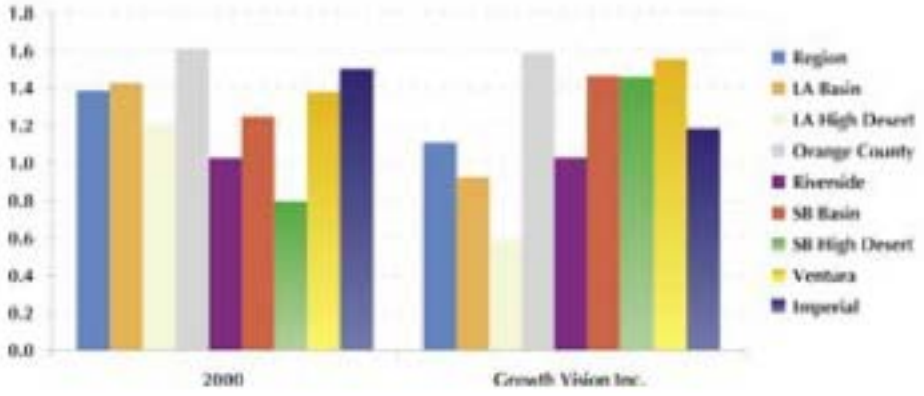
How was it measured?

For the Growth Vision alternative, a raster format map is created that shows the location of the various development types that comprise the scenario. Each development type represents a certain number of households and employees per grid cell. From the number of grid cells of each development type, the number of households and employees can be calculated for each modeling zone. The number of employees are divided by households to get jobs-housing balance. The 2000, 2010, and Baseline data are obtained at the TAZ level from the forecasters at SCAG and then summarized to the model zone level.

Jobs-Housing Balance

	Region	LA Basin	LA High Desert	Orange County	Riverside	SB Basin	SB High Desert	Ventura	Imperial
2000	1.39	1.42	1.21	1.61	1.02	1.25	0.80	1.38	1.50
2010	1.45	1.49	1.05	1.74	1.05	1.38	0.91	1.36	1.40
Baseline	1.36	1.39	0.80	1.75	1.09	1.40	1.00	1.39	1.31
Growth Vision	1.38	1.40	0.86	1.71	1.04	1.41	1.11	1.39	1.33
2000-2010	1.92	2.36	0.58	3.13	1.14	2.29	1.42	1.25	1.01
Baseline Increment	0.99	0.83	0.42	1.84	0.90	1.45	1.17	1.52	1.18
Growth Vision Inc.	1.11	0.92	0.58	1.59	1.03	1.47	1.46	1.56	1.18

Total Jobs-Housing Balance



AR0072714

MODE SHARE

What does it mean?

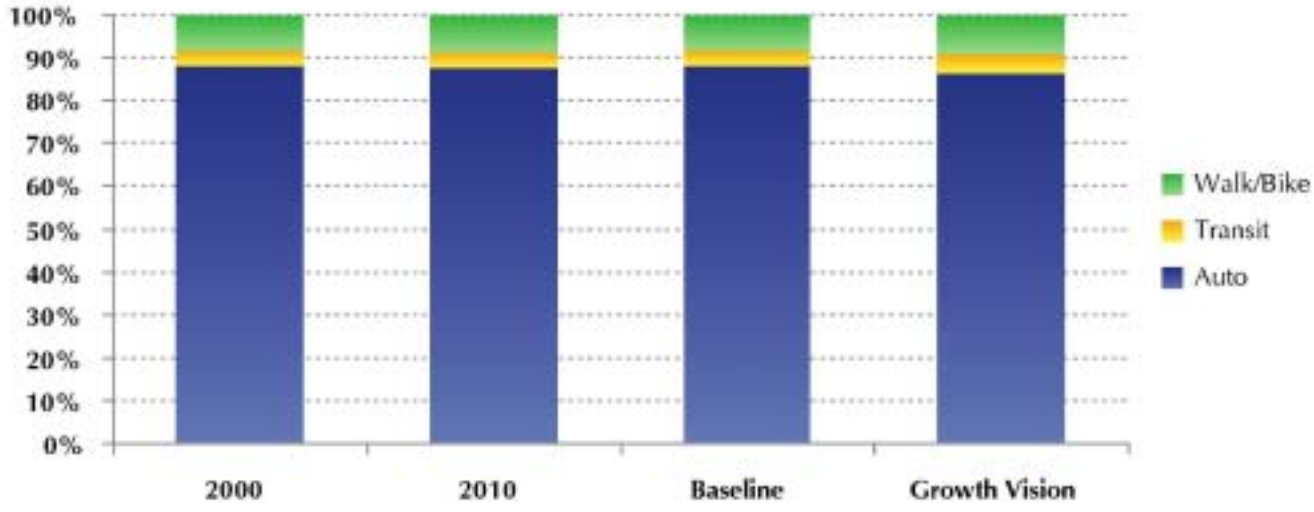
The mode share is a measure of the percent of trips made on an average day that are made by the various modes—walking, transit, and auto. Trips may originate from home, work, university, school or other. Even small changes in the share of trips made by automobile can make a big difference in congestion levels for those who are driving, especially in areas of congested corridors.

How was it measured?

The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input. The travel demand model uses these inputs, including the service characteristics of each mode, to calculate a probability of a trip choosing each mode. Choices are summed to determine the total probability of use by mode as well as categorized by the home base and trip destination.

TOTAL Person Trips Mode Choice				
	2000	2010	Baseline	Growth Vision
Drive Alone	26,461,571	29,464,117	35,710,642	35,406,343
% Person Trips	48.0	47.3	47.7	46.7
Carpool	22,206,444	25,265,296	30,550,236	30,227,403
% Person Trips	40.2	40.5	40.8	39.9
Transit	1,185,606	1,509,972	1,507,345	2,301,119
% Person Trips	2.1	2.4	2.0	3.0
School Bus	736,367	732,267	899,170	876,214
% Person Trips	1.3	1.2	1.2	1.2
Non Motorized	4,591,408	5,386,262	6,255,318	6,940,129
% Person Trips	8.3	8.6	8.3	9.2

Mode Choice Distribution



AR0072715

VEHICLE HOURS DELAYED

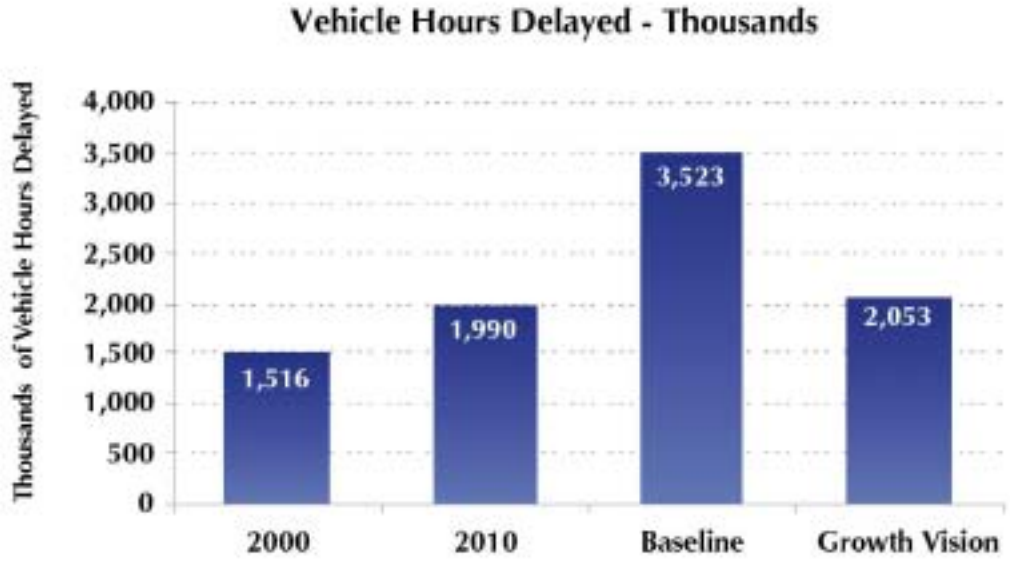
What does it mean?

The vehicle hours delayed is the amount of time travelers spend in congestion getting to their destinations over and above the amount of time it would take traveling in uncongested conditions. This measure reflects spatial relationships between residence and employment or other destinations as well as the efficiency of the road and transit network. The more hours in delay, the less time is allowed for work, recreation and other activities. Lower vehicle hours of delay reflects more efficient transportation networks and transit alternatives.

How was it measured?

The traffic speeds on each road network link are calculated using travel demand modeling software. The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input. Congested link speed values are divided by link length to determine the link travel time. Subtract the uncongested link travel time to determine the amount of time per link caused by delays. The sum of these links is the total vehicle hours of delay for the region.

Vehicle Hours Delayed	
2000	1,516,109
2010	1,989,824
Baseline	3,523,369
Growth Vision	2,053,128



AR0072716

VEHICLE HOURS TRAVELED

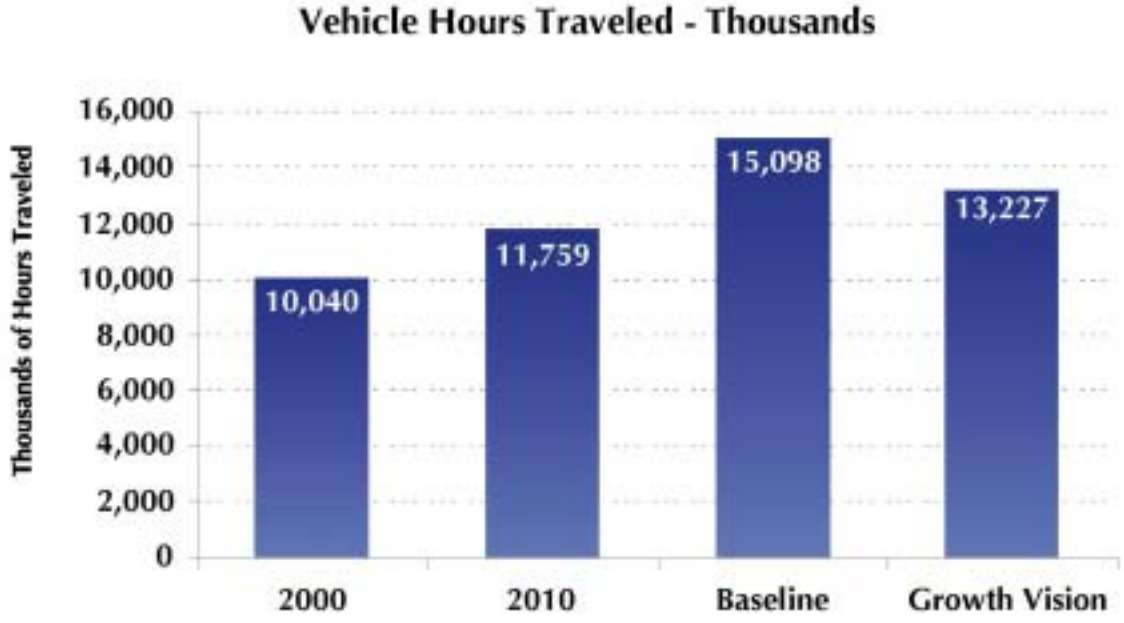
What does it mean?

Vehicle Hours Traveled (VHT) is the total hours of travel for cars or trucks per year for the total region. This measure reflects spatial relationships between residences and employment or other destinations as well as the efficiency of the transportation network and resulting air quality. The more hours spent traveling, the less time is allowed for work, recreation and other activities, and the higher the environmental impacts. Lower vehicle hours traveled reflects additional trips by non-auto modes as well as trips eliminated due to jobs, residences, and services within close proximity.

How was it measured?

The traffic speeds on each road network link are calculated using travel demand modeling software. The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input. The link speed and length are used to determine the link travel time. The link travel time is multiplied by the number of vehicles per link to obtain the vehicle hours traveled.

Total Vehicle Hours Traveled	
2000	10,040,350
2010	11,759,250
Baseline	15,097,543
Growth Vision	13,227,120



AR0072717

VEHICLE MILES OF TRAVEL PER CAPITA

What does it mean?

Vehicle Miles Traveled (VMT) per person per day is the average distance traveled by a single person in a 24 hour period. This can reflect the spatial relationship between residence and employment or other destinations. Lower average VMT often reflects a better spatial match between residence and employment, while higher average VMT can indicate a spatial mismatch between place of residence and place of employment. VMT per person per day also will be lower when non-auto mode share (walk and transit) increases.

How was it measured?

The traffic volumes on each road network link are calculated using travel demand modeling software. The demographic, travel behavior, and transport infrastructure data for each scenario are used as model input. Each link volume is multiplied by the average vehicle occupancy rate in the region. This value is multiplied by the length of each link to determine the person-miles traveled on each network link. All these values are added and then divided by the total regional population to determine the average VMT per person per day.

Vehicle Miles of Travel per Capita	
2000	21.9
2010	21.8
Baseline	21.5
Growth Vision	20.8

AR0072719

APPENDIX IV: SOUTHLAND POLICY DIALOGUES

Report on the Southern California Compass Project

by

The California Center for Regional Leadership

May 2004

I. WHY SOUTHLAND POLICY DIALOGUES?

The Southern California Compass Project is a collaborative regional planning process designed to develop a shared regional vision that will enable residents, local governments, developers, and other decision-makers to wisely manage projected growth across the region over the next twenty-five years. The Southern California Association of Governments and its Compass consultant team have produced a draft Growth Vision for the Southern California region through a variety of processes: development of growth principles, a survey of public opinion, development of growth "scenarios" through technical analysis, and public input through map-based workshops.

The Compass Project organized the Southland Policy Dialogues to enable local civic leaders to review and develop ideas for implementing the draft Growth Vision. The sessions aimed to achieve the following:

- Familiarize leaders across the region with the draft Growth Vision
- Help leaders to understand its implications for growth-related decisions within the Southland's "sub-regions"
- Identify barriers (regional and local) to effective implementation of the draft Growth Vision
- Develop and set priorities on key implementation strategies for SCAG, local governments, and other decision-makers

This report presents the key themes emerging from the Dialogues. Notes of the discussions were taken and revised by CCRL staff, and are available on the Compass website. They were sent to all participants, as was an online survey (results presented below).

AR0072720

II. What Did We Do?

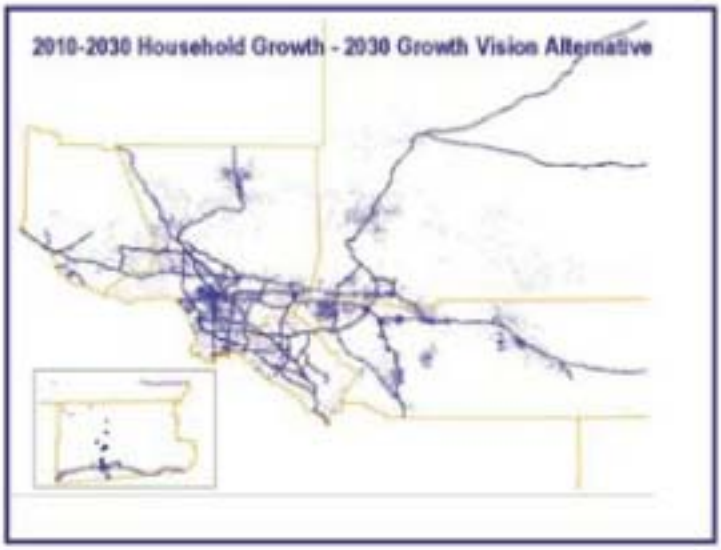
The California Center for Regional Leadership organized the Southland Policy Dialogues in five locations around the SCAG region, each focused on the unique issues of different sub-regions:

- Inland Empire – *March 10, 2004*
- San Fernando Valley, Ventura County, Arroyo Verdugo, North Los Angeles County (held in Van Nuys) – *March 11, 2004*
- South Bay Cities and Gateway Cities – *March 17, 2004*
- Orange County – *March 25, 2004*
- Downtown and Westside Los Angeles – *March 26, 2004*

The Compass Team also coordinated two sessions focused on the Latino community in Los Angeles and Orange County during April 2004.

In addition to the Dialogues noted above, a "pilot" Southland Policy Dialogue was convened on February 27, 2004, with the participation of the 48-member Leadership Southern California (LSC) Class XIV. This group provided invaluable feedback about the Dialogue presentation and discussion format. In addition, many LSC Class members and alumni attended the March Dialogue sessions.

Dialogue participants included local civic leaders, government officials, business owners, developers, neighborhood activists, and representatives of state agencies. In total, nearly 200 local community leaders participated in the five Dialogue sessions. Major sub-regional organizations, such as Councils of Government and other regional entities, were recruited to help plan and host these events. Summary reports and participant lists of each the sessions are attached to this report.



AR0072721

III. What Did We Learn?

1. About the Growth Vision and its Implementation

The attached Summaries provide detail about responses to the draft Growth Vision and ideas for implementation. However, certain key themes emerged from Dialogue participants across the sub-regions, especially the following actions and issues:

- Encourage local and regional officials to approve, and then use as guidance, the basic principles and directions of the Growth Vision, such as preserving stable, existing single-family neighborhoods; directing new development, whenever possible, to existing employment or housing centers and to robust transportation corridors; promoting development around transit stations; protecting or expanding park and recreation facilities and open space; using land more efficiently wherever development occurs.

- Understand that there are differing opinions on: 1) where further development can be accommodated in existing communities ("it's a good idea, just not here -- we're built out"); 2) which highways or arterials could accommodate additional traffic; and 3) what level of incentives it would take for more people to use transit over automobiles.
- Plan from the bottom up, and recognize and value the particular needs of sub-regions and localities. The Southland is composed of connected but profoundly diverse places, and planning should advance different models of development that fit these differences.
- For more integrated and cost-effective results, link regional and local land use planning and project approvals with transportation planning and investment.
- Foster collaborative planning across and among all public sector agencies making land-use and infrastructure investment decisions, including local governments but also transit agencies, school districts, and water districts.
- Promote "choice" (particularly housing and transportation options) through consumer and governmental incentives rather than top-down mandates.
- Appreciate that achievement of the Growth Vision will require broad public understanding and the alignment of thousands of individual decisions made in both the public and private sectors over many years. In that sense, achieving the Growth Vision is as much a "cultural" shift as it is a technical or policy challenge, and will require sustained public education and involvement.

AR0072722

"Local governments and regional agencies are not the only decision-makers that we have to take into account. Thousands of decision-makers will have to align with each other to achieve the Vision: consumers, developers, investors, business executives, employees, and countless others."

-- Nick Boltman, Dialogue Moderator

- Make the state government a full partner in achieving the Growth Vision, through major reforms in fiscal policy, state agency planning decisions, and infrastructure investments.
- Protect the environment. The commitment to this value runs deeply and broadly across the region and among all kinds of groups.
- Create more effective means of influencing business-location decisions to achieve a better "jobs-housing balance."
- Understand the differences of opinion on the economics benefits and challenges of mixed-use development.
- Acknowledge that, on the critical issue of whether or not the projected population growth in the region (6 million additional people) will actually occur, there was common agreement that it is likely to happen (often expressed with expressions of resignation rather than anticipation). On the other hand, long-term questions about the "carrying capacity" of the region, particularly with respect to water supply, remain unresolved.
- Bring the education sector into the collaboration. It is crucial to align K-12 education and worker training, as well as school siting, with community needs.
- Promote viable infill development projects by removing the regulatory barriers and supporting local public officials who make tough decisions.

2. About the Compass Project and the Southland Policy Dialogues

- Participation in the Dialogues was somewhat diverse, but did not mirror the population, let alone the future demography of the SCAG region and its sub-regions. Two additional Dialogues, with Latino leaders, were organized to ensure an opportunity for feedback and participation from that community.
- Participants were earnest about becoming engaged in discussion about the future of the entire SCAG region. They do not entirely believe that the Growth Vision will have a large enough impact on growth patterns, but there was general appreciation of SCAG's efforts to reach out to their communities.
- The Dialogues were a largely a conversation about possible futures and not necessarily the technical aspects of planning and growth management, even among local elected officials.
- The Dialogues represented an opportunity to "close the circle" from the map-based workshops, though the overlap in participants between the two was minimal.
- The opportunities for oral presentation directly to the Growth Visioning Subcommittee of first, the design, and then the results, of the Dialogues ensured a strong linkage between the Committee process and the Dialogue outcomes.

AR0072723

3. Of interest to the Southern California Association of Governments

> "If we are to accommodate the addition of a third more people in the state, water supply, quality, and systems will become an enormous problem."
>
> – Participant in the March 11 Southland Policy Dialogue

- Sub-regions matter, and local leaders were pleased that SCAG acknowledged them as important "building blocks" and valued their opinions.
- There was deep interest (especially among local elected officials and planners) about how the kind of Vision discussion engendered by the project can be continued, and expanded to the scale necessary to actually result in effective, sustained change.
- Participants expressed a desire for partnership and greater alignment of goals and decisions with the state government, but little knowledge or willingness to get directly involved in making that happen ("Let SCAG do it.").
- Very few participants (even many of the local elected officials) understand what leverage SCAG itself has (and does not have) to advance the Growth Vision.

IV. Evaluation results

1. Who participated in the Southland Policy Dialogues?

Dialogue participants were surveyed electronically two weeks following the events in an effort to help us better understand the sessions. Approximately 200 people attended the five Southland Policy Dialogues and were representative of a wide range of sectors, with business/building developers and regional/local government making up the greatest numbers of participants.

Participants in Southland Policy Dialogues by Sector
(according to survey responses)

Sector	%
Civic Group	20%
Building/Development	16%
Local/Regional Government	15%
Regional Council of Government	11%
State Government	8%
Manufacturing	8%
Other Business	8%
Other	8%
Labor	3%
Academic	3%
Finance	0%

2. Selected survey results

- In all five subregions, over 90% of survey respondents agreed that "the Dialogue increased my knowledge and understanding of the Growth Vision."
- By contrast, Downtown/Westside Los Angeles session data indicates that 50% of survey respondents were "dissatisfied" with the dialogue overall.
- In four of the five subregions, 75% of survey respondents agreed that "the Dialogue generated solutions to the successful implementation of the Growth Vision."

AR0072724

3. Written feedback

Below is a sampling of the written comments provided by respondents to the survey:

…These are fundamentally regional issues that can only be addressed regionally.

There are some good elements in the Vision, but there is no clear road to implementation, and especially no identification where the funding will come from.

…Mobility will be key. Alternatives to the auto must be provided and linked in the region…Maybe this is a start to really address the great challenges ahead to maintain and improve the quality of life in the region.

Although the concepts are terrific and very important to the future of our region, the Vision must include practical/doable/locally supportable implementations for it to make a difference in the real world. This next step in SCAG's vision effort (implementation) is so very critical.

Livability is a key ingredient often overlooked when visioning.

AR0072725

4. Ranking of barriers

Survey respondents ranked a series of statements regarding barriers to successfully implementing the Growth Vision:

- The highest-ranking barrier in all five regions was an "under-informed general public, media and other key institutions."
- The second-highest-ranking barrier in the five regions was the recognition that "local control over land use decisions and competition between municipalities drives land use decisions."
- There was some variation among the remaining barriers, with "big, diverse, multiple jurisdictions in the region" and "state government historically slow to respond to changing land use needs at the regional level" ranking as third in the South Bay and Downtown/Westside L.A, but fourth in the remaining subregions.

5. Ranking of policy recommendations

Survey respondents ranked a series of policy recommendations regarding the successful implementation of the Growth Vision. The following three strategies were rated as high priorities by participants at all of the Dialogues:

- *First priority*: Create a targeted public education campaign to increase awareness of the issues outlined in the Growth Vision
- *Second priority*: Develop a best practices database that shows progress towards implementation of the key principles outlined in the Growth Vision
- *Third priority*: Foster greater cooperation between business and government through public-private partnerships

The policy recommendations that received the most varied response, with no more than 30% of survey respondents supporting the strategy, were:

- Develop a legislative agenda for the region, supported by a range of local governments, to aid in the realization of the Growth Vision
- Work to make the regional economy of the Southland a place where businesses are supported by government policies

AR0072726

V. Questions for the Future

A. Would this project add value to the work of COGs and MPOs? How?

B. Is it possible to reach agreement on 5-10 statewide goals and 35-40 indicators that would measure progress against these goals?

C. Is it possible/valuable to present a few goals and measures unique to each sub-region?

D. Is the timeframe practical and are there sufficient resources to develop a quality product?

E. Who are the audiences for this report?

- Governor & Cabinet
- California Performance Review
- Legislature
- Regional leaders
- Media
- General Public
- Who else?

MESSAGE FROM THE CHAIRMAN

April, 1993

The federal Clean Air Act, the California Clean Air Act, and the 1991 AQMP revision have set forth an attainment program for this region to achieve the federal and state ambient air quality standards. Success in achieving our goal lies in the cooperative efforts of all levels of government as well as public support. Together, we have made the last three years the cleanest on record. But we have a long way to go to regain healthful air in this region. Our efforts will be challenged along the way by increases in population growth, the need to obtain emission reductions from more and smaller sources, and the need for technological breakthroughs.

However, there are actions that local government planners and project proponents can take to be proactive members of the clean air team. One of those actions involves the California Environmental Quality Act (CEQA) process. Only local governments have the ability to assess and mitigate the air quality impacts of land development or redevelopment. This fifth edition of the District's CEQA Air Quality Handbook is intended to assist you in carrying out this objective.

Without this extra effort by local government, new development could account for 43% of reactive organic compounds and oxides of nitrogen generated by mobile sources in the year 2010. It is critical that we reduce these pollutants, as they are precursors to the smoggy haze we see so frequently in our region.

If past experience is any indication of our potential to solve this problem, then I am confident that our continued partnership will succeed and the residents of this region will breathe healthful air by the year 2010.

Henry W. Wedaa

Henry W. Wedaa, Chairman
SCAQMD

AR0072729

PREFACE

The South Coast Air Quality Management District (District) has prepared this CEQA Air Quality Handbook which replaces the District's 1987 Environmental Impact Report Handbook. This Handbook is intended to provide local governments, project proponents, and consultants who prepare environmental documents with guidance for analyzing and mitigating air quality impacts of projects. This Handbook also describes the criteria the District uses when reviewing and commenting on the adequacy of environmental documents. Projects that are categorically or statutorily exempt from CEQA are not subject to these guidelines. This guidance document does not, nor does it intend to, supercede local jurisdictions' CEQA procedures.

This Handbook is an advisory tool and it is hoped that, over time, voluntary use will lead to a standardized format for the preparation of air quality analysis in environmental documents for new development and a proactive procedure for mitigating potential air quality impacts from new projects. This Handbook is intended to address the identification, analysis and mitigation of air quality impacts. Other resources which may be impacted, such as water quality, hazardous materials and light and glare are not addressed in this guidance.

The District staff will initiate a training program aimed at providing technical assistance to those persons responsible for the preparation or review of an air quality analysis. Please contact the District Local Government - CEQA Review Section for information on the training schedule.

The District will update sections of the CEQA Air Quality Handbook as new information and analysis methods become available. Purchasers of the Handbook will automatically be notified about annual subscriptions for these updates. (Subscription rates will cover costs of printing and distribution only.)

The District recognizes that the CEQA Air Quality Handbook may affect environmental documents which are currently being prepared or undergoing revisions prior to release as a final document. It is not our intent that the release of the District's CEQA Air Quality Handbook impede the progress of these documents. The CEQA Air Quality Handbook should, however, be utilized as a guide to preparing any newly initiated environmental documents.

AR0072730

NOTICE TO SUBSCRIBERS

If you purchased this copy of the 1993 CEQA Air Quality Handbook directly from the SCAQMD, you have automatically been recorded as a subscriber for all updates distributed in 1993. Thereafter, subscriptions for Handbook updates will be offered on an annual basis (rates cover costs of printing and distribution only).

INTRODUCTION TO THE CEQA AIR QUALITY HANDBOOK

CHAPTER 1

This California Environmental Quality Act (CEQA) Air Quality Handbook has been prepared by the South Coast Air Quality Management District (SCAQMD, or District) as guidance to assist local government agencies and consultants in developing the environmental documents required by CEQA. With the help of the Handbook, local land use planners will be able to analyze and document how proposed and existing projects affect air quality and should be able to fulfill the requirements of the CEQA review process.

It is within this framework of the CEQA review process that the air quality effects of proposed projects can be identified, analyzed, and mitigated. The CEQA review process is structured to: 1) identify significant adverse environmental impacts of the project, and 2) identify ways that environmental damage can be avoided or significantly reduced, by requiring changes in a project through alternatives or mitigation measures that are found to be reasonable and feasible.

1.1 Categories of Projects Reviewed by CEQA

Any project that has the potential to emit air pollutants should undergo some form of CEQA review. Generally, there are two categories of projects: (1) public, and (2) private. Public projects include those projects initiated by a local agency in support of its responsibilities. For instance, a water district may install water lines to provide customers with a water supply, a city or county may construct new roads, buildings, or other public infrastructure facilities; a local government may prepare a General Plan; or a school district may construct a new school. In each case, the project will have air pollutant emissions during its construction and operation that should be evaluated under CEQA to determine the potential for significant adverse impacts.

Private projects include private sector projects for which the local agency exercises its discretion in issuing a permit before each project can proceed. The most obvious examples of such projects include discretionary land use permits, (i.e., tentative maps, conditional use permits, Specific Plans, and other types of private development).

1.2 Categories of Emissions

In referring to sources of air pollutant emissions, the District categorizes them as:

- Stationary (area and point) sources
- Mobile (on-road and off-road) sources

Most sources produce emissions in each of these categories. These categories of emissions, illustrated in Figure 1-1, are defined and discussed below:

Stationary sources can be divided into two major subcategories: **point** and **area sources**. **Point sources** consist of one or more emission sources at a facility with an identified location and are usually associated with manufacturing and industrial projects. Examples are refinery boilers or combustion equipment that produces electricity or processes heat. **Area sources** are widely distributed and produce many small emissions. Examples of such sources are residential water heaters, painting operations, lawn mowers, agricultural fields, landfills, and consumer products such as barbecue lighter fluid or hair spray.

AR0072746

Mobile sources refer to emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either **on-road or off-road**.

- **On-road sources** are considered to be a combination of emissions from automobiles, trucks and **indirect sources**:

  Indirect sources are defined as sources that by themselves may not emit air contaminants; however, they indirectly cause the generation of air pollutants by attracting vehicle trips or by consuming energy. Examples of indirect sources include an office complex or commercial center that generates commuter trips and consumes energy resources through the use of electricity for lighting and space heating. Indirect sources include actions proposed by local government, such as redevelopment districts and private projects involving either large buildings or tract developments. Indirect sources also include those emissions created by the distances vehicles travel.

- **Off-road sources** include aircraft, ships, trains, and self-propelled construction equipment.

Some people are more likely to be affected by air pollution emissions as such, and are considered to be "sensitive." These include children, the elderly, persons with pre-existing respiratory and/or cardiovascular illness, and athletes and others who engage in frequent exercise. Because these groups of people are sensitive to air pollution, their environment is given special consideration. Thus, residences, schools, playgrounds, child-care centers, convalescent centers, retirement homes, and athletic fields are defined as **sensitive receptors**, as shown in Figure 1-2.

1.3 Handbook Organization and CEQA Review Process

The organization of this Handbook follows the steps of the local government project review process. The flow chart in Figure 1-3 sets out the organization of the Handbook and gives a simplified overview of the steps in the CEQA review process. Concurrently, the flow chart summarizes the different air quality impact categories and where each category is discussed in this Handbook. A brief description of each step in the CEQA review process is described below.

BACKGROUND INFORMATION (Chapters 2 and 3)

Chapters 2 and 3 give planners background information on air quality. Chapter 2 introduces the District and explains how the District manages air quality. Chapter 3 discusses why the region has smog and the effects of air pollution on quality of life.

INITIAL CONSULTATION (Chapters 4 and 5)

The first step in the project review process is the initial consultation between local governments and project proponents. The purpose of the initial consultation is to identify projects that may have problems with (1) land use compatibility and (2) site design and planning. The Handbook provides planners with suggestions for creating a local initial consultation process related to air quality. Finally, the Handbook discusses consultation between the District and the lead agency.

INITIAL STUDY AND DETERMINATION OF SIGNIFICANCE (Chapter 6)

The next step in the process is the preparation of the Initial Study and determination by the local government as to the project's significance. Projects with emissions found to be environmentally insignificant are granted a Negative Declaration (ND). Projects with emissions that are determined significant because one or more thresholds are exceeded will require a more in-depth environmental analysis, and the preparation of either a Mitigated Negative Declaration (MND) (when impacts can be

AR0072747

made insignificant due to the imposition of mitigation measures) or an Environmental Impact Report (EIR).

DOCUMENT PREPARATION (Chapters 7 through 13)

Pre-Screening Review/Preparation of Environmental Analysis Components. This Handbook provides guidance on preparing the MND and EIR, with sections on establishing baseline, emissions calculations, tables, mitigation, and consistency. The Handbook also gives instructions for using the Mobile Assessment for Air Quality Impacts (MAAQI) model to analyze air quality (mobile sources and energy) for all types of environmental documents. Prior to completion of the EIR CEQA requires lead agencies to consult with responsible agencies and provides for consultation with any persons or agencies with special expertise (PRC Section 21153).

The District as a Responsible Agency. The Handbook provides guidance in assessing the potential multi-media impacts for those cases when the environmental documentation will address both air quality and other environmental impacts (e.g., water, waste disposal, etc.).

PROJECT REVIEW (Chapter 14)

District Review and Commenting Process. The District reviews and comments on the air quality analysis in environmental documents for projects exceeding the thresholds of significance. The Handbook describes the review process when the District is a responsible and/or commenting agency.

MONITORING AND REPORTING (Chapters 15 and 16)

Implementing and Monitoring Mitigation. State law requires that mitigation be monitored after the EIR or MND is approved by the local government. The Handbook provides planners with suggestions for monitoring and enforcing air quality mitigation measures.

Reporting on Project Disposition. Each year, it is necessary for the District to report to the California Air Resources Board (ARB) and the Federal Environmental Protection Agency (EPA) on the progress made to date in reducing emissions. In order to credit local government actions, local governments are requested to voluntarily report information regarding CEQA documents to the District. Additional monitoring information may be requested by the Southern California Association of Governments (SCAG). The Handbook provides reporting forms.

APPENDICES

The Handbook appendices provide more detailed guidance information, including calculation procedures, quantification formulas, screening tables, and background material, to assist in the preparation of CEQA-required environmental documents.

AIR QUALITY MANAGEMENT AND THE DISTRICT'S ROLE

CHAPTER 2

The South Coast Air Quality Management District (SCAQMD, or District) was created by the 1977 Lewis-Presley Air Quality Management Act, which merged four county air pollution control bodies into one regional district. Under the Act, the District is responsible for bringing air quality in the areas under its jurisdiction into conformity with federal and state air quality standards. To that end, the District is working systematically to:

(1) Reduce present emissions to levels that will meet state and federal air quality standards, and

(2) Ensure that future emissions will be within state and federal standards.

The area managed by the District includes Los Angeles, Orange, and Riverside Counties, and the non-desert portion of San Bernardino County. The four counties lie within two air basins: the South Coast Air Basin (SCAB), which comprises Orange County and the non-desert portions of Los Angeles, San Bernardino, and Riverside Counties, and the Southeast Desert Air Basin (SEDAB), which covers a large area of the desert portion of Riverside and Los Angeles County and includes the Coachella Valley. Figure 2-1 shows the relative orientation and size of the two air basins.

Both Basins are named because their geographical formation is that of a basin, with the surrounding mountains containing the air and its pollutants in the valleys or "basins" below. In addition, each Basin has separate air quality problems. The SCAB must deal primarily with the pollutants created by dense population centers, heavy vehicular traffic, and industry; while in the Coachella Valley and Antelope Valley portions of the SEDAB, pollution results primarily from dust raised by heavy construction, and travel on unpaved roads and paved roads with silty debris. Unfortunately, as its population increases, the Coachella Valley may also begin to have smog problems similar to those in the SCAB.

2.1 Government Agencies and Air Quality Management

Air quality problems in the SCAB and SEDAB are addressed through the efforts of federal, state, local, and regional government agencies, as seen in Figure 2-2. These agencies work jointly as well as individually to clean up the air through legislation, regulations, policy making, education, and a variety of programs. These agencies include:

- Environmental Protection Agency (EPA)
- California Environmental Protection Agency (Cal EPA) and California Air Resources Board (ARB) which is a part of Cal EPA.
- Local governments
- Southern California Association of Governments (SCAG)
- Coachella Valley Association of Governments (CVAG)
- South Coast Air Quality Management District (SCAQMD)

In the following paragraphs, these agencies are further identified and their individual responsibilities summarized.

o Environmental Protection Agency

The federal Environmental Protection Agency (EPA) is responsible for setting and enforcing the national standards for atmospheric pollutants. The EPA enforces these national standards and also regulates emission sources that are under the exclusive authority of the federal government, such as aircraft and certain locomotives. The EPA has jurisdiction over emission sources outside state waters (outer continental shelf), and establishes various emission standards, including those

AR0072754

for vehicles sold in states other than California. Automobiles sold in California must meet the stricter emission standards established by the ARB.

o **California Air Resources Board**

The State of California Air Resources Board (ARB), which became part of the California Environmental Protection Agency (Cal EPA) in 1991, is responsible for ensuring implementation of the California Clean Air Act (CCAA), responding to the federal Clean Air Act (CAA), and for regulating emissions from motor vehicles and consumer products. The ARB has established emission standards for vehicles sold in California and for various types of equipment available commercially. The ARB also sets fuel specifications to further reduce vehicular emissions.

o **Southern California Association of Governments**

The Southern California Association of Governments (SCAG) is a council of governments for the following six southern California counties: Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. SCAG is a regional planning agency and serves as a forum for regional issues relating to transportation, the economy and community development, and the environment. SCAG also serves as the regional clearinghouse for projects requiring environmental documentation under federal and state law. In this role, SCAG reviews proposed projects to analyze their impacts on SCAG's regional plans.

As the largest metropolitan planning organization (MPO) in the United States, SCAG is primarily responsible for preparing the Regional Mobility Plan (RMP), and Growth Management Plan (GMP). The RMP and GMP form the basis for the land use and transportation control portions of the Air Quality Management Plan. SCAG is the region's state-designated transportation planning agency and the federally designated MPO. As such, SCAG is responsible for developing the Regional Transportation Plan and the Regional Transportation Improvement Program and performing the conformity analysis for transportation plans and programs.

o **Coachella Valley Association of Governments**

The Coachella Valley Association of Governments (CVAG) is a council of governments composed of cities in the Coachella Valley. The CVAG plays a key role in the implementation of the Coachella Valley PM10 Plan, wherein it is responsible for coordinating and monitoring local government efforts to reduce PM10 emissions.

o **Local Governments**

Local governments have the authority and responsibility to reduce air pollution through their police power and land use decision-making authority. Specifically, local governments are responsible for the mitigation of emissions resulting from land use decisions and for the implementation of transportation control measures as outlined in the Air Quality Management Plan (AQMP).

The AQMP assigns local governments certain responsibilities to assist the air basin in meeting air quality goals and policies. In general, a first step towards implementation of a local government's responsibilities will be accomplished through development of an enforceable local air quality implementation plan, or by amending a city's or county's General Plan, or by preparing a free-standing Air Quality Element to its General Plan. Air quality policies need to be subsequently codified into zoning ordinances (or other legally enforceable mechanisms) that will implement the AQMP. Such ordinances can encourage trip reduction, and be incorporated as design standards that may require bicycle racks, landscaping, etc.

Through capital improvement programs, local governments can fund infrastructure that contributes to improved air quality, by requiring such improvements as bus turnouts, energy-efficient street lights, and synchronized traffic signals. Local governments can also take administrative actions that reduce air pollution, such as creating a telecommunication program for local government employees that will enable them to work at home.

AR0072755

In accordance with CEQA requirements and the CEQA review process, local governments assess air quality impacts, require mitigation of potential air quality impacts by conditioning discretionary permits, and monitoring and enforcing implementation of such mitigation.

2.2 South Coast Air Quality Management District

The California Clean Air Act (H & S Section 40412) designates the South Coast Air Quality Management District as the agency principally responsible for comprehensive air pollution control in the South Coast Air Basin (SCAB) and certain areas of the Southeast Desert Air Basin (SEDAB). To that end, the District, a regional agency, works directly with SCAG, CVAG, county transportation commissions, local governments, and cooperates actively with all state and federal government agencies. The District develops rules and regulations, establishes permitting requirements, inspects emission sources, and enforces such measures through educational programs or fines, when necessary.

The District is responsible for reducing emissions from stationary (area and point), mobile, and indirect sources. The District works closely with the ARB, which regulates mobile sources, and is in the process of developing programs such as limits on bus or truck idling and requirements for low-emission vehicle fleets. The District works to reduce indirect sources through such measures as the "Carpooling Rule," Regulation XV. Finally, the District develops regulations and programs for reducing emissions from consumer products such as barbecue lighter fluid.

Organization of the District. The District operates and is organized in a manner similar to local governments, as outlined in Figure 2-3. The Governing Board is the decision-making body that adopts District rules and the Air Quality Management Plan much as a City Council approves its General Plan, ordinances, and specific projects. The twelve-member Governing Board is comprised of three state appointees and nine elected officials who represent local governments.

There are several special committees that review and recommend actions to the Governing Board. The Interagency Air Quality Management Plan Implementation Committee is made up of local government officials, transportation commissioners, and wastewater agency representatives. This committee offers local governmental agencies the opportunity to comment directly on the District's rulemaking and planning processes.

The Role of SCAQMD in the CEQA Review Process

The District takes an active part and a variety of roles in the CEQA review process. Pursuant to CEQA requirements, the District may act as a lead agency, a responsible agency, or a commenting agency in the process.

Lead Agency: A lead agency is the public agency with the principle responsibility for carrying out or approving a project; in general a local government agency with jurisdiction over land use serves as lead agency. However, the District may serve as lead agency for its own projects, such as its own new rules and regulations. As a lead agency, the District is responsible for deciding if an EIR or other environmental document must be prepared for these projects, and for causing the document to be prepared. In certain limited circumstances (CEQA Guidelines Section 15052), the District may also assume the lead agency role or prepare a subsequent Environmental Impact Report for impacts of permitted equipment for projects requiring a District permit, when prior environmental documentation is not adequate for the District to take action.

Responsible Agency: A responsible agency is a public agency that proposes to carry out or approve an aspect of a proposed project for which a lead agency is preparing an environmental document. The District serves as a responsible agency for those portions of a development project that require a District permit, or where the District has any other approval power over the project. If the development project does not require a District permit or approval, the District would be neither a lead nor responsible agency. In its responsible agency capacity, the District provides comments to the lead agency on the project's impact on air quality and recommended feasible mitigation measures.

AR0072756

Commenting Agency: In accordance with Health and Safety Code Section 40412, the District is the sole and exclusive local agency within the South Coast Air Basin with the responsibility for comprehensive air pollution control, and it shall have the duty to represent the citizens of the Basin in influencing the decisions of other public and private agencies whose actions might have an adverse impact on air quality in the Basin. As such, the District may comment on projects that have the potential to adversely affect air quality in the Basin and over which the District has no discretionary permit authority. As when the District is a responsible agency, the District's comments are advisory to the lead agency, similar to those provided by other limited-purpose agencies such as flood control districts. District comments are focused on identifying a project's impact on air quality and recommending potential mitigations for the lead agency's consideration.

Combined Responsible/Commenting Agency Role: The District can simultaneously serve as both a responsible and a commenting agency for a proposed project. For example, the District would be a responsible agency for the aspects of a hospital development which require a District permit or approval. The District would be a commenting agency for all other aspects of the project affecting air quality.

2.3 The Air Quality Management Plan

Both federal and state Clean Air Acts require that each nonattainment area prepare a plan to reduce air pollution to healthful levels. The 1989 AQMP was the first AQMP to define a comprehensive control strategy, achievable attainment dates, and an aggressive rulemaking schedule for implementation of the Plan.

Even as the 1989 AQMP was being developed, unprecedented population growth and concurrent environmental pollution precipitated passage of the 1988 California Clean Air Act (CCAA), and 1990 amendments to the federal Clean Air Act (CAA). Both of these laws require stricter controls on pollutants and attainment of the air quality standards within specified time frames. A revised AQMP, which reflected these new requirements from the federal and state government, was adopted on July 12, 1991.

In response to the 1988 CCAA, the 1991 AQMP proposed stricter control over emissions from industrial plants; extended the scope of District air pollution regulations to include the categories of air toxics, and global warming and ozone-depleting gases; and established an attainment schedule to approach the state requirement of a five percent per year reduction of emissions. Details regarding the policies and strategies of the AQMP and their implementation are given in Chapter 3.

The 1991 AQMP also responds to some of the 1990 CAA amendments by setting requirements for clean motor fuels; tightening controls on industrial plants; identifying a wide variety of air toxics to be restricted; and in recognition of the threat of global warming and ozone depletion, limiting chlorofluorocarbon (CFC) and halon use.

The updated AQMP establishes a blueprint to achieve the federal and state health-based air quality standards within twenty years. Finally, the 1991 AQMP is the nation's most advanced air pollution control program, providing a framework for future air pollution control efforts that will assure clean air for the South Coast and Southeast Desert Air Basins into the twenty-first century.

2.4 Other Air Quality Plans

In accordance with federal CAA requirements, the State of California must submit State Implementation Plans (SIPs) which demonstrate how nonattainment areas will meet a number of federal health-based standards by specific deadlines. The District has submitted specific attainment plans for carbon monoxide, nitrogen dioxide, and PM10 containing control measures derived from the 1991 AQMP, which are then incorporated into the state plans; each individual plan represents the current formal attainment strategy for that criteria pollutant. As part of CCAA requirements, the air quality status of each of these criteria pollutants will be reviewed in the 1994 AQMP submitted to the state.

BASIC AIR QUALITY INFORMATION

CHAPTER 3

Effects of Polluted Air on Health

The residents of Southern California pay for breathing polluted ambient air with:

- o Increased episodes of respiratory infections and other illnesses
- o Increased number of days of discomfort and missed days from work and school
- o Increased use of medications to relieve eye and throat irritation, headache, nausea, and aggravated asthma
- o Increased mortality.

Polluted air also damages agriculture, our natural environment and man-made materials, and decreases visibility. Cleaning up the air will result in improved public health and economic benefits that will offset, in whole or in part, the costs of attaining clean air.

A conservative estimate of the benefits derived from improved air quality in the District's four-county region, when expressed in economic terms, is approximately $6.2 billion per year. This estimate takes into account the economic benefits that will accrue from: (1) the improved health that will accompany reduced ozone emissions, (2) fewer deaths from high fine-particulate concentrations, and (3) fewer restricted activity days. There are many more health factors which have not been quantified (refer to Figure 3-1).

3.1 Regulated Pollutants

The pollutants regulated by the Clean Air Acts and state law fall under three categories:

- o Criteria air pollutants
- o Toxic air pollutants
- o Global warming and ozone-depleting gases

Each of these categories is monitored and dealt with differently. Criteria air pollutant levels are based on the measurement of their presence in the general atmosphere; toxic pollutant emissions are measured at their individual sources and general atmosphere; and global warming and ozone-depleting gases are subject to federal and regional policies that call for their reduction and eventual phase-out.

o Criteria Air Pollutants

Criteria air pollutants are defined as those pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations in order to protect public health. The federal and state standards have been set at levels above which concentrations could be generally harmful to human health and welfare. Table 3-1 compares existing regional levels of criteria pollutants with those levels set by federal and state standards. These standards are designed to protect the most sensitive persons from illness or discomfort with a margin of safety. However, a 1986 review of health information by EPA's Office of Air Quality Planning and Standards concluded that the existing one-hour ozone standard may not provide an adequate margin of safety. The criteria pollutants listed in Table 3-1 contribute to the smoggy haze visible in the SCAB (also referred to as "Basin" hereafter). The state standard for visibility is also given in Table 3-1.

Criteria air pollutant concentrations are higher in the Basin than any other area of the country. This regional problem exists because of local emission sources which are the principal cause of elevated levels (e.g., heavy industry, concentrated population, and dense vehicle traffic) within the SCAB. Table

AR0072764

3-2 lists the primary emission sources of these criteria pollutants and some of their harmful effects. These pollutants are known to damage property, impair visibility, and cause damage to plants. Adverse effects upon human health, however, are of greatest concern.

At the present time, six ambient air pollutants are of special concern: sulfur dioxide (SO_2), lead (Pb), carbon monoxide (CO), nitrogen dioxide (NO_2), ozone (O_3), and fine particulate matter (PM10). Although federal and state standards for sulfur dioxide are met within the SCAB, emissions of SO_2 contribute to violations of the state sulfate standards. Atmospheric concentrations of the other five pollutants exceed both the state and federal standard. The SCAB also exceeds the state visibility standards.

The following paragraphs describe briefly the adverse health effects of the five criteria pollutants that exceed the air quality standards in the SCAB. The District publication entitled "Where Does It Hurt?" provides additional health-related information on these pollutants.

Lead in the atmosphere occurs as particulate matter. The combustion of leaded gasoline is the primary source of lead emissions in the Basin. Other sources of lead include the manufacturing of batteries, paint, ink, ceramics, and ammunition and secondary lead smelters. With the phase-out of leaded gasoline, secondary lead smelters and battery recycling and manufacturing facilities are becoming lead-emission sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurologic dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance (including IQ performance, psychomotor performance and reaction time) and growth. Lead is currently classified as a probable human carcinogen with an EPA weight-of-evidence classification of B2.

Carbon Monoxide (CO). The automobile and other types of motor vehicle are the main source of this pollutant in the SCAB. This gas is colorless and odorless, which adds to its danger. In high concentrations, CO can cause physiological and pathological changes, and ultimately death, by incapacitating the red blood cells and interfering with their ability to carry oxygen to body tissues.

Nitrogen Dioxide (NO_2) is a by-product of fuel combustion. The principal form of nitrogen oxide produced by combustion is nitric oxide (NO), but NO reacts quickly to form NO_2, creating the mixture of NO and NO_2 commonly called NOx. Nitrogen dioxide acts as an acute irritant and, in equal concentrations, is more injurious than NO. At atmospheric concentrations, however, NO_2 is only potentially irritating. There is some indication of a relationship between NO_2 and chronic pulmonary fibrosis. Some increase in bronchitis in children (two to three years old) has also been observed at concentrations below 0.3 parts per million (ppm). Nitrogen dioxide absorbs blue light; the result is a brownish-red cast to the atmosphere and reduced visibility. NO_2 also contributes to the formation of PM10.

Ozone (O_3) is one of a number of substances called photochemical oxidants that are formed when reactive organic compounds (ROC)[1] and nitrogen oxides, both byproducts of the internal combustion engine, react in the presence of ultraviolet sunlight. Ozone is present in relatively high concentrations in this Basin, and the damaging effects of photochemical smog are generally related to the concentrations of ozone. Ozone may pose its worst health threat to those who already suffer from respiratory diseases. Ozone also hurts healthy people. In the past, those effects were thought to be limited to more difficult breathing during work and exercise. However, research indicates that children in the SCAB experience a 10-15% loss in lung function. Figure 3-2 shows how often the ozone standard is exceeded compared to other areas of the U.S. The SCAB has peak ozone levels two and a half times higher than the federal health standard, and three times higher than the more stringent state standard.

---

1 In District documents, the inclusive term "reactive organic compounds" (ROC) is gradually replacing the separate terms reactive organic gases (ROG), volatile organic compounds (VOCs), and hydrocarbons (HC), except in cases where such separation is useful.

AR0072765

Fine Particulate Matter (PM10) consists of extremely small suspended particles or droplets 10 microns or smaller in diameter that can lodge in the lungs contributing to respiratory problems. PM10 arises from such sources as road dust, diesel soot, combustion products, abrasion of tires and brakes, construction operations, and wind storms. It is also formed in the atmosphere from NO_2 and SO_2 reactions with ammonia. PM10 scatters light and significantly reduces visibility.

Fine particulates pose a serious health hazard, alone or in combination with other pollutants. More than half of the smallest particles inhaled will be deposited in the lungs and can cause permanent lung damage. Fine particulates can also have a damaging effect on health by interfering with the body's mechanism for clearing the respiratory tract or by acting as a carrier of an absorbed toxic substance.

Since 1987, when EPA established air quality standards for PM10, efforts to reduce fugitive dust levels have focused more specifically on PM10 emissions. While prior fugitive dust emission factors were developed for total suspended particulates (TSP), both EPA and ARB have developed "conversion" factors to convert TSP to PM10 emission factors. Accordingly, the CEQA Handbook uses PM10 emission factors.

- **Toxic Air Contaminants**

Toxic air pollutants are often termed "non-criteria" because ambient air standards have not been established for them. This is so, not because they are fundamentally different from criteria pollutants, but because they are diverse, and because their effects on health tend to be local rather than regional. There are hundreds of air toxics, and exposure to these pollutants can cause or contribute to cancer, birth defects, genetic damage, and other adverse health effects.

The regulatory approach used in controlling toxic air pollutant levels relies on a quantitative risk assessment process to determine allowable emissions from the source, rather than on ambient air concentrations. In addition, for carcinogenic air pollutants, there is no safe concentration in the atmosphere. Local concentrations can pose a significant health risk and are termed "toxic hot spots."

The state has implemented a long-term program to identify, assess, and control ambient levels of air toxics. Toxic air contaminants have been identified as carcinogens by ARB in conjunction with Cal EPA Office of Environmental and Health Hazard Assessments (OEHHA, formally DHS). After identification, ARB may adopt an air toxics control measure to reduce ambient concentrations below a specified threshold based on health effects, or to the lowest concentration achievable through the use of best available control technology (BACT). Based on a 1987 District report, the two toxics which appear to offer the greatest risk for the Basin's population are hexavalent chromium and benzene.

Toxic air contaminants have their sources in many aspects of our high-tech lifestyle. Studies have shown that the concentrations of many toxic air contaminants could be two to four times higher inside commuter vehicles than they are generally found outdoors. High concentrations may also be found in enclosed parking garages, office buildings, and gasoline stations.

Toxic air pollutants may have both chronic effects (i.e., of long duration), and acute effects (i.e., severe but of short duration) on human health. Acute health effects are due to sudden exposure to high quantities of air toxics. These effects include nausea, skin irritation, respiratory illness, and in some cases, death. Chronic health effects result from low-dose, long-term exposure from routine releases of air toxics. The effect of major concern for this type of exposure is cancer, which requires a period of 10 to 30 years after exposure to develop.

- **Global Warming and Ozone-Depleting Gases**

Stratospheric ozone depletion refers to the slow destruction of naturally occurring ozone, which lies in the upper atmosphere (called the stratosphere), and which protects the earth from the damaging effects of solar ultraviolet radiation. Figure 3-3 illustrates these reactions. Certain gases in the atmosphere affect the Earth's heat balance by absorbing infrared radiation. This layer of gases in the atmosphere functions much the same as glass in a greenhouse (i.e., both prevent the escape of heat).

AR0072766

This is why global warming is also known as the "greenhouse effect." The gases responsible for global warming, and their relative contribution to the overall warming effect are: carbon dioxide (55%), chlorofluorocarbons (CFCs) (24%), methane (15%), and nitrous oxide (6%). It is widely accepted that continued increases in greenhouse gases will cause global warming, although there is uncertainty concerning the magnitude and timing of the warming trend.

Certain compounds, including CFCs, halons, carbon tetrachloride, methyl chloroform, and other halogenated compounds accumulate in the lower atmosphere and then gradually migrate into the stratosphere. In the stratosphere, these compounds participate in complex chemical reactions to destroy the upper ozone layer. The role of these compounds in the depletion of stratospheric ozone was delineated by Molina and Roland in 1974 (Molina et al., 1974). Destruction of the ozone layer increases the penetration of ultraviolet radiation to earth's surface, a known risk factor that can increase the incidence of skin cancers and cataracts, contribute to crop and fish damage, and further degrade air quality.

Global warming gases and ozone-depleting gases include, but are not limited to, the following (Source; Piccot, et al., 1991):

> **Carbon Dioxide** - caused by fossil fuel combustion in stationary and mobile sources. Carbon dioxide contributes to the greenhouse effect, but not to stratospheric ozone depletion. In the Basin, approximately 48% of carbon dioxide emissions come from transportation, residential and utility sources contribute approximately 13% each, 20% come from industry, and the remainder comes from a variety of other sources.
>
> **CFCs** (Chlorofluorocarbons) - emitted from blowing agents used in producing foam insulation. They are also used in air conditioners and refrigerators, and as solvents to clean electronic microcircuits. CFCs are primary contributors to stratospheric ozone depletion and also to global warming. Based on a 1987 AQMD report, 63% of CFC emissions in the South Coast Air Basin come from the industrial sector.
>
> **Halons** - used in fire extinguishers, and behave as both ozone-depleting and greenhouse gases.
>
> **HCFCs** (Hydro-chlorofluorocarbons) - solvents, similar in use and chemical composition to CFCs. The hydrogen component makes HCFCs more chemically reactive than CFCs, allowing them to break down more quickly in the atmosphere.
>
> **Methane** - emitted from biogenic sources, incomplete combustion in forest fires, landfills, and leaks in natural gas pipelines. Methane is a greenhouse gas and traps heat 40 to 70 times more effectively than carbon dioxide. In the Basin, over 50% of human-induced methane emissions come from natural gas pipelines, while landfills contribute 24%.
>
> **TCA** (1,1,1,-Trichloroethane or Methyl Chloroform) - a solvent and cleaning agent commonly used by manufacturers. It is less destructive of the environment than CFCs or HCFCs, but its continued use will contribute to global warming and ozone depletion.

3.2 Causes of Smog

In the SCAB, two factors produce the region's high pollution concentrations and smog:

- Emissions
- Meteorology

Emissions. Emission sources may be as small as individual residential water heaters and as large as electrical power plants. Figure 3-4 illustrates typical emission sources found in the SCAB. Appendix 3 gives the percentages of emissions from these sources. ROC and NOx are the primary precursors of smog. In 1987, the base analysis year for the 1991 AQMP, emissions into the atmosphere of the SCAB from stationary, mobile, and indirect sources including consumer products added up to an average of 10,000 tons of pollutants per day.

AR0072767

Vehicular sources account for over 95% of the carbon monoxide emissions, approximately two-thirds of the oxides of sulfur emissions, three-fourths of the oxides of nitrogen emissions, and one-half of ROC. NOx (including NO and NO_2), ROC, and the ultraviolet energy from the sun are involved in the complex chemical reactions that form ozone, the primary constituent of smog. In 1990, the maximum ozone concentration was two and one-half times, and the maximum carbon monoxide was nearly twice the national standards set to protect public health.

Stationary source emissions made up almost 95% of the particulate emissions in 1987; however, two-thirds of the stationary source particulate emissions consisted of road dust, which is categorized as a stationary source emission. Approximately half of this road dust qualified as fine particulates or PM10, the basis of the particulate air quality standards.

Meteorology. Compared with other urban areas in the U.S., metropolitan Los Angeles, which lies in the central SCAB, has a low average wind speed. Sea breezes carry pollutants inland, but the mountains act as a barrier restricting the horizontal dispersion of the pollution.

An inversion layer is a layer of warm air that lies over cooler, ocean-modified air. Over the SCAB, this layer acts as a lid, preventing air pollutants from escaping upward. In the summer, these temperature inversions are stronger than in winter and prevent ozone and other pollutants from escaping upward. In the winter, a ground-level or surface inversion commonly forms during the night and traps carbon monoxide emitted by vehicles during the morning rush hours.

Figure 3-5 illustrates the combination of these smog-producing factors.

Episode Levels of Ozone Pollution. To protect the public health, the District has initiated a system to warn the public of severe pollution levels in the air. At times, meteorological conditions are so adverse to pollutant dispersion that concentrations of ozone exceed the state air quality standard by as much as a factor of three. The California Air Resources Board (ARB) has defined Episode Levels of ozone air pollution as follows:

> **Health Advisory Levels** occur when hourly ozone concentrations equal or exceed 0.15 ppm. At this level, residents are advised to avoid prolonged, vigorous outdoor exercise, and persons with respiratory or coronary disease should avoid exercise.
>
> **Stage 1 Episodes** occur when hourly ozone concentrations equal or exceed 0.20 ppm. At these times, persons with respiratory or coronary artery disease should be notified to take precautions against exposure and should stay indoors as much as possible. Schools are also notified to advise against strenuous physical activity for their students. To this end, schools are in regular communication with the District.
>
> **Stage 2 Episodes** occur when hourly ozone concentrations equal or exceed 0.35 ppm. The District requires industry to take prompt actions to reduce emissions at those times. Stage 1 and 2 episodes are less frequent in the SCAB today than a decade ago. In fact, no Stage 2 episodes occurred from 1989 through 1992.
>
> **Stage 3 Episodes** occur when hourly ozone concentrations equal or exceed 0.50 ppm. The last Stage 3 episode occurred in the Basin in 1974; the total lack of Stage 3 episodes in nearly two decades points to improved air quality and significant progress made in the SCAB attainment effort.

The District reports air quality in terms of a Pollutant Standards Index (PSI). The PSI is a simplified method of forecasting and reporting air quality conditions on a numerical scale averaging from 0 to 500. Good air quality is 0 to 50, while 400-500 PSI is a hazardous Third Stage Episode. Refer to Figure 3-6, which describes the PSI ganging.

AR0072768

3.3 SCAQMD Strategy and Control Measures

On July 12, 1991, the SCAQMD Governing Board adopted a revision to the Air Quality Management Plan (AQMP), which responded to new demands and tightened controls of pollutants specified by both the federal and California state governments.

As discussed in Chapter 2, the 1988 California Clean Air Act (CCAA) requires the District to adopt a plan that seeks to attain the California Ambient Air Quality Standards and that will also meet a variety of state performance standards; these include a five-percent annual reduction in emissions, and achievement of a 1.5-person average vehicle occupancy (AVO) during commute periods by 1999. In addition, the District must comply with the performance standards set by the 1990 Amendments to the federal Clean Air Act (CAA). The District seeks to do all of the above through the 1991 AQMP, which includes a variety of strategies and control measures. The 1991 AQMP was designed to comply with state and federal requirements, reduce the high level of pollutant emissions in the SCAB, and return clean air to the region by 2010.

To accomplish its task, the AQMP relies on a multi-level partnership of governmental agencies at the federal, state, regional, and local level. These agencies (EPA, ARB, local governments, SCAG, and the District) are the cornerstones that implement the AQMP programs.

The control measures in the 1991 AQMP are categorized into three tiers:

> **Tier I** includes measures that propose currently available technological applications and management practices than can be adopted within the next five years.
>
> **Tier II** measures are based on significant advancement of today's technological applications within the next ten to fifteen years.
>
> **Tier III** requires the development of new technologies that are currently in the research stage and that will be implemented within the next twenty years.

The AQMP provides an attainment planning framework that sets specific dates by which the SCAB will achieve the federal and state air quality standards.

- **Control of Criteria Pollutants**

The District has determined a schedule under which emissions of criteria pollutants must be reduced in order to attain state and federal standards. Under the present attainment schedule, the Plan calls for attaining federal standards by the years 2010 for ozone and 2006 for PM10. The deadlines for attaining federal and state standards for NO_2 and CO are earlier, as seen in Figure 3-7.

- **Control of Toxic Air Contaminants and Acutely Hazardous Emissions**

Control of toxic air pollutants is set out in Section 112 of the federal Clean Air Act, which established the National Emissions Standards for Hazardous Air Pollutants (NESHAPs), and under which the EPA established emission standards for toxic air contaminants.

The state also regulates toxic air pollutants through its air toxics program (AB 1807). In addition, the state legislature has passed several related legislative programs (AB 2588, AB 3205, and AB 3374). Finally, for the control of air toxics, there are several District rules being adopted and implemented by the District under authority based on Section 41700 of the California Health and Safety Code and by ARB. These are discussed below.

Tanner Air Toxics Act (AB 1807) established the California toxic air contaminant control program wherein ARB, working in conjunction with the OEHHA, identifies toxic air contaminants. Air Toxic Control Measures (ATCMs) may then be adopted to reduce ambient concentrations of the identified toxic below a specific threshold based on its effects on health, or to the lowest concentration achievable through use of best available control technology (BACT). The program is administered by ARB. The District must incorporate ATCMs into its regulatory program or adopt equally stringent control measures as rules. Currently, the District has adopted seven rules related to control of AB 1807 substances.

AR0072769

Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) requires operators of specified facilities to submit to the District comprehensive emissions inventory plans and reports by specified dates. The District reviews the reports and then places the facilities into high, intermediate, and low priority categories, based upon the potency, toxicity, quantity and volume of hazardous emissions, and the proximity of potential sensitive receptors to the facility. Facilities designated as high priority (category A) must prepare a health risk assessment. Those found to pose a significant risk are required to notify the surrounding population. The emissions inventory data are to be updated every two years. This process is intended to achieve the following goals:

- To collect emission inventories from facilities that use any of the 300 toxic substances currently listed by CARB.
- To develop health risk assessments for designated facilities that have emissions which may result in adverse public health impacts.
- To make information available to the public on the health risks from air toxic emissions.

Toxic Emissions Near Schools (AB 3205) requires new or modified sources of air contaminants located within 1,000 feet from the outer boundary of a school to give public notice to the parents of school children before an air pollution permit is granted. The District conducts field and data base surveys to identify all existing sources of air contaminants located within a quarter mile of a proposed school site.

Air Monitoring of Disposal Sites (AB 3374) requires owners of solid waste disposal sites to submit to the District a solid waste air quality assessment test report for evaluation. If the District determines that levels of specified air contaminants pose a health risk, remedial action must be taken.

District Rule 1401 (New Source Review of Carcinogenic Air Contaminants) assesses and manages risk from new or modified sources of air toxics through the District's permitting program. Rule 1401 also describes the risk assessment procedures to use in evaluating risks from sources that emit cancer-causing substances. Further, it specifies the allowable risks for new and modified stationary sources.

Acutely Hazardous Emissions. Any facility that handles, uses, or transports acutely hazardous materials is required to develop a Risk Management and Prevention Plan (RMPP). In most jurisdictions, the Fire Department is responsible for overseeing the preparation of the RMPPs.

- **Control of Global Warming and Ozone-Depleting Gases**

The South Coast Air Quality Management District adopted a policy on global warming and stratospheric ozone depletion on April 6, 1990, that commits the District to consider global impacts in its rulemaking and in drafting revisions to the Air Quality Management Plan. The policy was updated in April 1992, and includes the following directives:

- Phase out the use of chlorofluorocarbons (CFCs), methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995.
- Phase out the large-quantity use of hydrochlorofluorocarbons (HCFCs) by the year 2000.
- Develop recycling regulations for HCFCs.
- Include strategies in the 1991 AQMP to reduce carbon dioxide and methane emissions.
- Develop an emissions inventory of ozone-depleting and global warming gases.
- Support research funding and seek alternative technologies to control pollutant emissions contributing to global environmental change.

Since adopting the policy, the District has developed and adopted recycling rules to reduce CFC and halon emissions as well as developed 1991 AQMP control strategies to reduce emissions of carbon dioxide and methane.

AR0072770

3.4 Control of PM10 in the Coachella Valley

The latest AQMP revision also provides data on emission sources in that portion of the Southeast Desert Air Basin (SEDAB) under District jurisdiction. Figure 2-1 in Chapter 2 shows the relationship between the two air basins under the jurisdiction of the District.

In much of the SEDAB, ozone and PM10 standards are regularly exceeded. Much of the ozone problem is the result of ozone transport from the South Coast Air Basin. The geographic characteristics of the Coachella Valley nevertheless make it a prime candidate for a locally generated ozone problem in the future. Therefore, it is important at this time to mitigate emissions that lead to the formation of ozone and contribute to the local violations of ambient air quality standards. High PM10 concentrations, on the other hand, are strictly a localized problem resulting mainly from fugitive dust emissions.

In December 1989, the District Governing Board adopted the **State Implementation Plan for PM10** for the portion of the SEDAB known as the Coachella Valley. Typical control measures adopted include:

- Using soil stabilizers to treat areas adjacent to roadways
- Erecting snow-fence windbreaks
- Planting vegetative and tree windbreaks
- Removing accumulated dirt from streets
- Treating unpaved roads with chemical stabilizers
- Covering loaded trucks
- Prohibiting construction grading on windy days

Implementation of the control measures contained in this Plan by local governments, the District, and the Coachella Valley Association of Governments is expected to bring the Coachella Valley into compliance with the federal ambient air quality standards for PM10 by the year 1995.

Eighteen months after EPA classifies the area as non-attainment for PM10, a similar plan will be developed for the Antelope Valley.

Table 3-1. 1992 Maximum Concentrations of Criteria Pollutants in SCAB and Coachella Valley

Pollutants	National Standards	State Standards	Regional SCAB Levels and Exceedances	Coachella Valley Levels and Exceedances
Lead (Pb)	1.5 ug/m³ (calendar quarter)	1.5 ug/m³ (30-day average)	0.11 ug/m³ (quarterly avg.) 0.16 ug/m³ (monthly avg.)	No monitoring
Sulfur Dioxide (SO_2)	0.14 ppm (24-hour)	0.25 ppm (1-hour) 0.05 ppm (24-hour)	.035 ppm (24-hour) (no days exceeded) 0.15 ppm (1-hour) (no days exceeded)	No monitoring
Carbon Monoxide (CO)	9.0 ppm (8 hours) 35 ppm (1-hour)	9.0 ppm (8 hours) 20.0 ppm (1-hour)	18.8 ppm (8 hours) 31 days/federal 36 days/state 28 ppm (1-hour) (5 days/state)	2.4 ppm* (8 hours) (no days exceeded) 5.0 ppm* (1-hour) (no days exceeded)
Nitrogen Dioxide (NO_2)	0.053 ppm (annual average)	0.25 ppm (1-hour)	0.0507 ppm (annual average) 0.30 ppm (1-hour) 1 day/state	0.0210* ppm (annual average) 0.09* ppm (1-hour) (no days exceeded)
Ozone (O_3)	0.12 ppm (1-hour)	0.09 ppm (1-hour)	0.30 ppm (118 days/federal 164 days/state)	0.15 ppm 21 days/federal 69 days/state
Fine Particulate Matter (PM10)	150 ug/m³ (24-hour)	50 ug/m³ (24-hour)	649 ug/m³ (24-hour) 3% days/federal 66% days/state	175 ug/m³ 2% days/federal 31% days/state
Sulfate	None	25 ug/m³ (24-hour)	22.6 ug/m³ (no days exceeded)	No monitoring
Visual Range	None	10 miles (8 hour) w/humidity < 70%	39% days*	No monitoring

* Longest Travis Field data 12 full months of data.
Days/federal = Number of days that federal standard was exceeded
Days/state = Number of days that State of California standard was exceeded

AR0072779

Table 3-2. Primary Sources and Effects of Criteria Pollutants

Lead (Pb)	Contaminated soil	Impairment of blood function and nerve construction Behavioral and learning problems in children
Sulfur Dioxide (SO_2)	Combustion of sulfur-containing fossil fuels Smelting of sulfur-bearing metal ores Industrial processes	Aggravation of respiratory diseases (asthma, emphysema) Reduced lung function Irritation of eyes Reduced visibility Plant injury Deterioration of metals, textiles, leather, finishes, coatings, etc.
Carbon Monoxide (CO)	Incomplete combustion of fuels and other carbon-containing substances, such as motor vehicle exhaust Natural events, such as decomposition of organic matter	Reduced tolerance for exercise Impairment of mental function Impairment of fetal development Death at high levels of exposure Aggravation of some heart diseases (angina)
Nitrogen Dioxide (NO_2)	Motor vehicle exhaust High-temperature stationary combustion Atmospheric reactions	Aggravation of respiratory illness Reduced visibility Reduced plant growth Formation of acid rain
Ozone (O_3)	Atmospheric reaction of organic gases with nitrogen oxides in sunlight	Aggravation of respiratory and cardiovascular diseases Irritation of eyes Impairment of cardiopulmonary function Plant leaf injury
Fine Particulate Matter (PM10)	Stationary combustion of solid fuels Construction activities Industrial processes Atmospheric chemical reactions	Reduced lung function Aggravation of the effects of gaseous pollutants Aggravation of respiratory and cardio-respiratory diseases Increased cough and chest discomfort Soiling Reduced visibility

INITIAL CONSULTATION

CHAPTER 4

Local governments are encouraged to establish a formal consultation process for projects at the earliest planning stages. The purpose of this consultation is to identify construction procedures, air quality design standards, and reasonable mitigation measures that should be considered for incorporation into the project from the onset, as well as to discuss environmental documentation requirements.

Project proponents who begin the planning process with an understanding of environmental and air quality regulations will find it much easier to avoid or to mitigate air quality impacts as well as costly and unnecessary litigation. To make fundamental changes to a site plan, or to address land use compatibility issues or impacts on infrastructure after the CEQA review process has begun, is time consuming and expensive for both local government and the project proponent.

For this reason, early contact and initial consultation between local government planners and project proponents is vital, while the project is still in its conceptual phase.

Early consultation or informal review will not replace thorough environmental analysis of a project, but can assist the project proponent in anticipating and preparing for the requirements of CEQA. The initial consultation is intended to assist local government planners in identifying air quality impacts before the formal CEQA review process begins, thereby allowing the project proponent to make the appropriate changes during the initial design phase.

4.1 Consultation at the Planning Counter

An initial consultation can be as simple as a discussion of air quality issues at the planning counter with a project proponent, who is making inquiries about zoning and permits concerning a particular piece of property. Typically, the inquiries are focused on the zoning of the property, the land uses the zoning allows, and the discretionary permits that are needed to develop the property. This type of initial consultation can become more effective if government agencies and planners are well informed and are able to provide project proponents with up-to-date information on environmental issues and on local and regional air quality policies.

Effective initial consultation is largely dependent on local government planners familiar with air quality policies and an ability to identify land use compatibility issues and suggest mitigation measures. To that end, the District holds workshops and training sessions to assist planners in staying current with air quality issues. The District also plans to hold periodic meetings of the region's planning directors to discuss implementation of the Air Quality Management Plan (AQMP). Finally, technical assistance is always available from the District through the telephone contacts listed in the Introduction to this Handbook.

Local government can better communicate current information on air quality issues at the planning counter through the use of:

- Handouts
- Land use/zoning maps

Handouts. Handouts on local government land use policies and development standards can be expanded to include air quality issues. Handouts can include basic information on:

- Compatible land use - Higher densities in transit corridors; supportive services in commercial districts
- Incompatible land use - Location of sensitive receptors
- Preparing the Initial Study - Determining significance of air quality impacts

AR0072784

Handouts can also explain how specific measures improve air quality, such as:

- Landscaping requirements that reduce electrical energy use
- Development standards such as those that require commercial developments to provide bicycle racks, designate carpool parking spaces, and place interior bus turnouts
- Air quality mitigation measures (refer to Tables 11-2, 11-3, 11-4, 11-6, and 11-7 in Chapter 11)

Land Use/Zoning Maps. The location of industries that are significant sources of toxic air pollutants (defined as facilities producing emissions that exceed the maximum individual cancer risk of 10 in 1 million either individually or cumulatively) as well as properties that are adjacent to congested freeways can be identified on counter land use/zoning maps, so that issues of land use compatibility can be readily identified. As discussed in Chapter 5, the District will be providing planners with a database identifying known sources in their jurisdiction. Bicycle pathways and transit bus stops where land dedications are needed can also be identified on counter maps, along with transit corridors, which are important when considering density and land uses necessary to support ridership. Issues regarding air toxics and land use compatibility need to be fully addressed in the environmental documentation.

4.2 Establishing a Formal Initial Consultation Process

An initial consultation can be a formal, scheduled interview, requested by the planner or the project proponent. The District encourages local governments to incorporate a formal initial consultation as part of the project review, especially for significant projects (refer to Table 6-2 in Chapter 6), so that air quality issues and mitigation measures may be investigated early in the process. Upon request by the local government, the District will participate in the initial consultation for significant projects. Contact the District's Local Government - CEQA Section to request the District's assistance.

When establishing a procedure for a formal initial consultation, the local jurisdiction may need to consider the following:

- Is there an existing process that can be expanded to encompass this initial consultation, or does a new process need to be created?
- Should the consultation be mandatory or voluntary?
- Which projects should require an initial consultation?
- Should a fee be charged to cover the cost of the consultation?

To streamline the initial consultation and focus on the key issues of development, a checklist of items to look for when reviewing a project for air quality impacts is important. An example of such a checklist is given in Figure 4-1.

4.3 Air Quality Issues for Formal Consultation

Of particular interest to the project proponent are those policies that:

- Could significantly alter the project's design or scope
- Require an in-depth air quality analysis during CEQA review
- Require coordination with the District and other agencies

When a project is within a quarter mile of an existing land use that emits toxic pollutants, these issues should be discussed more fully.

AR0072785

The initial consultation, therefore, should identify those areas where air pollution mitigation might require redesigning the project; or where a finding is probable that the project could have a significant effect on air quality, and feasible alternatives and mitigation are not available; or where a responsible agency needs to be consulted. Major emphasis and consideration of potential air quality impacts should be given to the following issues during the initial consultation:

- Land use/densities, site plan design, and building design
- Land use incompatibility involving proximity to sensitive receptors of a (1) toxic air emission source, (2) objectionable odors, or (3) localized CO hot spots
- Intergovernmental coordination for major stationary sources and impacts on infrastructure that affect air quality

4.4 Land Use, Densities, Site Plan, Building Design

Land use, densities, site plan design, and building design are fundamental to the project's function. Together these factors affect the number of vehicle trips that the project may generate and, in turn, its transportation needs. According to the ARB document, *Guidance for the Development of Indirect Source Control Programs*, a design incorporating mixed uses can potentially reduce trips by 20% to 50% if certain design strategies are followed. A site plan with a design sensitive to air quality that incorporates facilities such as bicycle racks, pedestrian paths, etc., can be expected to reduce vehicle trips by 1% to 10% of the ARB estimate. Refer to Chapter 9 for specific quantification estimates.

Other design-related issues that are fundamental to reducing air pollution include densities and land uses in transit corridors, along with building orientation to maximize passive solar heating and cooling benefits.

The key items to look for in considering the site plan and building design at the initial consultation are the following:

Do the designs of public right-of-way and pedestrian walkways within the site encourage pedestrian traffic?

Is on-site traffic circulation designed to reduce vehicle queuing?

Are dedications needed for transit/bike pathways, in compliance with the Circulation Element of the General Plan?

Are links between the project and bike/pedestrian pathways adequate and will walking and bicycling, rather than driving, be facilitated?

Are supportive land uses such as restaurants, banks, and a post office included in office and industrial parks?

Do residential Specific Plans incorporate mixed uses?

Is the building or subdivision oriented to take advantage of natural heating and cooling patterns?

Are landscaped treatments designed to reduce the energy needs of the building?

Is the project accessible to transit facilities?

Do developments in transit corridors provide sustainable densities to support transit ridership? (Refer to the SCAG Transportation Corridors map in Figure 4-2 and Chapter 5 for information on sustainable densities.)

Could the project impact the levels of service on the Congestion Management Program (CMP) transportation system?

AR0072786

These questions complement the list of specific site-design mitigation measures, found in Chapter 5, that project proponents should employ to reduce emissions. At the conclusion of the initial consultation, the project proponent should have an understanding of the design features that will reduce emissions and that need to be incorporated into the site plan and building design.

4.5 Incompatible Land Uses

- **CO Hot Spots, Toxic Sources, and Sensitive Receptors**

An initial consultation can be particularly important when considering the siting of sensitive receptors, such as nursery schools or long-term health care facilities. Placement of sensitive receptors near localized concentrations of the criteria pollutant carbon monoxide (CO) is of concern. Since the automobile is the primary source of carbon monoxide, high levels of CO are associated with congested roadways, such as freeways and major intersections. Toxics are also of concern. For example, if a project wants to build a long-term health care facility next to a chrome plating shop, the initial consultation should alert the developer to the potential public health risk issues associated with this proposed siting. The project proponent should be made aware of any environmental documentation, including a public health risk assessment that is necessary to assess the public health impacts of the project. The project proponent should analyze publicly available information on public health risks posed by nearby sources of toxic emissions. The District serves as a clearinghouse for publicly available information on toxic emissions and associated public health risks. This information is compiled from documentation required of toxic emitters by Rule 1401 and the AB 2588 Air Toxics Hot Spots Program. The applicant should also make a reasonable attempt to obtain toxic information from any known sources that could potentially affect the project site which is not covered by Rule 1401 and AB 2588. Pursuant to CEQA Guidelines Section 15151, if the information is not available, the sufficiency of the air toxics analysis should be determined in light of what is reasonably available. Additionally, the project proponent should understand that, depending on the risk levels identified through the environmental process, the local government may determine that such a site is not an appropriate location for a particular sensitive receptor, e.g., in this example, a long-term health care facility.

These are the key items to look for when considering land use compatibility:

- Are there any sensitive receptors (defined in Chapter 1) that would be affected by the proposed siting of this facility?
- Does a sensitive receptor want to locate next to a congested roadway, which is a source of carbon monoxide? (Figure 5-4)
- Are high CO levels projected to decrease at the project site to acceptable levels in the future?
- Can the sensitive receptors be moved out of range of a CO hotspot on the same parcel?
- Will a sensitive receptor be located within a quarter mile of an existing facility that emits toxic pollutants? (The quarter mile distance is for screening only)

The initial consultation should determine if existing facilities that emit toxic emissions will affect the sensitive receptor and whether or not further analysis is needed. Refer to Chapter 5 for information on the initial screening for land use compatibility and District-recommended criteria for determining when a public health risk assessment is necessary.

- **Odor Issues**

Almost any source may emit objectionable odors, but some land uses will be more likely to produce objectionable odors because of the nature of their operation. The initial consultation should identify both new projects that have a high probability of emitting objectionable odors and new developments that may be affected because of their location downwind. (Refer to Chapter 8 for methods to identify downwind sources.)

AR0072787

In most cases, odor issues can be resolved with additional control equipment, a change in siting of the operation that is generating the odor, or process change. The initial consultation can be particularly useful in determining the appropriate location for equipment that produces odors, thereby lessening the potential impacts on surrounding properties. The initial consultation can also identify existing sources of odors and assess their impact on projects proposing to locate downwind. Refer to Chapter 5 for procedures to assess and mitigate potential odors.

4.6 Intergovernmental Coordination for Major Sources and Impacts on Infrastructure

During the initial consultation, planners have the opportunity to identify projects whose conditional use or building permits might require intergovernmental coordination. One example of a project requiring intergovernmental coordination on a project's permits is the construction of a major stationary source such as a cogeneration facility, which would be considered significant by both the local government and the District. At the initial consultation, the planner can also identify projects that could have an air quality impact due to increased demand on, or expansion of, the infrastructure. In this example, the transportation and wastewater treatment infrastructure are likely to be affected. Modifications to these systems involve coordination among the county transportation commissions, congestion management plan agencies, and wastewater treatment districts.

- **Major Stationary Sources**

In addition to obtaining local government discretionary permits, new or modified stationary emission sources will need to obtain permits from the District to construct and operate. Through the District's permitting process, factors such as the availability of emission offsets and their ability to reduce emissions are addressed. Some District permits, like local government permits that involve discretionary approval, are subject to a CEQA analysis. The District is a responsible agency for those permits considered to be projects under CEQA that are not exempt or ministerial. As soon as the lead agency has determined that an Initial Study will be required for the project, the lead agency should consult informally with all responsible agencies to obtain recommendations as to whether an EIR or Negative Declaration should be prepared (CEQA Guidelines Section 15063 (g)). In addition, there are a number of land use projects that could considerably impact air quality. For these projects, the District is a commenting agency. The District should be consulted to ensure that potential impacts are adequately identified.

Refer to Table 4-1 for a list of sources requiring intergovernmental coordination during the initial consultation. This list is based on the emission threshold criteria defined in Chapters 6 and 14, and is used by the District to determine if a project could have a significant impact, and if the District is to be consulted as a responsible agency under CEQA. The projects in this table either have the potential to significantly affect the air quality or require technical expertise to adequately assess impacts such as toxic sources.

Through intergovernmental coordination, the District and local government can ensure that the environmental documentation addresses both the local government land use permits as well as District permits to construct and operate equipment. Through closer coordination, the District can ensure that it does not issue permits for facilities that do not have land use approval from local governments; likewise, local governments can identify additional mitigation needed for a project that they might have otherwise missed.

Chapter 13 discusses additional required contents for environmental documents when the District is a responsible agency. Any environmental document that the project proponent intends to use to comply with CEQA for a District permit and local government permit should follow Chapter 13 for analyzing the potential secondary impacts of control technologies proposed for use.

Coordination between the District and local governments will enable local governments to obtain information about the facility's previous operation. The local government will then be able to evaluate the requests of facilities to relocate or expand. The local government can contact the District Office of Stationary Source Rules and Compliance at the numbers indicated in the Introduction. Table 4-2 provides planners with information sources on specific types of permits.

AR0072788

In addition, this type of intergovernmental coordination can be important to those local governments that have major stationary sources operating under outdated discretionary permits or with grandfathered uses. In those cases, intergovernmental coordination can provide local governments with an additional opportunity to comment and recommend mitigation on established projects to protect public health.

- **Transportation Infrastructure Impacts and Congestion Management Program (CMP)**

Projects affecting the regional transportation system will also affect air quality. Development that brings additional traffic to already congested roadways will increase localized carbon monoxide emissions. Traffic delayed by congestion will further degrade regional air quality, since vehicles produce more emissions when traveling at lower speeds. (It is interesting to note that recent research indicates that vehicles also produce substantial emissions at speeds greater than 55 mph.)

The requirements of CEQA and the Congestion Management Program (CMP) are closely linked. Under the CMP legislation, local governments are required to adopt and implement a program to analyze the impacts of land use decisions on their portion of the CMP transportation system. As such, CEQA may be used to facilitate the land use and transportation components of the CMP.

The initial consultation can identify local areas where a project or series of projects may bring increased congestion to a segment of roadway identified in the CMP. If the project would cause service to deteriorate below level of service (LOS) E (considerable congestion) or the level established in the CMP, the resulting congestion should be addressed by improvements, programs, or actions which either mitigate the deficiency or measurably improve the level of service of the system and contribute to significant improvements in air quality. In fact, the CMP legislation requires that the impact be mitigated through the development of a deficiency plan. Chapter 11 provides further guidance on preparing site-specific mitigation measures than can be used in deficiency plans. It is important to note that if a roadway deteriorates to a lower LOS, causing a CO hot spot, the resulting localized CO hot spot(s) should be mitigated under CEQA. (Refer to Chapter 5.)

In addition, as part of the CMP land use analysis element, most local governments will require project proponents to prepare a traffic impact analysis when, according to the initial study, the project is likely to impact the transportation system. The traffic impact analysis can also become the starting point for the analysis of congestion and air quality impacts by providing project-specific transportation inputs (assumptions) for calculating pollutant emissions.

Mitigation measures that reduce traffic and circulation also contribute to improved air quality. Therefore, planners should use the initial consultation process to determine where coordination of the CMP and air quality CEQA analysis is needed.

- **Wastewater Treatment Impacts**

Developments that significantly increase demands on the wastewater treatment system of an area can create a situation where service demand would be in excess of the system's capacity. Population projections in the Regional Growth Management Plan serve as the basis for determining the capacity of a wastewater treatment system. These projections also form the basis for the air quality estimates in the Air Quality Management Plan (AQMP). Figure 4-3 lists projects that produce a substantial amount of wastewater, or that have the potential for toxic discharges. Project proponents of these projects should consult the local wastewater treatment agency to determine if the project could affect overall wastewater treatment capacity and increase toxic emissions (e.g. since treating toxic wastewater could increase toxic air emissions).

Any development that would exceed wastewater treatment capacity would thereby exceed the geographic area's population projections in the AQMP. Subsequently, the future emissions forecast in the AQMP would be understated, and without additional mitigation, the region would not achieve the federal and state air quality standards. Therefore, if the wastewater treatment facility needed to expand to provide services beyond the growth projections, the AQMP would need to be amended and additional sources would have to be regulated to offset the increases in emissions due to population growth.

SENSITIVE RECEPTOR SITING CRITERIA and DESIGN MITIGATION MEASURES

CHAPTER 5

Prior to the formal submittal of the project to the local government, there are two issues that planners need to communicate and which project proponents need to address:

- Potential air quality impacts on sensitive receptors
- Integration of site design features that will reduce emissions

Any project evaluation undertaken by local government planners should include these issues.

5.1 Evaluating Impacts on Sensitive Receptors

Sensitive populations are more susceptible to the effects of air pollution than are the population at large. Sensitive populations (sensitive receptors) who are in proximity to localized sources of toxics and carbon monoxide (CO) are of particular concern. (Refer to Figure 5-1 for a list of land uses considered to be sensitive receptors and to Table 5-1 for a list of land uses associated with toxic air emissions.)

Local governments have a responsibility for determining land use compatibility in the case of sensitive receptors. They also determine the type of land uses (sensitive receptors) and densities of use within their jurisdiction. The District has established standards through its rulemaking authority for carcinogenic and toxic air contaminants that are emitted by stationary sources which are designed to protect public health. These standards are identified in Section 5.2. Local governments can use the District standards to assist in making their land use decisions.

State law currently requires school districts to consider the impact of siting a new facility within close proximity to existing facilities that emit toxics. This principle should be applied in siting other sensitive receptors such as rehabilitation centers. Furthermore, local governments should be aware of the potential effects on the health of sensitive populations when a sensitive receptor is proposed to be situated adjacent to a significant source of CO, such as a freeway or a major intersection. High levels of CO are associated with traffic congestion and with idling or slow-moving vehicles. Depending on existing background concentrations of CO, roadways have the potential to be CO hot spots. Therefore, projects with sensitive receptors or projects that could negatively impact levels of service (LOS) should utilize the screening procedures in this chapter to determine the potential to create a CO hotspot. The responsibility for properly siting sensitive receptors rests with local governments.

Another land use compatibility issue involves sources that emit odors. The District's compliance officers may receive a number of odor complaints from residents surrounding a source. Many of these complaints could have been avoided if equipment had not been located upwind of a sensitive receptor, or if the facility employed add-on control equipment to reduce odorous emissions.

Ideally, as suggested in Chapter 4, these types of land use compatibility issues would have been raised at an initial consultation. Otherwise, these siting issues need to be identified early in the project review process, preferably before projects are formally submitted to the jurisdiction. The three key air quality questions that affect land use compatibility and that should be considered for each sensitive receptor project are:

- Is the proposed sensitive receptor located within a quarter mile of an existing facility that emits toxic pollutants?
- Is the proposed sensitive receptor adjacent to a congested roadway or in an area with high background concentrations of CO?
- Is the proposed sensitive receptor downwind of an existing source of odorous emissions, or is a proposed use associated with odorous emissions upwind of an existing sensitive receptor?

AR0072798

In addition, proposed projects that could negatively impact the adjacent roadway's LOS, and as such subject an existing sensitive receptor to high levels of CO, should also undergo the screening procedures in this chapter.

These questions should be used to identify projects where additional review is needed.

5.2 Evaluating Sensitive Receptors for Toxic Impacts

The steps for evaluating toxic impacts on sensitive receptors are summarized in Figure 5-2. First, development plans for sensitive receptor projects should be accompanied by a radius map. An example of the information contained in the radius map is illustrated in Figure 5-3. The planner can compare the uses identified in the map with the list of land uses associated with toxic air emissions in Table 5-1.

If the map shows that there is an existing industrial source that emits toxic or carcinogenic air pollutants which may create a potential human health hazard within a quarter mile of the proposed sensitive receptor, planners should confirm with the District that this facility emits the pollutants indicated. The District is preparing a database of facilities that emit toxic emissions, and planners can contact the Toxics Unit at 909 396-3108. If the District confirms the location and type of emissions, then the local government should include a public health risk screening assessment as part of the environmental analysis. It is the responsibility of the local government to determine if the risk is significant and/or acceptable. The District uses the standard of 1 in 1 million as the maximum individual cancer risk and 10 in 1 million if the source of the toxic emissions uses best available control technology for toxics (T-BACT) when approving permits for new or modified stationary sources.

If the site is to be pursued as a potential location, then the toxic emissions from the existing nearby sources need to be identified (quantified to the extent that such data is reasonably available, Section 4.5) and a risk assessment performed. Chapter 10 discusses procedures for quantifying toxic emissions and making risk assessments. These assessments can be reviewed by the District prior to local government action to ensure that the assessment is adequate and that the risk is identified accurately.

There are no mitigation measures that sensitive receptors can employ to lessen the impact of siting next to a toxic source.

Additional Resources for Toxics Information

Sometimes additional information is needed to understand the extent and type of toxic emissions or to verify that a business does or does not emit toxic compounds. Several additional information sources are available to the planner including:

(1) State of California Health and Safety Code Section 25510(k) and (q) requires businesses that use hazardous materials or that involve a potential threatened release of acutely hazardous materials to submit a business plan for emergency response as set forth in Health and Safety Code Section 25503.5.

In most jurisdictions, the local or county fire department is charged with overseeing compilation of a **Hazardous Material Business Plan** for businesses that store or use hazardous materials in reportable quantities. The fire department will have a documentation package that can be used to provide the necessary information.

(2) Planners can contact the District's Toxic Source Unit to determine if a facility is operating under District permits and to learn the types of pollutants emitted by the facility.

(3) In 1987, the California legislature passed the **Air Toxics "Hot Spots" Information and Assessment Act of 1987** (AB 2588), which requires a statewide emissions inventory of toxic air pollutants. The Act further requires that the District first prioritize facilities and then require risk assessments of facilities that represent significant sources of toxic emissions. Facilities began entering this program on August 1, 1989, according

AR0072799

to the schedule set forth in the Act. After entering the program, facilities must submit updated air toxics emissions inventories every two years.

Based on (1) quantity and volume of emissions, (2) toxicity and potency of substances, and (3) proximity to receptors, facilities are placed into one of three categories. The categories are:

Category A: Facilities that are required to submit risk assessments within 150 days of being placed in this category.

Category B: Facilities that may be required to submit risk assessments in a later year.

Category C: Facilities that are not likely to be required to submit health risk assessments.

In addition, the District is developing "industry-wide" inventories and assessing risks of small business facilities with emissions that are easily characterized. Some of the facilities in the industry-wide program include gas stations, small auto body shops, small dry cleaners, plating shops, and fiberglass product manufacturers.

Currently planners and project proponents can request through a public records request to the District health risk assessments performed pursuant to AB 2588. The assessments identify impacts on nearby receptors, including existing sensitive receptors. That information can then be used as an initial screening tool to determine if a particular site is advisable for siting a sensitive receptor.

Ultimately, this program will yield a database that will be made available to local planners in 1993. The database will:

(1) Provide information necessary to assess health impacts from cumulative sources of toxic emissions.

(2) Provide information to planners on the amount and type of toxic emissions from a particular business and/or toxic hot spots that can then be identified on land use/zoning maps for future reference.

Planners can contact the District's Toxics Unit to determine if a business has already submitted a risk assessment that analyzes impacts on sensitive uses. If so, the risk assessment can be used to determine if the siting of a sensitive receptor within the impact area is appropriate. A public health risk assessment, however, may only be available for District 1401 permits (since June 1990) and AB 2855 facilities at this time.

5.3 Evaluating Projects for CO Impacts

In order to evaluate a project and assess the localized CO impacts on sensitive receptors that are sited adjacent to congested roadways, the following screening procedures should be followed, and the roadway level of service (LOS) should be identified during the initial consultation, as described in Chapter 4.

(1) Determine the "no project" ambient background CO concentrations based on information from the air quality monitoring station located in the same source receptor area (SRA) as the project. If CO is not monitored at the station in the same SRA as the project, the nearest or most representative air monitoring station data should be used. Contact the District for assistance in identifying the most representative station. Tables 5-2 (1-hour) and 5-3 (8-hour) may be used to determine project future year CO ambient concentrations.

(2) Estimate the projected 1-hour and 8-hour CO concentration levels at the site. CO concentrations may be determined based on roadway type and LOS. Table 5-4 provides estimates of roadway and intersection emissions. To establish the projected 8-hour concentration, the 1-hour concentration should be multiplied by the persistence factor (see Section 9.4).

AR0072800

(3) Add the "No Project" ambient concentration level to those generated by the project (i.e., total project impact).

(4) Compare the total project impact to the 1-hour and 8-hour state ambient CO standards (Chapter 3).

(5) If a CO hot spot is anticipated, determine the extent of area impacted. This can be accomplished by plotting the queuing distance from the intersection stopline (Q) as the X axis, and the distance from edge of roadway (A) as the Y axis. The area which falls within the XY coordinates is most likely impacted with CO concentration levels which exceed the state standard (refer to Figure 5-4). Identify and determine CO concentration levels for each sensitive receptor.

(6) Compare the concentration levels of CO at the proposed site locations for sensitive receptors to the 1-hour and 8-hour CO standards.

(7) Determine project significance.

This analysis should be performed for each development phase of the project and project build-out.

There may be cases where the background concentration already exceeds the state 1-hour and 8-hour CO standards. In these cases, the analysis should determine if there will be a measurable increase at the project site. A measurable increase is defined as one part per million (ppm) for the 1-hour CO standard and 0.45 ppm for the 8-hour standard (consistent with District Regulation XIII definition of a significant impact).

If it is determined that the project could be significant, there are a number of dispersion models that are available for site specific analysis. The District recommends the use of CALINE4 or CAL3QHC to estimate the potential for CO hot spots. These models are based on continuous line source emissions and therefore, can estimate roadway impacts. Both models are described in Section 9.7.

Unlike toxic land use compatibility issues, CO excesses can be mitigated to some extent by increasing traffic speeds through methods such as traffic light synchronization, improved intersection channelization, inclusion of left turn lanes, demand management strategies or through site design measures which can considerably reduce the impacts of proximate CO due to dispersion. Expansion of the roadway by adding additional lanes may not be a preferable mitigation measure because increased traffic volume may wipe out any reductions in CO gained from increasing speeds. If the analysis demonstrates that the sensitive receptor will be affected and the state 1-hour or 8-hour CO standards are exceeded, mitigation measures such as those given in Table 5-5 should be employed if the local government intends to approve the proposed project. However, the District does not recommend siting sensitive receptors on those portions of a project site where the state 1-hour or 8-hour CO standard could be violated.

5.4 Evaluating Projects for Odor Impacts

Because both the District and local government are receiving an increasing number of formal complaints about offensive odors, potential sources of odors need to be identified from the standpoints of both the emitter and of the downwind receptor. Preferably, this will be done while the project is still in its initial design phase. If potential odor issues can be identified and mitigated before construction, later problems with enforcement will be avoided.

Assessing odor impacts depends upon such variables as wind speed, wind direction, and the sensitivities of receptors to different odors. By contacting either the District's Office of Stationary Source Rules and Compliance or the jurisdiction's code enforcement department, a planner can learn if any complaints about odors have been filed by property owners/occupants in the general vicinity of the proposed project site and thereby determine if a sensitive receptor could be affected by odors. Additionally, if the proposed project is in close proximity to a use identified in Figure 5-5 or is one of these uses, then potential odor impacts should be addressed.

AR0072801

For sensitive receptors, mitigation measures are limited. In fact, in some instances the only mitigation available to sensitive receptors is to relocate upwind or further downwind from the source. The facility that is, or will be, producing the odor can also relocate equipment so that fumes can be emitted at locations to take the best advantage of wind patterns. Projects that may cause odors can also change stack heights and add additional control technology. In some cases, a project proponent for development of a sensitive receptor may be able to mitigate potential impacts by paying for mitigation at the source.

When odors are an issue, the air quality analysis should include a quantitative assessment of potential odors and meteorological conditions. A method of quantitatively assessing odors has been devised by the American Society of Testing Materials (ASTM, Standard Method D 1391), which considers how many times an air sample must be diluted with "clean" air before the odor is no longer detectable to an average adult with average odor sensitivity. The number of dilutions needed to reach this threshold level is referred to as a "dilution to threshold" (D/T) factor. An odor with a D/T of 2 (2 parts of fresh air to one part of odorous air) becomes faintly detectable to almost all receptors. At 5 D/T, people become consciously aware of the presence of an odor, and at 5 to 10 D/T, the odor is strong enough to evoke registered complaints. The standard to utilize in assessing off-site odor exposure is preferably below 5 D/T and acceptable below 10 D/T.

In addition, ASTM, standard method E679-79 can be used to analyze odors. This method relies on the sensory responses of a selected group of individuals called panelists. The threshold used in this method ranges from only detection that a very small amount of added substance is present but not necessarily recognized to recognition of the nature of the added substance.

Determining which properties will be subject to odors requires meteorological data, including a wind rose. A wind rose illustrates the different speeds and directions taken by the wind at different times during the day. With the information from the wind rose, measurements using the ASTM methods are to be taken from surrounding properties to assess the impact. Refer to Chapter 8 for information on developing meteorological information.

5.5 Site Plan Design and Building Design Mitigation Measures

All projects should integrate mitigation measures that facilitate trip reduction, reduce energy use, and reduce PM10 by modifying the following project factors:

- Site plan design
- Building design
- Land use/densities
- Landscape design

This Handbook provides a listing of mitigation measures that planners should make project proponents aware of before projects are designed. Ideally, these mitigation measures are discussed during an initial consultation between planners and the project proponents, as outlined in Chapter 4. Table 5-5 identifies the site plan/building design mitigation measures by type of land use. The District recommends that these mitigation measures be employed by all projects to the extent feasible and consistent with local land use policies.

The mitigation measures relating to site plan design and building design can be divided into four categories:

Support Facilities. Support facilities encourage modes of transportation other than the automobile, such as walking and bicycling. Support facilities include pedestrian pathways, showers and lockers for employees in office buildings, and bicycle racks.

Trip Reduction Through Land Use. Land uses, such as mixed uses, can reduce the number and/or length of vehicle trips by ensuring that supportive land uses are within walking distance of

AR0072802

one another. An example would be locating neighborhood retail services, such as food markets and a post office, within walking distance of a residential subdivision. In addition, increased densities in transit corridors (particularly within a quarter of a mile of a transit station, see Table 5-6 for distances) can support transit and carpooling levels.

Reduction in Vehicle Idling Through Design. Idling and slow-moving vehicles produce more emissions, particularly carbon monoxide (CO), than those that are moving more quickly. Enclosed parking facilities can also have high levels of carbon monoxide. Consideration should be given to vehicle speeds and idling when designing parking lots, egress/ingress areas, and drive-through facilities, such as fast-food restaurants.

Reduction in Energy Use. The amount of energy required to maintain a building depends upon such design factors as building orientation, window treatments, and type of indoor lighting. Through careful site planning, wise choice of building materials, and shade-producing landscaping, energy requirements are greatly reduced; this in turn places less demand on power-generating facilities.

Reduction in PM10. PM10 emissions can be reduced by requiring adequately maintained landscaping, inclusion of snow fences or trees as wind breaks in areas prone to dust storms, and ensuring all vehicle parking and maneuvering areas are paved.

In addition, the Local Government Commission (based in Sacramento) recently prepared a handbook, *Land Use Strategies for More Liveable Places*, that identifies site plan and building designs that are effective in mitigating air quality impacts.

DETERMINING THE AIR QUALITY SIGNIFICANCE OF A PROJECT

CHAPTER 6

Section 15002(g) of the state CEQA Guidelines defines a significant effect on the environment as "a substantial adverse change in the physical condition which exists in the area affected by the proposed project." Further, the project is considered to be of statewide, regional, or area-wide significance if it, for example, interferes with attaining the federal or state air quality standards (CEQA Guidelines Section 15206(b)(2)). To determine the significance of a project, CEQA requires the preparation of an Initial Study by the project proponent or lead agency. The Initial Study will evaluate the impact of the proposed project upon the environment, including air quality. From an air quality perspective, the impact of the project is determined by examining the types and levels of emissions generated by the project and its impact on factors that affect air quality. As such, projects should be evaluated in terms of air pollution thresholds established by the District. The thresholds of significance differ for the SCAB and the Coachella Valley. The scope of the evaluation and the extent of the required CEQA review will depend upon the estimated extent of the impact as determined by the lead agency in the Initial Study.

6.1 Preparing the Initial Study

To assist local planners and project proponents in answering the questions in the Initial Study, and thereby determining the air quality significance of a project, the key air quality issues to consider in each Initial Study category are summarized in Table 6-1.

Beyond the obvious primary impact of specific emissions arising from the operation and construction of a project, there is the potential for secondary effects. Secondary effects include such things as: impacts on the earth, water, population, transportation/circulation, energy/utilities, human health, and public services, that affect air quality indirectly. Among these secondary effects are, for example, high CO emissions from degradation in roadway level of service and NOx from power plants producing energy. All of those emissions contribute to air pollution, and need to be included in the project's emissions calculations. CEQA requires that in evaluating the significance of the environmental effect of a project, the lead agency shall consider both primary or direct and secondary or indirect consequences (CEQA Guidelines Section 15064 (d)). The impact of a project needs to be evaluated in terms of emisstion thresholds and other indicators of potential air quality impacts.

6.2 SCAB Air Pollution Thresholds for Operations

As seen above, new and modified projects will affect regional air quality both directly and indirectly. To determine the extent of a proposed project's environmental impact and the significance of such impact the project should be compared to established levels of significance. The District has established two types of air pollution thresholds to assist lead agencies in determining whether or not the operation phase of a project is significant. These can be found in the following sections under: 1) emission thresholds; and 2) additional indicators. If the lead agency finds that the operational phase of a project has the potential to exceed either of the air pollution thresholds, the project should be considered significant.

- **Emission Significance Thresholds (Primary Effects)**

The District has established these thresholds, in part, based on Section 182 (e) of the federal Clean Air Act which identifies ten tons a year of volatile organic gases as the significance level for stationary sources of emissions in extreme non-attainment areas for ozone. The South Coast Air Basin is the only extreme non-attainment area in the United States. This emission threshold has been converted to a pounds per day threshold for the operational phase of a project. The District staff also evaluated the thresholds established by other air quality management agencies in California and has taken into account the effect the thresholds would have on local governments' work load.

AR0072820

While Section 15064 (b) of CEQA Guidelines states that an ironclad definition of a significant effect is not possible because the significance of an activity may vary with the setting, the District believes that the setting as referred to in CEQA can be defined in this case. Under California state law (Health and Safety Code Section 40402), the South Coast Air Basin is defined as a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health. As such, the District believes that significance thresholds can be established based on scientific and factual data that is contained in the federal and state Clean Air Acts. Therefore, the District recommends that these thresholds be used by lead agencies in making a determination of significance. However, the final determination of whether or not a project is significant is within the purview of the lead agency pursuant to Section 15064 (b) of the CEQA Guidelines.

Both direct and indirect emissions should be included when determining whether the project exceeds these thresholds. The following significance thresholds for air quality have been established by the District for project operations:

55 pounds per day of ROC

55 pounds per day of NOx

550 pounds per day of CO

150 pounds per day of PM10

150 pounds per day of SOx

Ca. state 1-hour or 8-hour CO standard

Projects in the South Coast Air Basin (SCAB) with daily operation-related emissions that exceed any of the above emission thresholds should be considered to be significant.

Planners and project proponents may determine if a project is likely to be significant by screening the project using Table 6-2. The land uses listed therein are based on the mobile source emissions from projects that have the potential to exceed the emission thresholds. Table 6-2 does not cover all proposed projects or situations. If site-specific information is available, the MAAQI model or emission calculation procedures discussed in Chapter 9 of this Handbook can be used to estimate emissions totals to determine significance. Any emission reductions resulting from existing rules and ordinances should be calculated as the project's non-mitigated emissions and discussed in the project description.

In addition, level of service can be used as a screening method for determining when vehicle trips will impact a roadway, thus violating the state 1-hour or 8-hour standard, and creating a CO hotspot. Refer to Section 9.4.

- **Additional Indicators of Potential Air Quality Impacts (Secondary Effects)**

Additional indicators should be used as screening criteria indicating the need for further analysis with respect to air quality. Whenever possible, the project should be evaluated in a quantitative analysis; otherwise a qualitative analysis is appropriate. The additional indicators are as follows:

- Project could interfere with the attainment of the federal or state ambient air quality standards by either violating or contributing to an existing or projected air quality violation (refer to Chapter 12 and Appendix G, Significant Effects, State CEQA Guidelines);
- Project could result in population increases within the regional statistical area which would be in excess of that projected in the AQMP and in other than planned locations for the project's build-out year (refer to Chapter 12);
- Project could generate vehicle trips that cause a CO hot spot (refer to Section 9.4);

AR0072821

- Project will have the potential to create or be subjected to an objectionable odor over 10 dilution to thresholds (D/T) (refer to Chapter 5) that could impact sensitive receptors;
- Project will have hazardous materials on site (Table 10-4 and 10-5) and could result in an accidental release of air toxic emissions or acutely hazardous materials posing a threat to public health and safety (refer to Chapter 10);
- Project could emit an air toxic contaminant regulated by District rules or that is on a federal or state air toxic list (refer to Appendix 10);
- Projects could involve burning of hazardous, medical, or municipal waste as waste-to-energy facilities (refer to Chapters 10 and 13);
- Projects could be occupied by sensitive receptors within a quarter mile of an existing facility that emits air toxics identified in District Rule 1401 (New Source Review of carcinogenic air contaminants) or near CO hot spots (refer to Chapters 5 and 10);
- Project could emit carcinogenic or toxic air contaminants that individually or cumulatively exceed the maximum individual cancer risk of 10 in 1 million.

If the project has significant air quality impacts, an EIR should be prepared. If the impact of the project can be reduced below significant by the application of mitigation measures, then a Mitigated Negative Declaration (MND) can be prepared. The MND or EIR should quantify the level of emissions using the standards in this Handbook, and identify mitigation measures to lessen the project's impact to the greatest extent possible. The District recommends that all projects apply feasible mitigation measures to reduce individually and cumulatively significant air quality impacts to less than significant. Refer to Chapter 11 for an identification of mitigation measures, and the potential for emission reductions.

6.3 SEDAB (Under District Jurisdiction) Air Pollution Thresholds for Operations

The Coachella Valley and Antelope Valley, which are under the jurisdiction of the District, are in the SEDAB which has a distinctly different air pollution problem than the SCAB. The SEDAB is not classified as an extreme non-attainment area for ozone and therefore, the District has not changed the significance thresholds for the Coachella Valley and Antelope Valley from the 1987 version of this Handbook. In determining whether or not a project exceeds these thresholds, the project emissions should be calculated in the same manner as that for the SCAB (e.g. utilizing the highest daily emissions). These thresholds are as follows:

75 pounds per day of ROC

100 pounds per day of NOx

550 pounds per day of CO

150 pounds per day of PM10

150 pounds per day of SOx

Ca. state 1-hour and 8-hour CO standard

Projects in the Coachella Valley and Antelope Valley portion of the SEDAB with peak operation-related emissions that exceed any of the above emission thresholds should be considered significant.

AR0072822

As with the significance thresholds defined for the SCAB, planners and project proponents may determine if a project is significant by screening the project using Table 6-2 or the alternatives mentioned in Section 6.2. Level of service can also be used for determining a likely violation of the state 1-hour or 8-hour CO standard for the Coachella Valley and Antelope Valley.

The additional indicators of potential air quality impacts identified in Section 6.2 should also be used in determining if a project is significant in the Coachella Valley and Antelope Valley.

6.4 Construction Emission Thresholds for SCAB and Coachella Valley

Both the SCAB and SEDAB (that portion under the jurisdiction of the District) exceed the federal and state PM10 standards. The problem in these areas results from fugitive dust distributed during construction, from transport of disturbed dust on roadways by vehicles and wind. However, since a project's impact is limited to the construction phase, and level of mitigation, the procedure for determining significance is different than that for a project's operational impacts. When estimating a project's construction-related emissions, the emissions can be averaged over a 3-month period to include only actual working days.

The following significance thresholds for air quality have been established by the District on a quarterly basis:

2.5 tons per quarter of ROC

2.5 tons per quarter of NO_x

24.75 tons per quarter of CO

6.75 tons per quarter of PM10

6.75 tons per quarter of SO_x

However, if emissions on an individual day exceed 75 lbs a day for ROC, or 100 lbs a day for NOx, or 550 lbs a day for CO, or 150 lbs a day for PM10 , the project should be considered significant.

Projects in the SCAB or SEDAB with construction-related emissions in a quarterly period that exceed any of the emission thresholds should be considered to be significant.

Table 6-3 provides a screening table for determining when a project's construction emissions could exceed the threshold of significance.

6.5 Selecting the Appropriate Document

Upon completion of the Initial Study, the lead agency in consultation with responsible agencies determines the most appropriate type of environmental documentation, (i.e., a Negative Declaration (ND), a Mitigated Negative Declaration (MND), or an Environmental Impact Report (EIR)). Specific criteria for determining the appropriate environmental document with respect to air quality are described below. Table 6-4 provides a quick reference for planners to determine the appropriate environmental documents for particular types of land use projects.

- **Negative Declarations**

A Negative Declaration (ND) is prepared if the Initial Study identifies no significant environmental impacts from the project. Before the release of the ND for the project, the lead agency must determine that there is no substantial evidence that the project without mitigation may have a significant adverse effect on the environment. Article 6 of the State CEQA Guidelines contains the requirements for the ND process and the contents of an ND.

AR0072823

The District recommends that a ND be prepared for any project if it meets all of the below criteria:

(a) The construction or operation of the project will not exceed the emission thresholds of significance as established by the District.

(b) The project will not cause a CO hot spot.

(c) The project will not be occupied primarily by sensitive individuals within a quarter mile of any facility that emits air toxic contaminants which could result in a health risk for pollutants identified in District Rule 1401 or exposure to a CO hot spot.

(d) The project could not result in the accidental release of air toxic emissions or acutely hazardous materials, posing a threat to the public (Table 10-4 and 10-5).

(e) The project will not emit an air contaminant regulated by the District, or found on a federal or state air toxic list, and which causes a significant health risk (see section 6.2).

(f) The project does not involve the burning of municipal, hospital, or hazardous waste.

(g) The project will not violate any ambient air quality standard, contribute substantially to an existing or projected violation or expose sensitive receptors to substantial pollution concentrations (Refer to Appendix G, Significant Effects, State CEQA Guidelines).

(h) The project will not have a significant effect on the environment from a cumulative standpoint (Chapter 9).

- **Mitigated Negative Declarations**

Although the State CEQA Guidelines do not explicitly identify a document called a Mitigated Negative Declaration (MND), this term has come into use to refer to a specific type of environmental document. If an Initial Study is prepared for a project and significant adverse environmental impacts are identified, an MND may be prepared for that project if all potential impacts can be eliminated or mitigated to a level of insignificance. An MND is only appropriate for those projects that have been revised or modified by the application of mitigation measures that reduce the impact below the level of significance. Those mitigation measures then become part of the project description so that the project no longer has a significant impact and, therefore, may be addressed through a ND. The MND is subject to the same requirements as is an ND (see Article 6 of the state CEQA Guidelines).

In order to determine if all impacts are mitigated, all emissions associated with the project as well as the mitigation measures should be quantified through use of either the screening table (Table 6-2), the emission calculation procedures described in Chapter 9, or the MAAQI model. In order to determine the net air quality impact after mitigation is applied, mitigation measures efficiency may be derived by using the data in Tables 11-2, 11-3, 11-4, 11-6, and 11-7; the calculation procedures described in Chapter 11; or the MAAQI model. The District recommends that all projects employ all feasible mitigation measures to reduce individually and cumulatively significant air quality impacts caused by the project to less than significant. Refer to Chapter 11 for an identification of mitigation measures, and the potential for emission reductions.

Agencies certifying MND must take affirmative steps to determine that approved mitigation measures are implemented subsequent to project approval. Specifically, a mitigation monitoring and reporting plan must be prepared pursuant to Public Resources Code 21081.6 for any mitigation measures incorporated into the project or imposed as a condition of approval.

The District recommends that an MND be prepared for any project if it meets all of the following criteria:

(a) The construction or operation of the project may result in the threshold emissions being exceeded; however, quantifiable mitigation measures have been prescribed that reduce the emissions to below the significance thresholds.

AR0072824

(b) The project may cause a CO hot spot, however, quantifiable mitigation measures have been prescribed to prevent it.

(c) The project will not violate any ambient standard, contribute substantially to an existing or projected violation after mitigation or expose sensitive receptors to substantial pollutant concentrations. (Refer to Appendix G, Significant Effects, State CEQA Guidelines).

(d) The project could result in the accidental release of air toxic emissions or acutely hazardous materials, posing a threat to the public (Tables 10-4 and 10-5); however mitigation measures (e.g. safety engineering practices) have been prescribed that reduce the risk of a release to insignificance.

(e) The project could emit an air toxic contaminant that is regulated by the District, or is found on a federal or state air toxic list, and which causes a significant health risk (see Section 6.2); however, mitigation measures are employed which reduce the impact to insignificant.

(f) The project does not involve the burning of municipal, hospital, or hazardous waste.

(g) The project may have a significant effect on the environment from a cumulative standpoint (Chapter 9); however, mitigation measures have been prescribed that make the project's cumulative impacts insignificant.

- **Environmental Impact Reports**

If the Initial Study identifies potential significant adverse impacts from the project that cannot be mitigated below the significance thresholds, then the lead agency should prepare an Environmental Impact Report for the project rather than a Mitigated Negative Declaration. A lead agency may also elect to prepare an EIR if there is serious public controversy over the environmental effects of the project. (Refer to CEQA Guidelines Section 15064(h)(1).)

As with a Mitigated Negative Declaration, all potential impacts should be quantified using the emission calculations procedures described in Chapter 9 for mitigation measures quantified pursuant to Chapter 11.

The District recommends that an Environmental Impact Report be prepared for any project that can be characterized by any of the criteria listed below.

(a) The construction or operation of the project may result in the emission thresholds being exceeded even with application of all possible mitigation measures.

(b) The project will be occupied primarily by sensitive individuals within a quarter mile of a facility that emits an air toxic contaminant(s) which could result in a health risk for pollutants identified in District Rule 1401 or exposure to a CO hot spot.

(c) The project would create a a CO hot spot.

(d) The project could result in the accidental release of air toxic emissions or an acutely hazardous material (Tables 10-4 and 10-5) posing a threat to the public health and safety.

(e) The project will emit an air toxic contaminant that is regulated by the District, or found on a federal or state air toxic list, and which causes a significant health risk (see Section 6.2).

(f) The project involves the burning of municipal, or hospital, or hazardous waste.

(g) The project will violate any ambient air quality standard, contribute substantially to an existing or projected violation or expose sensitive receptors to substantial pollutant concentrations. (Refer to Appendix G, Significant Effects, State CEQA Guidelines.)

(h) The project may have a significant effect on the environment from a cumulative standpoint (Chapter 9).

AR0072825

CEQA requires that immediately after deciding an EIR is required for the project, the lead agency shall send to each responsible agency a Notice of Preparation (NOP). (Refer to CEQA Guidelines Section 15082.) The District will respond to NOPs and provide lead agencies with guidance in preparing the EIR.

6.6 Use of Another EIR for Air Quality Analysis

Prior to adopting the 1991 AQMP, the District prepared a comprehensive program EIR to evaluate any adverse environmental impacts that could be generated by implementing the control measures and strategies contained in the 1991 AQMP. A program EIR was prepared because the AQMP is composed of strategies related to the "issuance of rules, regulations, plans, or general criteria to govern the conduct of a continuing program." (Refer to CEQA Guidelines Section 15168(a)(3).)

The 1991 AQMP is a blueprint outlining the strategies identified for achieving clean air. Therefore, environmental impacts were analyzed in broad, general terms. The level of detailed analysis in the 1991 AQMP EIR is commensurate with the degree of specificity of the strategies contained therein. This degree of specificity is consistent with requirements in the CEQA Guidelines which recognize that the level of detail of an environmental analysis is directly related to the level of detail of the project.

The AQMP provides valuable information for the preparation of the air quality sections of EIRs, as well as information that can be extracted or referenced. The AQMP EIR provides an in-depth analysis of potential control measures. Using the AQMP EIR as a program EIR and tiering other environmental documents after the AQMP EIR is appropriate for programs or projects which implement AQMP control measures; this includes District rules, local government Air Quality Elements, and ordinances that implement control measures.

Although CEQA allows an EIR from a previous project to be used for a later project (refer to CEQA Guidelines Section 15153), this can only occur if "such projects are essentially the same in terms of environmental impact." Consequently, the 1991 AQMP EIR should not be used as the EIR for a specific land use project because the level of detail of the analysis between the AQMP and a land use project is substantially different. Furthermore, the 1991 AQMP EIR did not analyze impacts from specific land use projects, therefore, it is unlikely that impacts resulting from the 1991 AQMP are essentially the same as impacts generated by land use projects. The AQMP EIR is only appropriate for land use projects as a reference on regional air quality issues and source for pollutant baseline emission levels.

The program EIR or MND should identify impacts that are different than those identified at the regional level in the AQMP EIR, as well as any local impacts. The program EIR or MND should also include any appropriate mitigation measures identified in the AQMP EIR, and any additional mitigation measures necessary to mitigate local impacts that were not identified in the AQMP. (Refer to Table 6-4 for a list of mitigation measures identified in the AQMP EIR for local government implementation.) These EIRs or MNDs should also be sent to the District for review and comments.

Table 6-1. Preparing the Initial Study

Earth	Fugitive dust emissions from movement of soil Emissions from heavy duty diesel and gasoline-powered construction equipment Changes in topography that could affect wind patterns and cause emissions from the project to impact surrounding residential areas Alterations or expansions of landfills affecting public health as the result of moving toxic materials and contaminated soil Demolition of buildings containing asbestos Movement of contaminated soils
Air Quality	Emissions from construction (equipment and fugitive dust) or operation (vehicle trips and energy consumption) of the project will exceed the thresholds (refer to table 6-2 for land uses that could exceed the thresholds) Projects that could create or be subjected to objectionable odors
Water	Projects that involve the disposal of toxic or hazardous compounds into wastewater or groundwater that produces air emissions when the compounds are removed
Risk of Upset	Projects that are located on or near an active earthquake fault (Alquist-Priolo zone) and which could release acutely hazardous emissions due to an act of God or human error Projects using hazardous materials
Population	Projects resulting in population increases in excess of those projected in the Regional Growth Management Plan or projects locating population in areas other than those projected in the GMP, causing the region to fail to meet the federal and state air quality standards
Transportation/ Circulation	Emissions from vehicle trips (passenger vehicles and trucks) that are attached to or generated by the project (including transportation projects) Projects generating significant trips that could create a CO hot spot Emissions from ships, aircraft and locomotive engines
Energy/ Utilities	Projects demanding significant energy use, that produce emissions through the development of additional sources of energy Emissions from the development of power-generating facilities and waste-to-energy plans

(continued on next page)

Refer to Appendix B for methodologies and assumptions used in preparing this table.

NOTES:

* Trip generation rates from the 5th Edition ITE Manual were based upon small sample sizes.

These size construction projects have the potential to exceed the daily emissions significance thresholds. Local governments should use these thresholds as screening tools when a project proponent first approaches the lead agency for a permit, to determine whether or not the proposed project will be significant. Moreover, using these thresholds, a project proponent should be advised to include feasible mitigation measures at the project design level rather than in the later stages of the project.

DEFINITIONS:

"Manufacturing" means to make goods and articles by hand or by machinery, often on a large scale and with division of labor.

"Industry" means any large-scale business activity or manufacturing productive enterprises collectively, especially as distinguished from agriculture.

AR0072829

Table 6-2. Screening Table for Operation – Daily Thresholds of Potential Significance for Air Quality (continued)

PRIMARY LAND USE		POTENTIALLY SIGNIFICANT AIR QUALITY IMPACT
COMMERCIAL (continued)	*Special Activity Centers (Stadiums and Amusement Parks)	87 Employees
	Supermarket	12,500 sq. ft.

	Day Care Center	975,000 sq. ft. GFA
	Discount Store	975,000 sq. ft. GFA
	Fast Food	975,000 sq. ft. GFA
	Government Office Complex	559,000 sq. ft. GFA
	Hardware Store	975,000 sq. ft. GFA
	Hotel	745,000 sq. ft. GFA
	Medical Office	559,000 sq. ft. GFA
	Motel	745,000 sq. ft. GFA
	Movie Theatre	975,000 sq. ft. GFA
	Office	559,000 sq. ft. GFA
	Resort Hotel	745,000 sq. ft. GFA
	Restaurant	975,000 sq. ft. GFA
	Shopping Center	975,000 sq. ft. GFA
	Supermarket	975,000 sq. ft. GFA
INDUSTRIAL		1,102,520 sq. ft. GFA
UNPAVED ROADS	Passenger Vehicle	1,750 Vehicle Miles Traveled (1)
	Loaded Truck	430 Vehicle Miles Traveled (1)
PAVED ROADS	Local Road	24,000 Vehicle Miles Traveled (1)
	Construction Road	5,000 Vehicle Miles Traveled (1)
DEMOLITION		23,214,000 Cubic Feet of Building
GRADING		177.00 Acres

NOTES:

(1) VMT is a function of linear road length and average daily trips.

These size construction projects have the potential to exceed the quarterly emissions thresholds of significance. Local governments should use these thresholds as screening tools when a project proponent first approaches the lead agency for a permit, to determine whether or not the proposed project will be significant. Moreover, using these thresholds, a project proponent should be advised to include feasible mitigation measures at the project design level rather than in the later stages of the project.

For daily thresholds, divide thresholds by 65, not 91.

AR0072831

Table 6-4. 1991 AQMP EIR Mitigation Measures Identified for Local Government Implementation

Earth	Building/expanding transportation corridors, rail systems transmission lines, could affect topography or soils.	Use discretionary permit authority, place conditions on projects to control erosion, set landscape standards, etc.
Air Quality	Positive air quality impacts.	Implement indirect source control measures; recycling programs; promote energy efficiency for home appliances.
Water (Demand)	Increased demand for water as a fugitive dust suppressant during construction.	Use reclaimed water, non-toxic soil binders, pave dirt roads, etc.
Plant and Animal Life	Reduction in plant habitats and animal populations as a result of changes in land use designation or population relocations. (Primarily the result of factors other than AQMP.)	Establish project setting procedures to preserve sensitive habitat, protect animal populations, and preserve agricultural land.
Noise	Increased noise from construction of transit lines, freeways, etc.	Regulate hours of construction.
Light and Glare	Glare from solar panels for water heaters; increased density of industrial parks.	Establish building stands to screen panels and to minimize glare to adjoining residents.
Land Use	Shift in land uses; population relocation. (Primarily the result of factors other than the AQMP.)	Zoning changes; mixed land uses.
Natural Resources	Increased demand for natural resources, e.g. minerals, timber, etc., that will accompany infrastructure development and changes in land uses.	Establish recycling programs; promote conservation measures.
Population	Growth management and mode shifts resulting in population relocation.	Careful designation of transit routes; incorporate Regional Housing Needs Assessment into General Plan housing elements; use zoning and land use plans.

(continued on next page)

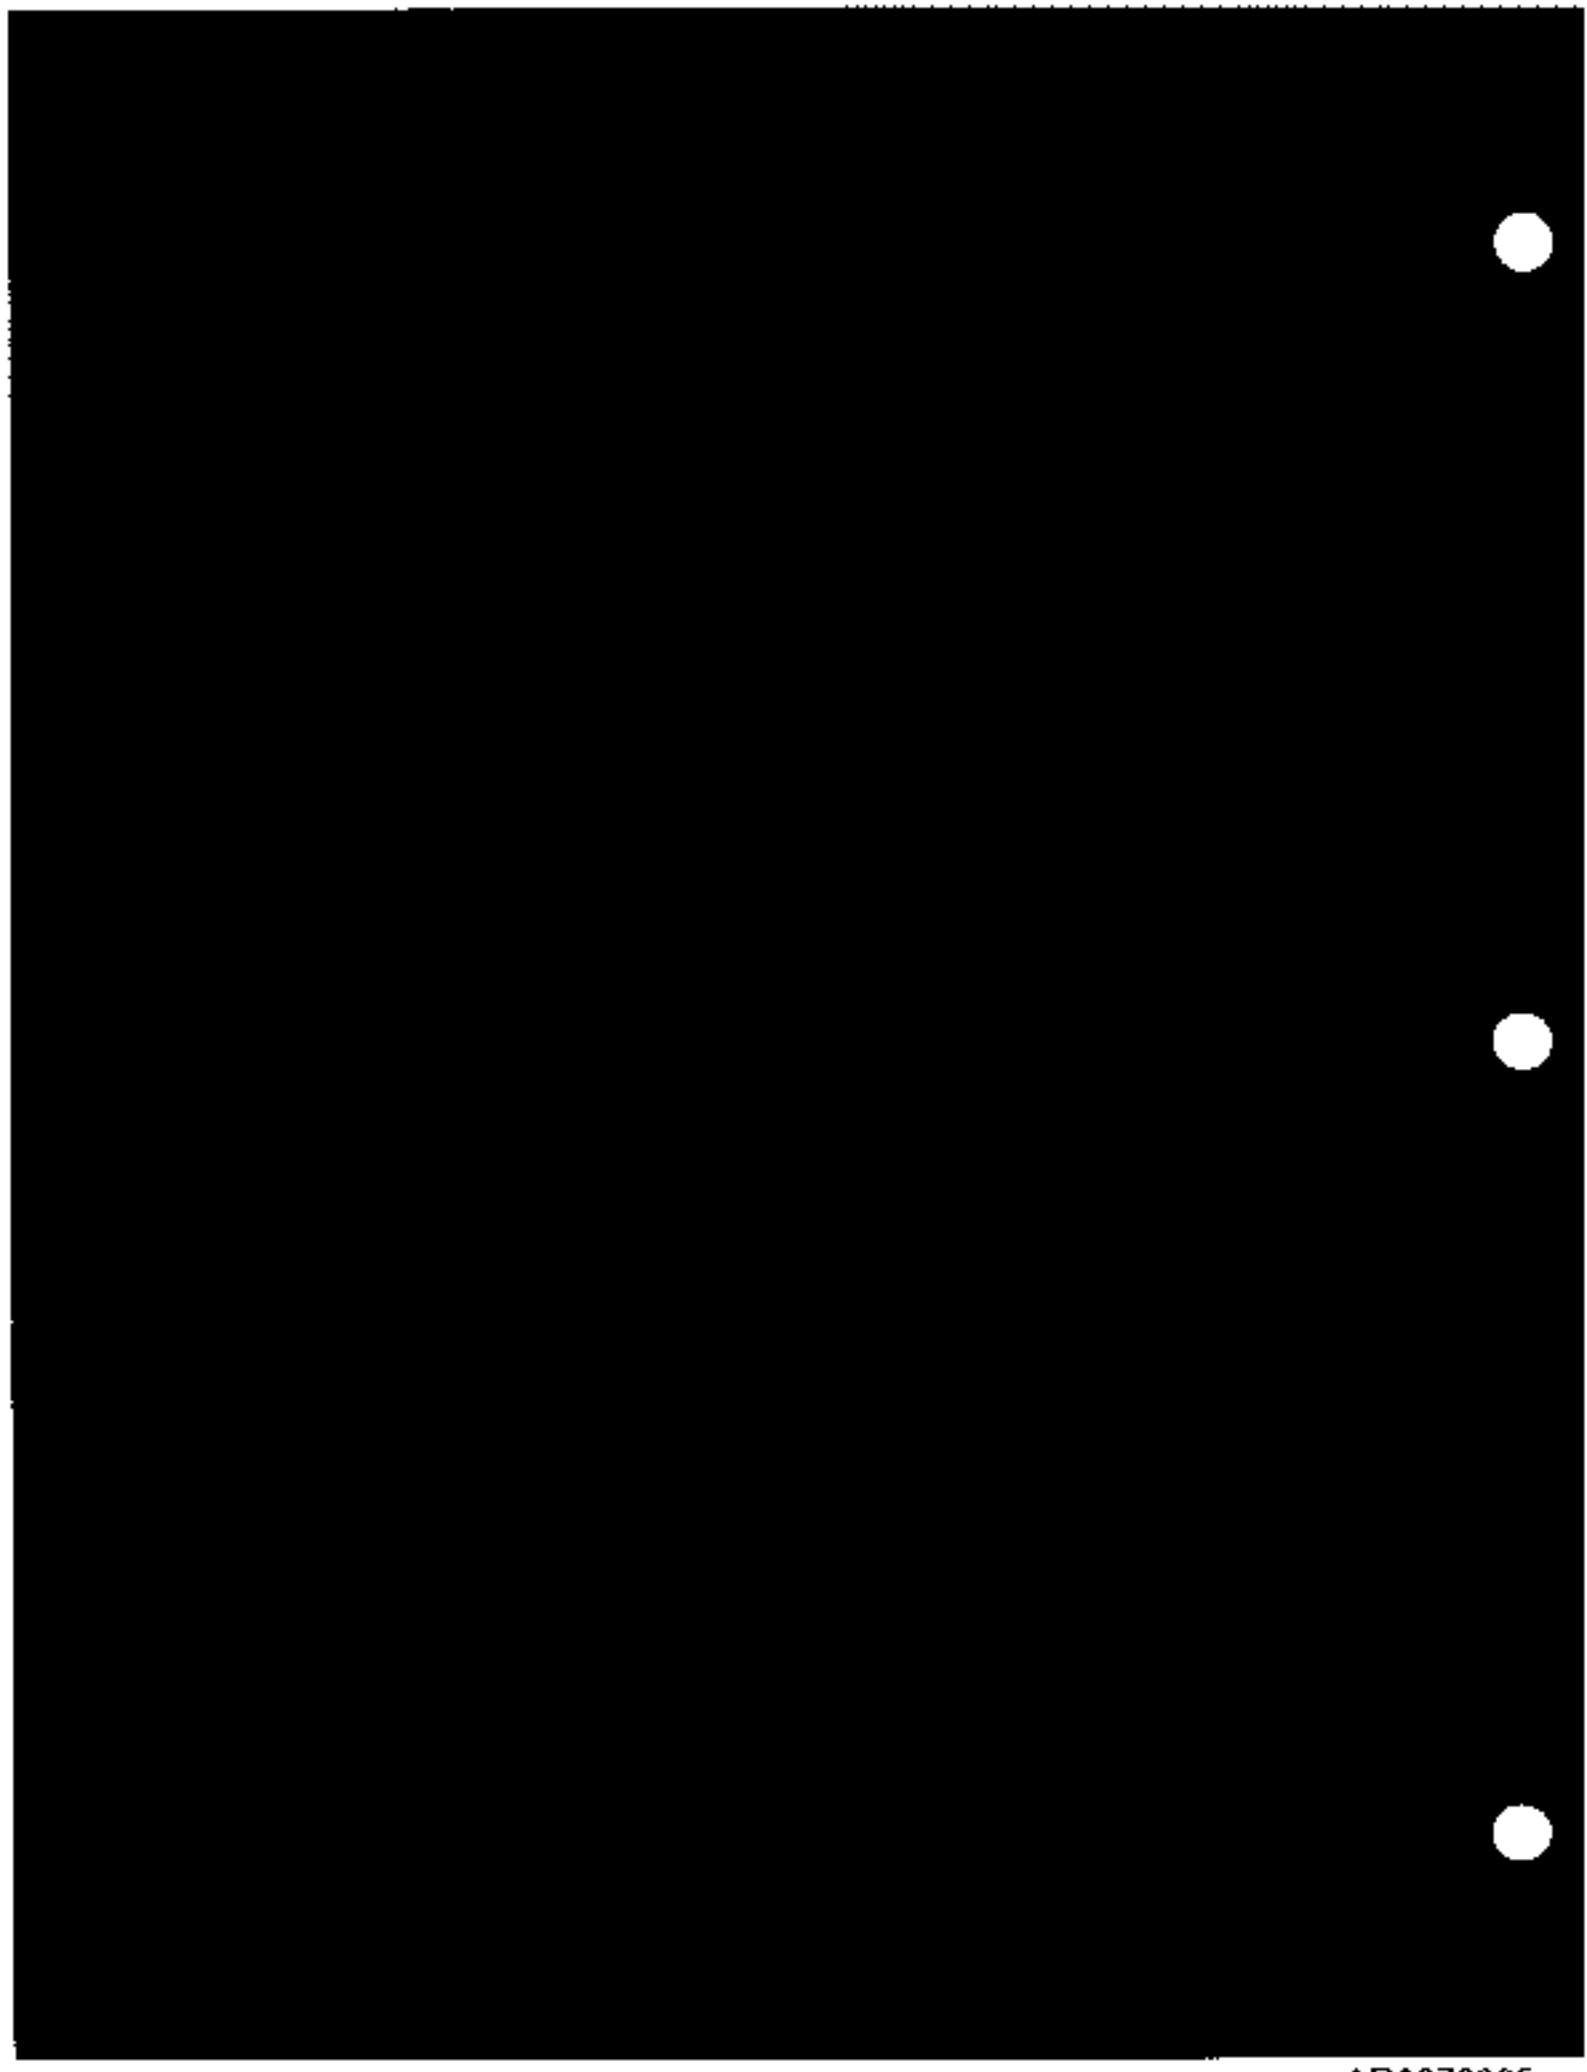
AR0072832

Table 4-4. 1991 AQMP EIR Mitigation Measures Identified for Local Government Implementation (continued)

Housing	Growth management policies may affect cost and distribution of housing.	Obtain VMT reduction through ISR measures; provide affordable housing through fee waivers or subsidies.
Transportation/ Circulation	Positive effect. Transportation congestion reduction.	VMT reductions through ISR measures; implement transportation management strategies; increase or expand urban transit systems.
Public Service Impacts	May require new and/or expanded services.	Work with the District to obtain technical and implementation support; secure new sources.
Energy	Shift away from petroleum-based liquid fuels to clean energy such as electricity or natural gas.	Improved standards for thermal integrity of building; high energy efficiency standards for major appliances and equipment; conservation programs; promote recycling.
Utilities-Solid Waste	AQMP has limited effect on solid waste disposal.	Promote recycling and waste minimization; establish conservation programs.
Aesthetics	Windbreaks to minimize fugitive dust could obstruct scenic vista; electrification of transit systems may produce visual impacts from overhead wires.	Establish architectural standards for windbreaks, e.g. height standards, use vegetation as windbreak; use underground electrical cables where possible.
Recreation	AQMP has limited effect, if any, on recreation resources.	Prepare/update local open space plans; establish development fees for new recreation facilities or maintain existing ones.
Cultural Resources	AQMP has limited effect, if any, on cultural resources.	Establish historical overlay zone status or equivalent for culturally significant sites.

AR0072833

[redacted]



COMPONENTS OF THE AIR QUALITY ANALYSIS FOR EIRs AND MNDs

CHAPTER 7

Any project that contributes emissions during construction or operation affects air quality. Therefore, the extent to which a project impacts air quality should be examined. If, during the preparation of an Initial Study, the impact of the project upon air quality is determined to be significant (see Chapter 6) and the emissions cannot be mitigated below the level of significance, then an EIR with an air quality analysis section should be prepared. The depth of the analysis will be in proportion to the level and significance of the emissions.

This chapter and Figure 1-3 (Chapter 1) are road maps to assist the planner in the preparation of the air quality analysis for an EIR or other CEQA documentation. Table 7-1 summarizes the steps for evaluating air quality impacts. At the end of this chapter is a comprehensive checklist (Table 7-2) that provides the basis for preparing the required components of the air quality analysis.

7.1 Baseline Air Quality Information

CEQA requires an EIR to include "a description of the environment in the vicinity of the project, as it exists before the commencement of the project, from both a local and regional perspective." (Refer to CEQA, Section 15125.) The background, or baseline air quality information, should include a discussion of the following points:

- Project setting and description
- Climate and meteorological conditions
- Existing regional and local air quality
- Existing sensitive receptors
- Existing toxics emission sources
- Extent of air basin affected, and applicable Plan (AQMP or PM10 Plan)
- Transportation system as it relates to air quality

The air quality analysis of each EIR and MND should provide a description of the existing regional and local environment. Such information is referred to as baseline information (see Appendix 3). Baseline information can consist of a summary of air quality and references to readily available documents which contain detailed information for regional analysis.

Baseline information for the local air quality analysis should include information obtained from the nearest or most appropriate District air quality monitoring station and any site-specific characteristics caused by such factors as congested roadways or existing facilities that emit toxics. Generally, the most appropriate air quality monitoring station is the one located within the same source receptor area as the proposed project (refer to Source Receptor Map, Figure 8-3). Section 8.1 contains specific information regarding selecting appropriate air quality monitoring data.

The baseline air quality data should be tailored to support the evaluation of the air quality impacts. For example, if odors are an issue, the baseline information should include a wind rose, which is necessary for evaluating air quality impacts on surrounding properties. All pertinent data should be included, or at least summarized, if the detailed baseline data necessary to corroborate the analysis are provided only through readily available reference documents.

Data should be concise. Detailed data unnecessary for assessing the impact should be omitted, so that the discussion of impacts can be readily identified by decision makers and the public. Chapter 8 provides more specific information on developing baseline air quality information.

AR0072836

7.2 Emission Sources: Construction and Operational

Emissions that can adversely affect air quality will originate from various activities. A project generates emissions both during the period of its construction and through ongoing daily operations. Emissions from both of these sources should be quantified in the EIR. In addition, the EIR should analyze the impact of emissions during each identified phase of project development and build-out year. As part of the impact analysis, emissions need to be compared to the thresholds of significance. The existing level of background emissions and local air quality need also be taken into account.

In the case of an MND, the analysis need not be as extensive as that prepared for an EIR. If the Initial Study identified emissions from construction and/or operation as a potentially significant effect, then the MND should quantify those sources of emissions and perform an analysis similar to an EIR.

Construction Emissions. The EIR and MND should identify all emissions associated with construction activities, including site preparation, construction of new facilities, or modification of an existing facility or site. Demolition, clearing, grading, excavating, using heavy equipment or trucks on unpaved surfaces and loading/unloading of trucks creates large quantities of fugitive dust, and thus PM10. Heavy equipment required for demolition, grading, and construction generates and emits exhaust emissions. The vehicles of commuting construction workers and trucks hauling equipment or materials (mobile source emissions) are another source of emissions which should be quantified. The emissions from electric power generators, architectural coatings, traffic impacts, and stationary construction equipment must be quantified. In addition, any asbestos removal should also be quantified. Procedures for calculating these various types of emissions are provided in Chapters 9 and Appendix 9. It is appropriate for an MND to utilize the screening tables in Chapter 9 as opposed to the detailed analysis recommended for an EIR.

Operational Emissions. After construction is completed, the project becomes operational. Operational emissions are produced by the occupancy of a facility or residential development and by both mobile and stationary sources connected therewith. Stationary emissions result from natural gas combustion and the use of electricity and equipment for manufacturing processes. Mobile emissions result from motor vehicles, airplanes, trains, ships, and construction equipment. A project may be an "indirect source" of mobile emissions by the nature of its operation; for example, vehicles operating within a project, such as warehouse forklifts or tour trains. However, the most significant indirect source emissions result from vehicles attracted to the project, such as shoppers visiting a mall or employees commuting to the work site. Procedures for calculating all of these emission sources are provided in Chapter 9 and Appendix 9. It is appropriate for a MND to utilize the screening tables in Chapter 9 if applicable as opposed to the detailed analysis recommended for an EIR.

If the District is a responsible agency and the stationary source has the potential to have significant environmental impacts, the calculation procedures in Appendix 13 should be utilized.

7.3 Analysis of Toxic Emissions and Risk of Upset

If a project may emit toxic emissions that could have an impact on sensitive receptors or risk of an on- or off-site upset or spillage, then a quantitative analysis should be performed using the guidelines provided in Chapter 10 and Appendix 10. In these cases, the District may be a responsible agency if a District permit is required. In order for the environmental document to be used for the permitting process, it must be found satisfactory by the District.

The District recommends that if a project is a sensitive receptor within a quarter mile of a source of toxic emissions, then a public health risk screening assessment should be performed as part of the environmental documentation. Refer to Chapters 5 and 10 for information on performing this type of analysis.

AR0072837

7.4 Cumulative Air Quality Impacts

While one insignificant project may not affect air quality, the cumulative effect of numerous smaller projects may. In order to reduce cumulative impacts, the District recommends that all projects should, to the greatest extent possible, employ feasible mitigation measures. CEQA requires that a proposed project be examined within the scope of the existing setting and that the examination take into account new and planned similar and nearby projects.

7.5 Project Alternatives

Analysis of Alternative Emissions. CEQA for EIRs requires that feasible alternatives are to be evaluated for environmental impacts. The analysis for the project alternatives does not need to be as extensive as those for the preferred alternative. Analyses may be developed for each alternative using either the MAAQI model or screening tables and default assumptions. The results should be presented in comparative tables. The comparative analysis more clearly defines the environmental implications and benefits of each proposal. In order to perform such an analysis, the air quality impacts of each alternative should be quantified, to the extent possible. (See section 9.6.)

Beneficial Air Quality Alternatives. The selection of feasible project alternatives should take air quality into account when it is identified as a key environmental issue by either the lead agency or the District. Varying degrees or densities of site development, and the corresponding emission differences, are often considered as project alternatives. Significant mitigation measures can at times be offered as project alternatives. An example is the inclusion of commercial or residential land uses within office complexes to reduce vehicular trips and emissions. Energy cogeneration is in some instances an alternative where introduction of an on-site emission source can result in an overall reduction of emissions (waste heat produced during electrical generation is used for heating and cooling near the power plant). Industrial projects should consider all feasible alternative processes and their resulting emissions. The analysis of beneficial air quality alternatives should be in addition to the "No Project" alternative. The procedures for calculating emissions are in Chapter 9 and Appendix 9.

7.6 Determining Significance with Emission Thresholds

The EIR and MND should compare total project emissions both before and after the application of mitigation measures to the existing regional and local air quality setting and the emission thresholds in Chapter 6. If the project is to be built out over a series of years, then the project emissions should be compared to the projected future baseline (without mitigation) for the years corresponding to project phasing and/or build-out year. In addition, Chapter 6 identifies other indicators of potential air quality impacts based on a project's secondary impacts. An analysis of the project should be performed for those indicators that relate to the project. These comparisons will provide the basis for a determination of significance. If it is determined that the project will have significant impacts on air quality, it is up to the lead agency to determine if the merits of the project outweigh the adverse environmental effects such that it chooses to approve the project. If such a project is approved by the lead agency, then the project should be mitigated to the greatest extent possible and a Statement of Overriding Considerations should be prepared.

7.7 Mitigation Measures

Mitigation is crucial to reducing a project's environmental impact. The question addressed in the analysis is not whether mitigation is necessary, but rather how much mitigation is required. Mitigation must be sufficient to reduce adverse impacts below the level of significance to the greatest extent possible.

AR0072838

A lead agency has the authority to require changes in any or all activities involved in the project to lessen or avoid significant impacts. A responsible agency, such as the District, can also require changes in that part of the project the responsible agency will be called on to carry out or approve. (Refer to CEQA Guidelines Section 15041.) Further, it is the policy of the State of California that agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects (PRC Section 21002). This Handbook identifies feasible mitigation measures that should be employed to reduce a project's impact on air quality.

Quantifying Effectiveness. The EIR and MND should quantify the extent to which mitigation measures can be effective and can reduce a given impact. Chapter 11 provides a menu of mitigation measures and their effectiveness in reducing emissions. Chapter 11 also includes calculation procedures for those cases in which site-specific quantification is desirable. It is appropriate for an MND to utilize the mitigation efficiency tables in Chapter 11 if applicable as opposed to the more detailed analysis recommended for EIRs. Projects should employ enough measures to reduce the impact to a level of insignificance.

In some cases, not all air quality impacts can be mitigated below a level of significance. In such cases, the District recommends that all feasible mitigation measures be applied to the project to reduce the impact to the greatest extent possible.

7.8 Consistency with Regional Plans

It is essential that the EIR analyze a project's consistency with regional plans that deal with large-scale environmental problems such as air quality as required by CEQA Guidelines Section 15125. The EIR should consider consistency of the project with all applicable plans, including:

- Air Quality Management Plan or Coachella Valley PM10 Plan
- Regional Growth Management Plan (population projections)
- Regional Mobility Plan (transportation projects)
- Locally adopted Congestion Management Plan (impacts on established levels of service and CO hot spots)
- Air Quality Element of the local General Plan (if adopted) or Air Quality Policies integrated into several General Plan Elements
- Any other plans that are applicable to the project

Refer to Chapter 12 for additional information on determining consistency/conformity of a project with the appropriate regional plans.

7.9 The District as a Responsible Agency

During the preparation of the Initial Study and throughout the preparation and approval of the EIR, CEQA requires that the lead agency consult with responsible agencies regarding the scope and content of the analysis in the EIR. The responsible agency should in turn review and comment on the notice of preparation of the EIR and the draft EIR, MND, or Negative Declaration (ND). If the responsible agency believes that the final EIR, MND, or ND is adequate for subsequent permit actions, the responsible agency may use that environmental documentation for its purposes. If the responsible agency does not believe the final document is adequate, CEQA requires a responsible agency to take one of four actions (CEQA Guidelines Section 15096(e)):

- Waive its objections.
- Prepare a subsequent EIR if permissible under CEQA Guidelines Section 15162.

AR0072839

- Assume the lead agency role if authorized pursuant to CEQA Guidelines Section 15052.

- Take the issue to court to seek a remedy.

Under CEQA, the District is a responsible agency for those portions of a project subject to a District permit. Chapters 13 and 14, and Appendix 13 provide a summary of the steps for coordinating with the responsible agency. Those same sections contain information on the additional emissions analysis the EIR should contain.

The thresholds of significance for District permits are identified in Chapter 13. Where District rules reduce project impacts below the level of significance, the analysis should concentrate on secondary impacts and their mitigation. Secondary impacts are those which result from the application of control technology. (Refer to Section 6.1.)

7.10 Findings

CEQA requires the decision-maker to balance the benefits of a proposed project against its unavoidable environmental impacts in determining whether to approve the project. If the lead agency determines that the benefits of the project outweigh the potential unavoidable adverse environmental impacts, the project may be approved (CEQA Guidelines Section 15093(a)). In these types of cases where the environmental impacts of the project identified in the EIR are not mitigated to a level of insignificance, the agency must state in writing specific reasons that support its action (Statement of Overriding Considerations). In approving such a project, the lead agency must make written findings, supported by substantial evidence in the record. Additionally, the lead agency may not make findings, if the agency making the findings has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives (CEQA Guidelines Section 15091).

One example of a case where a local government might consider approving a project with overriding considerations is the siting of high-density housing in a transit corridor which is likely to adversely impact the adjacent roadway system's level of service. In this case, the local government should consider orientation of the project to the roadway and other applicable mitigation to minimize impacts of CO on a sensitive receptor. If the project is still considered significant after application of the mitigation, then the local government should consider the benefit the project would have in supporting transit services in determining whether the benefits outweigh the environmental impact.

7.11 Mitigation Monitoring

As of January 1, 1989, lead agencies are required to prepare a mitigation monitoring plan to ensure implementation of mitigation measures in an EIR or Mitigated Negative Declaration. The Plan is to contain a list of all mitigation measures and to identify the agency responsible to ensure that the mitigation is carried out. In this way, proper follow-up is made, and all conditions applying to the project are fulfilled. Typically, a mitigation monitoring plan is completed after the draft EIR has been circulated for review and before the project is approved.

Mitigation Monitoring and the Need for District Review. The District requests that the draft portions of the mitigation monitoring plan pertaining to air quality be submitted for review. A copy of the response to comments, and a list of conditions of approval or other documentation indicating the mitigation measures included in the final approved EIR should also be forwarded to the District. It is recommended that these documents be submitted to the District within 60 days of approval of the project by the lead agency. All mitigation measures should identify the party responsible for implementation and monitoring. Refer to Chapter 15 for a detailed discussion on monitoring of air quality mitigation measures.

AR0072840

7.12 Program EIRs and EIRs for General Plans

Section 15168 of the CEQA Guidelines states that a program EIR can be prepared on a series of actions that can be characterized as one large project and are related either:

- o geographically;
- o as individual parts of contemplated actions;
- o in connection with the issuance of rules, regulations, plans, or other general criteria; or,
- o as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways.

At a programmatic level, the air quality assessment should be as comprehensive as possible. There are some cases, such as construction impacts of a General Plan, where specific information may not be available. A best-effort approach to disclose all reasonably available information should be used. If the program EIR was not sufficiently detailed so that all significant effects were evaluated, then such evaluation should be performed when subsequent activities involving site-specific operations are contemplated. Additional analysis is also necessary whenever the project could result in significant impacts not analyzed in or changed from the program EIR.

The environmental analysis for a General Plan EIR provides an opportunity for a more exhaustive consideration of effects and alternatives than would be practical for an EIR on a more specific action. Additionally, the program EIR for a General Plan can ensure consideration of cumulative impacts that might be slighted when development projects are considered on a case-by-case basis. A program EIR also allows the lead agency to consider broad policy alternatives and program-wide mitigation measures at an early time when the agency has greatest flexibility to deal with basic problems or cumulative impacts.

Inclusion of air-quality-related goals, policies, and programs may act as mitigation for the overall General Plan build-out scenario, provided that specific objectives and actions are included and implemented within the time frame specified in the General Plan.

7.13 EIR Format Issues

During the preparation of an EIR, many questions regarding the preparation of the air quality analysis arise. Among the most prevalent are:

- o What level of detail is necessary in the analysis?
- o How must assumptions be documented?
- o What format should be used for reporting emissions information?

The air quality analysis should contain sufficient detail to support the conclusions reached in the analysis. If background information pertaining to the analysis is readily available in separate documents, reference to those documents is adequate. The EIR should document all assumptions for quantifying emissions (or other impacts) and mitigation measures. To document assumptions and as a format for reporting emissions, the calculation tables in Appendix 9 may be used. At the option of the preparer these tables may be inserted into the air quality section or placed in a technical appendix to the EIR. All impacts and mitigation measures related to the project should also be summarized as part of the conclusion to the air quality sections.

A practical format for documenting the project's impact is a tabular listing of estimated project emissions, effectiveness of mitigation measures, and net total project impact for the proposed project and each alternative analyzed in the EIR. Concisely summarizing the conclusions of the air quality analysis will permit decision makers to base their decisions on the final results of all calculations and analysis.

AR0072841

Table 7-1. Steps for Evaluating Air Quality Impacts

STEPS	EIR	MND
1. **Baseline information:** Describe existing regional climate and air quality and cite specific ambient air quality from the District monitoring station located in project source receptor area.		
2. Identify and quantify all project **emission sources** (construction and operational).		
3. Identify and assess **toxic source emissions** and risk of upset if applicable.		
4. Assess **cumulative air quality impacts** from potentially related projects.		
5. Identify and quantify **project alternatives** that may attain the goals of the project with substantially fewer or less significant impacts.		
6. Compare anticipated project emissions with **thresholds of significance** and existing regional and site-specific air quality.		
7. Identify **mitigation measures** necessary to substantially reduce air quality impacts.		
8. Assess **consistency** of project with the AQMP.		
9. Integrate air quality analysis requirements for those projects where the District is a **responsible agency.**		
10. Make findings.		
11. Develop a **mitigation monitoring plan.**		

The MND can use screening tables to quantify emissions and mitigation measures, and may not need the same level of detail as an EIR.

AR0072842

Table 7-2. Checklist for an Air Quality Analysis Section

[illegible]	Key Questions and Issues	Ref.*	Page No.	Page No.
1. Baseline Air Quality Information (Chapter 8 and Appendix 8)				
Project Setting and Description	Has the local setting surrounding the project been identified, including any unique geographic elements? Has the total project area, square footage, and use of building been identified?	8.1		
Regional Climate and Meteorological Conditions	Has either a description or reference to regional climate and meteorological data been included? In cases where odors or toxics are an issue, have wind direction and speed been identified?	8.1 5.4 5.2 12.4		
Existing Climate and Local Air Quality	Have the most current data (i.e., background concentrations and numbers of days that exceed federal and state standards) from the nearest District monitoring station in the same source receptor areas as the project been identified?	8.1 A3		
Sensitive Receptors	Are there toxic emitters within 1/4 mile of a sensitive receptor?	5.2		
Air Basin & AQMP	Is the project located in the SCAB or Coachella Valley?	2.2 F2-1		
Transportation System	Have the segments and existing LOS of the transportation system on which the project will generate trips been identified? Will the project generate trips on CMP system? How does the project relate to existing and planned transit network? How does the project relate to regional HOV network?	9.1 4.6		
2. Project-Related Emissions (Chapter 9 and Appendix 9)				
A. Determine Construction-Related Emissions	Have all construction-related emissions been identified and quantified?	9.1		
Grading	Have the amount of soil and number of acres to be disturbed and number of days required for grading been identified? Will grading take place during the windy season for that area?	A9-9		
Demolition	Will any buildings containing asbestos be demolished?	A9-10		
Excavation	Has the amount of soil (cubic feet) to be excavated been identified?	A9-9

Determine Construction-Related Emissions (continued)				
Heavy Duty Equipment	Have the number and type (weight and wheels) of heavy-duty equipment and trucks on unpaved roads that are expected to operate on site been identified and PM10 emissions quantified?	9.3 AP		
Off-Road Mobile Source Emissions (construction equipment)	Have the number and type (i.e., fuel) of construction equipment been identified and tailpipe emissions quantified?	9.1		
On-Road Mobile Source Emissions (including work trips by construction employees, non-work trips to lunch, etc., and truck trips)	Are all construction-related trips (i.e., hauling, deliveries of materials, trips, and non-work trips) quantified?	9.1		
Power Usage	Has total power usage (i.e., electrical generation, natural gas consumption) been estimated?	9.2		
B. Determine Operation-Related Emissions	Have all operation-related emissions been quantified?	5.2		
Stationary Area Sources (incl. water heaters, energy generators)	Have emissions from area sources (pool heaters, water heaters, boilers) been identified and quantified?	9.2		
Stationary Point Sources (incl. those subject to District permits)	Have emissions from point sources (smoke stacks, paint booths, etc.) been identified and quantified?	9.2

		Ref*		
Determine Operation-Related Emissions (continued)				
On-Road Mobile Source Emissions (including work, non-work, truck trips, etc.)	Have the number and length for all trip types (i.e., work, non-work, truck) been identified for each land use?	9.2		
Off-Road Mobile Source Emissions (including ships, trains, etc.)	Will the project generate any emissions from sources such as ships, trains, airplanes, or ancillary operations? If so, have the emissions been quantified?	9.2		
Fugitive Dust (including mining operations, unpaved roads, etc.)	Will the project generate any fugitive dust emissions from mining or unpaved roads? If so, have the emissions been quantified?	9.2		
3. Toxic Emissions and Risk of Upset (Chapter 10 and Appendix 10)				
Sensitive Receptors	Has analysis been prepared to determine the risk of siting a sensitive receptor within 1/4 mile of a toxic source?	5.2		
Effects on Future Land Use	Has an analysis been included describing the implications of siting a sensitive receptor on land near future businesses handling toxic sources or vice versa?	5.2		
Risk of Facilities Emitting Toxics to Population of Jurisdiction	If the project is a toxic source, has the general risk to the population been identified? If risk of upset is an issue, either due to the nature of the toxic or due to proximity to an earthquake fault (Alquist-Priolo zones), has an analysis been included?	10.2 10.4 10.5		
4. Cumulative Air Quality Impacts (Chapter 9)				
Related Projects (under construction, or proposed future projects)	Have emissions from related projects (i.e., recently permitted, similar type, size, or next phase) either under construction or proposed, been identified?	9.5		

(continued on next page)

Comments	Item	Ref.*	Page of EIR No.
Cumulative Air Quality Impacts (Chapter 9) (continued)			
Analysis Consistent with CEQA Section 15130	Has the following information been provided? • A list of all past, present and reasonably anticipated future projects; • A summary of expected environmental effects; • A reasonable analysis of relevant projects including mitigation.	9.5	
Optional Cumulative Impact Analysis	Does the documentation provide: • An analysis comparing the project with mitigation to determine if emissions will be reduced by 1% per year or 18% to the year 2010? • An analysis comparing the project with mitigation to determine if it will achieve a 1.5 AVR (or AVO for transportation projects)? • An analysis comparing the project with mitigation to determine if it will reduce the rate of growth in VMT and trips?	9.5	
5. Project Alternatives (Chapter 9)			
Quantify Air Quality Impacts of Alternatives	Have the air quality impacts of the alternatives been determined utilizing the Handbook's emission calculation procedures?	9.6	
Select Alternatives to Reduce Air Quality Impacts When Such is a Key Issue	If air quality is a key environmental issue, have alternatives been selected that reduce air quality impacts?	9.6	
6. Analyzing Other Indicators of Potential Air Quality Impacts			
Compare Project to Secondary Effects	Has the project been compared to the secondary effects to determine whether the project will need further analysis?	6.2	

(continued on next page)

DEVELOPING EIR BASELINE INFORMATION

CHAPTER 8

When an environmental document is required, the preparer should begin to develop the baseline, or background information necessary for the environmental setting and the air quality assessment. Baseline information for the environmental setting should identify and describe the following:

- Project description
- Project setting
- Regional and local climate and meteorological conditions
- Existing air quality at the site-specific location of the project, including anticipated toxic emissions
- Sensitive receptors
- Identification of the appropriate air basin and air quality management plan (AQMP or PM10 Plan)
- Regional and local transportation system supporting the project

8.1 Background Air Quality Information

Prior to determining the air quality impacts of a proposed project, it is necessary to prepare a detailed description of the existing regional climate and site-specific air quality conditions. This will establish a basis for comparing the project's subsequent air quality impacts with the existing air quality setting.

Project Description. To the extent that the information is available, the description of the project should be specific as to total project area, square footage, and use of buildings and structures. The amount of development projected for each phase, approximate completion date for each phase, and build-out should also be defined. In addition, the project description should include a listing and expected emission reductions from District-required permits, as well as any existing local government ordinances that will result in quantifiable emission reductions.

Project Setting. The EIR should contain a description of the local setting surrounding the project, including identification of any unique geographic elements. The project setting description should identify any elements that may cause or generate air pollutant emissions (such as working construction equipment or the number of acres disturbed). The transportation system which will support the project and existing levels of service (LOS) should also be identified in the EIR. Figure 8-1 explains the LOS categories for freeways. In addition, any earthquake faults (i.e., Alquist/Priola zones) that could result in a threatened release of air toxics should be identified.

Regional Climate. Detailed descriptions of the regional climate are contained in Appendix 8. To streamline the environmental document, a summary of the information contained in Appendix 8 may be used to satisfy the regional climate description. The EIR may also incorporate Appendix 8 in full by reference. A wind rose, illustrated in Figure 8-2, should be provided if toxic emissions or odors are issues. The District maintains a historical archive of wind roses. This information is available upon written request to the District's Meteorological Section at the District's Diamond Bar Headquarters. Identify in the correspondence that this information is for an environmental analysis and it will be given priority.

Existing Air Quality. To characterize the site-specific air quality setting, the environmental document should contain a summary of the most current air quality data. The data must be derived from the nearest District monitoring station located in the same source/receptor area(s) (SRA) as the project (see map in Figure 8-3). Some stations do not monitor all pollutants. In that instance, information on the remaining pollutants should be drawn from the nearest upwind station which monitors the pollutants. Air quality data are prepared for each District air monitoring station in table format (see

AR0072852

Appendix 3). These tables are updated annually, generally in March of each year. Monitoring station data should be used to provide background concentration levels of criteria pollutants and the number of days in which the criteria pollutants exceeded state and federal standards. For trend information, refer to Appendix II-B of the 1991 AQMP dated July 1991.

For projects located in more than one SRA, use the SRA most representative of the on-site conditions; or for transportation projects, analyze the project links in each SRA. In some unique cases, the air quality monitoring station within the SRA may not be representative of project site characteristics. Project proponents may contact the District for a recommendation which monitoring stations would be most characteristic of the project site.

As an alternative, a project proponent may perform on-site monitoring based on approved methodologies and monitoring procedures. Contact the District's Air Quality Monitoring Section for assistance in developing an adequate background concentration.

Information on existing air quality is also needed to perform air quality modeling analyses required for environmental documents or for District permit applications. If the project is expected to generate toxic air contaminants, the lead agency should contact the District to obtain information on the specific toxic air contaminant of concern for use in future land use decision-making.

Sensitive Receptors. Special attention should be given to the effect of CO, toxic, and odor emissions on sensitive receptors including:

- Residences
- Schools (children)
- Playgrounds
- Child care centers
- Convalescent homes (senior citizens)
- Retirement homes
- Rehabilitation centers
- Athletic facilities (athletes)

When evaluating air quality impacts on sensitive receptors, planners should use the background data described in this chapter to:

(1) Map the source of elevated CO, toxic, or odor emissions in relation to existing sensitive receptor areas.

(2) Identify wind patterns, direction, and speed using nearby wind rose information.

Air Quality Management Plan. The federal and state Clean Air Acts require that non-attainment basins that do not meet federal or state clean air standards must prepare a plan for bringing the area into compliance. The 1991 AQMP is the appropriate plan for that portion of the SEDAB under District jurisdiction. Refer to Figure 2-1 in Chapter 2 to determine in which air basin the project is located.

Transportation System. The regional and local transportation system that will serve the project should be identified. In particular, the EIR should identify existing and proposed transportation infrastructure (i.e., freeways, major arteries, rail and bus transit, etc.), that could in any way be used by vehicle traffic generated by or attracted to the project. SCAG's Regional Mobility Plan should be consulted to determine location and mode of future transportation systems. Any significant roadways that serve the project should be identified, along with their levels of service (LOS). The general information on determining LOS for freeways is provided in Figure 8-1. The county transportation commission, Caltrans, and local governments should also be consulted when determining LOS for freeways and

AR0072853

other roadways. The Congestion Management Plan (CMP) identifies LOS for roads on the regional network. Local public works or traffic engineering offices should have information available on the LOS for local streets. See screening Tables 5-2 and 5-4 to determine if the state one-hour CO standard may be exceeded locally. In addition, some CMPs include methods for determining LOS. The CMP of each county should be consulted to determine which roadways are part of the CMP transportation system.

AR0072854

Figure 8-1. LOS Categories for Freeways

A	Highest quality of service. Free traffic flow, low volumes and densities. Little or no restriction on maneuverability or speed.	55+	None	Good
B	Stable traffic flow, speed becoming slightly restricted. Low restrictions on maneuverability.	50	None	Good
C	Stable traffic flow, but less freedom to select speed, change lanes, or pass. Density increasing.	45	Minimal	Adequate
D	Approaching unstable flow. Speeds tolerable but subject to sudden and considerable variation. Less maneuverability and driver comfort.	40	Minimal	Adequate
E	Unstable traffic flow with rapidly fluctuating speeds and flow rates. Short headways, low maneuverability and low driver comfort.	35	Significant	Poor
F	Forced traffic flow. Speed and flow may drop to zero with high densities.	<25	Considerable	Poor

CHAPTER 9

This chapter outlines District-recommended procedures for calculating emissions that may be generated during project construction and operation. Drafting an EIR or preparing a Negative Declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can (CEQA Guidelines Section 15144). The District recognizes that in all cases the information necessary for estimating emissions may not be available. However, in preparing the emission calculations, the lead agency should take a best-effort approach. If quantification is not possible, then a qualitative evaluation of project emissions may be acceptable to identify probable or likely emissions from construction and operational sources.

The air quality impact of the project is determined by estimating the total emissions from the construction and operation of the project. Emissions estimates are also necessary for assessing cumulative impacts and for evaluating the air quality impact of the project alternatives.

This chapter identifies the data needed to calculate the emissions estimates, describes the various methods of calculating estimates, and advises on the calculation method appropriate for each type of environmental document. If other methodologies and/or data are used, the source should be documented so that all parties can reasonably evaluate and determine the adequacy of the procedures and data used in assessing air quality impacts.

9.1 Construction Emissions

Emissions are a cause for concern beginning with the very first phase of project development. The first phase may include site preparation, construction of new facilities, modification of an existing facility or site, as well as demolition, renovation, and asbestos removal. These construction activities are responsible for the emissions of ROC and NOx produced by vehicular traffic, asbestos emissions associated with demolition work, and PM10 in the form of fugitive dust raised by earth-moving equipment.

Emissions from construction, renovation, and demolition may be estimated by one of two methods: (1) screening tables, or (2) using the methodology and emission factors shown in Appendix 9. The screening table is appropriate for estimating emissions for a Negative Declaration (ND) and Mitigated Negative Declaration (MND), but should not be used for preparing an EIR. The emissions estimates in screening Tables 9-1 (total construction emissions) and 9-2 (PM10) are based on regional averages. To further break down construction emission sources, Tables 9-3 and 9-4 call out emission factors for construction workers' travel and materials handling, which are a subset of total construction emissions. This information will be useful when quantifying the effectiveness of mitigation measures, as discussed in Chapter 11. To estimate emissions with these tables:

(1) Estimate daily emissions for each source category (i.e., on-road, off-road, and PM10) separately. (Mitigation efficiencies are subtracted from the applicable source categories.)

(2) For each source category, determine the total area for each activity (in units specified in the screening tables).

(3) Multiply those totals by the emissions estimates provided in the screening tables.

(4) Add the emissions from each category to determine total construction impacts.

Other sources of emissions should be identified as appropriate for the project using the information in Appendix 9 and added to the final total of unmitigated project emissions. An example of how to account for emissions by pollutant and source category is provided in Table 9-5.

AR0072860

Figure 9-1 illustrates the process used to identify a project's unmitigated emissions using the screening tables. As is shown in the shaded portion of the figure, once a project's unmitigated emissions have been calculated, quantified mitigation measures can be applied to reduce the potential air quality impact. This process is described in Chapter 11. Step-by-step instructions for using the screening tables to determine unmitigated emissions are described in Table 9-6. These instructions correspond with the unshaded portion of Figure 9-1.

Emissions estimates for an EIR should be made following the methods and emission factors provided in Appendix 9 of this Handbook. All sources of emissions should be identified (*refer* to Figure 9-2) and reasonably foreseeable significant environmental consequences considered for all emissions forecasting. Emissions estimates should be developed for each phase of development where construction, renovation, and/or demolition will occur. The emissions estimates can be averaged over a 3-month period (for actual working days) when determining tons per quarter. Those estimates should then be reported for each applicable pollutant in pounds per quarter for each year of construction. Where construction is scheduled to occur over several years, emissions estimates should be provided for the base year (initial year of construction), each development phase, and build-out. Any emission reductions resulting from existing rules or ordinances should be calculated as part of the project's non-mitigated emissions and included as part of the project description.

Sources of construction-related emissions, data needs, and emissions factors are discussed below. The emission calculation methodology, emission factors, and assumptions are provided in Appendix 9. The Appendix also provides worksheets for estimating emissions and emissions summary sheets.

In order to estimate emissions, specific information about construction activity is needed. When specific information is not available such as in long range planning documents, reasonable estimates based on past experience may be used. All of the basic assumptions for some of the other factors have also been formulated for this purpose and are provided in Appendix 9. All of the basic assumptions used to estimate construction emissions should be documented in the EIR. Prior to the issuance of a building permit or grading permit, the assumptions used in the EIR should be compared to the construction plan. If the comparison shows that emissions will be greater, additional environmental analysis may be necessary.

Emissions From Construction Equipment. Fugitive dust is generated not only by moving the earth, but by the heavy equipment that does the moving. The exhaust fumes of this equipment are a direct source of PM10, NOx, and ROC. To estimate emissions from heavy-duty construction equipment, the following should be considered:

- Emission factors for each piece of equipment
- Types and number of pieces of each kind of equipment
- Volume of material to be moved
- Number of hours of operation per average day
- Number of days of operation in a 3-month period
- Duration of each activity for each phase of the project

This information can be calculated using the tables provided in Appendix 9.

PM10 and Asbestos. When fugitive dust enters the atmosphere, the larger particles of dust quickly fall to the ground. The smaller particles, however, may remain suspended for long periods and are referred to as total suspended particulates (TSP). Within TSP are those dust particles that are less than ten microns in diameter and which are referred to as PM10. Because PM10 is respirable and can seriously damage the lungs, fugitive dust is a matter of concern. Therefore, sources of fugitive dust which can generate PM10 need to be quantified by identifying the amount of soil that will be disturbed by the following activities:

AR0072861

- Grading
- Excavation
- Demolition
- Heavy-duty equipment on unpaved roads
- Loading and unloading trucks of sand, dirt, etc.

The EPA has developed various emission factors which are provided in Appendix 9 for estimating PM10 emissions. When using these factors to estimate emissions, the following data are needed:

- **Grading and Excavation**
  - Amount of soil to be disturbed
  - Emissions factors for disturbed soil (26.4 pounds of PM10 per day per acre)
  - Duration of grading or excavation
  - Number of days of grading in a 3-month period
- **Demolition**
  - Cubic feet of buildings
  - Emission factors for demolition (.00042 per cubic foot)
  - Duration of demolition in a 3-month period
- **Heavy-Duty Equipment on Unpaved Roads**
  - Length of the road
  - Type of soil
  - Type and number of pieces of equipment
  - Average weight and number of wheels on the trucks
  - Duration of activity in a 3-month period
- **Loading/Unloading Trucks**
  - Volume of material
  - Approximate number of truck loads during a 3-month period
  - Type of material
  - Vehicle speed

In addition, any demolition or renovation work involving asbestos-containing material must be identified. An estimate of potential asbestos emissions should be determined using the procedures in Appendix 9. District Rule 1403 (Asbestos Emissions From Demolition/Renovation Activities) should be identified as a required permit in the EIR. (Compliance with Rule 1403 is considered to mitigate the emissions to a level of insignificance).

AR0072862

Energy Use. Temporary power is often utilized at the construction site to operate equipment. Power usage from temporary generators, natural gas hookups, existing power sources, and other sources should all be identified for the EIR. Such calculations should be based on the following factors:

- Type of power source
- Fuel used if power is provided by a generator
- Duration of power usage
- Estimated power demand over a 3-month period

Architectural Coatings. Architectural coatings applied to a building either during or just after construction are a source of emissions that need to be quantified. In some cases specific information on architectural coatings may not be available, and a good faith effort based on generalized factors would be appropriate. Examples of architectural coatings include painting the exterior walls, or coatings applied to windows and window casings at the construction site. To estimate these emissions, the following should be considered:

- Total area to be covered by the architectural coating
- Estimated amount of material (architectural coating) needed to cover the area
- ROC (reactive organic compounds) emitted by the coating material

Vehicle Trips. Construction and development activities also contribute to mobile emissions generated by commute trips to and from the site, non-work trips associated with lunch or other errands, and trucks hauling soil or construction materials. To quantify these emissions, the following should be considered:

- Number of employee-related work trips and non-work trips and average vehicle miles traveled (VMT), for each type of trip
- Estimated total vehicle emissions based on number of trips, average speed (lowest speeds should be used for assessing CO and higher speeds for NOx and ROC), and VMT (use worksheets in Appendix 9)
- Number of construction trucks in fleet, number of trips, and VMT averaged over a 3-month period
- Estimated total vehicle emissions based on number of trips, average speed (lowest speeds should be used for assessing CO and higher speeds for NOx and ROC), and VMT (use worksheets in Appendix 9)
- Estimated total mobile heavy-duty (gasoline- or diesel-powered) truck emissions based on number of trips, average speed, and VMT (use worksheet, Appendix 9)
- Calculated emissions from the above sources using the most recent ARB emission factors.

In some cases, construction vehicle trips are difficult to accurately quantify at the time environmental documents are prepared. In all cases, a good faith effort should be made to quantify emissions from these sources to the degree practicable.

Traffic Impacts. Other construction impacts include potential construction-related traffic impacts. Such impacts are caused by congestion and the resulting reduction in level of service (LOS) on nearby streets due to such construction activities as lane closures and parking for construction personnel and/or equipment. These impacts should be identified in the Initial Study. The subsequent environmental document should estimate the impacts by considering the following:

AR0072863

- Existing local street level of service (LOS) based on existing volume
- Implications of lane closures and detours on local street LOS
- Average length of delays at strategic points on local streets within the construction areas
- Determination of level of pollutant concentrations within construction areas

9.2 Operational Emissions

During the life of the project, a variety of emissions are produced by its day-to-day operations. On-site equipment may emit reactive organic compounds (ROC) and nitrogen oxides (NOx). In addition, vehicle trips to and from the project produce ROC, CO and NOx.

There are three methods available for estimating emissions from the operation of a facility:

- Screening data through Tables 9-7 and 9-8
- Employing the Mobile Assessment for Air Quality Impacts (MAAQI) model for mobile emissions
- Using the methodology and emission factors given in Appendix 9

Tables 9-4 and 9-5 are adequate for estimating emissions when preparing a ND or a MND, but it should not be depended upon for estimates for an EIR. The emissions estimates shown in screening Tables 9-4 and 9-5 are based on regional averages, and focus on emissions from vehicle trips and energy consumption. To estimate emissions with these screening tables:

1) Estimate emissions for each source category (i.e., on-road and area) separately. (Mitigation efficiencies are subtracted from the applicable source categories);
2) Determine total square footage (or other appropriate unit and land use);
3) Multiply those totals by the emissions estimates provided in the tables;
4) Add the emissions from each category to determine total operation impacts;

The District has developed a version of the Urban Air Shed model specific to the South Coast Air Basin (SCAB) called MAAQI. The MAAQI model will estimate emissions associated with vehicle trips, and energy use for residential areas. Planners can estimate emissions with relatively little site-specific information by using the county-wide defaults in the MAAQI model or by entering site-specific information if available.

The MAAQI Model can be used to estimate emissions for the ND or MND; however, site-specific information should be developed to the fullest extent possible for the EIR. Also, emissions from other sources need to be identified in the EIR. (Appendix 9 provides calculation procedures for estimating emissions from these other sources.) The MAAQI model can only be used as a substitute for analyzing the motor vehicle emissions.

If through the Initial Study it is determined that a significant amount of emissions will come from stationary sources, emissions estimates should be developed using the references provided in Appendix 9. These should be added to the total emissions from the project.

Emissions estimates for the EIR should follow the methodology and emissions factors provided in this Handbook. All sources of emissions should be identified (refer to Figure 9-3), with reasonably foreseeable significant environmental consequences addressed. Emissions estimates should be developed for each phase of development and reported in pounds per day for each applicable pollutant. The daily emissions estimate should be based on the highest day (including weekdays and weekends).

AR0072864

This is because travel characteristics are different for weekdays and weekends. In addition, emissions estimates should be provided for the base year (initial year of operation), each development phase, and build-out, based on information available in the traffic impact study. Any emissions reductions resulting from existing ordinances and rules should be calculated as part of the project's non-mitigated emissions.

Sources of operation-related emissions, data needs, and emission factors are discussed below. The emission calculation methodology, emission factors, and assumptions are provided in Appendix 9. The Appendix also provides emissions summary sheets. In order to estimate emissions, specific information about the operation of the facility is needed. When specific information is not available, reasonable estimates based on past experience may be used. Assumptions for some of the factors have also been formulated for this purpose and are provided in the Appendix. All of the basic assumptions used to estimate operation emissions should be documented in the EIR.

Stationary Sources. There are two types of stationary sources: point and area. Point sources refer to a site that has one or more emission sources at a facility with an identified location (e.g., power plants, refinery boilers). Area sources comprise many small emissions sources for which locations are not specifically identified, but for which emissions over a given area may be calculated using socioeconomic data (e.g., water heaters, painting and coatings, and fuel use and consumption).

Emissions from new, modified, or relocated stationary source equipment are regulated extensively through the following:

- o District's Regulation XIII: New Source Review Program
- o District's Permitting Program
- o Compliance with the District's source-specific regulations

Stationary source emissions can be calculated by determining the following:

- o Types and number of pieces of equipment
- o Rate and quantity of fuel consumption
- o Number of hours of operation per day
- o Phases and duration of operation
- o Estimated emissions assuming implementation of SCAQMD-adopted Rules and Regulations (which should be identified in the environmental documentation)

If the number and types of equipment, or other necessary data, are not available when the environmental document is prepared, stationary source emissions may be estimated by using other indicators, such as emission rates per square foot of development. Refer to Appendix 9 for calculation tables. In addition, ARB source classification codes and EPA emission factors should be consulted.

Energy Use. The generation of electric energy and use of natural gas by facilities to power lights, appliances, equipment, etc. should be calculated. Usage factors for natural gas and electric generation are included in Appendix 9, and should be based on the highest daily usage.

Vehicle Trips. Motor vehicles are the primary source of emissions associated with residential, commercial, professional, institutional, and some industrial land uses. Typically, these land uses do not directly emit significant amounts of air pollutants from on-site activities. Motor vehicle trips to and from these facilities do however, emit pollutants adversely affecting air quality.

Development projects and public infrastructure projects are classified as "indirect sources" of vehicle emissions because of trips made to and from them. Quantifying and mitigating emissions from indirect sources poses difficult theoretical and methodological issues.

AR0072865

When quantifying the emissions from indirect sources the issue of assignment and generation of vehicle trips should be considered. When assigning trips to a development there may be some circumstances where a proposed project might divert trips, decrease vehicle trips and/or vehicle miles, or not result in an increase to the extent assumed when using standardized trip generation figures.

For example, the issue of diverted trips arises when a city rejects a proposal to develop a new grocery store. The trips to and from the grocery store do not simply disappear from the region. Customers are likely to travel to another grocery store. Depending on the location of the grocery store's distance from the customer or possible location on a more congested road, VMT and emissions could increase or decrease. Schools are another example of a situation where the construction of a neighborhood school designed to accommodate existing student demand could reduce the number of vehicle miles that students generate by commuting to school outside the neighborhood.

Developers, occupants, and local governments have different abilities to reduce indirect source emissions. Each of these parties can influence trip making, but not fully control trip making through their own actions. The District recommends that project proponents and approving jurisdictions adopt mitigation measures to discourage mobile source emissions which, in the circumstances of the specific project as identified in the CEQA process, are feasible and effective.

Finally, land uses naturally evolve and shift with economic and demographic trends in ways that are difficult to predict and model. These dynamics can completely change commute patterns and related emissions. For example, in the last twenty years, Orange County evolved from a residential county to one with a substantial employment base. Employment centers that once had primarily industrial or manufacturing firms now have mainly commercial and service firms, which have different residential needs and trip-making patterns.

The major technical issue is the difficulty in correlating indirect source emissions from an individual development or infrastructure project with the projections of regional emissions used to develop the AQMP. The Building Industry believes that development and infrastructure projects typically accommodate economic and demographic trends assumed in the AQMP, although they acknowledge that the projects also add to the cumulative impact that greater economic activity has by "inducing" additional trip-making and higher emissions. District staff believes that projects may stimulate as well as respond to growth.

This Handbook recommends the use of the 5th edition of the ITE Trip Generation Manual. The ITE Manual recognizes that the issues of multi-use developments and quantifying capture rates for developments are limited by the specificity of the information provided. Additionally, the ITE Manual discusses primary trips, pass-by trips and diverted linked trips and provides guidance, in the form of technical methodologies, on estimating percentages of each type of trip by land use type. The methodologies contained in the ITE Manual are based on actual data. Just as the CEQA Handbook provides default values for emissions calculations based on county averages, the ITE Manual provides traffic averages based on actual data. Additionally, both the CEQA Handbook and the ITE Manual recommend the utilization of the best available data to calculate impacts. Therefore, if project specific data is available it should be used to adjust the factors for calculating both the traffic reports as recommended by the ITE Manual, and the project emissions. The District is committed to working cooperatively with other public agencies and private groups to improve both the theory and methodologies for quantifying indirect source emissions.

Mobile source emissions include vehicle emissions from work trips, non-work trips, and truck trips to and from the project site. Therefore, when estimating indirect source emissions the following should be considered:

AR0072866

- Types of land uses (i.e., commercial, industrial, residential, and/or institutional)
- Size of land use project (i.e., square footage, number of units, and capacity)
- Modes of transportation and fleet mix of trips associated with each land use category
- Number of employees per land use category
- Average number of daily trips associated with each type of trip (work, non-work, truck trips)
- Vehicle speed (linked to roadway volume) and ambient temperature
- Average vehicle miles traveled for each trip type

Calculation of project-related trips should be based on the Trip Generation Manual (Fifth edition, 1991) published by the Institute of Transportation Engineers (ITE). Trip generation should be based on the highest day (either weekday or weekend) trips for each land use category. Trip generation data from other sources (i.e., traffic impact analysis) may be used if determined to be more appropriate for a given project. In performing a traffic impact analysis, the procedures specified in the county CMP within which the project is located should be followed. It is presumed that all trips attributed to project development are new trips unless it can be reasonably demonstrated that such trips are derived from elsewhere. There may be some circumstances where a proposed project might decrease vehicle trips and/or vehicle miles, or not result in an increase to the extent assumed when using standardized trip generation figures. Schools are one example of a situation where the addition of an on-site dormitory design to accommodate existing student capacity could reduce the number of vehicle miles that students would generate by commuting to school. Any such analysis in an environmental document should not be based on speculative information. Substantive data based on information from sources such as site-specific and market studies needs to be available to agencies reviewing the environmental documentation to substantiate that trips attributed to the project are either not new trips or that the number or length of trips are less than that expected when using standardized trip information. The air quality analysis should utilize ARB emission factors. Contact the District regarding the current version of the EMFAC program.

In addition, to identify mobile source emissions from trip generation, the impact of additional trips to and from the project site on the transportation system must be assessed. In order to do this, the trips on the transportation network and the impact on level of service must be identified. In particular, the analysis should calculate change in vehicle speed and resulting emissions. Hot spots at intersections should also be assessed and the ARB CALINE4 model or EPA CAL3QHC model should be employed.

PM10. Although fugitive dust is associated primarily with initial construction activity, many operational aspects of a facility can contribute to PM10 emissions. These include vehicles traveling on unpaved roads, tire wear based on vehicle miles traveled, as well as land use specific impacts from mining operations, outdoor storage of building materials such as sand and dirt, and landfills. In order to estimate emissions, the following factors will need to be determined:

- Amount of material or soil
- Type of material or soil
- Emission factors for materials or disturbed soil
- Duration of disturbance of material or soil averaged over 3 months
- Length of road (for unpaved roads)
- Average vehicle weight and number of wheels per vehicle (unpaved road)

AR0072867

9.3 Assessing Other Indicators of Potential Air Quality Impacts (Secondary Impacts)

In addition to primary emission thresholds of significance, Chapter 6 also identifies other indicators of potential air quality impacts. The analysis of a project's impact should include an evaluation of these indicators as appropriate for the project. For example, only projects that involve sensitive receptors need to evaluate surrounding land uses within a quarter mile to determine if there are any sources of toxic emissions.

The type of analysis to perform for each indicator is discussed in the Handbook as follows:

Chapter 5: Potential to create or be subjected to an objectionable odor over 10 dilution to threshold that could impact sensitive receptors;

Chapter 5, 9: Generation of vehicle trips causing a roadway to be reclassified and create a CO hot spot;

Chapter 5, 10: Emitting air toxic contaminants that are regulated by District rules or on a federal or state air toxic list;

Chapter 5, 10: Sensitive receptors within a quarter mile of an existing facility that emits air toxics identified in District Rule 1401;

Chapter 10: Emitting carcinogenic or toxic air contaminants that individually or cumulatively exceed the maximum individual cancer risk of 10 in 1 million;

Chapter 10, 13: Burning of hazardous, medical, or municipal waste in waste to energy facilities;

Chapter 12: Interference with the attainment of the federal or state ambient air quality standards by violating or contributing to an existing or projected air quality violation;.

Chapter 12: Population increases in excess of that projected in the AQMP and in other than planned locations for the project's build-out year.

9.4 Guidance for Assessing Carbon Monoxide Emissions

Carbon monoxide (CO) is a localized problem requiring additional analysis when a project is likely to impact a roadway's level of service (LOS), subject sensitive receptors to CO hot spots, or the project itself is the development of transportation infrastructure. For CEQA purposes, a CO analysis should be performed when air quality has been identified as having a significant impact.

Whenever a land use project could have a significant impact on air quality as a result of vehicle trips, even after mitigation is included, a CO analysis should be performed. Transportation projects that should be analyzed for localized CO problems include: park-and-ride lots, high-occupancy vehicle (HOV) lanes, mixed-flow lanes, designation of new transportation corridor, transportation plan or program, rail and bus transit projects, etc. The methodologies contained in SCAG's Carbon Monoxide Transportation Project Protocol, Technical Addendum Sections 1 through 14 (see Appendix 9) would be appropriate for use in a CEQA CO analysis. CEQA, however, requires additional information beyond the discussion contained in the CO Protocol. The methodology discussed below is intended to assist in preparing a complete and adequate CEQA analysis for air quality. To assist planners in preparing a CO analysis and adequately evaluating the potential impacts, the following guidelines were developed.

Methodology. To assess CO emissions and evaluate the impacts, the following steps should be employed:

AR0072868

1. Determine "No Project" ambient concentration of CO emissions. Utilize Tables 5-2 and 5-3 for future year ambient concentrations, or use Table 9-9 to adjust on-site monitoring data to reflect future year emissions.

2. Estimate the CO emissions from the project by modeling.

3. Add the "No Project" ambient concentration level of CO emissions to those generated by the project (i.e., total project impact).

4. Compare the total project impact to the state 1-hour and 8-hour CO standards.

5. If modeling indicates a CO hot spot could occur, determine the area impacted and determine if sensitive receptors are located in that area. Identify and determine the level of CO emissions at sensitive receptors. (Refer to Section 5.3(5) for methodology.)

6. Compare the levels of CO emissions at sensitive receptors to the state 1-hour and 8-hour CO standards.

7. Determine project significance.

The analysis should be performed for the following years: each development phase and project build-out.

If the project causes the state 1-hour and 8-hour CO standards to be exceeded, then a "CO hot spot" is created. As such, it is considered that the project is likely to cause or contribute to a CO exceedance of a state air quality standard. There may be cases where the background concentration already exceeds the state 1-hour and 8-hour CO standards. In these cases, the analysis should determine whether there will be a measurable increase at the project site. A measurable increase is defined as one part per million (ppm) for the 1-hour CO standard and 0.45 ppm for the 8-hour standard (consistent with District Regulation XIII definition of a significant impact). A measurable increase is considered likely to increase the frequency or severity of an existing CO violation.

There are a number of dispersion models that are available to estimate potential CO hot spots. Two such models, CAL3QHC and CALINE4, have been developed to estimate potential CO hot spots. The models are based on continuous line source emissions and therefore, can estimate roadway impacts. The CAL3QHC model has been enhanced to analyze idling and queuing from congestion and impacts on sensitive receptors. CALINE4 is the model used by ARB and CalTrans. The District recommends CALINE4. Both models are described in Section 9.7 of this Chapter.

Establishing the "No Project" Ambient Concentration. Two options are available for establishing CO 1-hour ambient background concentrations. Table 5-2 provides projected future year 1-hour CO concentrations based on adopted rules or regulations. These projections may be utilized as the future year ambient concentrations. These numbers will be revised as better modeling techniques are developed and as necessary due to the results of the District's ongoing monitoring.

Planners or the project proponent may wish to utilize the second option and perform more site specific monitoring to determine the CO "No Project" ambient concentrations. On-site monitoring requires a minimum of 4 months of continuous sampling during the winter CO season, November through February. Sampling and receptor siting for this option should be in accordance with 40 CFR 58 microscale criteria and achieve a minimum of 90% data completeness. The monitored data may be adjusted for future years utilizing the factors in Table 9-8. These adjustment factors are also based on implemented rules and regulations.

The 8-hour CO concentration levels may be established in two ways. Table 5-3 provides projected future year 8-hour ambient CO concentrations, adjusted to take into account adopted rules and regulations. For the second option the 8-hour CO concentrations are calculated from the 1-hour levels directly by a factor termed the Persistence Factor. This factor is the ratio over the most recent three years between the highest annual maximum 1-hour and 8-hour CO concentrations as measured at the

AR0072869

nearest representative permanent monitoring station. If no nearby monitoring station data is available, the following factors are suggested:

Factor	Setting
0.6	Attainment
0.7	Non-attainment
0.8	Urban areas with persistent stagnation and/or congestion

If a project is located in more than one source receptor area, the background concentration from the air monitoring station which is most representative of the conditions at the project site should be used, or each source receptor area should be modeled separately. It is necessary to evaluate CO impacts based on the highest concentrations, or actual concentrations if they can be determined, because the state law mandates that violation of the CO standards at any location during the year results in the area being classified as non-attainment for that pollutant.

Relocation of CO Hot Spots. Occasionally, project development will cause emission patterns to shift or move, possibly resulting in the reduction or elimination of a hot spot at one location, and the initiation of a new hot spot at another location. For example, if an extra lane for traffic flow is added to a roadway link which has a hot spot, the hot spot may shift to the portion of the roadway link where the extra lane ends. The hot spot is then caused by congestion from vehicles merging into a fewer number of lanes. It is acceptable in some instances to move a hot spot without it being considered as creating a new hot spot when the following criteria are met:

- The relocated hot spot will not be within a quarter mile of sensitive receptors or it is demonstrated that a hot spot will not be created that will impact sensitive receptors;
- The CO emissions will be equal to or less than the emissions at the original hot spot within the project impact area; and
- The relocated hot spot will not result in a new CO violation.

9.5 Cumulative Impact Evaluation

CEQA defines cumulative impact as follows:

- Two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts (refer to CEQA Guidelines Section 15355), and
- The change in the environment which results from the incremental impact of the project when added to other closely related past, present, or reasonably foreseeable future projects, and can result from individually minor, but collectively significant, projects taking place over a period of time (refer to CEQA Guidelines Section 15355(b)

Section 15130 of the CEQA Guidelines specifies that cumulative impacts shall be discussed when significant. The discussion of cumulative impacts should reflect the severity of the impacts and the likelihood of occurrence, but need not provide as great detail as needed to assess the effects of the project itself. CEQA requires that the following elements be discussed when assessing cumulative impacts:

AR0072870

- A list of past, present and reasonably anticipated future projects producing related or cumulative impacts, including those outside the control of the Agency or a summary of projections contained in an adopted General Plan or related planning document which is designated to evaluate regional or areawide conditions. The discussion should be guided by the standards of practicality and reasonableness; and

- A summary of the expected environmental effects to be produced by those projects; and

- A reasonable analysis of the cumulative impacts of relevant projects including the examination of reasonable options for mitigating or avoiding any significant cumulative effect of the proposed project.

The following approach has been developed by District staff as a possible means to determine the cumulative significance of a land use project. This approach is consistent with the AQMP which contains performance standards and emission reduction targets necessary to attain the federal and state air quality standards. This approach is not mandatory under CEQA, and District staff is available to consult on the preparation of a cumulative impact analysis.

The environmental documentation could analyze the project according to the following assumptions (as applicable to the project):

- *1% per year (or 18% over 18 years to the year 2010) reduction in project emission (ROC, NOx, CO, PM10, SOx)*

  The analysis can be performed by calculating the total project unmitigated emissions using the procedures in Chapter 9, and then dividing by the reductions from the application of mitigation measures. This will provide the percent reduction in project emissions. (Refer to Appendix 9 for methodology.)

- *1.5 average vehicle ridership (AVR), or average vehicle occupancy (AVO) if a transportation project*

  The calculation procedures in the District's Regulation XV should be used for commercial and industrial land use projects in determining AVR. The AVO for transportation projects should be determined based on ARB's guidance document for complying with the CCAA transportation performance standards. (Refer to Appendix 9 for methodology.)

- *Reduce the rate of growth in vehicle miles traveled (VMT) and trips*

  According to ARB's transportation performance standards, the rate of growth in vehicle miles traveled (VMT) and trips should be held to the rate of population or household growth. Compliance with this performance standard for residential projects, General Plan amendments, and Specific Plans is assessed by determining the population for the projected build-out year of the project. Planners should use population, VT, and VMT projections disaggregated to the local jurisdiction by SCAG that were contained in the AQMP. The population increase from the project should then be divided by the population projection for the build-out year. This gives the acceptable rate of growth in VMT and trips. To determine the number of VMTs a project can generate, determine VMT and trips projection for the build-out year for the local jurisdiction (after consultation with SCAG), and divide by the acceptable rate of VMT and trip growth percentage. (Refer to Appendix 9 for methodology.)

If the analysis shows that the project complies with the above assumptions, the project's cumulative impact could be considered insignificant. If the analysis shows that the project does not comply with the above assumptions, then cumulative impacts are considered to be significant, unless there is other pertinent information to the contrary.

AR0072871

9.6 Analyzing Project Alternatives

CEQA requires that the project be compared to feasible alternatives, including a no-project alternative. CEQA Guidelines Section 15126(A)(d)(3) states that the discussion of alternatives shall focus on alternatives capable of eliminating any significant adverse environmental effects (such as air quality) or reducing them to a level of insignificance even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The EIR should include an air quality impact analysis of all the project alternatives. For this type of assessment, it is appropriate to estimate emissions only for the build-out year and consider emissions associated only with operations. CEQA does not require the same level of analysis for alternatives as it does for the project-specific analysis. This Handbook suggests that project alternatives should be quantified so that decision makers have the ability to determine which alternative is environmentally superior from an air quality perspective. Quantification may be done to a lesser degree, and does not need to be as extensive as that performed for the preferred alternative. For instance, if a project is reduced in size, emissions can be proportionally reduced. If however an alternative site is considered, it may not be feasible to do a quantified air quality analysis. In addition, since there may not be project specific information developed for each of the alternatives, the MAAQI model with the county-wide default assumptions or the screening table may be used to quantify the alternatives.

All of the alternatives, including the proposed project, should use the same basic assumptions, except where a change in assumptions is necessary due to the nature of the alternative. For example, a project alternative might involve electric vehicles rather than gas-fueled vehicles so that the vehicle emission factors would be different. It is important that all appropriate assumptions be held constant so that it is possible to ascertain the difference in emissions as a result of the alternatives. The use of default assumptions from Appendix 9 is acceptable for the alternatives (including the preferred project alternative) in this analysis. This means that the emissions estimates used in the analyses for the alternatives will be different than those used in estimating the impacts of the proposed project (e.g., preferred alternative).

The emissions estimates for the proposed project and alternatives should be reported in the EIR along with the basic underlying assumptions used in assessing all of the alternatives. Also to be reported is an identification of differences in assumptions among the alternatives, for those cases where a change in assumptions is necessary due to the nature of the alternate. An example of a reporting format for the emissions estimates of the project alternatives is provided in Table 9-10.

9.7 Air Quality Modeling Tools

There are a number of air quality modeling tools available to assess air quality impacts of projects. A few of the models that are available to planners and project consultants are described below. Planners and project consultants are not limited to these models and can use other models, as appropriate, to perform the analysis.

The accuracy from any model is directly dependent on the accuracy of the input variables or assumptions. Meteorology, trip generation rates, and emission factors can vary widely, and in many situations there is a degree of uncertainty in their selection. The user should be confident with the input assumptions before they are used in the model. Preferably, the inputs are based on research or case studies. It is recommended that the user contact the District's Modeling staff prior to selecting meteorological parameters and estimating composite running and idling emission factors. For recommendations on other types of input assumptions, contact the District's Local Government-CEQA Section.

Mobile Assessment for Air Quality Impacts (MAAQI). The MAAQI model is used to estimate CO, ROC, NOx, SOx, and PM10 emissions from the motor vehicles associated with new or modified land uses (e.g., shopping centers, residential development, commercial mini-malls, etc). The District has developed MAAQI to include county default assumptions (for trip length, speeds, temperature, etc.), energy use in residential developments, and quantification of mitigation measures.

AR0072872

The District's MAAQI model has been designed for planners wanting to assess the indirect vehicular emissions associated with various projects, such as residential developments, shopping centers, and offices. The program uses the emission factors generated by the EMFAC7E.P model for on-road motor vehicles as input. The data needed to run the MAAQI model for a new or modified land use project can be as simple as the following:

- Type of land use
- Size of the project
- Year of project operation

The MAAQI model contains a number of built-in default values (values automatically inserted by the program when project-specific data are unavailable). Unless project-specific information is available and documented, the default values for each of the four counties under the District's jurisdiction are recommended for the following model inputs:

- Trip rate
- Percent cold starts
- Vehicle fleet mix types
- Trip speed
- Trip lengths

Input values other than those recommended in MAAQI may be used for calculating commercial and industrial emissions. Likewise, modified trip generation rates and percent work trips may also be used. However, if different values are used, full documentation and justification for the different inputs should be provided. If the MAAQI model is used to estimate emissions associated with land uses, the following non-vehicular emissions must be added to the estimate.

- Emissions from stationary sources
- Emissions from other mobile sources (planes, trains, etc.)
- PM10 emissions
- Emissions from traffic impacts

CALINE4. The CALINE4 is a computer model used to predict CO, nitrogen dioxide (NO2), and particulate concentrations near a roadway. CALINE4 is an effective tool for forecasting free-flowing mobile source emissions resulting from a proposed project and can be used to determine if a CO hot spot will be created. The information obtained from CALINE4 projections can also be used to determine the project's effect on ambient air quality in localized areas. (Contact the CalTrans Technical Support Division for further information about the CALINE4 model.)

CAL3QHC. The CAL3QHC is another computer model for predicting the level of carbon monoxide or other criteria pollutant concentrations from motor vehicles near a roadway. The model is based on the assumption that vehicles near an intersection are either in motion or idling. Therefore, CAL3QHC is effective at estimating mobile source emissions which are either free-flowing or idling. Details of the modeling application can be found in "User's Guide to CAL3QHC" (EPA, Contract No. 68-02-4394, 1990).

EMFAC7E.P. These emission factors use the most current assumptions for estimating and projecting emissions from motor vehicles. The model can be used to quickly estimate pollutant emission factors given a vehicle fleet size, year, temperature and operating speed. The output can be used as input to the CALINE4 model. The vehicle types programmed into this model include light-duty auto, light-duty truck, medium-duty truck, heavy-duty truck and motorcycles.

AR0072873

The EMFAC7E.P model takes into account all ARB regulations adopted up to January 1, 1991. The District recommends that this version be used for all emissions estimates. These emissions factors or the most recent factors can be obtained by contacting the ARB Technical Support Division or the District's Local Government/CEQA unit. The emission factors contained in Appendix 9 for on-road mobile sources are generated from EMFAC7E.P.

9.8 Analyzing and Reporting Emissions

Once the emissions from construction and operation of the project have been estimated, the effect of District rules and local ordinances should be taken into account. Any reductions should be documented in the EIR and calculated as part of the project's emissions prior to the inclusion of mitigation. This is because mitigation refers to actions beyond those required by rules or ordinances. Then a quantitative assessment should be completed comparing the project emissions to the thresholds in Chapter 6. In addition, qualitative assessments that compare the project with the existing setting described in Chapter 8 and with any potential impacts identified during the Initial Study need to be made.

The environmental documentation should demonstrate clearly that the amount of emissions generated by the project have been compared to the thresholds of significance. (In this step, construction and operation related emissions should be considered separately). While the analysis for the ND and MND may analyze emissions impacts based on the screening tables, the EIR must include a project specific analysis.

The impacts of the project on the existing setting should be analyzed (e.g., changes to current traffic LOS, etc.) and any other changes from current conditions noted. In addition, an analysis of any impacts relating to air quality identified during the Initial Study should also be included (e.g., changes in population projections, etc.).

All of the assumptions used in estimating future emissions must be documented in the EIR. Emissions estimates for each source related to construction and operation activities along with total emissions from each applicable pollutant (e.g., tons or pounds of pollutant a day) should be reported. Emissions estimates should be reported for each phase of build-out and project completion.

* GFA = GROSS FLOOR AREA

**Construction emissions include on-site construction equipment and workers' travel.

E = (((Project square footage/1,000) × (Table 9-1 emission factor))/(Number of days to construct)
E = Daily construction emissions

For on-site construction equipment and material handling construction emissions, subtract emissions obtained by using screening Table 9-3.

For on-site construction equipment emissions, subtract emissions obtained by using screening Tables 9-3 and 9-4.

Refer to Appendix 9 for methodologies and assumptions used in preparing this table.

These emissions were estimated using energy consumption values provided in Energy and Labor in the Construction Sector, B. Hannon, R. Steitz, and D. Serbst, Science, 1978, 202:837–847.

AR0072878

Table 9-2. Screening Table for Estimating Construction PM10 Emissions – Fugitive Dust

LAND USE	UNIT OF MEASURE	EMISSION FACTOR (LBS/DAY)
UNPAVED ROADS		
Passenger Vehicle	Vehicle Miles Traveled (1)	5.56
Loaded Truck	Vehicle Miles Traveled (1)	23.00
PAVED ROADS		
Local Road	Vehicle Miles Traveled (1)	0.33
Construction Road	Vehicle Miles Traveled (1)	2.00
DEMOLITION	Cubic Foot	0.00042

*GFA = Gross Floor Area

E = Daily Construction Emissions (construction emissions include material handling)

E = (((project square footage/1000)×(Table 9-4 emission factor))/(Number of days to construct))

These emissions were estimated using energy consumption values provided in Energy and Labor in the Construction Sector, B. Hannon, R. Stein, and D. Serber, Science, 1978, 202:837–847

Total Operation Emissions	**57.05**	**37.57**	**561.42**	**5.88**
Construction Significance Thresholds	55.00	55.00	550.00	150.00
Significant?	Yes	No	Yes	No

* Assumes 1 year with 261 days per year is construed.
** Assumes 8.36 acres of grading in first 31 days of construction.

AR0072882

Table 9-6. Steps for Calculating Project Emissions (Screening Analysis)

(The following steps correspond to the extended portion of the flow chart in Figure 9-3.)

1. Determine if the project could be significant by comparing the project to the thresholds in Tables 6-2 and 6-3.
2. Calculate construction emissions using screening Tables 9-1 (Total Construction), 9-2 (Construction PM10), and 9-3 (Construction Workers' Travel) to determine total construction emissions.
3. Calculate operation emissions using screening Tables 9-7 (Mobile Source) and 9-8 (Stationary Source) to determine total operation emissions.
4. Compare project construction emissions to thresholds in Section 6.4 to determine significance.
5. Compare project operation emissions to the thresholds in Section 6.2 or 6.3 to determine significance.
6. Determine if the project could be cumulatively significant (Section 9.5).

ASSESSING TOXIC AIR POLLUTANTS

CHAPTER 10

During the past decade, concern has grown over certain air pollutants (other than the criteria pollutants) that may cause cancer or otherwise harm human health and the environment. Public interest and hence public policy clearly demand that air toxics and acutely hazardous materials be taken into account. Chapter 3 provides background information on air toxics, defining and explaining their origins. Chapter 5 discusses the siting of sensitive receptors within a close proximity to toxic emission sources. This chapter discusses three primary issues: 1) the analysis necessary for sources of air toxics, 2) the analysis necessary to assess the siting of sensitive receptors within a quarter mile of a toxic source, and 3) the analysis necessary to assess risks from acutely hazardous materials. Figure 10-1 illustrates the sequential flow of these analyses.

Projects emitting significant levels of air toxics must be carefully evaluated, since air toxics may cause harmful effects. Because of their known expected harmful effects, regulations adopted by the federal and state governments and limited purpose districts restrict the levels of air toxics that may be emitted from stationary sources (refer to Chapter 3 for background information.

Concern about toxics introduces a new dimension into the environmental planning process. Planners must now be aware of air toxics and what is required to prevent their release. Historically, environmental planning for air quality has focused on criteria pollutants, about which a great deal is known and on which information can be built into the planning process. "Safe" limits are established for criteria pollutants (ambient air quality standards), and thresholds for significant levels of emissions can be established relative to the air quality standards threshold levels. Release of criteria pollutants at levels exceeding the standards can cause reversible effects, such as eye irritation and coughing, as well as irreversible health effects including deterioration of lung function. When emissions are kept at or below the accepted threshold levels, no adverse health effects are expected to occur.

There are different types of toxics analysis depending on the type of toxic air pollutant and conditions of release (i.e., routine and accidental releases). Table 10-1 provides an overview of the compounds that should be analyzed depending on whether there is a routine or accidental release.

The state is required to compile and maintain a list of substances recognized by the state ARB as presenting a chronic or acute threat to health when present in the ambient air, including, but not limited to, any neurotoxins, or chronic respiratory toxins. Table 10-2 provides a list of current state and federal designated toxic contaminants (AB 1807 and federal NESHAPs) that should be analyzed for chronic health hazards. Table 10-3 lists District-recommended air dispersion models for risk assessment use. Table 10-4 provides a list of acutely hazardous materials that should be analyzed where there is a risk of accidental release. Table 10-5 provides a list of air contaminants that should be analyzed for acute health hazards during routine short-term releases.

As California is part of a belt of earthquakes and volcanic activity that circles the Pacific, there is concern in the Basin regarding the siting of facilities that use acutely hazardous materials and their proximity to active earthquake faults. The San Andreas fault, which extends almost the entire length of the state, is an area of high seismic activity.

The U.S. Geological Survey (USGS) evaluates California earthquake probabilities. Its evaluations are based on a probability model that assumes increased probability with elapsed time since the previous major earthquake on a fault system. A report by FEMA (Federal Emergency Management Agency), 1980) stated that a major earthquake in Southern California comparable to the great earthquake of 1857 (L.A., 7.9 Richter) has a probability of occurrence greater that 50% in the next 30 years. The Working Group of the USGS found that the earthquake hazard on the South San Andreas fault is at least as high as that reported by FEMA. Planners should consult the Alquist/Priolo maps to determine if a project proposes to locate near an earthquake zone.

AR0072892

10.1 Roles of the District and Local Governments

Both the District and local governments issue permits to sources that could emit toxic air or acutely hazardous contaminants. The District regulates air toxics and acutely hazardous materials by issuing operating permits which limit the amount of emissions. Local governments control the impact of air toxics on sensitive receptors through land use decisions. The District has adopted Rule 1401 which specifies limits for maximum individual cancer cases from new or modified stationary sources which emit carcinogenic air toxics. Local governments grant discretionary permits for land uses emitting air toxics and issue building permits for the construction of such facilities. In some cases, the local government permit is for equipment that is directly related to a land use, such as a permit for a gas station. Other times the equipment is an accessory to the primary land use, as would be the case with the extensive consumption of gasoline fuels by internal combustion engines at a special activity center.

The local government is the lead agency with respect to the land use decision and any discretionary permits that are required. The District is the lead agency for the District permit to construct and operate. In both cases, the local governments and the District are the respective responsible agencies. The lead agency must consult with responsible agencies. Refer to the front matter of this Handbook to identify the appropriate District number to contact regarding environmental documentation.

10.2 Local Government Land Use Permits (for Stationary Sources Emitting Toxic Emissions)

Most likely, planners will only see those projects that fall into one of two categories: (1) those that involve a use new to the local government, or (2) those for an expanding use that is subject to a discretionary permit. The local government's involvement for most existing uses, is often limited to issuing business licenses, and building permits for minor alterations and equipment. When evaluating permits for new uses, planners have the opportunity to focus on the land use implications of the proposed project. In considering air toxics, planners may use Table 5-1 which identifies land uses and equipment commonly associated with significant toxic emissions, to determine when public health risk assessment should be performed. Refer to Appendix 3 to obtain a full listing of toxic air contaminants under District Rule 1401, ARB (AB 1807), and EPA (NESHAPs).

Planners can use the information in Table 5-1 to identify projects prior to consulting with District staff and prior to the completion of the Initial Study and the preparation of the draft EIR. If the planner determines that the project could have carcinogenic air toxics emissions, based on the District's information, the EIR should thoroughly analyze the air toxics emissions and include a discussion of land use compatibility issues.

In reviewing the EIR, local governments should consider the potential for carcinogenic toxic emissions and threat of release of acutely hazardous materials due to earthquakes from a land use perspective. Local governments should focus the analysis primarily on land use siting issues. As with toxics, the District adopts rules to regulate emissions from these sources. In granting a land use permit that involves carcinogenic toxic emissions or acutely hazardous materials, local government decision makers should ask the following:

- What is the health risk to the population surrounding the facility?
- If a discretionary permit is granted to a significant source of toxic emissions, how will this affect land use in the future?
- What are the health risks associated with siting a sensitive receptor within a quarter mile of a source of toxic emissions?
- What is the risk of upset from siting a facility using acutely hazardous materials near an earthquake zone? (i.e., Alquist/Priola zone).

AR0072893

The EIR should provide technical information that will assist local governments in addressing these issues. The District staff is available to review any air toxic analysis. The EIR does not need to address District permitting requirements for stationary sources, since the District is responsible for ensuring that emissions from both small and large sources are kept at acceptable levels. The District permitting process does not address land use compatibility or siting issues, which are the responsibility of local governments.

Land use compatibility issues need only be addressed for: (1) projects that emit toxic air contaminants as identified in District Rule 1401, AB 1807, and NESHAPs (2) the siting of sensitive receptors that could be impacted by existing sources of toxic emissions, and (3) projects that have a risk of releasing (either routinely or accidentally) acutely hazardous materials. Refer to Table 5-1 for an example of land uses that could meet this criteria. In addition, if an existing source emitting toxic air contaminants has not obtained a Rule 1401 permit and if a sensitive receptor is to be located within a quarter mile of the existing source, the issue of land use compatibility should be considered.

10.3 District Permits

The District regulates levels of air toxics through a permitting process that covers both construction and operation. Both new and existing industries routinely use materials classified as air toxics. For both new and modified sources, the District has adopted Rule 1401, with which the project proponent must comply before the project can be constructed and put into operation. A permit, when issued, will allow the facility to operate and will specify the conditions, if any, that might limit its operation. The District permit is granted on the basis of an independent environmental analysis conducted according to CEQA Guidelines.

The District's CEQA Guidelines for permit processing consider the following types of projects significant:

- Any project involving the emission or threatened emission of a carcinogenic or toxic air contaminant identified in District Rule 1401 that exceeds the maximum individual cancer risk of one in one million or 10 in one million if the project is constructed with best available control technology for toxics (T-BACT) using the procedures in District Rule 1401
- Any project that could accidentally release an acutely hazardous material (Table 10-4) or routinely release a toxic air contaminant posing an acute health hazard (Table 10-5)
- Any project that could emit an air contaminant that is not currently regulated by District rule, but that is on the federal or state air toxics list (see Appendix 3 and Table 10-2)

Under CEQA, the District is the lead agency for District permits involving projects meeting these criteria. The District will prepare a Negative Declaration when it is determined that the project does not have a significant adverse impact on the environment pursuant to Article 6 of the District CEQA Guidelines. The District will prepare a Mitigated Negative Declaration (MND) when it is determined that the project may have significant adverse impacts on the environment, but that the permit applicant can modify the project so as to eliminate all identified significant impacts or reduce them to a level of insignificance. The District will prepare an EIR when it is determined through substantial evidence that the project might produce significant adverse environmental impacts pursuant to Articles 7 and 9 of the District CEQA Guidelines.

The local government within whose jurisdiction the proposed project is located will be considered the responsible agency. When the District prepares an EIR for its permit, the District will circulate both the Notice of Preparation and draft EIR to the appropriate local government. The District provides the local government, as responsible agency, the opportunity to review and comment on the EIR.

AR0072894

10.4 Assessing Toxics/Acutely Hazardous Materials

Whenever a proposed project will likely entail the use of chemical compounds that: have been identified in District Rule 1401; have been placed on the ARB air toxics list pursuant to AB 1807 or EPA's National Emissions Standards for Hazardous Air Pollutants (NESHAPs) (Table 10-2) and air toxic air contaminants of concern for acute exposure (Table 10-5); or will entail a facility using an acutely hazardous material (Table 10-4), the project proponent should anticipate that some level of risk assessment will be required. In addition, if a facility is using acutely hazardous materials near an earthquake zone or sensitive receptor, a risk assessment should also be performed. The quantities involved for some projects, and the actual release, may result in insignificant levels of risk. In such cases, a very simple "worst case" screening assessment may make that case clear and allow permitting to move ahead. In others, the situation may be uncertain or potentially result in unacceptable risks. At that point, a refined risk assessment may be required. Additional information is available on how to prepare a risk assessment by referring to the SCAQMD document, *"Procedures for Preparing Risk Assessments to Comply with the Air Toxics Rules of the SCAQMD,"* at the Public Information Center.

As required in the EIR, assessing toxics and acutely hazardous materials can be complex and time consuming. It is important at the start to distinguish between those cases where some lesser level of analysis may be sufficient and where nothing less than the most thorough assessment will serve the public interest. Even with limited information, a screening procedure may define a "worst-case" estimate of risk. Simple screening procedures may also give the basis for a more detailed assessment. Contact the District local governments/CEQA unit if the Planner is unsure about the level of analysis necessary.

A useful first step in the screening procedure is to find out whether or not a risk assessment for the facility has been required and performed under AB 2588. A facility will only have an AB 2588 assessment if it is an existing facility. Such an assessment will have brought together most though not necessarily all of the information required for analysis. Information in all cases will include an estimate of the quantities of materials that might be released based on: (1) data from emissions testing, (2) a mass balance calculation, or (3) emission factors for types of processes.

When the District's screening procedure as detailed in the District's procedures for preparing risk assessments is used, some simplified assumptions are made: flat terrain in an urban area, uniform emissions throughout the operation schedule, a source close to the property line. If the project is at substantial variance from these conditions, the simple screening procedure may not be accurate. Exposures to an urban population in a residential area are assumed to extend over the standard reference lifetime of 70 years. Exposures in commercial or industrial areas, presumably limited to working hours, can be adjusted downward.

The District's air toxics compliance guide, listed in the references at the end of this chapter, will help an applicant or consultant work through the required screening procedure, leading to an estimated maximum cancer risk for each carcinogenic air contaminant. Although the District does not currently regulate non-carcinogens, the risks associated with exposure to these air toxics may be assessed following the guidelines established by the California Air Pollution Control Officers Association (CAPCOA) for use in preparing risk assessments for the AB 2588 program.

In those cases where substantial potential risk may be involved, or where the simpler screening approach leads to a determination of significance, a more extensive refined risk assessment will be necessary. At that point, more detailed information will be required, such as:

Stack Height
Stack Diameter
Exhaust Gas Exit Velocity
Exhaust Gas Exit Temperature
Exhaust Gas Volume
Dimensions of Building Structures Near the Source
Dimensions of Area Sources
Land Use and Geographical Features Surrounding the Facility

AR0072895

It can be particularly important to have information available on land uses in the surrounding area, and information such as: population distribution in general and population distribution by time of day; locations of potentially sensitive receptors; location and availability of emergency services and their relative sophistication; and similar data.

EIRs for land uses that have the potential to emit toxics must address and identify potential risks associated with siting, including identifying risks to surrounding land uses. The potential for risk and impact on future land uses as well as impact on projects already in place should be considered. The EIR should assist local government in making the land use decision that specifically will:

(1) Identify the risk to the population from the facility

(2) Evaluate future land use implications

(3) Incorporate mitigation measures when appropriate

Sometimes facilities that emit toxics can apply mitigation measures such as: adjusting the location of equipment emitting toxics so that it is not upwind of sensitive receptors, and designating surrounding properties for industrial uses.

The CEQA air toxic analysis is not a substitute for complying with District toxic regulations. The project will still need to undergo an in-depth risk assessment prior to issuance of a District permit. Appendix 10 summarizes the procedures to be followed in complying with Rule 1401 and is a useful guide for preparation of a toxic emission analysis for the EIR.

10.5 Siting of Sensitive Receptors

The local government will need to analyze the land use implications when siting a toxic source within its jurisdiction, particularly when sensitive receptors will be involved (refer to Chapter 5 for discussion on sensitive receptors). Such an analysis is not a substitute for the subsequent District permitting action over the source of the toxic emissions which requires a health risk assessment to be performed pursuant to Rule 1401. Local government analysis of the land use implications should only be based on an accurate health risk assessment, and the District staff is available to review such assessments.

Screening procedures identified in Chapter 5 will determine if further toxic emissions analysis is necessary when siting a sensitive receptor in proximity to a project that releases air toxics. If the initial screening indicates that the toxic emissions could exceed significance thresholds, the planners should require a thorough analysis as part of the CEQA documentation.

Specifically, planners can require that a public health risk assessment be performed and reviewed by the District. This type of assessment would involve summing risks from facilities within a quarter mile radius to the proposed sensitive receptor. Local governments then need to determine if the risk is acceptable in their community. The District uses the following standards for protecting existing receptors from new sources of toxic emissions: exceedance of the maximum individual cancer risk of 1 in 1 million, or 10 in 1 million if the project has best available control technology for toxics (T-BACT).

The health risk assessment for sensitive receptors should be performed using the same methodologies and inputs as those performed for a direct source of toxic emissions on the AB 1807 and NESHAPs lists. Each facility that does not have a Rule 1401 permit should be included in the analysis to the extent feasible. The toxic emissions should be quantified for each source using the District's procedures for Rule 1401 and an individual cancer risk identified for the sensitive receptor in Chapter 5. Risk assessments that have been previously performed pursuant to AB 2588 and Rule 1401 can be used in lieu of a new assessment. The analysis should include AB 2588 data, District Rule 1401 data, AB 1807, EPA NESHAPs toxic compounds and toxic air contaminants of concern for acute exposure. The project proponent should analyze publicly available information on health risks posed by nearby sources of toxic emissions. The District serves as a clearinghouse for publicly available information on toxic emissions and associated public health risks. This information is compiled from documentation

AR0072896

required of toxic emitters by Rule 1401 and the AB 2588 Air Toxics Hot Spot Program. The applicant should also make a reasonable attempt to obtain toxic information from any sources that could potentially affect the project site which is not covered by Rule 1401 and AB 2588. Pursuant to CEQA Guidelines Section 15151, if the information is not available, the sufficiency of the air toxics analysis should be reviewed in light of what is reasonably feasible.

The EIR, at a minimum, should:

- Identify all potential land uses emitting toxics within a quarter mile surrounding the proposed project
- List types of pollutants most commonly associated with these uses
- Check the AB 2588 database and identify any risk levels that have been reported
- Perform a health risk assessment for those pollutants listed on the AB 1807 and EPA NESHAPs lists (Table 10-2), toxic air contaminants of concern for acute exposure (Table 10-5), and data from District Rule 1401 and the AB 2588 program

10.6 Air Quality Modeling Tools

Table 10-3 lists the air dispersion models recommended by the District for use in performing risk assessments. This list is consistent with the CAPCOA-recommended models. The most recent version of these models should be used. The CAPCOA *Air Toxics Hot Spot Program Risk Assessment Guidelines* should be consulted prior to performing any dispersion modeling.

Routine Releases of Toxic Air Contaminants	Accidental Releases
• Carcinogenic compounds • Compounds of concern for non-cancer health effects from chronic exposure • Compounds of concern for acute exposure	• Compounds of concern for acute exposure from accidental release

AR0072899

Table 10-2. Toxic Air Contaminants Identified Under AB 1807 and Federal NESHAPs

Acetaldehyde	Combustion of fuel from mobile sources, agricultural burning, wildfires
Asbestos	Manufacturing of brakes, acoustic ceiling tiles, gaskets, brake shoe rebuilders and recyclers
Benzene	Constituent of gasoline; used in organic chemical manufacturing, pharmaceuticals, food processing
1,3-Butadiene	Incomplete combustion of petroleum-derived fuels, petroleum refining, certain fumigant production and styrene-butadiene copolymer production
Cadmium	Secondary smelters; cement manufacturing plants; cadmium electroplating facilities; oil or coal burning; sewage sludge incinerators
Carbon Tetrachloride	Use of pesticides; production of fluorocarbon, chlorinated paraffin wax, and carbon tetrachloride
Chlorinated Dioxins and Dibenzofurans	Manufacture of chemicals such as pesticides and wood preservatives; manufacture of PCBs, solid waste incinerators
Chloroform	Manufacture of fluorocarbon 22 refrigerants and fluoropolymers; manufacture of pharmaceuticals, laboratory use; water chlorination (POTWs); air stripping towers, chemical manufacturing cooling towers; pulp bleaching in paper manufacturing
Chromium VI	Chrome plating, combustion of oil, coal, municipal waste and sewage sludge, used in production of chromium chemicals and paints
Ethylene Dibromide	Pesticide and solvent use; chemical feed stock for dye; manufacturing of pharmaceuticals
Ethylene Dichloride	Manufacture of vinyl chloride, solvents, paints, varnish, and finish removers; metal degreasing, soaps and scouring compound

(Continued on next page)

AR0072900

Table 10-2. Toxic Air Contaminants Identified Under AB 1807 and Federal NESHAPs (continued)

Ethylene Oxide	Sterilization; fumigation; surfactant manufacturing; ethylene oxide distribution
Formaldehyde	Manufacture of resins, rubber and paper products, dyes, plastics and cosmetics; chemical sterilant, leather tanner, plating, preservative, embalming fluid and fumigant; fuel combustion
Inorganic Arsenic	Pesticide use; herbicide use, arsenic mining; cement, glass, and chemical manufacturing; agricultural burning; waste incineration; secondary lead smelting
Methylene Chloride	Food processing; manufacturing of paint removers, aerosols, degreasers, polyurethane foam, electronics, chemical, and pharmaceuticals
Trichloroethylene	Polyvinylchloride production; adhesive, painting, and coating operation; refrigerant and heat exchange operations; solvent applications; land POTWs; ground aeration; air strippers
Nickel	Production of polyvinylchloride for plastic products, fabrication facilities; landfills; POTWs
Perchloroethylene	Dry cleaning; degreasing, paint, coatings, adhesives, aerosols and chemical production; printing operations
Vinyl Chloride	Asbestos mining and milling; secondary smelting; solid waste and sewage sludge incineration; electroplating and electrical equipment manufacturing; cement manufacturing

Table 10-4. Acutely Hazardous Materials

Acetone cyanohydrin	Trans-1,4-dichlorobutene	Nickel carbonyl
Acrolein	Dichloroethyl ether	Nitric acid
Acrylonitrile	Dimethyldichlorosilane	Nitric oxide
Acryloyl chloride	Dimethylhydrazine	Nitrobenzene
Allyl alcohol	Dimethyl phosphorochloridothioate	Parathion
Allylamine	Epichlorohydrin	Peracetic acid
Ammonia (anhydrous)	Ethylenediamine	Perchloromethylmercaptan
Ammonia (aqueous solution, conc. ≥20%)	Ethylenimine	Phenol (liquid)
Aniline	Ethylene oxide	Phosgene
Antimony pentafluoride	Fluorine	Phosphine
Arsenous trichloride	Formaldehyde	Phosphorous oxychloride
Arsine	Formaldehyde cyanohydrin	Phosphorous trichloride
Benzal chloride	Furan	Piperidine
Benzenamine, 3-(trifluoromethyl)-	Hydrazine	Propionitrile
Benzotrichloride	Hydrochloric acid (solution, conc. ≥20%)	Propyl chloroformate
Benzyl chloride	Hydrocyanic acid	Propyleneimine
Benzyl cyanide	Hydrogen chloride (anhydrous)	Propylene oxide
Benzyl trichloride	Hydrogen fluoride	Pyridine, 2-methyl-5-vinyl-
Boron trifluoride	Hydrogen peroxide (conc. ≥52%)	Sulfur dioxide
Boron trifluoride compound with methyl ether (1:1)	Hydrogen selenide	Sulfuric acid
Bromine	Hydrogen sulfide	Sulfur tetrafluoride
Carbon disulfide	Iron, pentacarbonyl-	Sulfur trioxide
Chlorine	Isobutyronitrile	Tetramethyllead
Chlorine dioxide	Isopropyl chloroformate	Tetranitromethane
Chloroethanol	Lactonitrile	Thiophenol
Chloroform	Methacrylonitrile	Titanium tetrachloride
Chloromethyl ether	Methyl bromide	Toluene 2,4-diisocyanate
Chloromethyl methyl ether	Methylene chloride	Toluene 2,6-diisocyanate
Crotonaldehyde	Methylene chloroformate	Toluene diisocyanate (unspecified isomer)
Crotonaldehyde (E)-	Methyl hydrazine	Trichloroethylsilane
Cyanogen chloride	Methyl isocyanate	Trimethylchlorosilane
Cyclohexylamine	Methyl mercaptan	Vinyl acetate monomer
Diborane	Methyl thiocyanate	Vinyl chloride
	Methyltrichlorosilane	

Acutely hazardous substances are substances which pose a risk of causing death, injury, or serious adverse effects to human health or the environment if released short-term as accidental releases. Listed in the table are substances commonly in use within the Army which may pose a serious health hazard during a short-term or accidental release.

AR0072903

Table 10-5. Toxic Air Contaminants of Concern for Acute Exposure

Ammonia	Hydrogen Sulfide
Acrolein	Lead
Arsine	Maleic Anhydride
Benzyl Chloride	Inorganic Mercury
Carbon Tetrachloride	Methyl Chloroform
Chlorine	Methylene Chloride
Copper and Compounds	Nickel Compounds
1,4-Dioxane	Nitrogen Dioxide
Ethylene Glycol Methyl Ether	Ozone
Ethylene Glycol Ethyl Ether	Perchloroethylene (Tetrachloroethylene)
Ethylene Glycol Monoethyl Ether Acetate	Phosgene
Ethylene Glycol Monobutyl Ether	Propylene Oxide
Formaldehyde	Selenium
Hydrochloric Acid	Sodium Hydroxide
Hydrogen Cyanide	Sulfates
Hydrogen Fluoride	Sulfur Dioxide
	Xylenes

Listed in this table are substances commonly found within the Basin which may pose an acute health hazard during reported short-term releases.

MITIGATING THE IMPACT OF A PROJECT

CHAPTER 11

CEQA requires public agencies to take responsibility for protecting the environment. In regulating public or private projects, agencies are expected to avoid or minimize environmental damage. The purpose of an EIR is to identify the significant effects of a project on the environment, identify alternatives to the project, and indicate the manner in which significant impacts can be mitigated or avoided (PRC Section 21002.1). CEQA further states that a public agency should not approve a project as proposed, if there are feasible alternatives or mitigation measures that would substantially lessen any significant effects on the environment (unless all feasible mitigation has been applied and overriding considerations are made pursuant to CEQA Guidelines Section 15093).

If the impacts cannot be mitigated below the significance threshold, they must nevertheless be reduced. CEQA describes various types of mitigation as follows:

(a) Avoiding the impact altogether by not taking a certain action or part of an action

(b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation

(c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment

(d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action

(e) Compensating for the impact by replacing or providing substitute resources or environments

Section 15041 (a) of the State CEQA Guidelines states that the lead agency has the authority to require changes in any or all activities involved in a project in order to lessen or avoid significant effects on the environment. With regard to any aspects of a project over which the District acts as a responsible agency, the District has the authority to also require that changes be made to those aspects of the project over which the responsible agency has authority. The District as a commenting agency has a duty to recommend mitigation to lessen air quality impacts as the local agency responsible for air quality.

Mobile source emissions in the SCAB and construction-related PM10 emissions in the Coachella Valley are of particular concern to the District. In addition to CEQA requirements, mitigation of impacts are necessary to achieve the federal and state ambient air quality standards. Specifically, all future sources of emissions, including those associated with land development, must be mitigated to the greatest extent possible to expeditiously achieve ambient air quality standards.

11.1 Overview of Mitigation Measures

This chapter contains a menu of mitigation measures that project proponents and local governments can use to select those measures that are feasible to mitigate the project's impact. According to CEQA Guidelines Section 15364, feasible means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. Lead agencies are responsible for determining the feasibility of mitigation measures. In instances where a project has a significant impact, CEQA requires that feasible mitigation measures be applied to the project in order to reduce cumulative impacts and to reduce individually significant impacts (Section 9.5, Chapter 9). The District considers a project to be mitigated to a level of insignificance if its impact is mitigated below the thresholds in Chapter 6. Refer to Chapter 6 to determine when an impact is significant.

AR0072908

A project which incorporates all feasible mitigation measures and/or CEQA options for mitigation (refer to CEQA Guidelines Section 15370 (a)(e)) is considered to have substantially mitigated air quality impacts pursuant to CEQA Guidelines Section 15093 (b). However, if the project's emissions are still over the significance level and the agency decides to approve the project, the lead agency must prepare a Statement of Overriding Considerations pursuant to CEQA.

The Handbook establishes mitigation measures for reducing emissions associated with the construction and operation of a project. These lists are not exhaustive. Both lead agencies and project proponents are encouraged to identify and quantify additional mitigation measures appropriate to individual projects.

11.2 Criteria for Mitigation Measures

The project's net emissions will determine the impact that the project will have after mitigation measures are applied. Net project emissions are determined by subtracting the emission reductions due to mitigation measures from the total project emissions. The District recommends that only mitigation measures which meet the following criteria (which are summarized in Table 11-1) can be used in calculating a project's emission reductions to determine if the project could have a significant air quality impact.

1. **The effect of the mitigation measures should coincide with the cause of the impact.**

Mitigation measures should be linked to the phase of construction or operation that is generating the impact to be mitigated. Project proponents should implement the mitigation measure in concert with the activity that will generate the impact. For example, if the emissions caused by idling vehicles exiting a congested parking lot are mitigated by the institution of a staggered work schedule, that work schedule should commence when the project is initially occupied. In some cases, interim mitigation measures will need to be implemented until the final mitigation is in place (i.e., transit line to be built at a later date, serving as mitigation).

Large projects that have several construction and operational phases should be linked to the particular phase that creates the impact that the measures are mitigating. In addition, if the project is to be developed in phases and it is determined that mitigation measures need to become progressively more stringent in order to reduce emissions, standards that act as triggers should be identified. For example, a predetermined number of trips generated by the project could serve as a trigger for requiring the implementation of a shuttle service at a shopping center.

2. **The agency responsible for implementing the mitigation measures should have the resources to carry out the mitigation.**

When ensuring that the mitigation measures will be implemented, it is imperative that the financial resources be available to carry out the mitigation measures. It is particularly important to demonstrate the availability of funding where the mitigation involves capital expenditures. In most cases, the project proponent can demonstrate financial resources for capital improvements by, for example, posting a bond or entering into an enforceable development agreement with the local government.

3. **To ensure implementation and enforcement, the mitigation should be enforceable by a legally binding commitment.**

Mitigation measures should meet the test of enforceability. Agencies can utilize mechanisms such as recording the conditions of approval (including the mitigation measures) on the property title, including conditions in developer agreements, posting bonds, adopting a local ordinance, drawing up a legal agreement between the project proponent and the jurisdiction to implement the measures or by placing phasing requirements on projects to assure a measure is in place before the next stage of a project proceeds. It is the responsibility of the lead agency to determine the appropriate mechanism. For public projects, lead agencies should request a verification by the responsible public agency that the public improvement will be constructed in time to reduce the impact.

AR0072909

4. The mitigation measures should define the basis for their monitoring and enforcement.

Assumptions used to quantify the effectiveness of the mitigation measure should be used as the basis to determine implementation. For example, if a telecommunications program is used as a mitigation measure to reduce ROC emissions from work trips, the assumptions (e.g., that one percent of the work force will work at home each day) used in quantifying its effectiveness should become the basis for determining whether or not a mitigation measure is being implemented.

Quantitative standards should be used whenever possible. If it is not possible to quantify the mitigation measure, qualitative standards are appropriate. Only when all quantitative mitigation measures reasonably available to the project have been applied should qualitative measures be used. More details on use of qualitative analyses are provided in Section 11.9.

5. The mitigation measure can be reasonably accomplished within a reasonable time frame by the project proponent.

The lead agency should determine that the mitigation measures selected are reasonable, that targets can be met within the stated time frame, and that the measures to be taken are within the project proponent's legal authority. Interim targets should be established for mitigation measures that have a long lead time (more than five years).

6. Public agencies should verify the effectiveness assumed for any public improvements or permitting requirements that are used as mitigation measures.

If mitigation measures are to be implemented by an agency other than the lead agency or the project proponent, the responsible agency should verify the ability of the measure to reduce the project emissions. The following questions should be asked to ascertain the validity and effectiveness of the measure:

(1) What is the effectiveness of the improvement or permitting requirement in reducing the impact?

(2) During what time frame will the measure be implemented?

(3) Is constrained funding available for public improvements (i.e., federal, state, or local commitment to provide the funds)?

(4) Is the project proponent seeking a permit subject to the permitting requirements?

For example, if a project will generate fewer vehicle trips and therefore less emissions after the development of a rail transit line, then before the reductions can be credited, the county transportation commission should be consulted through the CEQA review process. The effectiveness of the rail line for reducing trips should also be ascertained: Are trips being reduced within the same time frame assumed for the project? Have federal, state, or local funds been set aside for the improvement?

For most transportation improvements, planners can consult with the county transportation commission. If a transportation improvement is not in the biennial element of the Regional Transportation Improvement Program (RTIP) or identified in the Regional Mobility Plan as having funding, it should not be used as a quantifiable mitigation measure, unless the transportation improvement will be privately funded through a development agreement enforceable against the project proponent.

11.3 Mitigation Measures Related to Construction

In many cases, the largest impact on air quality by land use projects is from emissions produced by construction. Construction emissions are often dismissed as short term impacts and not examined as thoroughly as are emissions associated with the long term operation of the project. Emissions from construction, however, can be significant. Because widespread growth is anticipated in the SCAB along with corresponding increases in construction activity, mitigating the impact of construction on air quality should be emphasized. For example, grading one acre of land without implementation of

AR0072910

mitigation measures can contribute 55 pounds of PM10 a day. The PM10 problem in the Coachella Valley is largely caused by wind-blown dust in the desert areas. However, the second largest source of PM10 is from construction activities.

The District's Rule 403 governs construction projects and other fugitive dust-generating activities. Rule 403 is primarily based on emission standards and does not contain project-specific mitigation measures. As such, Rule 403 should be considered as a performance standard to any specific mitigation measures required for any proposed project. Copies of Rule 403 and its Implementation Handbook can be obtained from the District's Public Information Center at (909) 396-3600.

The mitigation measures to reduce air quality impacts of construction, demolition, or renovation activities are identified in Tables 11-2, 11-3, and 11-4. Mitigation measures are categorized by the source of emissions to be reduced. The percentage of emission reductions that can be expected from implementation of mitigation measures is identified as that measure's control efficiency. The estimated efficiencies represent the percent reduction in emissions anticipated from one of three source categories from a project's construction activities (on-road mobile sources, off-road mobile sources, and PM10 emissions). Efficiencies may differ for each pollutant depending on the mitigation measure, emission source, and specific process affected. Wherever possible, a range of likely efficiencies are provided. Using any efficiencies within this range should be supported by reviewing: a) the favorable factors listed for each mitigation measure in Appendix 11, and b) the packaging guidance in Section 11.10. Additional justification can also be presented by the air quality analysis. The assumptions that were used to determine these efficiencies are in Appendix 11. The assumptions (i.e., actions and/or setting) used in determining the control efficiency of the mitigation measure should become the basis for determining whether or not a mitigation measure is implemented. Where there are no control efficiencies identified, a qualitative evaluation is appropriate. See Section 11.9 for more details on performing a qualitative analysis.

The efficiencies listed in Tables 11-2, 11-3, and 11-4 along with the assumptions in Appendix 11, represent data from case studies and reports, sources of which are referenced at the end of this Chapter. In some cases, data for particular mitigation measures was unavailable. As such, these measures may be quantified in the future as more programs are implemented and monitored for results. Other quantified data are subject to change as new information becomes available. In addition, these anticipated reductions are representative of conditions in the South Coast Air Basin and portions of SEDAB under the jurisdiction of the District and as such may not be applicable to other air basins.

Planners may use one of two methods to quantify construction mitigation measures: (1) the control efficiencies provided in screening Tables 11-2, 11-3, and 11-4; or (2) quantification calculation procedures described in Appendix 11. The control efficiencies in the screening tables are based on region-wide data and assumptions, and should be applied to the appropriate source category of unmitigated emissions (refer to Chapter 9) to determine net emissions. Other sources of emissions should be identified as appropriate for the project using the information in Appendix 11 and added to the final total of unmitigated project emissions. An example of how to account for emissions by pollutant and source category is provided in Table 11-9.

Figure 11-1 provides a graphic illustration of the process used to identify a project's unmitigated emissions using the screening tables. As is shown in the shaded portion of the figure, once a project's unmitigated emissions have been calculated, quantified mitigation measures can be applied to reduce the potential air quality impact. Step-by-step instructions for using the screening tables to determine unmitigated emissions are described in Table 11-1. These instructions correspond with the unshaded portion of Figure 11-1. Appendix 11 identifies calculation procedures, emission factors, and assumptions necessary to determine the effectiveness of various mitigation measures and thus to determine project specific reductions in emissions.

An example of a summary table that can be used to determine net project emissions is provided in Table 11-5. Information provided in a similar format should be included in the EIR.

AR0072911

11.4 Mitigation Measures Related to Operation

Emissions resulting from operation of a project are critical because these impacts continue throughout the life of the project. It is important to remember that even in those cases where the emissions related to operation are less than construction-related impacts, the operational emissions create long-term impacts on air quality.

District-recommended mitigation measures to reduce air quality impacts of operational activities are identified in Tables 11-6 and 11-7, in addition to the design-related mitigation measures which were identified in Table 5-5. The mitigation measures are categorized by land use and by the emission sources within each land use category. The percentage of emission reductions that can be expected from implementation of mitigation measures is identified as that measure's control efficiency. The estimated efficiencies represent the percent of reduction in emissions anticipated from one of two source categories associated with the project's operations activities (on-road mobile sources or stationary sources). Efficiencies may differ for each pollutant depending on the mitigation measure, emission source, and specific process affected. Wherever possible, a range of likely results is provided. Using any efficiencies within this range should be supported by reviewing: a) the favorable factors listed for each mitigation measure in Appendix 11, and b) the packaging guidance in Section 11.10. Additional justification can also be presented by the air quality analysis. The assumptions used in determining these efficiencies are in Appendix 11. The assumptions (i.e., actions and/or setting) used in determining the control efficiency of the mitigation measure should become the basis for determining if a mitigation measure is implemented. Where there are no control efficiencies identified, a qualitative evaluation is appropriate. See Section 11.9 for more details on performing a qualitative analysis.

The efficiencies listed in Table 11-6 and 11-7, along with the assumptions in Appendix 11, represent data from case studies and reports, sources of which are referenced at the end of this Chapter. In some cases, data for particular mitigation measures was unavailable. As such, these measures may be quantified in the future as more programs are implemented and monitored for results. Other quantified data are subject to change as new information becomes available. In addition, these anticipated reductions are representative of conditions in the South Coast Air Basin and portions of the SEDAB under the District's jurisdiction and as such may not be applicable to other air basins.

Furthermore, any site plan design and building design mitigation measures identified in Section 5.5 that are already incorporated into the project should be quantified if possible or should be qualitatively discussed. See Section 5.5 for further discussion of design-related mitigation measures and Section 11.8 for caveats in using such measures as quantifiable mitigations.

There are three methods planners can employ to quantify operation mitigation measures: (1) the control efficiencies provided in screening Tables 11-5 and 11-6; (2) the quantification calculation procedures described in Appendix 11; or (3) the MAAQI model. The control efficiencies in the screening tables are based on region-wide data and assumptions and should be applied to the appropriate source category of unmitigated emissions (refer to Chapter 9) to determine net emissions. Examples of how to use the screening tables are discussed in Section 11.3. Appendix 11 identifies calculation procedures, emission factors, and assumptions necessary to determine the effectiveness of various mitigation measures to determine project specific reductions in emissions. The MAAQI model can also be used to quantify mitigation measures. This model can determine net emissions either based on pre-set mitigation measures that rely on county averages, or planners can input project specific data to determine efficiency. Chapter 9 provides additional discussion on the MAAQI model. In addition, the District's MAAQI model manual may be consulted.

In addition, many models and studies have identified procedures for analyzing transportation control measures, and estimating travel and emission effects of implementing transportation control measures. These resources provide more complex methodologies for determining a mitigation measure's effectiveness and can be used in lieu of the simplified approaches in this Handbook.

A summary table that can be used to determine net project emissions is provided in Table 11-8. Information provided in a similar format should be included in the EIR.

AR0072912

11.5 Other Mitigation Measures

Project proponents and local planners are also encouraged to identify other types of mitigation not suggested in this Handbook or in the 1991 AQMP. Local governments and project proponents are often in the best position to identify unique mitigation measures. For example, in an urban area, a community may have designated an extensive network of bicycling paths. This community could require access, dedications for future bicycle pathways and support facilities (e.g., showers, lockers, and storage areas) to encourage travel by bicycles rather than by automobile. Such specific mitigation for the community is best developed at the local level.

As with the other mitigation measures, the EIR should quantify the effectiveness of unique mitigation measures whenever possible. In those instances where quantification is not possible, a qualitative analysis should be provided. Lastly, the assumptions used to determine the effectiveness and the source from which estimates were obtained should be identified and the guidelines for preparing such an analysis in Section 11.9 consulted.

11.6 Mitigation for Cumulative Impacts

The District recommends that all cumulatively significant projects apply feasible mitigation measures to a project's contribution to reduce region-wide cumulative impacts. Refer to Chapter 11 for an identification of mitigation measures and the potential for emissions reductions.

11.7 Off-Site Mitigation

A project with a significant air quality impact may be able to mitigate the impact below the threshold of significance by reducing emissions off-site through off-site improvements. Off-site emissions reductions can come either from stationary or mobile sources. For example, NOx emissions from vehicle trips could be reduced by installing solar water heaters in a residential development. The off-site mitigation measures should meet the same standards as on-site mitigation, and be enforceable and quantifiable. The emission reductions resulting from off-site mitigation can only be credited within the same pollutant. Reducing emissions for one pollutant and crediting it to another is not permissible.

Off-site improvements can include the following:

Park-and-ride lots
HOV bypass lane
Class 1 bike path
Transit shelters and benches
Contributions to transit
HOV capital improvements
Clean fuel dispensing station
Contributions to a local shuttle service
Purchase of clean fuel vehicle for another facility
Purchase of clean fuel transit buses
Purchase of CNG school buses

11.8 Quantification Issues

There are four key issues relating to quantifying emission reductions that planners need to consider. These involve adding the emission reductions for different mitigation measures to determine net emissions associated with the project; selecting efficiencies for mitigation measures; determining whether the assumptions used to determine the effectiveness of the mitigation measures are reasonable; and determining emission reduction credits for site plan and building design mitigation measures.

AR0072913

Adding Emission Reductions. In order to determine net emissions for a project, the emission reductions attributed to each mitigation measure applied to the project need to be subtracted from the project's unmitigated emissions. The screening tables in Chapters 9 and 11 have been developed in such a way that planners can apply the efficiencies from mitigation measures identified in the tables in Chapter 11 to the project's emissions that are derived by using the tables in Chapter 9. Mitigation measures have been divided into five source categories to correspond with the five source categories listed in the Chapter 9 screening tables. These include three source categories for construction mitigation:

- o On-road mobile emissions associated with construction work trips (Table 11-2)
- o Off-road mobile emissions associated with construction equipment (Table 11-3), and
- o PM10 emissions from grading, etc. (Table 11-4);

and two source categories for operation mitigation:

- o On-road mobile emissions associated with vehicle trips (Table 11-6)
- o Area source emissions associated with energy consumption (Table 11-7).

The percentage efficiency for any mitigation measure in Tables 11-2 through 11-7 should be applied to the corresponding source category table in Chapter 9 (Tables 9-1 through 9-4 and 9-7, 9-8). The resulting emission reductions should be subtracted from the unmitigated emissions derived in Chapter 9.

The efficiencies in each of the five tables are generally additive, with the following exceptions:

1) Table 11-3 (Mitigation for Off-Road Mobile Source - Construction) assumes that only one of the four mitigation measures can be applied to any construction site;

2) Table 11-4 (Mitigation for PM10 Emissions - Construction) efficiencies apply when only one measure within a source category (e.g., grading, paved roads, or unpaved roads) is applied. If more than one mitigation measure within a source category is applied, the efficiency of the second measure must be adjusted to account for the reduction in unmitigated PM10 emissions from the first measure. To quantify this impact, see Table A11-9 of the Appendix to Chapter 11 for specific direction.

The same procedures can be used when quantifying unmitigated emissions using the methodologies in the Appendix to Chapter 9 and in quantifying emission reductions using the methodologies in the Appendix to Chapter 11.

Selecting Efficiencies. The screening tables that identify efficiencies for mitigation measures often provide a range of efficiencies. Planners should select efficiencies that best coincide with the on-site characteristics for the project as well as the community the project is located in. The low and high numbers represent the range of efficiencies planners can select from. Unless justified, the low end of the range should be used. Planners can use the favorable factors identified in Appendix 11 to justify a higher rate of efficiency. In addition, planners can use the guidance in Section 11.10 to select the higher end of the range when there may be synergistic effects between packages of mitigation measures and the low end when there may be neutral or conflicting effects. Finally, a third criterion should be considered when applying mobile source mitigation measures in Table 11-6, where the ranges of effectiveness also reflect how much of a project's daily trip generation is due to the type of trip being mitigated. For example, a restaurant generates a significant number of daily vehicle trips, most of which are non-work (e.g., customer) trips. Consequently, a mitigation measure that reduces employee work trips is likely to reduce few trips relative to the facility's total daily trips. In such a case, the low

AR0072914

end of the efficiency range is appropriate. On the other hand, a commercial office project's daily trips are largely work-related.

The two previous criteria noted above should be used to select a value within the efficiency range for all mitigation measures. For mitigation measures in Table 11-6, the trip generation criteria should also be considered as the primary criterion for selecting a value.

Assumptions. Another of the key quantification issues that planners face is determining whether or not the reduction in emissions assumed through the implementation of mitigation measures is "reasonable." The test of reasonableness depends on two primary factors: (1) the assumptions used in determining the reduction, and (2) the emission factors used to calculate the emissions. For mitigation measures identified in this Handbook, planners can refer to the mitigation measure effectiveness numbers in Tables 11-2, 11-3, 11-4, 11-6, and 11-7 to assess whether or not the percentage of reduction is reasonable.

In situations where planners are unsure of the reasonableness of assumptions, planners can confer with the District and/or make the assumptions enforceable. This can be accomplished by requiring that the assumptions used in determining the effectiveness, and thus the net impact of the project on air quality, are also used as the measurement of whether or not a mitigation measure has been implemented. For example, if it is assumed that five percent of the work trips to the site will be reduced through telecommuting, then the mitigation monitoring program should use the five percent participation rate as the indicator of whether a measure has been implemented pursuant to AB 3180.

Vehicle trips are generally the greatest source of emissions from the operation of a project. As such, the assumptions about trip reduction are critical to assessing the overall impact of a project on air quality. In particular, the use of transit as mitigation and assignment of future trips to transit and other modes of travel should be reviewed. It is important that projects depending on transit or other modes of travel to reduce vehicle trips use appropriate trip assignment percentages. A trip assignment percentage refers to that percentage of future trips projected to be made by a single occupant vehicle, carpool/vanpool, transit, walking, bicycling, etc. Transit agencies should verify that service is available and passenger capacity exists to support the assumptions. In addition, the number of trips to be mitigated through measures such as carpooling programs needs to be "reasonable."

Emission reductions for site plan and building design mitigation measures. While mitigation measures can be added to a proposed project, some mitigation may have already been incorporated into the site plan and/or building design (Section 5.5), and have become a part of the project's description.

These design measures can be credited for quantified emission reductions only if energy or mobile source credits were not already included in the project's non-mitigated analysis of impacts. For example, a development that will include bicycle shower and locker facilities may take credit for reducing vehicle trips in the traffic study of the environmental analysis. In turn, the calculation of the project's non-mitigated emissions may reflect such a design measure. However, additional credit may not be taken in the project's mitigation measure analysis, as the vehicle trip and emissions reductions would be double-counted.

11.9 Qualitative Analysis

In mitigating the air quality impacts of a development proposal, quantitative mitigation measures should be used to the extent possible to demonstrate reduction of emissions below thresholds of significance. However, not all effective mitigation measures can reasonably be quantified. Once all reasonably available mitigation measures have been applied to a project, it is appropriate to apply qualitative measures whose specific emission reductions are not known. Such a qualitative analysis can be used to further reduce air quality impacts of a project.

Qualitative mitigation measures can also be used to mitigate significant impacts to below the thresholds of significance identified in Chapter 6. In making such a finding, the air quality analysis should identify the rationale used to arrive at such a determination. Use of non-quantified mitigation measures to

AR0072915

reduce significant amounts of emissions should be used with discretion, however, as many non-quantified measures are unlikely to produce substantial reductions.

An air quality analysis that describes the effectiveness of implementing non-quantified mitigation measures should address, but not be limited to, the following issues:

1. What is the source category (e.g., Work Trips, Energy Use, Congestion Relief) being affected and how significant are emissions from that category? For example, work commute trips constitute the majority of vehicular trips to office worksites. Mobile source emissions may in turn constitute the majority of total emissions from these land uses. Consequently, a mitigation measure that would reduce work commute trips to an office park has the potential to reduce a significant amount of vehicle trips and the corresponding emissions. Conversely, a mitigation measure that reduces energy use from swimming pools is likely to have a much smaller emissions reduction potential.

2. What are the pollutants affected by the emission source category? For each source category, measures reduce ROC, CO, NOx, PM10, and SOx to varying degrees. For example, energy use primarily generates NOx emissions while construction grading and demolition creates significant levels of PM10. Consequently, a mitigation measure that reduces emissions from demolition and grading activities during the construction phase may reduce substantial amounts of PM10 but is unlikely to reduce substantial levels of ROC, CO, NOx, or SOx. The qualitative analysis should identify the pollutants associated with the emission source category and draw conclusions accordingly.

3. Are there favorable factors associated with a mitigation measure? As with the quantified mitigation measures, the success of any mitigation measure is largely dependent on the project setting. This can include site-specific conditions and/or characteristics in the local vicinity. Favorable factors can improve the effectiveness of a mitigation measure and facilitate greater emission reductions. The analysis should identify all those factors which are likely to produce more favorable results.

4. Are any of these measures, when combined with other proposed mitigation, likely to complement or impact the effectiveness of any other measures? Some combinations of measures can produce synergistic or non-complementary reactions that increase or decrease the effectiveness of the actions. The analysis should identify whether the qualitative mitigation measures are likely to produce such reactions with other measures and identify potential impacts (See Section 11.10 below).

11.10 Packaging of Mitigation Measures

In many cases the most effective way to reduce a project's impact is to package mitigation measures. In selecting a package of mitigation measures, a lead agency and/or project proponent takes into account several criteria, including the nature of the significant impact requiring mitigation, those measures that are most reasonable and cost-effective, and the applicability of the measures to the project.

Another important criterion for packaging should be to combine mitigation measures that will improve and maximize their aggregate effectiveness. While Tables 11-2, 11-3, 11-4, 11-6, and 11-7 attempt to quantify the effectiveness of isolated mitigation measures, the actual effectiveness of many measures is affected by other measures within the same source category that are implemented as part of a package. Mitigation measures can complement one another or detract from their individual effectiveness depending on upon site-specific and local conditions. The ways in which mitigation measures interact can be divided into three basic groups: Neutral, Synergistic, and Non-Complementary.

Neutral measures. These measures exhibit no change in effects when combined. Neutral actions generally fall into two categories: combinations that address different sources of emissions and combinations that affect different targets within a source of emissions. For example, mitigation measure from one source of emissions such as energy reduction are most likely to have a neutral affect on another source that reduces vehicle trips to the site. In addition, two neutral measures can target different markets within the same source of emissions without affecting the effectiveness of each such as when some mitigation measures target work trips and other measures target non-work trips.

AR0072916

Synergistic measures. These measures are complementary to the extent that the combined effects are greater than the sum of the effects if the two measures were implemented separately. For example, incorporating a mitigation measure that provides an on-site transit stop is more effective when discounted transit passes are provided to employees. These measures should be the primary focus of packaging efforts. At the present time, there are no procedures for providing extra emission reductions for these types of packages, however by packaging measures that have synergistic effects the likelihood of the measures successfully mitigating the impact is increased.

Non-complementary measures. These measures reduce the effectiveness of one another when combined. When implemented together, the combined efficiency in reducing emissions is less than the sum of the benefit in implementing each measure individually. For example, measures that address the same target market as in the case of seeking to reduce the number of work trips to a site by encouraging telecommuting and compressed work schedules (e.g. working 40 hours in 4 days) could result in less emission reductions than if the telecommuting measure was packaged with ridesharing incentives.

Steps for Developing Effective Packages of Mitigation Measures. In selecting and evaluating a package of mitigation measures, planners and/or project proponents should consider the following steps:

1. Identify those mitigation measures that will have neutral effects on the remainder of measures in the proposed package. For these measures, estimate the emission reduction efficiency assuming that the packaging will not affect the effectiveness of these mitigation measures.

2. Identify whether the package includes combinations of measures that are potentially non-complementary. Determine if this package of mitigation measures is likely to result in less emission reductions due to the conflict. If so, revise the package to reduce the conflict.

3. Identify whether the package includes combinations of measures that are potentially synergistic. For synergistic mitigation measures, it may be appropriate to base the effectiveness on the higher end of the range if the project site and community are consistent with the favorable factors identified for each measure in Appendix 11.

Table 11-1. Criteria for Mitigation Measures

1. Implementation of mitigation should coincide with environmental impact.
2. Adequate resources should be available to ensure implementation of mitigation.
3. Mitigation should be enforceable by a legally binding commitment.
4. Standards should be defined for monitoring and enforcing mitigation.
5. Mitigation should be able to be reasonably accomplished within a reasonable timeframe.
6. Public projects and other agencies' permit conditions should be verified when identified as mitigation.

AR0072919

Table 11-2. Mitigation for On-Road Mobile Source Emissions - Construction

• Configure construction parking to minimize traffic interference	NQ			
• Provide temporary traffic control during all phases of construction activities to improve traffic flow (e.g., flag person)	NQ			
• Schedule construction activities that affect traffic flow to off-peak hours (e.g., between 7:00 p.m. and 6:00 a.m. and between 10:00 a.m. and 3:00 p.m.)	NQ			
• Develop a trip reduction plan to achieve a 1.5 AVR for construction employees	0.1-2.2%	0.1-2.9%	0.1-2.9%	0.1-2.9%
• Implement a shuttle service to and from retail services and food establishments during lunch hours	0.1-1.0%	0.1-1.3%	0.1-1.3%	0.1-1.3%
• Develop a construction traffic management plan that includes, but is not limited to:	NQ			
- Rerouting construction trucks off congested streets				
- Consolidating truck deliveries				
- Providing dedicated turn lanes for movement of construction trucks and equipment on- and off-site				
• Prohibit truck idling in excess of two minutes	NQ			

* These efficiencies represent additive reductions from unmitigated on-road mobile source construction emissions (Table 9-3). The resulting emission reductions can be subtracted from the unmitigated totals. These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix 11.

Where efficiency is provided as a range:
If project-specific efficiency is unknown, use the lowest number given;
If project-specific efficiency is utilized, provide supporting analysis and documentation.

AR0072920

Table 11-3. Mitigation for Off-Road Mobile Source Emissions - Construction

• Methanol-fueled pile drivers	54%	+29%	25%	95%
• Suspend use of all construction equipment operations during second stage smog alerts. For daily forecast, call (800) 242-4022 (L.A. and Orange counties) or (800) 367-4710 (San Bernardino and Riverside counties)	NQ			
• Prevent trucks from idling longer than two minutes	NQ			
• Use electricity from power poles rather than temporary diesel power generators	99%	97%	98%	98%
• Use electricity from power poles rather than temporary gasoline power generators	99%	96%	99%	98%
• Use of methanol or natural gas on-site mobile equipment instead of diesel	54%	+29%	25%	95%
• Use of propane- or butane-powered on-site mobile equipment instead of gasoline	53%	+53%	96%	18%

* These efficiencies represent additive reductions from unmitigated on-road mobile source construction emissions (Table 9-1). The resulting emission reductions can be subtracted from the unmitigated totals. These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix H.

AR0072921

Table 11-4. Mitigation for PM10 Emissions - Construction

GRADING				
• Apply non-toxic soil stabilizers according to manufacturers' specification to all inactive construction areas (previously graded areas inactive for ten days or more)				30-65%
• Replace ground cover in disturbed areas as quickly as possible				15-49%
• Enclose, cover, water twice daily or apply non-toxic soil binders according to manufacturers' specifications, to exposed piles (i.e., gravel, sand, dirt) with 5% or greater silt content				30-74%
• Water active sites at least twice daily				34-68%
• Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 mph				NQ
• Monitor for particulate emissions according to District-specified procedures. For information, call (714) 396-3600.				NQ
• All trucks hauling dirt, sand, soil, or other loose materials are to be covered or should maintain at least two feet of freeboard (i.e., minimum vertical distance between top of the load and the top of the trailer) in accordance with the requirements of CVC Section 23114				7-14%
PAVED ROADS				
• Sweep streets at the end of the day if visible soil material is carried onto adjacent public paved roads (recommend water sweepers with reclaimed water)				25-60%
• Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash off trucks and any equipment leaving the site each trip				40-70%

NQ = Not Quantified

* These efficiencies represent additive reductions from unmitigated PM10 construction emissions (Table 9-3). The resulting emission reductions can be subtracted from the unmitigated subtotals (Unpaved Road, Paved Road, Demolition, Grading, Asbestos). These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix 11.

** Additive reductions: Reductions in emissions obtained from one source category, then added to that from another source category.

When efficiency is provided as a range:
If project-specific efficiency is unknown, use the lowest number given;
If project-specific efficiency is utilized, provide supporting analysis and documentation.

(continued on next page)

AR0072922

Table 11-4. Mitigation for PM10 Emissions - Construction (continued)

UNPAVED ROADS				
• Apply water three times daily, or non-toxic soil stabilizers according to manufacturers' specifications, to all unpaved parking or staging areas or unpaved road surfaces				45-85%
• Traffic speeds on all unpaved roads to be reduced to 15 mph or less				40-70%
• Pave construction roads that have a traffic volume of more than 50 daily trips by construction equipment, 150 total daily trips for all vehicles				92.5%
• Pave all construction access roads at least 100 feet on to the site from the main road				92.5%
• Pave construction roads that have a daily traffic volume of less than 50 vehicular trips				92.5%

* These efficiencies represent additive reductions from unmitigated PM10 construction emissions (Table 9-2). The resulting emission reductions can be subtracted from the unmitigated subtotals (Unpaved Road, Paved Road, Demolition, Grading, Asbestos). These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix 11.

– Additive reductions: Reductions in emissions obtained from one source category, then added to that from another source category.

When efficiency is provided as a range:
If project-specific efficiency is unknown, use the lowest number given;
If project-specific efficiency is utilized, provide supporting analysis and documentation.

• Include satellite telecommunications centers in residential subdivisions	0.1-0.7%	0.1-0.9%	0.1-0.9%	0.1-0.9%
• Establish a shuttle service from residential subdivisions to commercial core areas	0.1-0.2%	0.1-0.3%	0.1-0.3%	0.1-0.3%
• Construct on-site or off-site bus turnouts, passenger benches, and shelters	0.2-1.9%	0.2-2.5%	0.2-2.5%	0.2-2.5%
• Construct off-site pedestrian facility improvements, such as overpasses and wider sidewalks	0.1-0.3%	0.1-0.4%	0.1-0.4%	0.1-0.4%
• Include retail services within or adjacent to residential subdivisions	1.0-4.0%	1.3-6.0%	1.3-6.0%	1.3-6.0%
• Provide shuttles to major rail transit centers or multi-modal stations	0.1-0.3%	0.1-0.5%	0.1-0.5%	0.1-0.5%
• Contribute to regional transit systems (e.g., right-of-way, capital improvements, etc.)	NQ			
• Synchronize traffic lights on streets impacted by development	4.0-8.0%	4.0-8.0%	4.0-8.0%	4.0-8.0%
• Construct, contribute, or dedicate land for the provision of off-site bicycle trails linking the facility to designated bicycle commuting routes	0.1-0.6%	0.1-0.8%	0.1-0.8%	0.1-0.8%

* These efficiencies represent additive reductions from facility operations, specifically unmitigated emissions from On-Road Mobile Sources (i.e., Work Trips, Non-Work Trips, Congestion Relief, Truck Trips, Off-Road Vehicles). These efficiencies can be subtracted from the corresponding unmitigated emissions from this category (Table 9-7). These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix 11.

Where efficiency is provided as a range:
If project-specific efficiency is unknown, use the lowest number given;
If project-specific efficiency is utilized, provide supporting analysis and documentation.

AR0072925

Table 11-6h. Mitigation for On-Road Mobile Source Emissions - Operation (Commerical)

• Provide preferential parking spaces for carpools and vanpools and provide 7'2" minimum vertical clearance in parking facilities for vanpool access	0.1-1.0%	0.1-1.3%	0.1-1.3%	0.1-1.3%
• Implement on-site circulation plan in parking lots to reduce vehicle queuing	NQ			
• Improve traffic flow at drive-throughs by designing separate windows for different functions and by providing temporary parking for orders not immediately ready for pickup	NQ			
• Provide video-conference facilities	NQ			
• Set up resident worker training programs to improve job/housing balance	NQ			
• Implement home dispatching system where employees receive routing schedule by phone instead of driving to work	Negl.	0.1%	0.1%	0.1%
• Develop a program to minimize the use of fleet vehicles during smog alerts (for businesses not subject to Regulation XV or XII)	NQ			
• Use low-emission fleet vehicles - TLEV - ULEV - LEV - ZEV	NQ			
• Reduce employee parking spaces for those businesses subject to Regulation XV	0.1-2.2%	0.1-2.9%	0.1-2.9%	0.1-2.9%

* These efficiencies represent additive reductions from facility operations, specifically unmitigated emissions from On-Road Mobile Sources (i.e., Work Trips, Non-Work Trips, Congestion Relief, Truck Trips, Off-Road Vehicles). These efficiencies can be subtracted from the corresponding unmitigated emissions from this category (Table 9-7). These data will be updated as more information becomes available. More detailed descriptions of mitigation measures are included in Appendix H.

When efficiency is provided as a range:
If project-specific efficiency is unknown, use the lowest number given;
If project-specific efficiency is utilized, provide supporting analysis and documentation.

AR0072938

Table 11-10. Steps for Mitigating Project Unmitigated Emissions (Screening Analysis)

(The following steps correspond to the unshaded portion of the flow chart in Figure 11-1.)

7. If a project is significant, apply all feasible mitigation for construction and/or operation. To calculate emission reductions, multiply the percent efficiency by the unmitigated emissions from the same source category, then subtract the result from unmitigated emissions. The following lists unmitigated emission sources and corresponding mitigation measures: 9-1 and 11-3 (Total Construction); 9-2 and 11-4 (Construction PM10); Table 9-3 and 11-2 (Construction Workers' Travel); 9-7 and 11-6 (Operation Mobile); and 9-8 and 11-7 (Operation Stationary).

8. If the project's construction and operation impacts are not significant, the lead agency has the discretion to require further analysis of impacts if the project has other potential air quality impacts (Section 6.2).

9. Compare construction and operation emissions to the thresholds of significance (Section 6.2).

10. If the project's construction AND/OR operation emissions remain above significance thresholds, apply qualitative mitigation measures that have not been quantified (Section 11.9). These can be found in Tables 11-2, 11-3, 11-4, 11-6, or 11-7, or can represent unlisted measures.

11. If the project's construction AND operation impacts are reduced below the thresholds of significance, an MND is appropriate.

12. Determine if the project's construction AND/OR operation emissions still exceed the thresholds of significance.

13. If construction AND operation emissions fall below thresholds of significance, an MND is appropriate.

14. If construction AND operation emissions remain above the significance thresholds, an EIR should be prepared. Appendices 9 and 11 should be used to calculate specific emissions.

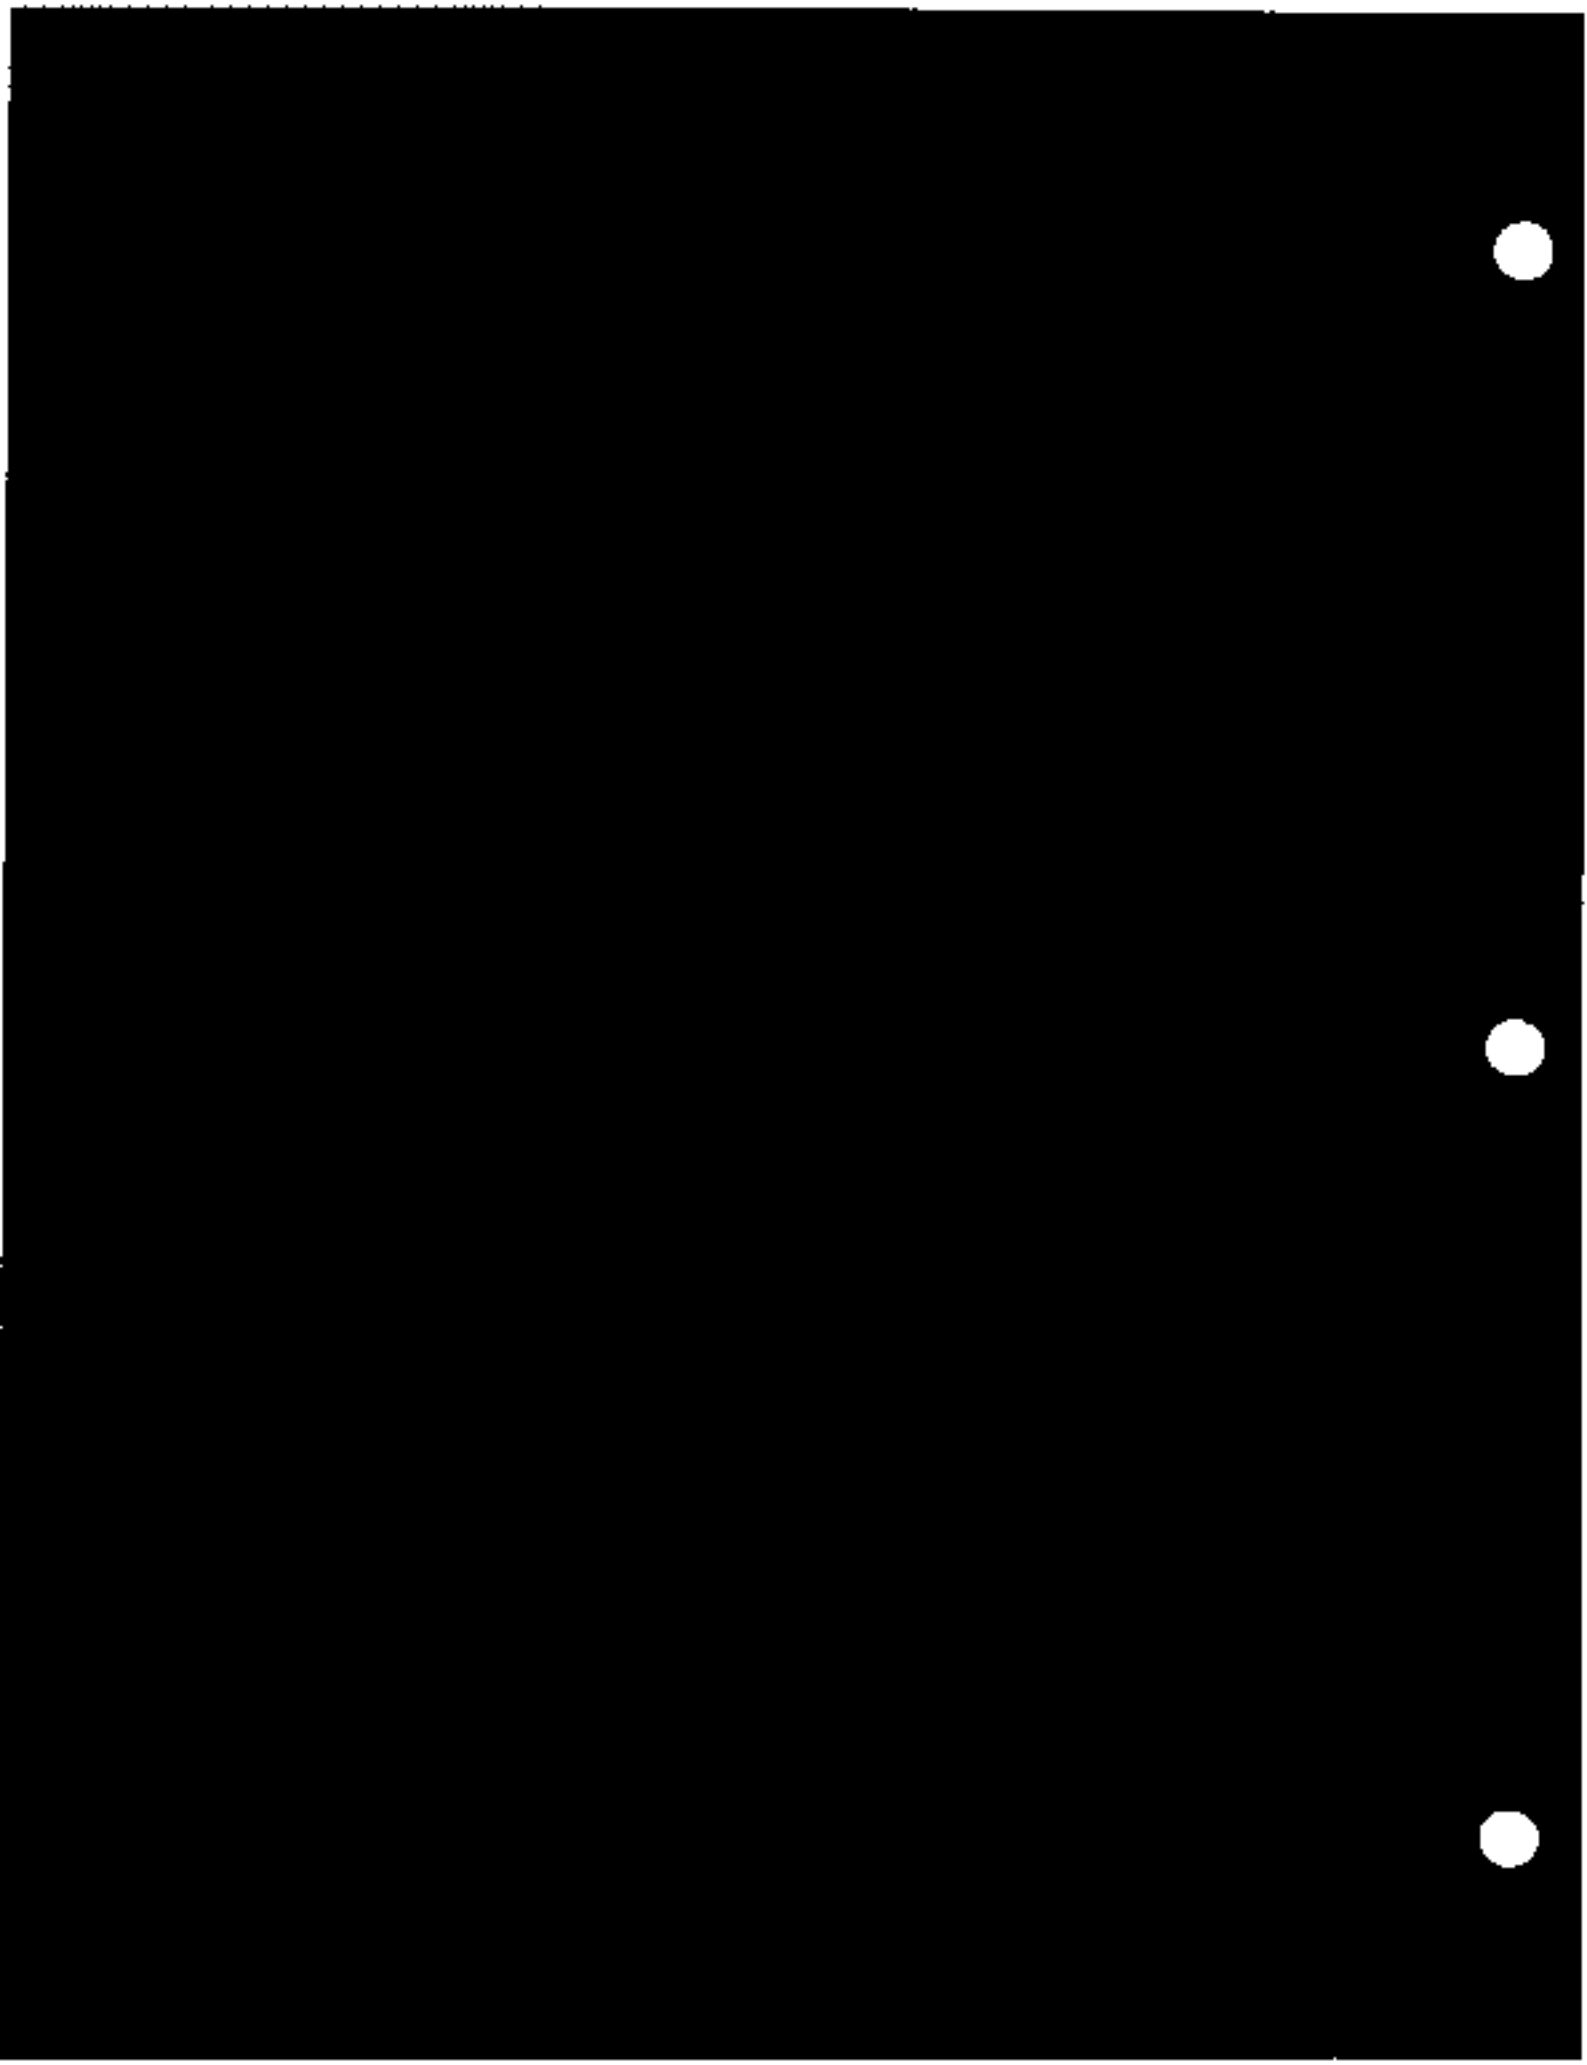
15. If a project is not cumulatively significant, an ND is appropriate.

16. If a project is cumulatively significant, an EIR or MND is appropriate. Appendices 9 and 11 should be used to calculate project-specific emissions.

17. Apply all feasible mitigation measures.

AR0072939

[redacted]



ASSESSING CONSISTENCY WITH APPLICABLE REGIONAL PLANS

CHAPTER 12

Information should be provided in the EIR to determine consistency of a project with the AQMP and other applicable regional plans. Consistency is different from conformity. Consistency is a CEQA requirement. Conformity is a federal Clean Air Act requirement. Specifically, the federal Clean Air Act prohibits federal departments, agencies, or other agencies acting on behalf of the federal government, and the Metropolitan Planning Organization (MPO) which is SCAG from engaging in, supporting in any way, providing financial assistance for, licensing or permitting, or approving any activity that does not conform to the AQMP. For projects involving federal approval, the federal agency is the lead agency for making the conformity finding. In the case of transportation plans and programs, the MPO, SCAG, is responsible for conformity of its actions. The EPA is developing guidance for determining conformity of non-transportation related projects and actions, and transportation projects, plans, and programs. Refer to this guidance when preparing a conformity analysis.

Use the guidelines provided in this chapter for assessing consistency with regional plans relating to air quality as required under CEQA.

12.1 Overview of Consistency with Regional Plans

Section 15125 of the State CEQA Guidelines requires that EIRs analyze and discuss any inconsistencies between the proposed project and applicable General Plans and regional plans. As such, the EIR should address the General Plans and regional plans in the SCAB, Coachella Valley, and Antelope Valley that are applicable to the project.

Specifically, the EIR should discuss the project's consistency with the current AQMP or Coachella Valley PM10 State Implementation Plan (if the project is located in the Coachella Valley). In addition, several of the underlying key assumptions for both the air quality plans should be included in the analysis as well:

- Assumptions such as the number and location of population, housing units, and employment from the SCAG Growth Management Plan (GMP).
- Assumptions concerning type, size, and location of transportation infrastructure from SCAG's Regional Mobility Plan (RMP).
- Consistency with a local government's Air Quality Element or air quality related policies in other General Plan Elements, if the local government has adopted such policies.

The purpose of the consistency finding is to determine if a project is inconsistent with the assumptions and objectives of the regional air quality plans, and thus if it would interfere with the region's ability to comply with federal and state air quality standards. If the project is inconsistent, local governments should consider project modifications or inclusion of mitigation to eliminate the inconsistency. It is important to note that even if a project is found consistent it could still have a significant impact on air quality under CEQA. For example, if the analysis demonstrates a project is consistent with the regional air quality plans and local Air Quality Element, that does not mean that the project could not also have a significant effect on air quality by exceeding the significance thresholds.

12.2 Consistency with AQMP/PM10 Plan

The consistency determination at the environmental review stage in the planning process plays an essential role in local agency project review by linking local planning (e.g. General Plan and Specific Plans) to the AQMP and PM10 Plan in the following ways. It fulfills the CEQA goal of fully informing local agency decision makers of the environmental costs of projects under consideration and does so at a stage early enough to ensure that air quality concerns are fully addressed. It provides the local agency with ongoing information assuring local decision makers that they are making real contributions to the

AR0072942

clean air goals contained in the 1991 AQMP and PM10 Plan. Only new or amended General Plan Elements, Specific Plans, and significant projects need to undergo a consistency review. This is because the AQMP control strategy is based on projections from local General Plans. As such, projects consistent with local General Plans are considered consistent with the air quality related regional plans.

Consistency with the AQMP and PM10 Plan means that a project is consistent with the goals, objectives, and assumptions in the respective plan to achieve the federal and state air quality standards. As part of assessing consistency with the AQMP, consistency should also be assessed with the following regional plans:

- **AQMP/PM10 Plan**

If the project is in the SCAB or SEDAB (under District's jurisdiction), consistency with the AQMP (and PM10 plan for the Coachella Valley) should be assessed. Section 12.3 provides guidance in performing a consistency analysis. In addition to assessing consistency with the AQMP, a project should also be assessed with two of the regional planning documents prepared by SCAG that relate to air quality: the Growth Management Plan, and the Regional Mobility Plan.

Growth Management Plan (GMP). The growth projections and location of population should be compared to the growth the project will generate. That is important because the GMP was used to determine the control strategy needed to attain the federal and state clean air standards, while accommodating future growth. This can be accomplished by comparing the project's density, location, and land use pattern with the adopted local General Plan and associated zoning ordinance and maps that were in place in 1989 when the GMP was adopted. If the project will result in a significant change in the density, location, and land use pattern, then it is considered to be inconsistent with the GMP. For General Plan amendments and projects involving a significant change to the General Plan, a comparison to the growth projections in the appropriate regional statistic area (RSA) for the build-out year should be performed to determine consistency.

Regional Mobility Plan (RMP). If the project is a transportation project, it should be compared to the assumptions in the RMP concerning the type, size, and location of the project. The comparison is necessary because many of these transportation projects are relied upon in the AQMP to reduce emissions.

- **Congestion Management Plan (CMP)**

Projects should be compared to the CMP goals to retain and obtain certain levels of service on roadways. When the impact of a project will be reduced by transit use, the trip assignment that the project assumes must be consistent with the transit provider's assumptions. The local CMP should be consulted when assessing consistency. Consistency with the CMP is important to air quality because vehicles traveling at slower speeds generate more pollution than those traveling at higher speeds (up to 55 mph).

- **Consistency With General Plans**

Both CEQA and the California planning, zoning and development laws require projects to be consistent with the jurisdiction's General Plan. The EIR should identify if the local government has an Air Quality Element or has incorporated air quality goals and objectives into another element of the General Plan. This project should be evaluated for consistency with the appropriate element. Examples of air quality related goals that can be included in a General Plan are identified in Table 12-1.

12.3 AQMP Consistency

New or amended General Plan Elements (including land use zoning and density amendments), Specific Plans, and significant projects must be analyzed for consistency with the AQMP. There are two key indicators of consistency:

AR0072943

(1) Whether the project will not result in an increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay timely attainment of air quality standards or the interim emission reductions specified in the AQMP (except as provided for CO in Section 9.4 for relocating CO hot spots).

(2) Whether the project will exceed the assumptions in the AQMP in 2010 or increments based on the year of project build-out and phase (Table 12-2).

In order to address the first criterion, an air quality modeling analysis that identified the projects impact on air quality will need to be performed. As with the CO analysis, the "No Project" ambient concentration should be determined using information from District monitoring stations (refer to Chapter 9). In order to be found consistent, the analysis will need to demonstrate that the project's emissions will not increase the frequency or the severity of existing violations, or contribute to a new violation at the project. The violations that are referred to are the state and federal criteria pollutant ambient air quality standards (refer to Chapter 3). The analysis must look at each phase and build-out, and include a no-project and project alternatives analysis.

Consistency with the AQMP assumptions is determined by performing an analysis of the project with the assumptions in the AQMP for the year 2010. Table 12-2 identifies the types of projects and assumptions they should be compared with. Additionally, those types of land uses identified need to undergo an emissions analysis. The information regarding specific assumptions can be obtained from the District or SCAG. When specific information for a build-out year is not available, data that is available between the two nearest dates can be interpolated to estimate the assumptions for the interim years.

If the air quality modeling demonstrates that the project is inconsistent with the AQMP, the project can be modified and mitigation measures applied. However, before a determination of consistency can be made, the project must quantitatively demonstrate that such modifications or mitigation measures fully offset the negative impact on air quality, such that the project can be found consistent with the applicable regional plan; otherwise the project is considered significant. Any mitigation applied to reduce the impact must meet the test of having adequate funding, a legally binding commitment to ensure implementation, and a showing that it will be implemented simultaneous with the impact.

12.4 Consistency Findings

CEQA states that an agency has the authority to approve projects with the potential to cause significant adverse environmental impacts (California Public Resource Code 21002 and State CEQA Guidelines 15092 and 15093). Thus, even if a project is found inconsistent with the AQMP and a net degradation of Basin air quality could occur, a local agency may approve a discretionary land use project or a government project that results in unmitigated air pollutant emissions.

On the other hand, some state and federal statutes affect local agency discretion to trade off social, economic, or other benefits for significant impacts on air quality. The federal Clean Air Act establishes requirements to prevent air quality degradation beyond established standards. The SCAB exceeds federal standards for five pollutants at this time. The AQMP represents the regional plan for attaining both the federal and state clean air goals. Therefore, any findings of overriding considerations for projects that are not consistent with the AQMP should consider the potential ramifications. Specifically, that the region will not be able to achieve the air quality standards within the time frame specified in law, potential restrictions on federal funding, imposition of a federal plan and regulations, federal sanctions and/or the need for regulation of additional sources in order to make up the emission reductions lost.

THE DISTRICT AS A RESPONSIBLE AGENCY

CHAPTER 13

According to the State CEQA Guidelines, a responsible agency is a public agency that proposes to carry out or approve an aspect of the project for which a lead agency is preparing environmental documentation. The District is a responsible agency for aspects of projects requiring District permits. The District is a commenting agency for those portions of a project not subject to a District permit. As a responsible agency, the District will review, comment, and establish mitigation whenever necessary to reduce air quality impacts for those aspects of the project relating to the District's permit. For example, a hospital would probably require permits from the District (boilers, sterilization apparatus, etc.), and as such, the District would be a responsible agency under CEQA for those aspects of the project relating to the permit. For the other aspects of the project that could impact air quality such as non-work vehicle trips, the District would recommend mitigation measures for reducing these environmental impacts as a commenting agency.

Most of the District permits are considered to be either ministerial or exempt (statutorily or categorically), or to have a non-significant effect on air quality. (Refer to District CEQA Guidelines, Articles 18, 19, 20 and 21.) As such, the environmental documentation prepared by the lead agency should in most cases be sufficient to cover the District's subsequent permit action. In those cases, where the District action is not considered to be ministerial or exempt, the environmental documentation prepared by the lead agency should include an environmental analysis description and recommended mitigation for any impacts resulting from the District permit, if that document is intended to suffice for the District permit.

13.1 Thresholds for District Permits

Currently, the District uses the thresholds for significance specified in this Handbook for determining which projects requiring District permits could have a significant effect on the environment. When the District's CEQA Guidelines are revised, these thresholds may be revised. A number of qualitative thresholds have also been identified.

Projects requiring District permits may significantly affect the environment when any of the following is involved:

- Criteria emissions that are not regulated under a District rule with an established emissions limitation over the following thresholds--
  - 55 pounds per day for ROC
  - 55 pounds per day for NOx
  - 150 pounds per day for PM10
  - 550 pounds per day for CO
  - 150 pounds per day for SOx
- Carcinogenic or toxic air contaminants identified in Rule 1401 are emitted from the project that exceed the maximum individual cancer risk of one in one million or 10 in one million if the project is constructed with best available control technology for toxics (T-BACT).
- The project may result in the accidental release of an acutely hazardous air pollutant.
- The project could emit an air contaminant not regulated by District Rules, but that is on the federal or state air toxics list (Appendix 3).

AR0072950

Refer to Table 4-1 in Chapter 4 which provides a list of land uses likely to involve equipment that will meet these criteria. For these projects, the District assesses the environmental documentation already prepared for the land use approval by the local government. If that analysis is sufficient, the District will not require additional environmental documentation. If the analysis is not sufficient, the District will assume a lead agency role for the District permits, if authorized pursuant to CEQA Guidelines Section 15052, or prepare a subsequent EIR, if appropriate, pursuant to CEQA Guidelines Section 15162, since the project could have potentially significant air quality impacts.

13.2 Environmental Analysis

The District has determined that in some situations various air pollution control equipment may generate cross-media environmental impacts, or in some cases the reduction of one air pollutant may result in an increase in another air pollutant. A cross-media impact refers to the removal of a contaminant from one medium, such as air, and release to another medium, such as water. Cross-media impacts should be identified and discussed as part of the environmental documentation for the project. These impacts may require analysis in a CEQA document to determine the significance of the impact. If necessary, suitable mitigation measures will be required.

Cross-media impacts should be investigated during the Initial Study for all significant projects where the District is a responsible agency to determine whether there is the potential for a significant impact. When an EIR is prepared for the project, the environmental documentation should include an analysis of cross-media impacts, and based on that analysis, incorporate a finding that the cross-media impact is either significant or insignificant.

The environmental analysis should identify the control technology to be used and any potential cross-media impacts. The purpose of the analysis is to identify multi-media impacts as a result of the permitting action. Since these potential environmental impacts are within the responsibility of agencies other than the District, these other agencies should be consulted through the CEQA review process to determine if the impact is significant and what recommendations for mitigation should be made. Often the responsible agency will be a water supply agency, Regional Water Quality Control Board, wastewater treatment agency, and agency responsible for solid waste disposal. The analysis of the potential cross-media impacts should be performed whenever the District has a subsequent permitting responsibility and an EIR is being prepared.

The significance of a cross-media impact should be determined by the thresholds established by the responsible agency (e.g., sanitation district, water quality control board, etc.). To date, only the Solid Waste Management Boards have established a threshold of significance, which is a ten percent increase in the capacity utilization of a solid waste disposal facility.

There will be some cases where the District will not be able to use another agency's environmental documentation. An example would be environmental documents considered by the District to have insufficient analysis of the potential environmental impacts. Projects with significant emissions, involving toxic emissions, or threatened releases of acutely hazardous materials most likely will fall in this category. In other instances, the project proponent may not know which specific control technology will be used in the project, and in that case, the environmental analysis will need to wait until the applicant applies for the permit.

Appendix 13 describes the specific control technologies, potential cross-media impacts of the different control technologies, and identification of agencies that should be consulted as responsible or commenting agencies. The analysis described in Appendix 13 must be followed for EIRs where the District will be taking a subsequent permit action.

AR0072951

DISTRICT REVIEW AND COMMENTING PROCESS

CHAPTER 14

The air quality analysis in an EIR (or other environmental documentation) is often so technical that only a specialist in air quality can ensure that it is adequate. This is particularly true as evaluation of impacts becomes more complex and concern over toxic emissions grows. Given the severity of air quality problems already plaguing the region and the certainty of continued population growth, it is imperative that air quality analyses be adequate in relation to CEQA standards. In addition, CEQA Guidelines Section 15086 requires lead agencies to consult responsible agencies, other agencies which exercise authority over resources which may be affected by the project, and any person who has special expertise with respect to any environmental impact involved. The District, therefore, has established a program for reviewing and commenting on the air quality analyses in environmental documents submitted to the District pursuant to CEQA Guidelines Sections 15086, 15087, and 15096.

This chapter should be consulted prior to the public review period of an EIR (or other environmental documentation) for any project deemed to have a significant impact on air quality. Refer to Chapter 6 for a listing of the types of projects and emission thresholds that determine which projects are significant.

14.1 Purpose of the District's CEQA Program

The District, as commenting or responsible agency for air quality issues, evaluates the air quality analysis in environmental documents to ensure impacts are accurately identified and mitigation applied to lessen the impact. Lead agencies can be confident that the environmental documents that meet the District's standards for performing an air quality analysis are adequate for decision making.

The District's CEQA program is also intended to provide the framework within which the District will fulfill its role, under CEQA and the Health and Safety Code, as the agency responsible for protecting air quality. Thus, the District is responsible for commenting on any project that may have an adverse impact on air quality within its jurisdictional boundaries (Health and Safety Code, Section 40412). The District is considered to be a responsible agency for any project for which a subsequent District permit is required (refer to Chapter 3) and also has authority over projects that could affect air quality. CEQA (Section 15086) requires the lead agency to consult with and request comments on the draft EIR (or other environmental documentation) from responsible agencies and other involved agencies.

14.2 Role of the District

The District, acting as a commenting and/or responsible agency under CEQA, will review the EIR (or other environmental documentation) and comment on the adequacy of the air quality analysis, as well as recommend mitigation measures. The District will review the air quality analysis according to its uniform standards (refer to Section 14.4). While the Handbook provides general guidance, the District's comment letter is the project-specific review for adequacy under CEQA.

This does not mean, however, that the District's CEQA program moves the District into the role of lead agency with respect to the air quality portion of an EIR (or other environmental documentation).

14.3 District's CEQA Program

The District will review and comment on the air quality analysis in an environmental document during the public review period. The lead agency should send all significant projects with air quality impacts to the District.

In order to determine which projects are considered significant from an air quality perspective, refer to Chapter 6. In order to facilitate the District's review, the following items should be submitted to the District:

AR0072954

- Draft EIR or other environmental documentation
- Any technical appendices that relate to air quality (including traffic impact analysis, growth forecasts, etc.)
- Name and address of the person to whom the District should submit comments
- Date public comments are due
- Mitigation Monitoring Program, if available

This information should be sent to:

CEQA Coordinator
Office of Planning and Technology Advancement
21865 East Copley Drive
P.O. Box 4939
Diamond Bar, CA 91765-0939

Early consultation with the District can ensure that the EIR adequately addresses air quality issues. The District recommends that project proponents and/or local governments consult with the District if the project is an extremely large project encompassing several hundred acres or attracts a large number of trips (such as a stadium, new town, etc.), or if regardless of size the project has the potential to emit substantial amounts of air pollutants, or if project proponents would like to explore innovative mitigation measures for the project (such as energy fuel cells). A planner or project proponent can consult with the District prior to the completion of the EIR or even earlier during the project design phase by contacting the CEQA Coordinator through the District's Local Government/CEQA Unit.

The District will review each portion of the EIR that could have an impact on air quality. In addition to the section entitled "Air Quality," for example, sections that describe impacts on mobility, and hence determine vehicle miles traveled must be considered because transportation contributes substantial emissions. Consideration of air quality relates to such concerns as the levels of congestion experienced at roadway intersections. Waste management issues may also involve air toxics, as can advanced technology and new processes with new materials.

The District will carefully review the air quality analysis and the mitigation measures. At the conclusion of the District's review, local governments will receive a letter identifying any deficiencies in the air quality analysis and recommending mitigation measures.

The flow chart in Figure 14-1 illustrates District involvement in the CEQA process.

14.4 Criteria for the Performance of an Air Quality Analysis

To determine if an air quality analysis is adequate to assess and mitigate a project's impact, a series of criteria has been developed. The District will use these criteria when reviewing the adequacy of an air quality analysis and in recommending mitigation measures. As such, the Districts comments will be based on the following:

(1) Air Quality Analysis

- All emission sources from construction and operation are quantified according to Chapter 9 and Appendix 9 of the CEQA Handbook.
- Most current emission factors are used in calculations.
- Assumptions used in calculating emissions are reasonable.
- Project employs the appropriate environmental document.
- Cumulative impact analysis is performed pursuant to Chapter 9.

AR0072955

- All alternatives are quantified, at a minimum using the screening tables in Chapter 9.
- The baseline information identified in Chapter 8 is included in the EIR.
- A consistency analysis has been performed consistent with Chapter 12.

(2) Mitigation Measures

- Assumptions used in quantifying mitigation are reasonable.
- Mitigation measures are included to reduce cumulative impact projects.
- Mitigation measures are included as appropriate to use.
- Mitigation measures are enforceable as described in Chapter 11.

(3) Mitigation Monitoring

- The lead agency commits to including standards for measuring whether or not air quality mitigation measures have been implemented.
- The lead agency commits to remedial action if air quality mitigation is not implemented.

(4) Toxics

- An impact screening assessment is performed when sensitive receptors are to be sited within a quarter mile of a known source of toxic air pollutants.
- The potential of an accidental release of an acutely hazardous material into the air has been analyzed.

IMPLEMENTING AND MONITORING MITIGATION

CHAPTER 15

Pursuant to AB 3180 (California Public Resources Code), CEQA requires public agencies to monitor and to report on any mitigation required on an approved project. This ensures that the mitigation will be implemented and the environment protected. Mitigation measures, once implemented, should be judged for their effectiveness. Refer to Chapter 11 for further information on developing appropriate mitigation measures. A mitigation monitoring program includes several key components. A checklist is provided in Table 15-1 to assist planners in preparing the mitigation plan.

15.1 Mitigation Monitoring Plan Components

The District recommends that mitigation monitoring plans contain the components described below. The District believes these components are important to fulfilling the monitoring and reporting requirements of CEQA. They will also assist in ensuring that mitigation measures reduce air quality impacts.

Communicating Mitigation Measures and Reporting Requirements. Frequently, the requirements for mitigating impacts and reporting are not properly explained to those responsible. For example, mitigation measures related to construction, such as street sweeping, should be explained to the construction site manager and to contractors. Business owners need to be aware of mitigation measures related to operation, such as transit passes for shoppers at malls. One method of ensuring that those responsible are properly informed is to have contractors and business owners certify, at the time they are issued a business license, that they are aware of and will commit to employing the mitigation measures identified for that project. Mitigation measures could also be recorded on the title of properties, thereby informing future owners of the requirements.

Identification of Agency Responsible for Monitoring. The governmental body responsible for monitoring each mitigation measure should be clearly identified. The lead agency is responsible for the majority of the mitigation measures (including those recommended by commenting agencies).

Identification of Implementation Time Frame. The time frame for implementing the mitigation measures should be identified for each measure. Identification could consist of pinpointing a step in the project approval process when the measure should be implemented, setting a trigger such as when a project produces a certain number of vehicle trips, identifying a project phase, or simply selecting a date.

Establishment of Specific Compliance Criteria. In order to adequately monitor a mitigation measure, it is imperative that the measure have a quantifiable standard or a specific set of actions identified for determining whether or not it has been implemented. Compliance criteria can be the assumptions used in quantifying the mitigation measures, the standard established as a trigger for additional mitigation measures, or criteria based on a qualitative assessment such as odors. (Refer to Chapter 11.)

Identification of Remedial Actions. The program should identify remedial actions that the local government can take, including such measures as fines or court orders. Lead Agencies may also wish to consider having the program provide for the substitution of a more effective mitigation measure by the responsible agency if the current measure proves ineffective. This latter suggestion is not required by CEQA, but could provide an insurance policy for assumed mitigation effects.

Reporting Mechanism and Requirements. The program should state the method of reporting and its requirements. Further it should specify the frequency of monitoring, designate the monitoring party (i.e., building department, planning department, fire department), and identify any agency that should receive periodic activity reports.

An outline of the key components is provided in Table 15-1. This outline can be used as a checklist for determining if the appropriate components are included in the mitigation monitoring program.

AR0072960

15.2 Monitoring and Reporting of Mitigation Measures

In order to determine if measures are being implemented and if the measures are effectively reducing the impact, CEQA requires that a monitoring and reporting system be established. Local governments need to establish a monitoring and reporting system for projects for which they are the lead agency. The District also has a role in local government monitoring and reporting systems when it is a responsible agency for the project.

- **Local Government Monitoring and Reporting Programs**

The key issues in monitoring are: frequency of monitoring, and at what stage in the project permit/construction process mitigation should be monitored. The frequency of monitoring mitigation measures should be based on the duration of implementation of the measures and the amount of monitoring necessary to ensure that measures are implemented. For construction mitigation measures, monitoring during both scheduled building inspections and at a pre-established frequency (such as once a week) is desirable. If the construction phase is extremely long, or if emissions exceed the PM10 standard, or the project is very complex, the local government may want to require continual on-site monitoring.

Operational mitigation measures should be monitored at least once a year, or more frequently if:

- The project is to be developed in phases
- Land uses other than those anticipated during project approval are present
- The project's impacts are extremely significant
- The mitigation measures protect sensitive receptors

Monitoring may be linked to a specific step in the planning process that requires local government approval or inspections. Examples of such steps include:

- Final subdivision map approval
- Grading permit
- Land use clearance permit
- Building permit
- Construction inspections
- Occupancy permit
- Business license
- Discretionary permit annual review

The flow chart in Figure 15-1 identifies types of mitigation measures that can be monitored in each development phase. This is intended to be a general list. Since local government planning processes vary, other steps in the planning process may also exist that can be used to monitor implementation. Table 15-1 provides a sample checklist for monitoring and reporting air quality mitigation measures. Figure 15-2 provides a sample outline of a mitigation monitoring program that contains all the components recommended in Section 15.1. Figure 15-3 provides a sample reporting form to assist local governments in tracking and determining effectiveness of mitigation measures.

Local governments have the authority to levy charges, fees, or assessments to pay for the monitoring and reporting program. Local governments have an opportunity to use the information gathered through the monitoring program to determine if a mitigation measure is effective. The January/February 1989 issue of California Planner suggested that if the measures are not as effective

AR0072961

as intended and the impact remains substantial, the local government may substitute a more effective measure. While not specifically required by CEQA, Lead Agencies can exercise this approach at their option.

- **District and Monitoring and Reporting Programs**

The District is involved in local government monitoring and reporting programs as both a responsible agency and technical resource to local governments. The AB 3180 also requires the District to adopt a mitigation monitoring program for mitigation measures imposed on projects for which the District is the lead agency. As a responsible agency, the District can only impose mitigation measures that are related to the District's permitting authority. For example, the District would be responsible for monitoring mitigation measures relating to the permitting process imposed on projects where the District is a responsible agency under CEQA; however, the District is not responsible for monitoring mitigation measures that it has recommended in the role of a commenting agency. The District can be both a responsible agency for aspects of a project relating to District permitting and a commenting agency relating to other aspects of the project.

The District will, if necessary, recommend mitigation measures when it reviews and comments on a project. In addition, the District may specify required mitigation measures relating to the District's subsequent permitting action and submit monitoring and reporting requirements for these measures. The District will work with local governments to coordinate monitoring of District permit-related mitigation measures when applicable.

The District can assist local governments in monitoring certain mitigation measures by providing its technical expertise or by using District permitting and enforcement activities, particularly when measures relate to District permits; by evaluating air quality monitoring samples; and by making District inspections. In those cases in which local governments identify the District as a responsible monitoring agency for air quality mitigation measures, both the EIR and mitigation monitoring program must be submitted for District review and comments.

15.3 Enforcement

Measures that are critical to mitigating the impact should be legally enforceable. Enforcement depends largely on the implementation mechanism and specificity of the measures. The easiest measures to enforce are those that clearly identify who is going to do what by when. When mitigation fees are involved, it is important to identify when in the planning process the fee should be paid, how much the fee is (or the mechanism for determining the fee), and what the fee is to be used for (identification of the particular program or improvement).

AB 3180 (Cortese), which codified mitigation monitoring requirements, does not provide additional sanctions for local governments to impose if monitoring reveals that the mitigation measures or changes to the project have not been implemented. Local governments can, however, use existing sanctions available to them, such as stop work orders, fines, and restitutions. In addition, a variety of enforceable mechanisms are available to local planners to ensure that the air quality mitigation measures are implemented.

- **Examples of the Enforceable Mechanisms for Mitigation Measures**

Conditions of Approval on Discretionary Permits. Air quality mitigation measures can become conditions of approval on discretionary permits (e.g., conditional use permits, variances, design review permits, subdivision maps, etc.). Local governments have the authority to condition projects as long as the conditions are reasonably related to the discretionary permit. Mitigation measures are related to the project in the sense that through the environmental process these measures have been deemed necessary to reduce the potential environmental impact of the project.

Most mitigation measures are tied to conditions of approval as they relate to a particular step in the planning process. For example, if a mitigation measure that required the planting of shade trees to reduce electrical energy usage had been included in an EIR, a requirement could be made that such trees be planted prior to the issuance of an occupancy permit.

AR0072962

Impact, Mitigation, or Improvement Fees. Local governments are empowered to exact impact, mitigation, or improvement fees from developments as long as the fee meets the nexus test. In most cases, the environmental documentation can establish a nexus by showing that the fee will be used to offset the impact and fund its amelioration.

Impact or mitigation fees support mitigation measures such as transportation demand management (TDM) programs where the program will benefit properties in addition to the project site. Improvement fees are best suited for mitigation measures that involve capital improvements, such as traffic light synchronization, where the improvement involves expenditure of funds beyond the funding that can be reasonably exacted from the project.

Conditions, Covenants, and Restrictions. Through the discretionary permitting process, local governments can require that certain mitigation measures be recorded on a property's conditions, covenants, and restrictions (CC&Rs). CC&Rs can govern aspects of a project including land uses, development standards, responsibilities of property owners and associations, and any other requirements unique to the area covered under the CC&Rs.

Mitigation measures included in CC&Rs may be recorded on the title of the property and made available to future owners and concerned citizens through the county recorder's office. In that way, CC&Rs are effective implementation mechanisms for long-term operational mitigation measures (such as ridesharing requirements) and measures that are expected to be carried out by an association of the owners of individual lots (such as maintaining low-energy lights in the common parking area of a planned unit development). CC&Rs are also effective in ensuring mitigation of projects that are to be built out over a series of several years, such as Specific Plans that will serve as the guide for all future development of the project.

Improvement Securities. Through local ordinances, local government can require project proponents to furnish a security for the performance of any act, agreement, or work. Improvement securities include bonds, deposits with a local agency, a trust account, instrument or letter of credit, or lien. Local governments commonly use improvement securities for items such as construction of capital improvements. Improvement securities can also be used to assure implementation of air quality mitigation measures. Improvement securities would permit a local government to carry out the work if the project proponent failed to implement the measure. Examples include: traffic light synchronization, bus turnouts and passenger benches, and recycling collection service.

Development Agreements. Local governments have the authority to enter into development agreements with any property owner. Development agreements can specify the permitted uses on the property, the density or intensity of use, the maximum height and size of proposed buildings, provisions for reservation or dedication of land for public purposes, and terms and conditions relating to financing public facilities and subsequent reimbursement. The development agreement may include conditions, terms, restrictions, and requirements for subsequent discretionary actions. While development agreements are not specifically entered into to implement mitigation measures, development agreements, if instituted, should incorporate such measures.

The most appropriate measures for inclusion in a development agreement are design and land use related, such as support services in business parks, operational mitigation measures such as participation in a transportation management association, dedications for uses such as bicycle lanes and public transit, and financing of public facilities such as rail transit line extensions. In addition, development agreements are beneficial in establishing trigger mechanisms and requirements for additional mitigation measures, if the existing measures do not prove adequate.

Memorandum of Understanding. Local governments are empowered to enter into memoranda of understanding (MOUs) with other public agencies, private developers, etc., to facilitate a public interest or cause. Mitigating environmental impacts, including those on air quality, fall within these parameters. MOUs are most useful in implementing measures that require a long term commitment on behalf of the project proponent, a partnership between the local government and project proponent, or an enforceable mechanism. For example, an MOU would be appropriate where the commitment calls for the operation of a shuttle service between residences and a commercial district, requiring a long-term enforceable agreement to ensure appropriate implementation.

REPORTING ON PROJECT DISPOSITION

CHAPTER 16

The need for local governments to report to the District on environmental analysis is important for a number of reasons:

- to take credit for actions local governments take to reduce emissions under the AQMP (i.e., reductions from mitigation measures applied to projects)
- to reassess the key assumptions that were used in determining the appropriate attainment strategy that was included in the AQMP (i.e., population projections, etc.)
- to assess cumulative impacts of insignificant projects
- To comply with CEQA

Credit for Local Government Actions. The District is responsible for demonstrating that the SCAB, Coachella Valley and Antelope Valley are making sufficient progress in attaining the federal and state ambient air quality standards. Therefore, the District must show that emissions within its jurisdiction are being reduced and must substantiate its progress through quantitative reporting. In the past, the District has not been able to quantitatively demonstrate reductions in emissions from local government actions, despite the mitigation measures now in force. Therefore, the District is requesting that local governments voluntarily participate in monitoring programs.

When the lead agencies report on the disposition of environmental documents for projects, the District is able to document emission reductions. These reports will also document the progress of local governments in implementing the 1991 AQMP since a heightened CEQA involvement process was included as a control measure (M-H-1) in the Plan. Documenting the contributions of local governments in implementing the AQMP is critical. Without the cooperation of local governments, the region could face a situation in which emission reductions would need to be made up through the application of more stringent regulations and the regulation of smaller sources, and contingency measures would need to be implemented. Additionally, federal funds for transportation and wastewater treatment facilities could be restricted.

Most importantly, recent gains toward cleaning up the air could be set back, and the region would not be able to meet the federal and state ambient air quality standards within the 20-year time frame set out in the 1991 AQMP.

Assessing AQMP Assumptions. The AQMP must set out a comprehensive emissions reduction strategy that demonstrates attainment of National Ambient Air Quality Standards by the deadlines established in the federal Clean Air Act for each type of pollutant. In addition, the AQMP strategy must also achieve federal and state targets for interim emissions reductions. The AQMP strategy forecasts emission levels, based in part on SCAG's forecasts of future employment, population, and travel in the region. SCAG's forecasts reflect trends in the many complex forces which determine regional growth: births, deaths, immigration, emigration, shifts in regional, state, national and international economic factors; and changes in local land use plans and policies. It is important to monitor and regularly update forecasts of future emissions, employment, population, and travel. It is also important that new and existing development implement the measures which the AQMP assumes they will perform.

Cumulative Impacts. Individually, projects may not have a significant impact on air quality, however when considered together the impact may be significant. Annual reporting will assist the District in assessing the impacts that the unmitigated emissions from projects are having on the attainment strategy contained in the AQMP.

CEQA Reporting. CEQA Guidelines Section 15095 requires that lead agencies provide a final certified EIR to responsible agencies. The District requests a copy of the final certified EIR whenever it is a responsible or commenting agency under CEQA. In addition, CEQA Guidelines Section 21092.5

AR0072972

requires lead agencies to provide written responses to public agencies on comments made by that agency at least ten days prior to certifying the final EIR for the project.

Ten days prior to certifying the final EIR, the lead agency should provide the District with written responses to comments made by the District.

Project environmental documentation which the District has commented on should be sent to the District. Specifically, the lead agency should transmit the final environmental documentation and the mitigation monitoring program, along with a District reporting form (see Figure 16-1). The District will use the information on the reporting form relating to unmitigated and mitigated emissions to document local government efforts in implementing the AQMP. In addition, if the project proponent will be applying for a District permit which is covered by the environmental document, it should be submitted to Engineering when the permit is applied for. At that time, the District will make a determination as to whether the environmental documentation is sufficient to cover the District's permitting activity. In addition, the District will request annual reporting of all projects to document region-wide cumulative impacts. SCAG monitors local government actions to assess the key assumptions, such as population forecasts, that went into the AQMP.

16.1 Reporting on Environmental Documents

Local governments are requested to report on the disposition of all significant projects. Refer to Chapter 6 for a list of projects deemed to be significant.

The report should be made to the District within 60 days of approval of the project by the lead agency. The information submitted to the District should include the following:

- Final certified EIR or Mitigated Negative Declaration (MND)
- Mitigation monitoring program
- Completed reporting form

The project disposition reporting form is divided into three sections. Section I requests information on the lead agency, project location, and State Clearinghouse and District project identification numbers (the District assigns identification numbers only to those projects that it has reviewed and commented upon). It is imperative that information on the estimated year of construction and build-out be included on the reporting form.

Section II requests specific information regarding the type and size of the project. The District needs a definitive description of the project in order to quantitatively determine the emission reduction benefits of the CEQA program. It is preferable that planners provide the number of units or square feet of facilities whenever possible. Use acres only when estimates of square footage are not available.

In Section III, planners should identify the emissions produced by the project prior to mitigation (unmitigated emissions), the emissions reductions from mitigation (mitigated emissions), and the emissions that the project will produce with mitigation being applied (net emissions). If the EIR or MND was prepared in accordance with the CEQA Handbook, these emissions estimates should be readily available.

The completed reporting form, along with the final certified EIR or MND, mitigation monitoring program, and response to District comments should be sent to:

CEQA Coordinator
South Coast Air Quality Management District
21865 East Copley Drive
P.O. Box 4939
Diamond Bar, CA 91765-0939

If you have any questions about reporting or completing the reporting form, contact the CEQA Coordinator at (909) 396-3109.

INFORMATION
FOR
TEMPERATURES, AREAS, AND EMISSION FACTORS

AR0072977

TABLE A9 - 5 - I

ESTIMATING TEMPERATURES NEEDED TO CHOOSE COMPOSITE EMISSION FACTORS

The air quality analysis in environmental documents (EIR, NDs, MNDs, etc.) should include emission estimates using average speed, vehicle miles traveled (VMT), average daily trips (ADT) and number of vehicles (NOVs). Composite emission factors are provided in Table A9 - 5 - I, A9 - 5 - K, A9 - 5 - L and A9 - 5 - N of the Appendix 9.

COMPOSITE EMISSION FACTORS

Emission factors associated with gasoline vehicles equipped with and without catalytic converters were combined. These combined factors were added to the diesel-fueled vehicles emission factors to estimate a weighted average between three fuels. For passenger vehicles, the weighted average was for light-duty automobiles and light-duty trucks, and for materials hauling vehicles, the weighted average was for medium-duty, light-heavy-duty, medium-heavy-duty, and heavy-heavy-duty trucks as defined by the California Air Resources Board.

TEMPERATURES FOR EACH POLLUTANT TYPE AND AREA TYPE

Table A9 - 5 - I, A9 - 5 - K, A9 - 5 - L and A9 - 5 - N provide emissions factors for the Areas 1-3.

Area 1	Orange County
Area 2	Los Angeles County
Area 3	Riverside County and San Bernardino County

Temperatures for each area were selected using worst-case scenarios. The ten highest exceedance days experienced, in the counties and subcounties within the District, were examined to determine the worst-case temperatures. Each exceedance day had six two-hour time periods in which high levels were observed. Temperature readings between four time periods were selected. Morning temperatures were averaged for time periods between 6 a.m to 8 a.m., and 9 a.m. to 11 a.m. for each County. For the remainder of the exceedance day, the temperatures between 12 p.m. to 2 p.m., and 3 p.m. to 5 p.m. were averaged for each County.

The lowest temperatures were selected for carbon monoxide (CO) and oxides of nitrogen (NOx), because at lower temperatures incomplete combustion occurs that leads to high CO and NOx emissions. CO emission factors for all areas were adjusted to 60°F. For Area 1, NOx emission factors were adjusted to 70°F, for Area 2 to 75°F, and for Area 3 to 80°F. Temperature correction factors for PM10, sulfur and lead are not currently available. The enclosed emission factors are based on room temperatures (i.e., 75°F) for these three pollutants.

AR0072978

The District takes limited measurements of reactive organic compounds (ROCs). Temperature estimates are based on the 10 worst ozone exceedance days. Ozone is formed from reactions between ROC and NOx in the presence of sunlight. Greater levels of ozone are formed at higher temperatures. ROC emission increases are high during high temperatures due to evaporative and combustive emissions, with minimal evaporative emissions during cooler weather. For Areas 1 and 2, ROC emission factors were adjusted to 85°F, while for Area 3, these were adjusted to 100°F. (0.92 factor was used to convert Total Organic Compounds to Reactive Organic Gases.) Following are the pollutant concentrations exceedance day temperatures and selected temperatures for the composite emission factors:

Time of the Day	Exceedance Temperature			Temperatures For Each Area (°F)
	6-11	12-14	15-17	
Carbon Monoxide (CO)				
Orange (Area 1)	69	71	66	60

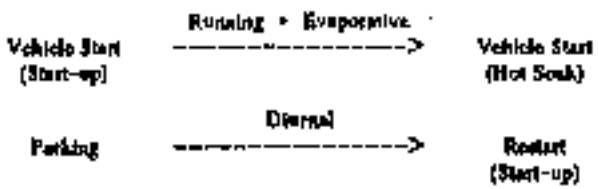
Example of one daily trip.



* Vehicle Miles Traveled (VMT)/Average Daily Trips (ADT) -weighted emission factors:
Includes VMT/ADT from diesel-fueled vehicles (1.11%), gasoline-fueled vehicles equipped with catalyst (97.32%), and gasoline-fueled vehicles not equipped with catalyst (1.57%).

** Number of Vehicles (NOV)-weighted emission factors:
Includes NOV from diesel-fueled vehicles (1.54%), gasoline-fueled vehicles equipped with catalyst (95.06%), and gasoline-fueled vehicles not equipped with catalyst (3.40%).

*** Vehicles with gross vehicle weight 6,000 pounds and less:
Includes ARB's light automobiles, light-duty trucks, vans, station wagons and 4x4 trucks.

Example of one daily trip:

* Vehicle Miles Traveled (VMT) or Average Daily Trips (ADT)-weighted emission factors:
Includes VMT or ADT from diesel-fueled vehicles (33.33%), gasoline-fueled vehicles equipped with catalyst (46.02%), and gasoline-fueled vehicles not equipped with catalyst (20.65%).

** Number of Vehicles (NOV)-weighted emission factors:
Includes NOV from diesel-fueled vehicles (33.33%), gasoline-fueled vehicles equipped with catalyst (37.74%), and gasoline-fueled vehicles not equipped with catalyst (28.93%).

*** Vehicles with gross vehicle weight 6,001 pounds and up:
Includes ARB's medium-duty and light/heavy-duty, medium/heavy-duty and heavy/heavy-duty vehicles, e.g.: construction and demolition materials hauling trucks.

Cold and hot start percentages provided in Table A9 - 5 - M are District assumptions based on ITE manual. For each land-use type (except for a few such as mail delivery, UPS delivery, etc.), all employee-related trips were assumed to be with cold start. Visitors and other short trips were assumed to be with hot starts. Both assumptions were combined to determine above reported hot and cold start percentages. The District recommends use of these percentages only when project-specific data is not available.

Cold start trips result when car is started after one sitting for one hour or more. An example would be cars used to commute to work then not being used until lunch hour trips. In this case both work-trips and lunch trips will be with cold starts. Hot start trips are those trips when car is re-started before one hour of non-use. An example would be a mini-market or gas station where visitors' cars are turned off for less than one hour before they are re-started.

AR0073006

- Use *AM Peak Speeds* to select hot and cold starts emission factors for CO, and NOx; *and,* use *Off Peak Speeds* to select hot and cold start emissions factors.

Table A9 - 5 - M - 1 includes the percent of hot and cold starts on various types of roadways. These percentages may be used for analysis of pollutants in Table A9 - 5 - P and Q as well as to determine project related emission estimates. After determining the number of vehicles on a road, use Table A9 - 5 - M - 1 to determine % cold start and hot start. Remaining vehicles will be at stabilized levels. Then use Table A9 - 5 - M - 3 to determine % passenger vehicles and Trucks for each of the hot and cold start vehicles on that road. Use Table A9 - 5 - G to determine % passenger vehicles and trucks for stabilized vehicles on that road.

The information provided on Table A9 - 5 - M - 1 is from federal EPA Table 26, entitled, <u>For Suggested Ranges of Values of the Percentages of Vehicles Operating in the Cold Mode for Various Conditions of Time and Location</u>. The table includes information for three different cases as follows:

**	Case 1:	No access time added
***	Case 2:	1-minute additional access time
****	Case 3:	2.5-minute additional access time

These cases are identified in Table A9 - 5 - M - 1 by an asterisk.

First six columns: for percentages associated with each vehicle type from total cold starts or hot starts. Last six columns: for hot and cold start percentages associated with each vehicle type from total average daily trips. Bus ADTs, cold starts & hot starts are not included in the totals used to create above data. (Source: ARB)

Fuel Consumption (Gallons per day or per quarter) = (*Daily or quarterly project related VMT x Gallons per VMT)

*VMT = Vehicle Miles Traveled per Day or per Quarter

For total VMT in the county please see Table A - 9 - 14 - A

NCAT = Gasoline-fueled vehicles without catalyst

CAT = Gasoline-fueled vehicles with catalyst

Diesel = Diesel-fueled vehicles

AR0073018

INFORMATION
FOR
ESTIMATING ROLLBACK 8-HOUR AND 1-HOUR PPM LEVELS OF POLLUTANTS

AR0073019

TABLE A9 - 5 - P

ESTIMATING ROLLBACK 8-HOUR PPM LEVELS FOR FUTURE YEARS

(Note: Values used in examples were created, therefore, may not match with values in referenced tables. When performing project-specific analysis always use values from referenced tables and project-specific data. Do not use values from our example in your analysis. For future year CO adjustment factors use Table A9 - 9.)

$E = (\{F \times G\} + \{[G \times H] + [(I \times G \times H) \times (J/K)]\})$ *(See Table A9 - 5 - Q for 1-Hour Levels)*

Where,

- E = Rollback 8-hour PPM levels for the future year.
- F = Percent contribution of that pollutant to ambient levels by stationary (direct) sources. *(District's reports for Air Quality Management Plan or see Table A3 - 1.)*
- G = The highest 8-hour concentration in PPM for the previous three years *(Use the last 3 years of air quality monitoring data.)*
- H = Percent contribution of that pollutant to ambient levels by mobile (indirect) sources. *(District's reports for Air Quality Management Plan or see Table A3 - 1.)*
- I = Percent VMT Growth for that future year

  = [100 x (Future Year VMT - Current Year VMT)]/[Current Year VMT]

  To determine percent increase in VMT, use Table A9 - 14 - A of this Handbook.
- J = Composite (between all autos, trucks, motorcycles, buses, etc.) on-road vehicle emission factor for the future year in grams per mile. See Table A9 - 5 - P - 1
- K = Composite (between passenger vehicles, trucks and other on-road vehicles) emission factor for the current year in grams per mile. See Table A9 - 5 - P - 1

NOTE: Even though the following methodologies in Table A9 - 5 - P - 1 and 2 are included under a methodology that estimates background levels in ppm, these can also be used to estimate composite grams per mile emissions for Caline 4 ppm levels needed to determine CO, NOx and PM10 hot spots, and mass emissions needed to establish project significance.

- *Table A9 - 5 - P - 1 to determine composite emission factor expressed in grams per mile; and,*
- *Table A9 - 5 - P - 2 to determine composite emission factor expressed in grams per minute.*

AR0073020

TABLE A9 - 5 - P - 1

ESTIMATING COMPOSITE EMISSION FACTORS IN GRAMS PER MILE (FOR CALINE 4, BACKGROUND LEVELS OR MASS EMISSIONS)

$$(J) \text{ or } (K) = [(B \times B_{CHS}) + (M \times M_{CHS}) + (P \times P_{CHS}) + (T \times T_{CHS})]/(B + M + P + T)$$

Where,

J = Composite emission factor for future year in **Grams per Mile**

K = Composite emission factor for current year in **Grams per Mile**

B = Bus percent ADT from Table A9 - 5 - G. (If 0.5 %, use 0.5, not 0.005)

B_{CHS} = Bus related composite emission factor between hot start, cold start and stabilized mode

$$= (\{B_C \times [(C_C/A_B) + (D_{RE})]\} + \{B_H \times [(C_H/A_B) + (D_{RE})]\} + \{B_S \times D_{RE}\})/(B_C + B_H + B_S)$$

Where,

B_C = Bus percent cold start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)
(If Table A9 - 5 - M - 1 is used to determine hot and cold start percentages by the road type, use Table A9 - 5 - M - 3 percentages to determine hot and cold start related fleet mix and Table A9 - 5 - G percentages to determine stabilized vehicles related fleet mix)

C_C = Bus cold start emission factor in **grams per trip** from Table A11 - 5 - H

A_B = Bus travel related trip length in miles. If unknown, use 3.59 miles.

D_{RE} = Bus running emission factor in **grams per mile** from Table A11 - 5 - H

B_H = Bus percent hot start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)

C_H = Bus hot start emission factor in **grams per trip** from Table A11 - 5 - H

B_S = Bus percent stabilized estimates, if Table A9 - 5 - M - 1 is used for hot and cold start %
$= [100 - (B_C + B_H)]$

M = Motorcycle percent ADT from Table A9 - 5 - G. (If 0.6 %, use 0.6, not 0.006)

M_{CHS} = Motorcycle related composite emission factor between hot start, cold start and stabilized mode

$$= (\{M_C \times [(N_C/A_M) + (O_{RE})]\} + \{M_H \times [(N_H/A_M) + (O_{RE})]\} + \{M_S \times O_{RE}\})/(M_C + M_H + M_S)$$

Where,

M_C = Motorcycle percent cold start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)
(If Table A9 - 5 - M - 1 is used to determine hot and cold start percentages for the road type, use Table A9 - 5 - M - 3 percentages to determine hot and cold start related fleet mix and Table A9 - 5 - G percentages to determine stabilized vehicles related fleet mix)

N_C = Motorcycle cold start emission factor in grams per trip from Table A9 - 5 - N (1, 2 or 3)

A_M = Motorcycle travel related trip length in miles. If unknown, use 3.59 miles.

O_{RE} = Motorcycle running emission factor in grams per mile from Table A9 - 5 - N (1, 2, or 3)

M_H = Motorcycle percent hot start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)

N_H = Motorcycle hot start emission factor in grams per trip from Table A9 - 5 - N (1, 2, or 3)

M_S = Motorcycle percent stabilized estimates, if Table A9 - 5 - M - 1 is used for hot and cold start %
$= [100 - (M_C + M_H)]$

P = Passenger vehicle ADT from Table A9 - 5 - G. (If 85.0 %, use 85.0, not 0.85)

P_{CHS} = Passenger vehicle related composite emission factor between hot start, cold start and stabilized mode

$$= (\{P_C \times [(Q_C/A_P) + (R_{RE})]\} + \{P_H \times [(Q_H/A_P) + (R_{RE})]\} + \{P_S \times R_{RE}\})/(P_C + P_H + P_S)$$

AR0073021

Where,

P_C = Passenger vehicle percent cold start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)
(If Table A9 - 5 - M - 1 is used to determine hot and cold start percentages for the road type, use Table A9 - 5 - M - 3 percentages to determine hot and cold start related fleet mix and Table A9 - 5 - G percentages to determine stabilized vehicles related fleet mix)

Q_C = Passenger vehicle cold start emission factor in grams per trip from Table A9 - 5 - J

A_P = Passenger vehicle travel related trip length in miles. If unknown, use 3.59 miles.

R_{RE} = Passenger Vehicle running emission factor in grams per mile from Table A9 - 5 - J

P_H = Passenger vehicle percent hot start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)

Q_H = Passenger vehicle hot start emission factor in grams per trip from Table A9 - 5 - J

P_S = Passenger vehicle percent stabilized estimates, if Table A9 - 5 - M - 1 is used for hot and cold start %
$= [100 - (P_C + P_H)]$

T = Trucks or material hauling vehicle ADT from Table A9 - 5 - G. (If 10.0 %, use 10.0, not 0.10)

T_{CHS} = Truck related composite emission factor between hot start, cold start and stabilized mode
$= (\{T_C \times [(U_C/A_T) + (V_{RE})]\} + \{T_H \times [(U_H/A_T) + (V_{RE})]\} + \{T_S \times V_{RE}\})/(T_C + T_H + T_S)$

Where,

T_C = Truck percent cold start estimates from Table A - 9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)
(If Table A9 - 5 - M - 1 is used to determine hot and cold start percentages for the road type, use Table A9 - 5 - M - 3 percentages to determine hot and cold start related fleet mix and Table A9 - 5 - G percentages to determine stabilized vehicles related fleet mix)

U_C = Truck cold start emission factor in grams per trip from Table A9 - 5 - K

A_T = Truck travel related trip length in miles. If unknown, use 3.59 miles.

V_{RE} = Truck running emission factor in grams per mile from Table A9 - 5 - K

T_H = Truck percent hot start estimates from Table A9 - 5 - M - 1 (Caline 4) or 2 (Background or Mass)

U_H = Truck hot start emission factor in grams per trip from Table A9 - 5 - K

T_S = Truck percent stabilized estimates, if Table A9 - 5 - M - 1 is used for hot and cold start %
$= [100 - (T_C + T_H)]$

TABLE A9 - 5 - P - 2

ESTIMATING COMPOSITE EMISSION FACTORS IN GRAMS PER MINUTE

J^* or $K^* = \{[W \times Y]/60$

Where,

J^* = Composite emission factor for future year in grams per minute

K^* = Composite emission factor for current year in grams per minute

W = Freeflow (5 mph or higher) or congested (Lower than 5 mph) travel speed expressed in miles per hour *(see Table A9 - 5 - F for freeflow speeds)*

Y = Composite emission factor expressed in gms per mile at W mph
(Use Table A9 - 5 - P - 1 methodology to estimate grams per mile composite emission factors)

Use the following methodologies to estimate project emissions:

If the distance traveled is in meters (as required in CALINE 4 model)

$E^* = (L \times Y)/(1609.3)$, where,

E^* = Emissions in gms for distance traveled at W mph speed

L^* = Actual distance traveled in meters at W mph speed

If the distance traveled is in miles (as required in the mass-emission estimating model, Table A9 - 5)

$E^* = (L^* \times Y)$, where,

L^* = Actual distance traveled in miles at W mph speed

AR0073022

TABLE A9 - 5- Q

ESTIMATING ROLLBACK 1-HOUR PPM LEVELS FOR FUTURE YEARS
(Parts Per Million or PPM)

(Note: Values used in examples were created, therefore, may not match with values in referenced tables. When performing project-specific analysis always use values from referenced tables and project-specific data. Do not use values from our example in your analysis.)

E = (F)/(G)

Where,

E = Rollback 1-hour PPM levels for the future year.
F = Rollback 8-hour PPM levels for the future year.
(Use Table A9 - 5 - P to determine the value for F.)
G = The highest persistent factor among previous three years.
(To determine 1- to 8-hour persistent factor, use the last 3 years of air quality monitoring data.)
= (H)/(I)

where,

H = 8-hour concentrations for each of the previous three years
I = 1-hour concentrations for each of the previous three years

AR0073023

TABLES FOR ESTIMATING GASOLINE AND DIESEL FUELING EMISSIONS

AR0073024

TABLE A9 - 6

ESTIMATING EMISSIONS FROM GASOLINE AND DIESEL FUELING ACTIVITY
(Pounds Per Day)

$E = [(F/365) \times ((G1, G2 \text{ or } J)/H)] \times I$

Where,

E = Emissions of Reactive Organic Compounds (ROC) or Benzene* From Gasoline Station During Fueling and Storage

F = Amount of Gasoline Dispensed in Gallons per Year (If Unknown, Use 248,000,000 Gallons Per Year For Stations with both controls, Phase I and Phase II; 12,900,000 per year for stations without any Control and 20,900,000 per year for stations with only Phase I Control)

G1, G2 or J = Emission Factor per 1,000 gallons Dispensed

H = 1000; Because the emission factor is used for 1000 gallons

I = 0.92; Use only to convert Total Organic Compounds (TOC) Emissions to ROC emissions. (Do not use "I" for Benzene)

TABLE A9 - 6 - A

EMISSION FACTORS (G1) FOR EACH CRITERIA POLLUTANT FOR INDIVIDUAL ACTIVITIES ASSOCIATED WITH ORIGINAL (REMOVED) EQUIPMENT

(For composite activities emission factor (G2) please see third column of Table A - 9 - 6 - B)

(Pounds Per 1000 Gallons)

Pollutant Type	CO	TOC	NOx	SOx	PM10
Stage I (Storage Tank Loading and Storing)					
Storage					
Breath-Underground Tank	N/A	1.0	N/A	N/A	N/A
Loading					
Splash Filling	N/A	11.50	N/A	N/A	N/A
Sub-Fill No Control	N/A	7.30	N/A	N/A	N/A
Unloading	N/A	1.00	N/A	N/A	N/A
Sub-Fill Balanced	N/A	0.30	N/A	N/A	N/A
Stage II (Motor Vehicle Fueling)					
No Vapor Control	N/A	11.00	N/A	N/A	N/A
No Liquid Control	N/A	0.67	N/A	N/A	N/A
Vapor Controlled	N/A	0.90	N/A	N/A	N/A

N/A = Not Applicable

TABLE A9 - 6 - B

EMISSION FACTORS (J) FOR BENZENE* AND EQUIVALENT EMISSION FACTORS (G2) FOR TOC IN VEHICULAR FUELING AND STORING COMPOSITE ACTIVITIES
(Pounds per 1000 Gallons)

(NOTE: Benzene is identified as a carcinogenic air contaminant, which should be quantified using above methodology)

	Benzene Emissions (J)	TOC Emissions (G2)
Phase I and II Control	0.0138 lbs. / 1000 gallons	1.725 lbs. / 1000 gallons
Phase I Only	0.0974 lbs. / 1000 gallons	12.175 lbs. / 1000 gallons
No Control	0.1696 lbs. / 1000 gallons	21.200 lbs. / 1000 gallons

* **If ROC (E) is estimated using "G2" emission factors, benzene emissions can be estimated by the following methodology: $[(E_{ROC}) \times (J)]/[(G2 \times (0.92)]$**

SOURCE: Proposed Airborne Toxic Control Measure for Emissions of Benzene from Retail Service Stations, July 9, 1997

AR0073025

INFORMATION
FOR
AVERAGE VEHICLE RIDERSHIP DETERMINATION

AR0073026

TABLE A9 - 7

ESTIMATING PROJECT-RELATED EXISTING OR CURRENT AVERAGE VEHICLE RIDERSHIP OR OCCUPANCY
(Based on the District's Regulation XV)

CAVR = [F]/[G]; *OR*
CAVR = [{A x B} + {C x D}]/[{(A/E)xB*} + {(C/E)xD*}]

Where,

CAVR = Current or Pre-Mitigation Average Vehicle Ridership

To improve AVR, the number of cars associated with the following should be eliminated or reduced;

- F = Average Persons Arriving in Vehicles at the Project Site; and,
- G = Average Cars Arriving at the Project Site; *OR*
- A = Total Number of 1-Way or 2-Way Trips made with Automobiles, trucks, etc. by 1 Person in 1 Vehicle per Week;
- B = Number of Days Trips made with Automobiles, trucks, etc. by 1 Person in 1 Vehicle per Week;
- C = Total Number of 1-Way or 2-Way Trips made with Motorcycles by 1 Person on 1 Motorcycle per Week;
- D = Number of Days Trips made with Motorcycles by 1 Person on 1 Motorcycle per Week;
- E* = 1.0 or 2.0; *(Used to Determine Number of Cars Arriving at the Project Site).*
- * If A and C were One-Way Trips, then A and C will be divided by 1.0 To obtain Number of Cars.
- * If A and C were Two-Way Trips, then A and C will be divided by 2.0 to obtain Number of Cars.

To improve AVR, the number of cars arriving at the project site must be reduced.
Use Table 11-5 methodologies from Appendix 11 for emission reductions after implementation of each mitigation measure that reduces number of cars arriving at the project site.

AVR for the Vehicles Staying Home but Used for Other Trips = 1/1 = 1:00

Even though the following information is not needed to estimate the work-related AVR, this information should be provided in an environmental document as Non-work Related AVR. Use the following information for Appendix 11 methodologies to estimate emissions from Non-work trips. *The 1991 AQMP states that 5% of the following trips were for Home to Other trips:*

Non-work 1-Way Project Trips = [{(J+K+L+M+N+O+P+Q+R+U) x 0.05} + {(S+T) x V}]; Where,

- J = Number of Persons Walked 1-way
- K = Number of Persons Traveled 1-way by Bicycle
- M = Number of Persons did not travel to the project site due to days off from 3/36 work week
- N = Number of Persons did not travel to the project site due to days off from 4/40 work week
- O = Number of persons did not travel to the project site due to days off from 9/80 work week
- P = Number of persons did not travel to the project site due to vacation
- Q = Number of persons did not travel to the project site due to sick leave
- R = Number of persons did not travel to the project site because they were absent for reasons other than vacation and sick leaves
- S = Number of persons did not travel to the project site because it was Saturday
- T = Number of persons did not travel to the project site because it was Sunday
- V = Percent Weekend Trips to other

Note: 1-way trip is trip to work.

AR0073027

INFORMATION
FOR
MOBILE EQUIPMENT EMISSIONS

AR0073028

TABLE A9 - 8

ESTIMATING EMISSIONS FROM MOBILE *** EQUIPMENT (EXHAUST AND EVAPORATIVE TYPE) (Pounds Per Day)

$E^{*} = (F \times G) \times H$; or

$E^{**} = (F \times G) \times (K \times L \times M)$

Use Table A9 - 3 of this Handbook with information provided in Tables A9 - 8 - C and A9 - 8 - D

Where,

E* = Time specific exhaust emissions of criteria pollutants in pounds per day or pounds per quarter

F = Source population or number of equipment with the same characteristic information****
(Please see Tables A9 - 8 - A, B, C, D and E for the types of equipment for which this formula can be used)

G = Daily hours or quarterly hours of operation per day per F type equipment
(If unknown, use 8, 16 or 24 hours depending on the number of shifts in a day; use 65 to 91 days per quarter depending on the number of work days in a quarter, and use 261 to 365 days per year depending on the number of work days in a year.)

H = Time specific emission factors in pounds per hour per F type equipment
(Please see Table A9 - 8 - A for time specific emission factors)

E** = Mechanical energy output specific exhaust emissions of criteria pollutants in pounds per day

K = Average rated mechanical energy output for F type equipment in horsepower
(Please see Table A9 - 8 - C for average rated horsepower)

L = Mechanical energy output specific emission factors at 100 % load in pounds per horsepower-hour

M = Fraction for typical load factor *(If unknown, use value from Table A9 - 8 - D divided by 100)*

* Use this formula only when hours of operation of each equipment is available

** Use this formula only when mechanical energy output in horsepower and hours of operation is known.

*** Contact California Air Resources Board (El Monte, California Branch) to obtain the copy of the most recent version of regulations on exhaust emission standards and performance specifications for mobile (off-road) equipment.

**** For an initial study, use Table A9 - 8 - E to estimate number of equipments that can be operated in a day without exceeding construction thresholds.

TABLE A9 - 8 - A

EXHAUST EMISSION FACTORS (H) FOR EACH CRITERIA POLLUTANT
(Pounds Per Hour)

Note: As much as possible use the following emission factors from Table A9 - 8 - A. If these emission factors cannot be applied to your project then only use emission factors provided in Table A9 - 8 - B.

Equipment Type	CO		ROC		NOx		SOx		PM10

*** Fuel types: G = Gasoline-Powered; and D = Diesel-Powered

Source: AP-42 Report, September 1985, Federal Environmental Protection Agency

AR0073029

TABLE A9 - 8 - B

EXHAUST EMISSION FACTORS (L) AT 100% LOAD FOR EACH CRITERIA POLLUTANT

(4-stroke and 2-stroke description applies only to gasoline-powered equipment)

(Pounds Per Horsepower-Hour)

As much as possible use emission factors provided in Table A9 - 8 - A. The following emission factors should be used only if emission factors from previous Table cannot be used. As a last source to estimate construction related exhaust emissions use Tables A9 - 5 - G and A9 - 5 - H. These tables provide methodology to estimate construction related BTU values for a project. Convert daily BTU consumption to daily horsepower-hour (multiply BTUs by 0.000393) consumption and then use the following emission factors.

Equipment Type ***	CO		ROC		NOx		SOx		PM10

TABLE A9 - 8 - E

NUMBER OF CONSTRUCTION EQUIPMENT THAT WILL EXCEED SCAQMD DAILY THRESHOLDS AT 100 PERCENT LOAD
(Based on Emission Factors from Table A9 - 8 - A)

(The following table provides pieces of equipment that can be operated for each category and emissions for that equipment category which will still remain within daily thresholds during 8-hour construction activity.)

EQUIPMENT TYPE	GASOLINE-OPERATED	DIESEL-OPERATED
DETERMINING FACTOR	CARBON MONOXIDE THRESHOLDS (550 Pounds/Day)	OXIDES OF NITROGEN THRESHOLDS (100 Pounds Per Day)
Wheeled Loader	4	6+
Wheeled Tractor	7	9+
Roller	5	14+
Fork Lift - 50 HP	4	28
Fork Lift - 175 HP	4+	8
Trucks: Off-Highway	--	3
Tracked Loader	--	15
Tracked Tractor	--	9+
Scraper	--	3+
Motor Grader	5+	17
Miscellaneous	4	7

\+ *An Additional Equipment in this Category may be Operated for 4 or Less Hours Per Day, and Remain Below the District New Threshold Levels for That Equipment Category*

Note: Table A9 - 8 - E shall only be used as a reference in selecting the amount of potential equipment that may be needed for the project. It shall not be used for estimating emissions. Manufacturers' emission data should be used to determine emission estimates. If manufacturers' data is not available, use applicable tables from appendices. If manufacturers' data is used, make sure that the data is developed using EPA, ARB and SCAQMD approved test protocols.

A9-9

* Default value

** L = Length in feet of the Parking Lot

*** W = Width in feet of the Parking Lot

Note *If value of (L + W) is unknown, use the following methodology to best estimate that value: Multiply the width of a carspace by 3.0 and add it to the length of that carspace. Multiply the addition by number of cars estimated for that parking lot or a project. For a normal size passenger carspace, width is 10 ft and length is 20 ft; for a compact size passenger carspace, width is 7 ft and length is 15 ft.*

***** Tables with examples to estimate emissions and project specific emission factors

AR007303

TABLE A9 - 9 - A

ESTIMATING VEHICLE MILES TRAVELED FOR DUST EMISSIONS

$V = W \times (X/Y) \times Z$

This formula can also be used for estimating vehicle miles traveled (VMT) for Table A9 - 5 of this Handbook

Where,

- V = Vehicle Miles Traveled or VMT (*Use this VMT to estimate fugitive dust and PM10 from fugitive on roads in Table A9 - 9*).
- W = Traveled Distance or Trip Length in miles (*For unpaved haul road, please see Example - 1 for unpaved country road, see Example - 2.*)
- X = Number of vehicles (*See environmental document or analysis for Tables 9 - 5 and 9 - 17*).
- Y = One Hour
- Z = Travel times in hours (*See environmental document or analysis for Tables 9 - 5 and 9 - 17*)

EXAMPLE - 1

EXAMPLE FOR AN UNPAVED HAUL ROAD
(Estimated VMT = 9,000 with the following input assumptions)
(Please do not copy these assumptions, use the project specific data)

	Input Example	Input Examples
W =	Distance	5 miles
X =	Number of Vehicles per hour	150
Z =	Hours of Dust-Causing Activity	12

EXAMPLE - 2

EXAMPLE FOR AN UNPAVED COUNTRY ROAD
(Estimated VMT = 13,500 with the following input assumptions)
(Please do not copy these assumptions, use the project specific data)

	Input Example	Input Examples
W =	Distance	5 miles
X =	Number of Vehicles per hour	150
Z =	Hours of Dust-Causing Activity	18

Note: In above two examples hours of dust-causing activities was changed; therefore, VMT was changed from 9,000 to 13,500 miles. Use project specific estimates.

AR0073040

TABLE A9 - 9 - B

ESTIMATING EMISSIONS FROM PASSENGER VEHICLE TRAVEL ON PAVED ROADS

$E^* = V \times F$ (without street cleaning); or,
$E^{**} = V \times G$ (with street cleaning and is dependent on type of road); or,

Where,

- E^* = Emissions for passenger vehicles on paved roads and paved parking lots without street cleaning,
- V = Vehicle miles Traveled *(See Table A9 - 9 - A to estimate VMT associated with passenger vehicles.)*
- F = Default Emission Factor *(without street cleaning)* of 0.33 Pounds per Mile Traveled
- E^{**} = Emissions for passenger vehicles on paved roads and paved parking lots with street cleaning,
- G = Emission factors *(with street cleaning and is dependent on type of road)* from Sierra Research *(See Table A9 - 9 - B - 1)*

TABLE A9 - 9 - B - 1

PAVED ROAD EMISSION FACTORS - PASSENGERS CARS WITH STREET CLEANING

(Pounds of PM10/Mile Traveled)

Road Type	G
Local Streets	0.018
Collector Streets	0.013
Major Streets/Highways	0.0064
Freeways	0.00065

AR0073041

TABLE A9 - 9 - C

ESTIMATING EMISSIONS FROM TRUCK TRAVEL ON PAVED ROADS

$E = V \times F$

Where,

E = Emissions for Truck Travel on paved roads and paved parking lots without street cleaning.

V = Vehicle miles Traveled (*See Table A9 - 9 - A to eminate VMT associated with trucks.*)

F = Emission Factor for Truck Travel on paved roads and paved parking lots without street cleaning.

$0.77 \times (G \times 0.35])^{0.3}$ in pounds per miles traveled

Where,

G = Surface silt loading in grams/square meter (*Please see Table A9 - 9 - C - 1 for the type of roads and the silt loading*)

TABLE A9 - 9 - C - 1

PAVED ROAD SILT LOADING (G) AND ROAD TYPE - TRUCK TRAVEL

(G = Grams per square meter of the road)

Road Type	G
Construction sites (without cleaning)	300.0
Construction sites (with cleaning)	1.4
Industrial Sites (in operation)	100.0
Local Streets	1.4
Collector Streets	0.9
Major Streets/Highways	0.4
Freeway	0.022

EXAMPLES

Examples of Estimating Emission Factor (F) for Truck on Local Road

(F = pounds per vehicle miles traveled)

Truck on	F
Example 1 Local Road	$F = 0.77 \times ([(G = 1.4) \times 0.35]^{0.3})$ = 0.62
Example 2 Construction Site (without cleaning)	$F = 0.77 \times ([(G = 300) \times 0.35]^{0.3})$ = 3.11

AR0073042

TABLE A9 - 9 - D

ESTIMATING EMISSIONS FROM VEHICLE TRAVEL ON UNPAVED ROADS

$E = V \times F$

Where,

E^* = Emissions for Vehicle Travel on unpaved roads and unpaved parking lots.

V = Vehicle Miles Traveled *(See Table A9 - 9 - A to estimate VMT associated with passenger vehicles.)*

F = Emission Factor for Vehicle Travel on unpaved roads and unpaved parking lots.

$2.1 \times (G/12) \times (H/30) \times \{(I/3)^{0.7}\} \times \{(J/4)^{0.5}\} \times \{(365 - K)/365\}$ in pounds per miles traveled

Where,

G = Surface silt loading in percent *(Please see Table A9 - 9 - D - 1 for the type of road and the silt loading for that road)*

H = Mean vehicle speed in miles per hour *(Please see Table A9 - 9 - D - 2 for the speed assumptions)*

I = Mean vehicle weight in tons *(Please see Table A9 - 9 - D - 3 for mean vehicle weight corresponding to the mean number of wheels)*

J = Mean Number of wheels on vehicles *(Please see Table A9 - 9 - D - 3 for number of wheels corresponding to the mean vehicle weight)*

K = Mean number of days per year with at least 0.01 inches of precipitation *(Please see Table A9 - 9 - D - 4 for number of days of precipitation for the project area)*

TABLE A9 - 9 - D - 1

UNPAVED ROAD SILT LOADING AND ROAD TYPE (G = Percent)

Road Type	G
Gravel Road	4.0
Sand/Gravel Plant Road	6.0
Mining Haul Road	8.0
Crushed Limestone Road	10.0
Mountain Roads	12.0
Stone Quarrying Plant Roads	14.0
Farm Road	16.0
Copper Smelting Plant	18.0
Coal Mine Haul Road (freshly Scraped)	24.0
City and County Road	28.0

TABLE A9 - 9 - D - 2

MEAN VEHICLE SPEEDS (H = Miles per Hour)

Scenario Description	H
Recommended Maximum	15.0
Maximum Allowable	25.0
Worst-case	35.0

AR0073043

TABLE A9 - 9 - D - 3

MEAN NUMBER OF WHEELS (I) AND MEAN NUMBER WEIGHT (J) OF THE VEHICLE

Vehicle Type	Weight of the Vehicle (I)	Number of Wheels (J)
Autos, Light Duty Pick-up Trucks, & Vans	2,000 to 6,000	4
Light Duty Vans and Utility Vehicles	6,001 to 10,000	4 to 6
Motor Homes, Medium Duty Flat-bed Trucks and Multi-stop Trucks	10,001 to 16,000	6 to 8
Heavy-Duty Flat-bed Trucks and Delivery Vans	16,001 to 19,500	6 to 10
Light/Heavy duty garbage dump and ready mix Concrete Trucks, Heavy/Heavy duty fuel and Waste Dump Trucks	19,501 to 33,000	10
Tractor Trailer Trucks	33,001 or More	18 to 30

TABLE A9 - 9 - D - 4

PRECIPITATION CONDITIONS AND NUMBER OF DAYS
(K = Number of Days)

Number of Days	K
Worst-case desert/drought	2.0
Worst-case SCAB/drought	10.0
Average year for desert	18.0
Average year for SCAB	34.0
Average year for mountains	40.0

EXAMPLES

Examples of Estimating Emission Factor (F) for Truck on Local Road
(F = pounds per vehicle miles traveled)

Example 1 **Truck to Pick-up Goods in Drought Conditions**

(F = 2.1 x [(G=28)/12] x [(H=35)/30] x [(I=(10,000 lbs/2,000))/3)^0.7] x [(J=6/4)^0.5] x [(365 - (K=10)}/365]) = 9.73

Example 2 **Truck on Haul Road in Drought Conditions**

(F = 2.1 x [(G=28)/12] x [(H=12)/30] x [(I=(70,000 lbs/2,000))/3)^0.7] x [(J=18/4)^0.5] x [{365-(K=2)}/365]) = 23.08

AR0073044

TABLE A9 - 9 - E

ESTIMATING EMISSIONS FROM WIND EROSION OF STORAGE PILES
(Pounds/Day/Acre)

$E = (1.7 \times [G/1.5] \times [365-H]/235] \times [I/15]) \times J$

Where,

- E = PM10 Emissions from wind erosion of storage piles in pounds per day per acre
- G = Silt content of aggregate in percent (*Please see Table A9 - 9 - E - 1 for the type of aggregate in storage pile and silt content.*)
- H = Number of Days with $\geq$ 0.25 mm (0.01 inch) of precipitation per year (*Please see Table A9 - 9 - E - 2 for number of days in the project area.*)
- I = Percentage of time that the unobstructed wind speed exceeds 12 miles per hour or 5.4 meters/second at mean pile height.
- J = Fraction of Total Suspended Particulates which is estimated at 0.5.

TABLE A9 - 9 - E - 1

SILT CONTENT AND TYPES OF AGGREGATES IN ACTIVE STORAGE PILES
(G = Silt Content of Aggregate in Percent)

Types of Aggregates	G
Limestones	0.5
Sinter	0.7
Crushed Limestones	1.5
Slag and Coke	5.0
Coal	6.0
Overburden	7.5
Blended Ore and Dirt	15.0
Fine Dust	18.0

TABLE A9 - 9 - E - 2

PRECIPITATION CONDITIONS AND NUMBER OF DAYS
(H = Number of Days)

Number of Days	H
Worst-case desert/drought	2.0
Worst-case SCAB/drought	10.0
Average year for desert	18.0
Average year for SCAB	34.0
Average year for mountains	40.0

EXAMPLE

Examples of Estimating Emissions (E) from a Storage Pile
(E = pounds per day per acre)

(E = {1.7 x [(G = 15% = 0.15)/1.5] x [(365 - (H = 10)]/235]) x [(I = 100 % = 100.0)/15]} x [J = 0.5] = 0.86)

AR0073045

TABLE A9 - 9 - F

ESTIMATING EMISSIONS FROM DIRT PUSHING OR BULLDOZING OPERATIONS
(Pounds/Day)

$E = \{[0.45 \times (\{[G]^{1.5}\}/\{[H]^{1.4}\})] \times I\} \times J$

Where,

- E = PM10 Emissions from Dirt Pushing (Bulldozer Type Operations)
- G = Silt content of aggregate in percent (*Please see Table A9 - 9 - F - 1 for the type of aggregate in storage pile and the silt content.*)
- H = Moisture Content of the surface material (*Please see Table A9 - 9 - F - 2 for the moisture content and soil condition.*)
- I = 2.2046; a conversion Factor to convert kilograms per hour to pounds per hour.
- J = Hours of Pushing Operation (*User provides the value for J; See environmental documents.*)

TABLE A9 - 9 - F - 1

SILT CONTENT AND TYPES OF AGGREGATES IN ACTIVE STORAGE PILES
(G = Percent)

Types of Dirt	G
Limestones	0.5
Sinter	0.7
Crushed Limestones	1.5
Slag and Coke	5.0
Coal	6.0
Overburden	7.5
Blended Ore and Dirt	15.0
Fine Dust	18.0

TABLE A9 - 9 - F - 2

DIRT CONDITIONS AND MOISTURE CONTENT
(H = Percent)

Dirt Conditions	H
Dry	2.0
Moist	15.0
Wet	50.0

EXAMPLE

Examples of Estimating Emissions (E) for Dirt Pushing Operations
(E = pounds per day)

$(E = [(\{0.45 \times [(G = 15\ \% = 15.0)^{1.5}]\}/\{[(H = 2.0\ \% = 2.0)^{1.4}]\}) \times I = 2.2046] \times [J = 4\ hours] = 87.36)$

AR0073046

TABLE 9 - 9 - G

ESTIMATING EMISSIONS FROM DIRT PILING OR MATERIAL HANDLING
(Pounds/Day)

$E = [0.00112 \times (([G/5]^{1.3})/([H/2]^{1.4}))] \times [I/J]$

Where,

- E = PM10 Emissions from dirt piling or material handling to form a storage pile on ground
- G = Mean Wind speed in miles per hour (*user should provide this information in environmental documents, or use 12 miles per hour for daily maximum and 25 miles per hour for worst-case scenario.*)
- H = Moisture Content of the surface material (*Please see Table 9 - 9 - G - 1 for the moisture content and soil condition.*)
- I = Pounds of dirt handled or stocked in a storage pile per day (*for truck piling please see Table 9 - 9 - G - 2 for guidelines.*)
- J = 2,000; a conversion factor to convert pounds of dirt to tons of dirt

TABLE 9 - 9 - G - 1

DIRT CONDITIONS AND MOISTURE CONTENT
(H = Percent)

Dirt Conditions	H
Dry	2.0
Moist	15.0
Wet	50.0

TABLE 9 - 9 - G - 2

MAXIMUM DIRT WEIGHT (I) THAT CAN BE STORED IN A TRUCK
(User should provide the value for H. For truck piling use the following for guidelines)

Vehicle Type	Maximum Weight of the Dirt (I)
Light Duty Pick-up Trucks	(2,000 to 6,000) -* (Wt.** of Empty Truck)
Utility Vehicles	(6,001 to 10,000) - (Wt. of Empty Truck)
Medium Duty Flat-bed Trucks and Multi-stop Trucks	(10,001 to 16,000) - (Wt. of Empty Truck)
Heavy-Duty Flat-bed Trucks	(16,001 to 19,500) - (Wt. of Empty Truck)
Light/Heavy duty garbage dump and ready mix Concrete Trucks	(19,5001 to 33,000) - (Wt. of Empty Truck)
Heavy/Heavy duty waste dump trucks, Tractor Trailer Trucks	(33,001 or More) - (Wt. of Empty Truck)

* "-" = Minus sign or subtraction sign ** "Wt." = Weight

EXAMPLE

Example of Estimating Emissions (E) for Dirt Pushing Operations
(E = pounds per day)

$(E = 0.00112 \times (([(G=25\ mph)/5]^{1.3})/([(H=2.0\ \% \div 0.02)/2]^{1.4})) \times (I=[10,000\ lbs/J = 2,000]\ tons) = 28.63)$

AR0073047

TABLE A9 - 9 - H

ESTIMATING EMISSIONS FROM BUILDING WRECKING
(Pounds/Day)

$E = 0.00042^{*} \times J$

Where,
J = Building volume handled per day (*Use environmental documents for the following information*); or
$J = (N \times O \times P)/Q$

where,

N = Width of building in feet
O = Length of building in feet
*P = Height of building in feet
Q = Number of days required to demolish a building

* = Pounds of PM10 Per Cubic Feet

AR0073048

TABLE A9 - 10

ESTIMATING ASBESTOS EMISSIONS FROM DEMOLITION AND RENOVATION ACTIVITIES
(POUNDS PER DAY)

SOURCE TYPE	SOURCE-RELATED ESTIMATIONS	MULTIPLY BY	EMISSION FACTORS (F)	REFERENCE TO TABLES**	EMISSIONS (E) (Pounds/Day)
Asbestos Removal or Asbestos in Structural Debris	_____ Ft^3 of Building Disturbed/Day	X	_____, or (0.00006 lbs/ft^3)*	Table 9 - 10 - A	_____

* Default value

Example: Estimated Value _____, or Estimate Emission Factors Using Project Specific Data and Appropriate Tables

Default Value — Use this value instead of estimating project specific emission factor

** Tables with examples to estimate emissions and project specific emission factors

AR0073050

TABLE A9 - 10 - A

ESTIMATING EMISSIONS FROM DRY REMOVAL OF ASBESTOS

(Emissions associated with wet removal of asbestos should be included as emissions after implementation of mitigation measure. See Table 11 - 10 Appendix 11.)

(Pounds/Day)

$$E = \{[(F/G) \times (H/I) \times (J/K) \times (L/M) \times (N/O) \times (P)]/[(Q) \times (R) \times (S/T) \times (N/O)]\}$$

Where,

E = Asbestos emissions during the dry asbestos removal activities

Ft^3 = Cubic feet

F = Typical number of fibers counted per cubic meter of work area
(5×10^5 to 80×10^5 fibers per cubic meter is the range of asbestos concentration in a typical work area.)

G = 35.315 cubic feet, a conversion factor to convert 1 cubic meter into cubic feet

H = 1.0 nanograms, a weight of 30 asbestos fibers

I = 30.0, number of fibers weigh equivalent to 1 nanogram

J = 2.2046 pounds, a conversion factor to convert 1 kilogram into pounds

K = 10^{12} nanograms, a conversion factor to convert 1 kilogram into nanograms

L = Volume of air released during M hours to the atmosphere during air changes
Usually, equals to = U x V x W x X

Where,

U = Width of a room from which air escapes or is released

V = Length of a room from which air escapes or is released

W = Height of a room from which air escapes or is released

X = number of rooms from which air escapes or is released

M = Rate in Hours by which (L) amount of air is released to the atmosphere

N = 0.0283 cubic meters, a conversion factor to convert 1 cubic foot to cubic meters

O = 1 cubic foot

P = Total number of hours the air is released to the atmosphere

Q = V/r, where,

V = Volume of asbestos bearing surfaces, i.e.,

For Ceiling a x b x c x r

For Pipelines $\{(a \times c \times pi \times [(OD)^2/4]) - (a \times c \times pi \times [(ID)^2/4])\}$

For rectangular or square object — For circular surface

a = Width of the asbestos bearing object — = Length of asbestos bearing object

b = Length of the asbestos bearing object — = Square of outer and/or inner diameter

c = Number of asbestos bearing objects — = Number of asbestos bearing objects

r = Thickness of in-place asbestos in same unit (Foot) as a, b, OD and ID

pi = 3.14159265

R = Thickness of in-place asbestos in inches; — OD = Outer diameter of the pipeline

S = 0.083 feet, a conversion factor to convert 1 inch — ID = Inner diameter of the pipeline = [OD-(2r)]

T = 1.0 inch

AR0073051

EXAMPLE

Example of Estimating Emissions from Dry Removal of Asbestos From a Ceiling

Source: SCAQMD's Rule 1403 staff report

F = 1.5×10^6 fibers per cubic meter of work area
(5×10^6 to 80×10^6 fibers per cubic meter is the range of asbestos concentration in a typical work area.

L = 2,250 Ft^3 of air released during M hours to the atmosphere (U = 15 feet, V = 15 feet, W = 10 feet, & X = 1)

M = 1 Hour (rate of one change per hour)

P = 8 Hours (for 8 hour shift with the rate of one change per hour)

O = 225 square feet of asbestos bearing surface (a = 15, b = 15, c = 1) for rectangular objects; or *[For pipelines (a x c) x (pi x {[(b = outer diameter)^2]/4.0}) - (pi x {[(b = inner diameter)^2]/4.0})]*

R = 0.5 inches [For Pipelines *(a x c) x (pi x {[(b = outer diameter at the asbestos thickness)^2]/4.0}) - (pi x {[(b = inner diameter at the asbestos thickness)^2]/4.0})*]

E = {{[1.5x10^6/35.315]x(1/30)x(2.2046/10^{12})x(2250/1)x(0.0283/1)x(8)}/{(225)x(0.5)x(0.083/1) x (0.0283/1)}}

= 0.00006 pounds of asbestos per cubic feet of structure demolished or renovated

AR0073052

FOR
ENERGY CONSUMPTION IN VARIOUS STRUCTURES

AR0073059

TABLE A9 - 11

EMISSIONS FROM ELECTRICITY CONSUMPTION BY LAND USES
(Pounds Per Day)

$E = (\{F \times G\}/365)/1000) \times H$

Where,

E = Emissions of criteria pollutants in pounds per day due to electricity consumption by land uses

F = Gross square foot (*see Environmental Document*) of each type of land use except for residential uses; *or*
= Number of units for residential land use (*see Environmental Document*)

G = Electricity usage rate to determine annual usage (*see Table A9 - 11 - A*)
Varies according to the type of land use (*see Environmental Document*)

H = Emission factors in pounds per megawatt-hours (*see Table A9 - 11 - B*)
Varies according to the type of criteria pollutant

TABLE A9 - 11 - A

ELECTRICITY USAGE RATE (G)
(To Determine Annual Consumption, Kilowatt-hours)

Land Use Type	Unit Type	Usage Rate Average for Southern California Edison and Los Angeles Dept. of Water and Power
Residential	Kilowatt-hour/Unit/Year	5,626.50
Food Store	Kilowatt-hour/Square feet/Year	53.30
Restaurant	Kilowatt-hour/Square feet/Year	47.45
Hospitals	Kilowatt-hour/Square feet/Year	21.70
Retail	Kilowatt-hour/Square feet/Year	13.55
College/University	Kilowatt-hour/Square feet/Year	11.55
High School	Kilowatt-hour/Square feet/Year	10.50
Elementary School	Kilowatt-hour/Square feet/Year	5.90
Office	Kilowatt-hour/Square feet/Year	12.95
Hotel/Motel	Kilowatt-hour/Square feet/Year	9.95
Warehouse	Kilowatt-hour/Square feet/Year	4.35
Miscellaneous	Kilowatt-hour/Square feet/Year	10.50

TABLE A9 - 11 - B

EMISSION FACTORS (H) FOR EACH CRITERIA POLLUTANT FROM CONSUMPTION OF ELECTRICITY
(Pounds Per Megawatt-Hours)

Pollutant Type	CO	ROC	NOx	SOx	PM10
	0.20	0.01	1.15	0.12	0.04

AR0073060

TABLE A9 - 11 - C

ESTIMATING REMAINING EMISSIONS OF EACH POLLUTANT AFTER REMOVING CONTRIBUTED FRACTIONS BY EACH SOURCE CATEGORY

$N = [(E - (O_1 + O_2 + O_3 + \ldots\ldots O_n)$

Where,

N = Remaining Non-mitigated Electricity consumption emissions after the removal of all source categories for which mitigation measures are included.

E = Total Non-mitigated Electricity Consumption Emissions of a Criteria Pollutant. (*See above methodology*)

$O_1, O_2, O_3, \ldots\ldots O_n$ = Emissions of a Criteria Pollutant Associated with Each Source Category for which mitigation measures are included. (See Table A9 - 11 - D)

TABLE A9 - 11 - D

ESTIMATING PRE-MITIGATION EMISSIONS OF EACH POLLUTANT FOR EACH SOURCE CATEGORY

$O_1, O_2, O_3 \ldots O_n = [(E_R \times I_1)]$, *OR* $[(E_R \times I_2)]$, *OR* $[(E_R \times I_3)]$, *OR*$\ldots\ldots$ $[(E_R \times I_n)]$

Where,

$O_1, O_2, O_3 \ldots O_n$ = Source Category's Market Segment of Total Non-mitigated Emissions
(See Table A9 - 11 - D to determine which source category the mitigation measure is going to impact to obtain emission reductions. Use respective percent value to extract the fraction of non-mitigated emissions associated with that source category.)

E = Total Non-mitigated Electricity Consumption Emissions of Each Pollutant.
(Utilizing Table A9 - 11 - A and Table A9 - 11 - B methodologies)

$I_1, I_2, I_3 \ldots I_n$ = Percent of Total Non-mitigated Emissions For Each Source Category
(See Table A9 - 11 - E to determine which source category the mitigation measure is going to impact to obtain emission reductions. Use respective percent value (fraction) for I to extract the fraction of non-mitigated emissions associated with that source category.)

AR0073061

TABLE A9 - 11 - E

SOURCE CATEGORIES (I) OF PRE-MITIGATION ENERGY USE IN RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SECTORS

(Committee Draft Energy Efficiency Report, 1990, California Energy Commission)

TABLE A9 - 12

ESTIMATING EMISSIONS FROM NATURAL GAS CONSUMPTION BY LAND USE
(Pounds Per Day)

$E = (\{[F \times G]/30\}/1000000) \times H$

Where,

E = Emissions of criteria pollutants due to natural gas consumption land uses

F = Gross square foot of each type of land use (*see Environmental Document*) except for residential and industrial uses; or
= Number of units for residential land use (*see Environmental Document*); or
= Number of meters (per business) as to an industrial park (*see Environmental Document*)

G = Natural gas usage rate to determine daily usage (*see Table A9 - 12 - A*)
Varies according to the type of land use

H = Emission factors in pounds per million cubic feet (*see Table A9 - 12 - B*)
Varies according to the type of criteria pollutant

TABLE A9 - 12 - A

NATURAL GAS USAGE RATE (G)
(To Determine Daily Consumption)

Land Use Type	Unit Type	Usage Factor
Residential		
Single Family Units	Cubic Feet/Unit/Month	6,665.0
Multi-Family Units	Cubic Feet/Unit/Month	4,011.5
Nonresidential		
Industrial	Cubic Feet/Parcel/Month	2,939.6 x 1,000
Hotel/Motel	Cubic Feet/Square Feet/Month	4.8
Retail/Shopping Centers	Cubic Feet/Square Feet/Month	2.9
Office	Cubic Feet/Square Feet/Month	2.0

TABLE A9 - 12 - B

EMISSION FACTORS (H) FOR EACH CRITERIA POLLUTANT From Consumption of Natural Gas
(Pounds Per Million Cubic Feet)

CO	ROC	NOx	SOx	PM10
20.0	5.3	80.0 (*for Residential Use*); or 120.0 (*for Nonresidential Use*)	Negligible	0.2

AR0073063

TABLE A9 - 12 - C

ESTIMATING REMAINING EMISSIONS OF EACH POLLUTANT AFTER REMOVING CONTRIBUTED FRACTIONS BY EACH SOURCE CATEGORY

$N = [E - (O_1 + O_2 + O_3 + \ldots\ldots O_n)]$

Where,

N = Remaining Non-mitigated Natural Gas consumption emissions after the removal of all source categories for which mitigation measures are included.

E = Total Non-mitigated Natural Gas Consumption Emissions of a Criteria Pollutant. (*See above methodology*)

$O_1, O_2, O_3, \ldots\ldots O_n$ = Emissions of a Criteria Pollutant Associated with Each Source Category for which mitigation measures are included. (See Table A9 - 12 - D)

TABLE A9 - 12 - D

ESTIMATING PRE-MITIGATION EMISSIONS OF EACH POLLUTANT FOR EACH SOURCE CATEGORY

$O_1, O_2, O_3 \ldots O_n = [(E_R \times I_1)]$, *OR* $[(E_R \times I_2)]$, *OR* $[(E_R \times I_3)]$, *OR* $\ldots\ldots [(E_R \times I_n)]$

Where,

$O_1, O_2, O_3 \ldots O_n$ = Source Category's Market Segment of Total Non-mitigated Emissions
(*See Table A9 - 12 - D to determine which source category the mitigation measure is going to impact to obtain emission reductions. Use respective percent value to extract the fraction of non-mitigated emissions associated with that source category.*)

E = Total Non-mitigated Natural Gas Consumption Emissions of Each Pollutant.
(*Utilizing Table A9 - 12 - A and Table A9 - 12 - B* methodologies)

$I_1, I_2, I_3 \ldots I_n$ = Percent of Total Non-mitigated Emissions For Each Source Category
(*See Table A9 - 12 - E to determine which source category the mitigation measure is going to impact to obtain emission reductions. Use respective percent value (fraction) for I to extract the fraction of non-mitigated emissions associated with that source category.*)

AR0073065

INFORMATION
FOR
ARCHITECTURAL COATINGS AND OTHER COATING MATERIALS

AR0073066

TABLE A9 - 13

ESTIMATING EVAPORATIVE EMISSIONS FROM ARCHITECTURAL COATINGS AND BUILDING MATERIALS
(Pounds Per Day)

$E = [(F \times G)/(H)] \times [I]$

Where,

E = Non-mitigated emissions of Reactive Organic Compounds (ROCs) from architectural coatings.
(These emissions will be during exterior finish and interior finish phases of the project construction. If these phases are overlapping with other phases of the construction, these emissions should be combined with ROC emissions from other phases. These combined emissions should be used to determine project significance.)

F = Pounds of ROC emissions. (If unknown, use Table A9 - 13 - C for this value. These values are expressed for 1000 square feet area to be coated 1 mil thick .)

G = One mil (0.001 inch) thick total exterior and/or interior area to be coated
(If unknown, use Table A9 - 13 - D methodology to determine this value. Thickness should always be expressed in "mils" for this methodology to work.)
(See Table A9 - 5 - 13 - C for percent transfer efficiency default values.)

H = One thousand (1,000) square feet. *(This value is needed because value for F is for a 1,000 square foot surface area one mil thick.)*

I = Required "mils" of coating thickness for the project. *(If unknown, use 17.5 mils for exterior and interior walls, and 3 mils for wood and metal surfaces. Also, use Table A9 - 13 - A for mil thickness default values for coatings on various surfaces.)*

TABLE A9 - 13 - A

DRY FILM THICKNESS
(Mils)

Surface Type	Thickness
Wood/Metal	1 < 4
Concrete/Masonry	5 < 30

TABLE A9 - 13 - B

TRANSFER EFFICIENCY FRACTIONS
(Percent)

Coating Equipment Type	Transfer Efficiency
Air Atomized Spray	25
HVLP Spray[2]	65
Hand Application[3]	100

1 Architectural coating emissions are currently expressed in terms of Volatile Organic Compounds (VOC), however, the term VOC has been incorporated under the larger category of Reactive Organic Compounds (ROC). *(See Chapter 3, Section 3.1, Ozone, of this Handbook for clarification)*

2 High Volume Low Pressure spray is a coating application system which is operated at air pressure between 0.1 and 10 pounds per square inch gauge (Psig)

3 Application of coatings by manual methods such as paint brush, hand roller, trowel, spatula, dauber, rag or sponge.

AR0073067

TABLE A9 - 13 - C

ESTIMATING NON-MITIGATED EMISSIONS OF REACTIVE ORGANIC COMPOUNDS (ROCs) FROM ARCHITECTURAL COATINGS

(Value for "F" in Pounds for 25 % Transfer Efficiency of Air Atomized Spray Equipment.)

(This table provides VOC[1] (ROC) emissions for 1 mil thick 1000 square feet area for all VOC limits included in Rule 1113. Rule 1113 should be consulted for corresponding coating types.)

Rule 1113 limits (Grams/Liter)	Rule 1113 limits (Pounds/Gallon)	Coatings (Gallons/1000 SF)	Clean-up Solvents Percent	VOCs Lbs
Conventional Coatings				
*(Conventional coatings assumed to have 66.26 percent by weight solids, and 10.45 pounds per gallon density.)***

* If unknown use 2.08 pounds/gallon VOC coatings for exterior walls.

** ARB's test results in 1988 report for Rule 1113 sales survey.

1. Architectural coating emissions are currently expressed in terms of Volatile Organic Compounds (VOC), however, the term VOC has been incorporated under the larger category of Reactive Organic Compounds (ROC). *(See Chapter 3, Section 3.1, Ozone, of this Handbook for clarification.)*

AR0073068

ASSUMPTIONS:

1. The use of solvents in the cleaning and painting of the structures will generate Volatile Organic Compound emissions.
2. Non-mitigated VOCs are those which should not exceed Rule 1113 limits as coating is applied to the surface.
3. After removing % volume of VOC (non-exempt solvent), water and exempt solvents, what remains is the % volume of solids.
4. Non-exempt solvent density is 7.36 pounds per gallon of solvent.
5. Exempt solvent (1, 1, 1 -TCA) density is 11.06 pounds per gallon of solvent.
6. Water density is 8.337 pounds per gallon.
7. Water percent by weight is assumed to be 3.5 times higher than that of exempt solvent in the coating. (ARB's test results in 1988 report for Rule 1113 sales survey.)
8. For non-mitigated emissions, transfer efficiency is 25 percent of solids applied to the surface.
9. Mathematical formulation indicates that 1 gallon of solids will cover 1 mil (0.001 inch) thick a 1604 square foot area. For the same amount of coating if thickness is increased, the size of the area that can be coated with that amount of paint will be proportionally decreased. For the same size of the area if thickness is increased, the amount of coating will be proportionally increased.

TABLE A9 - 13 - D

ESTIMATING SURFACE AREA TO BE COATED

Estimate interior and exterior area to be covered by using the following methodologies:

Residential Structures:

Method 1.

It was estimated that every square foot of floor space would require the coating equivalent of 2.7 square feet of surface area. This may actually be an underestimate, but allows for non-coated surfaces such as windows, fireplaces, cabinets, overhead recessed ceiling lighting, etc.

For single family units consider 1/7 acre of floor surface or lot size per unit (ARB Report March 1990).
For multi-family units 1/20 acre lot size per unit (ARB Report March 1990).

Method 2.

Exterior Wall

1,280 square feet of exterior wall per single-family unit; or,
1,800 square feet of exterior wall on average for other than single-family units.
(Energy and Labor in the Construction Sector, Hannon, et.al.).

Interior Wall

The exterior wall amount can be tripled to consider interior walls, ceiling coatings, trim, etc.

Non-residential Structures:

For nonresidential structures (schools, shopping malls, etc.) rooms will be larger in size, ceilings will be acoustic panels type. In this case, each of the floor areas can be multiplied by 2.0 to obtain the total area to be coated.

Emissions from exterior and interior walls should be estimated and reported separately. These emissions should be combined with emissions from other construction activities.

AR0073069

TABLES TO ESTIMATE CUMULATIVE IMPACTS

AR0073070

TABLE A9 - 14

OPTIONAL CUMULATIVE IMPACT ANALYSIS BASED ON ARB PERFORMANCE STANDARDS

STANDARDS

Rate Of Growth In Vehicle Miles Traveled Must Not Exceed The Rate Of Growth In Population During The Life-span Of The General Plan, Specific Plan, Redevelopment Plan And Project Developments

If A/B > C/D The project is cumulatively significant for population related activities; and, the additional vehicle miles traveled (VMT), average daily trips (ADT) and/or number of vehicles (NOVs) has to be mitigated to the extent feasible before writing the Overriding Consideration.

And/Or

If E/F > G/H The project is cumulatively significant for employment related activities; and, the additional vehicle miles traveled (VMT), average daily trips (ADT) and/or number of vehicles (NOVs) has to be mitigated to the extent feasible before writing the Statement of Overriding Consideration.

Where,

Utilize growth in population to estimate impact on cumulative population related VMT, ADT, or NOV

- A = Calculated or estimated population related VMT, ADT or NOV due to the project development for the build-out year;
- B = Anticipated cumulative population related VMT, ADT or NOV for each county; see Table A9 14 - A;
- C = Calculated or estimated project related population due to the project development for the build-out year
- D = Expected or Anticipated cumulative population for the City or County in the Growth Management Plan and/or by SCAG for the build-out year;

Utilize growth in employment to estimate impact on cumulative employment related VMT, ADT, or NOV

- E = Calculated or estimated employment related VMT, ADT or NOV for each County please see Table A9 - 14 - A;
- G = Calculated or estimated project related employment due to the project development for the build-out year
- H = Expected or anticipated cumulative employment for the City or County in the Growth Management Plan and/or by SCAG for the build-out year.

TABLE A9 - 15

OPTIONAL CUMULATIVE IMPACT ANALYSIS BASED ON THE 1991 AQMP PERFORMANCE STANDARDS

STANDARD

One Percent Per Year Reduction In Project Emissions
During The Life-span Of The General Plan

$A = \{B\} - \{[(C)^{-(D)}] \times [B]\}$

Where,

- A = Emission reduction in pounds for given year
- B = Starting cumulative emissions
- C = 0.99, a fraction for remaining emissions (The fraction assumes that 100 pounds are unmitigated cumulative emissions. Using the procedures outlined in Chapter 9, 1 percent or 1 pound of this 100 pounds of unmitigated emissions must be eliminated for given year)
- D = Number of years

EXAMPLE

B = 500 pounds of Unmitigated cumulative emissions in 1993 beginning of the project development
C = 0.99

For first year A = 500 - (500 x 0.99) = 5.0 per year from 1993 onward should be reduced (approximately)

Year	Starting Emissions		Remaining Emissions	= Cumulative Emission Reduction
1993	500.00	-	N.A.	= 0 Project Starts to Operate
1994	500.00	-	495.00	= 5.00 pounds of reduction in cumulative emissions
1995	495.00	-	490.05	= 4.95 pounds of reduction in cumulative emissions
1996	490.05	-	485.15	= 4.90 pounds of reduction in cumulative emissions
1997	485.15	-	480.30	= 4.85 pounds of reduction in cumulative emissions
1998	480.30	-	475.50	= 4.80 pounds of reduction in cumulative emissions
1999	475.50	-	470.74	= 4.75 pounds of reduction in cumulative emissions
2000	470.74	-	466.03	= 4.71 pounds of reduction in cumulative emissions
2001	466.03	-	461.37	= 4.66 pounds of reduction in cumulative emissions
2002	461.37	-	456.76	= 4.61 pounds of reduction in cumulative emissions
2003	456.76	-	452.19	= 4.57 pounds of reduction in cumulative emissions
2004	452.19	-	447.69	= 4.52 pounds of reduction in cumulative emissions
2005	447.69	-	443.19	= 4.48 pounds of reduction in cumulative emissions
2006	443.19	-	438.76	= 4.43 pounds of reduction in cumulative emissions
2007	438.76	-	434.37	= 4.39 pounds of reduction in cumulative emissions
2008	434.37	-	430.03	= 4.34 pounds of reduction in cumulative emissions
2009	430.03	-	425.73	= 4.30 pounds of reduction in cumulative emissions
2010	425.73	-	421.47	= 4.26 pounds of reduction in cumulative emissions
2011	421.47	-	417.26	= 4.21 pounds of reduction in cumulative emissions
Total				= 82.74 pounds of reduction in 17 years

A reduction in cumulative impacts should continue at the rate of approximately 5 pounds per year
N.A. = Not applicable in start year.

AR0073074

TABLE A9 - 16

OPTIONAL CUMULATIVE IMPACT ANALYSIS BASED ON THE CALIFORNIA CLEAN AIR ACT PERFORMANCE STANDARDS 1.5 AVERAGE VEHICLE RIDERSHIP (AVR)

G = H - C

where,

G = Needed Reduction in Number of Vehicles to Achieve Targeted AVR

H = Current Number of Vehicles = D/E

where,

D = Average Daily (Weighted using weekday and weekend Travel data) Number of Persons Traveling in vehicles for the buildout year = A + B + L1

Where,

To improve the AVR, trips associated with the following should be eliminated or reduced.

A = Number of Persons Traveled in 4+ Person vehicles 1-way Alone

B = Number of Persons Traveled in 2 Person Motorcycles 1-way Alone

L1 = Number of Persons Traveled 1-way but No Survey Response (If Not Applicable, Use 0.0) *(Treat these as A, i.e., traveling Alone in 4+ Person Vehicles)*

E = Estimated AVR for the City or County without implementation of TCM mitigation measures *(To Estimate buildout year AVR, Use Table 9-7 methodology)*

C = Number of Allowed Vehicles = D/P, Where,

D = Average Daily (Weighted using weekday and weekend travel data) Number of Persons Traveling in buildout year

P = Targeted AVR for the City or County for the buildout year *(If unknown, Use 1.5, the California Clean Air Act requirement)*

Examples of Cumulative Work Trips AVR

Cumulative AVR for 1 Person Traveled to Work 1-Way by One vehicle	= 1/1 = 1.0
Cumulative AVR for 2 Persons Traveled to Work 1-way by One vehicle	= 2/1 = 2.0
Cumulative AVR for 3 Persons Traveled to Work 1-way by One vehicle	= 3/1 = 3.0
Cumulative AVR for 4 Persons Traveled to Work 1-way by One vehicle	= 4/4 = 4.0
Cumulative AVR for 7 Persons Traveled to Work 1 way by One Van	= 7/1 = 7.0
Cumulative AVR for 15 Persons Traveled to Work 1-way by One Subscription or planned bus	= 15/1 = 15.0
Cumulative AVR for 15 Persons Traveled to Work 1-way by One Public transit (rail/buses)	= 15/1 = 15.0
Cumulative AVR for 1 Person Traveled to Work 1-way to Report to Another Site *(1991 AQMP states that 5% of following trips were for Home to other)*	= 1/1 = 1.0

Example of Non-Work Trip AVR for the Vehicles Not Used for Work trips but Used for Other Trips=1/1

Non-work 1-Way Cumulative Trips = [{(J+K+L+M+N+O+P+Q+R+U) x 0.05} + {(S+T)xV)]; Where,

L = Number of Persons Travel did not travel due to Telecommuting at home

J = Number of Persons Traveled 1-way by Walk V = Percent Weekend Trips to other

K = Number of Persons Traveled 1-way by Bicycle

M = Number of Persons did not travel to the project site due to days off from 3/36 work week

N = Number of Persons did not travel to the project site due to days off from 4/40 work week

O = Number of persons did not travel to the project site due to days off from 9/80 work week

P = Number of persons did not travel to the project site due to vacation

Q = Number of persons did not travel to the project site due to sick leave

R = Number of persons did not travel to the project site because they were absent for reasons other than vacation and sick leaves

S = Number of persons did not travel to the project site because it was Saturday (Weekend)

T = Number of persons did not travel to the project site because it was Sunday (Weekend)

U = Number of persons did not use cars due the mitigations described to estimate various AVRs above

ESTIMATING
NUMBER OF CONSTRUCTION EMPLOYEES

AR0073076

TABLE A9 - 17
ESTIMATING THE NUMBER OF ON-SITE CONSTRUCTION EMPLOYEES
(Number of Employees Per Project)

E* = ((F x G x H)/1,000,000) x I; or, ***
E** = (G x H)/1,000,000) x I; ***

Where,

E = Number of Construction Employees
F = Gross square footage of that type of construction for which the value for (G) will be selected (*Refer to project description of environmental documents*)
G = Construction Value
(*If unknown, use cost values from Table A9 - 17 - C*)
H = Full time employment rate for construction related on-site[1] and off-site[2] activities.
(*If unknown, see Table A9 - 17 - A*)
I = Rate of on-site construction employment
(*If unknown, see Table A9 - 17 - B*)

1. 'on-site' means at the construction site and does not include employees needed to move goods; and
2. 'off-site' means employees needed at the goods (cement, walls, nails, etc.) manufacturing sites and goods transportation*** activities. For CEQA there is no need to estimate impact associated with employees needed at the goods manufacturing sites, however, impact associated with employees*** needed to transport goods to the project site should be estimated and included in the environmental documents.
3. In order to estimate employees needed to transport goods use the methodology suggested in Energy and Labor in the Construction Sector, B. Hannon, R. Stein, and D. Serber, Science, 1978, 202: 837-847.

* *For E* use information from column labelled as dollars/gross square foot.*

** *For E** use the methodology suggested in footnote of the Table A9 - 17 - C and historical values provided in the third column of this table (New Valuation) or estimate current values by applying seasonal and annual rate changes provided in the Composite Index Example column of this table to the historical values provided in the New Valuation column of this table.*

*** To determine employee related Average Daily Trips, use Tables A9 - 5 - A - 1 or A9 - 5 - A - 2.

TABLE A9 - 17 - A

FULL TIME EMPLOYMENT FACTORS (H) ASSOCIATED WITH THE CONSTRUCTION INDUSTRY****

Land Use Type	FTE Factor (H)
o Building Construction (Construction of New Residential, and Non-Residential)	9.2
o Non-building Construction (Construction of parking lots roadways, etc.)	8.78
o Demolition/Renovation/Repairs	9.15

TABLE A9 - 17 - B

PERCENT RATE (I) OF ON-SITE CONSTRUCTION JOBS****

Land Use Type	Percent Values/100 (I)
o Building Construction (Construction of New Residential, and Non-Residential Structures)	0.392
o Non-building Construction (Construction of parking lots roadways, etc.)	0.458
o Demolition/Renovation/Repairs	0.602

**** *Use the values as provided in Tables A9 - 17 - A and A9 - 17 - B*

AR0073077

For quick computation of present replacement costs from dependable historical costs, use Cooperative Cost Index subject of Section 98 reflecting the latest quarters. These are published by Marshall Valuation Service (Marshall and Swift - printed in U.S.A.) January, April, July and October of each year. The index values are developed by taking into consideration seasonal and annual changes. In order to estimate current (Yr 1989) cost divide current index value by former (Yr 1988) index value, multiply the answer with known cost (yr 1988 cost).

Source: Residential building cost data are from the U.S. Department of Commerce, Bureau of the Census, and Construction Industry Research Board. Nonresidential building cost data are from the U.S. Department of Commerce, Bureau of the Census, Security Pacific National Bank, and Construction Industry Research Board. Nonbuilding costs are from Dodge Division of McGraw-Hill and compiled by Construction Industry Research Board.

Note: Commercial Construction usually assumes 3-7 acres/$1,000,000 and built in 11 months.

TECHNICAL ADDENDUM

CARBON MONOXIDE TRANSPORTATION PROJECT PROTOCOL

This reproduction contains
Sections 1 through 14 only.
Original issued by SCAG
December 1992

AR0073081

TECHNICAL ADDENDUM

1. General

A Gaussian based line source model is to be used, as appropriate, to assess the effects of specific projects on local CO concentrations. An example of such a model is the Caltrans supported CALINE4 model.

The CALINE4 model is the most commonly used line source model in California. The technical assumptions contained in this Addendum are for use with this model. The use of CAL3QHC or TEXIN II models may require modification of these assumptions.

Use of alternative line source models, while not discouraged, must be agreeable to the local air district.

2. Background CO Levels

An important element in a microscale analysis of the CO concentrations expected as a result of particular projects, is the "background" concentration levels of CO upon which to add the estimated CO concentrations expected from the proposed project.

The model analysis must be carefully designed so as to minimize duplication of CO concentrations resulting from traffic otherwise accounted for in "background" CO levels.

The objective of the model analysis is to determine the incremental change in the CO concentration level between the "no project" alternative, and the CO concentration level resulting if the proposed project is constructed. The resultant incremental CO concentration levels are to be added to the background CO level and compared to the CO standards.

The appropriate "background" CO level shall be the estimated ambient levels determined either by using the CO concentration levels as measured by a nearby permanent monitoring station, or by the use of project-specific monitoring.

Unless otherwise agreed to by the sponsors and the local air district, a project-specific monitoring program shall consist of 4 months of continuous sampling during the winter CO season (November thru February). The sampling shall be in accordance with 40 CFR 58; Appendices A, D and E; and shall achieve a 90% data completeness. Sampling shall be at location(s) so as to both minimize duplication of CO concentrations resulting from traffic otherwise accounted for in the model analysis, and appropriately account for CO concentration levels from other major sources.

AR0073082

The "background" or ambient CO levels used in the analysis must be reflective of the same time of day as the traffic volumes used in the project analysis.

In the CO nonattainment area of the South Coast Air Basin, "background" levels for future years shall be estimated by application of factors to the base year "background" levels. The factors are directly proportional to the estimated future year total CO emissions, within each air quality analysis zone, as estimated by the South Coast AQMD in a manner consistent with SCAG's most recent transportation plan or program conformity analysis. The current estimated future year total CO emissions are attached.

3. Receptor Sites

A key element in the CALINE analysis is the location used to calculate the expected CO concentrations for comparison to the standards. These location(s) are termed the critical receptor sites. The critical receptor site(s) shall be at location(s) which are estimated to be representative of the highest CO concentrations expected in the area potentially effected by the proposed project.

Generally, receptor sites shall be representative of locations where there is a reasonable expectation of continuous human exposure during the time period(s) coinciding with peak CO concentrations. Receptor site(s) shall be located in a manner consistent with EPA's "microscale" criteria contained in 40 CFR 58. The location(s) shall be representative of existing and reasonably expected future land development projects.

Additionally, the receptor site(s) are to be selected reflective of meteorology, background CO levels, and the traffic/operational characteristics of the nearby existing and proposed transportation facilities.

Frequently, it is necessary to analyze multiple receptor sites in order to identify the critical site(s) with the highest CO concentrations with and/or without the proposed project. Once identified, the CO concentrations at the critical receptor site(s) will be used to judge the acceptability of the proposed project under the applicable laws.

If the project is unusually complex, or if the CO analysis appears potentially a deciding issue as to whether the project is allowed to proceed, sponsors should consult with the local air district regarding selection of the critical receptor site(s). This should be accomplished as early as possible in the process.

AR0073083

4. Calculation of 8-hour CO Concentrations - Persistence Factors

Estimated 8-hour CO concentrations expected to occur in the area are calculated by use of the persistence factor from the 1-hour levels estimated to occur at the 8-hour receptor sites. This factor is the ratio between the 1-hour and 8-hour CO concentrations as measured at the nearest representative permanent monitoring station.

Because the persistence factor really represents a combination of both the traffic persistence and the meteorological persistence, the preferred method is to use monitoring data to calculate the 1-hour to 8-hour ratio, as it would inherently include both traffic and meteorological conditions.

The persistence factor should be based on values obtained using the 10-highest non-overlapping 8-hour concentrations obtained from the latest three CO seasons of monitoring data. The ratio of the 8-hour concentration to the highest 1-hour concentration in each of the non-overlapping 8-hour periods is determined, and the average of the 10 values is used as the persistence factor.

Optimally the use of three seasons of CO monitoring data should be utilized to establish the 8-hour concentrations at the project site. However, two seasons of CO monitoring performed subject to 40CFR58 would be acceptable. If less than two years of information is available then the persistence factor values from the table below should be utilized.

Factor	Setting
0.6	Attainment areas
0.7	Nonattainment areas
0.8	Urban area with persistent stagnation and/or congestion

5. Ambient Air Temperature

For purposes of initial estimating, the lowest winter (November thru February) mean minimum temperature over a representative three-year period may be used. Temperature Adjustments for the time of day analyzed are noted on Table 3120.1 of the Caltrans "Air Quality Technical Analysis Notes" - AQTAN - (1988).
A more accurate estimation is achieved by using the temperatures associated with the actual time periods during which the historic high CO events in the area have occurred.

AR0073084

6. Vehicle Mix

The vehicle type distribution must be compatible with the version of EMFAC utilized in the analysis, and representative of the facility analyzed.

Heavy duty gas trucks are the most critical classification. The "Annual Truck Traffic Reports," available from Caltrans, contain the average daily percentage of trucks on State Highways. Time period adjustment factors must be applied to these percentages to more accurately reflect the targeted time period of the air quality analysis. (See Table 3130.2 of the AQTAN, 1988).

7. Percent Cold & Hot Starts

Vehicle emissions are especially sensitive to the percentages of cold starts within the vehicle mix. To a much lesser extent, emissions are also sensitive to hot starts.

The start-up phase is defined as the first 505 seconds or 3.59 miles. A cold start is defined as occurring after 1 hour of off time for a catalytic equipped vehicle, or 4 hours for a non-catalytic equipped vehicle.

For initial estimating purposes on urban freeways, these percentages are able to be estimated with Equation 2 from Section 3140 of the AQTAN (1988). Further, AQTAN Sections 3140, 6134, and 6221 (1988) contain simplified methods for making approximate estimates.

For initial estimating on non-freeways, cold and hot starts should be estimated at 95% and 5%, respectively.

In non-freeway situations, the range of the percent of cold starts can vary widely. More accurate estimates are able to be achieved through a project specific analysis, and may be utilized with appropriate documentation.

8. Speed

The vehicle operating conditions (speeds, accelerations, etc.) should represent the average conditions on the route, or element thereof, during the hour(s) analyzed. The present and projected conditions should be obtained from speed profiles or appropriate traffic models.

AR0073085

9. Surface Roughness

Surface Roughness affects the mechanical turbulence, thus the dispersion of the pollutants near the ground. Surface roughness is to be 15% of the average canopy height, and should be limited between 3 and 400 cm. As the calculations are not very sensitive to changes in surface roughness; generally, a rough order of magnitude estimate, based on the predominate land use, is sufficient.

10. Mixing Height

A mixing height of 1000 meters should be used, bypassing the mixing height algorithm, unless the local air district indicates otherwise.

11. Wind Speed

Unless the local air district indicates otherwise, the wind speeds in Table 4127.1 from the AQTAN (1988) may be assumed for estimating purposes.

12. Wind Direction

For estimating purposes, the "worst" wind angle is to be used. In order to determine the "worst" wind angle, it is necessary to calculate CO levels at the receptor site for a range of alternative angles at 10 degree increments. The "worst" wind angle, is the angle, within 1 degree, which results in the highest CO concentration at the receptor site.

13. Stability Class

Stability class describes the potential of atmospheric conditions to disperse pollutants through the process of turbulent diffusion. The line source model is not very sensitive to changes in the stability class. Unless the local air district indicates otherwise, the stability classes in Table 4127.1 from the AQTAN (1988) may be assumed for estimating purposes.

AR0073086

14. Sigma Theta

Sigma theta is the standard deviation of the wind direction. With receptors close to the roadway and parallel winds (a typical worst case scenario), changes in sigma theta can have a very dramatic effect on predicted concentrations. Unless the local air district indicates otherwise, the sigma thetas in Table 4127.1 from the AQTAN (1988) may be assumed for estimating purposes.

AR0073087

[redacted]

APPENDIX 10 SUMMARY OF GUIDELINES FOR LAND USE ANALYSIS WITH AIR TOXICS

The EIR that considers air toxics as well as criteria pollutants will differ in a few respects from the conventional EIR, *but the differences are critical*. The additional analyses will determine what kinds and level of mitigation are required and what residual impact cannot be eliminated if the project is pursued.

Substantial technical complexity may be involved in assessing air toxics. Publications prepared by the District and the ARB can be helpful. Assistance with understanding technical aspects may be obtained from the District. Of necessity, analysis involving air toxics will follow the basic approach used in preparing a risk assessment.

An outline listing elements needed for such an approach follows.

A. Description of the Facility and the Area of Planning Concern

- o The usual content provided under the project's 'Setting'
- o Focused description of each operation which may release air toxics including actual facility operating hours and release characteristics

B. Emissions Sources—a flow diagram of all process flows for a toxics-emitting facility, identifying:

- o Specific processes with a potential for emissions
- o Devices associated with emitting processes
- o Estimate of number of possible accidental release sites
  - valves
  - flanges
  - locations, devices sensitive to seismic events
- o All locations of possible exhaust release locations

C. Substances Emitted:

- o Quantities expected to be released, from all emission points
  - routine releases
  - accidental releases, with probability for the causative event
- o How releases take place (source data for modeling)
- o Emission control equipment and its efficiency

D. Possible Modeling Approaches and Requirements:

- o Available and suitable modeling approaches
- o Information requirements for modeling
  - Terrain: Flat, or complex topography
  - Degree of urbanization
  - Meteorological data available

E. Receptor Data:

- o Particularly sensitive receptor points
- o Commercial receptors
- o Zone of potential impact defined as an area with a 1 in 2 million risk
- o Exposed population: size, character (census tracts)
- o Type of exposure: inhalation, non-inhalation

F. Estimation of Health Risk:

- o Cancer risk analysis
  - Individual excess cancer risk for sensitive receptors
  - Individual excess cancer risk for commercial receptor

AR0073091

- Population excess cancer burden including both sensitive and commercial receptors

o Estimation of non-cancer health effects (if identifiable) and description of non-cancer effects (both chronic and acute) for each air toxic emitted

Planning for air toxics must first establish what emissions may result if the project is carried out, together with where, how, and when they may be released. The District Engineering staff will need to be consulted for data estimates. The District Modeling staff can be consulted for emissions estimates used in modeling. Data must be site- and facility- specific. As noted in Chapter 5, risk assessments prepared under AB 2588, when available, are a useful starting point for the planning analysis. Source and surrounding receptor locations must be characterized with a particular view toward the kind and extent of risk which may result from the project. Conventional features such as terrain, building characteristics of surroundings, and population distribution and character are also essential.

TABLES FOR ESTIMATING STATIONARY EQUIPMENT EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Gasoline- and Diesel- Powered Stationary Equipment

- Replace Gasoline- and Diesel-Powered Stationary Equipment With Natural-Gas-Powered Stationary Equipment;
- Replace Gasoline- and Diesel)-Powered Stationary Equipment With LPG (Propane and Butane)-Gas-Powered Stationary Equipment; or,
- Replace Gasoline- and Diesel-Powered Stationary Equipment With Battery-Powered Stationary Equipment; and/or
- Replace Reciprocating Stationary Engines with Turbine Stationary Engines.

AR0073104

TABLE A11 - 3

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM STATIONARY OR HEAVY-DUTY ENGINES
(Pounds Per Day)

M = R + N

Where,

M = Mitigated Stationary Equipment Emissions After Implementation of Mitigation Measures *(Use Table A9 - 3 to Estimate Non-mitigated Emissions from Original Stationary Equipment)*

R = Remaining or Residual Non-mitigated Emissions From Remaining Original Equipment
= {[E x (1 - {F/G})]; Where,

E = Non-Mitigated Emissions from Table A9 - 3

F = Number of Removed Original (and Replaced with New) Stationary Equipment

G = Number of Original Stationary Equipment
(Used to Estimate Non-Mitigated Emissions (E) in Table A9 - 3 of Appendix 9)

N = New Emissions per Million BTUs From Replacement Equipment
= {V x (H/I)}; Where,

V = Emissions from Removed Original Equipment
= {(E x {F/G)]

H = New Emission Factor Per Million BTUs** For New (*or Replaced*) Equipment *(Please see Table A11 - 3 - A or C)*;

I = Emission Factor per Million BTUS For Original Equipment *(Please see Table A11 - 3 - B or D)*

** *BTUs = British Thermal Units*

AR0073107

TABLE A11 - 4

SOURCES OF EMISSION FACTORS FOR QUANTIFYING STATIONARY SOURCE* EMISSIONS

SCAQMD's Best Available Control Technologies Guidelines should be Consulted for Mitigating Emissions from Stationary Equipment.

1. California Air Resources Board, 1988, Instructions for the Emission Data System Review and Update Report, January 1988.

2. United States Environmental Protection Agency, 1981, Compilation of Air Pollution Emission factors, April 1981.

3. United States Environmental Protection Agency, 1979, Compilation of Air Pollution Emission factors - AP - 42, Sec. 6.13.1, Supplement 9, July 1979.

4. United States Environmental Protection Agency, 1973, Air Pollution Engineering Manual, May 1973.

5. United States Environmental Protection Agency, 1987, Estimating Releases and Waste Treatment Efficiencies for the Toxic Chemical Release Inventory Form, December 1987.

6. United States Environmental Protection Agency, 1988, Toxic Air Pollutant Emission Factors - A Compilation For Selected Air Toxic Compounds And Sources, October 1988.

7. United States Environmental Protection Agency, 1988, Gap Filling PM10 Emission FActors for Selected Open Area Dust Sources, March, 1988.

8. United States Environmental Protection Agency, 1988, Control of Open Fugitive Dust Sources, September, 1988.

9. United States Environmental Protection Agency, 1991, NonRoad Engine and Vehicle Emission Study, November, 1991.

10. United States Environmental Protection Agency, 1985, Assessment of Heavy-Duty Gasoline and Diesel Vehicles in California: Population and Use Patterns, Prepared in July 1985 by Yuji Horie, and Richard Rapoport of Pacific Environmental Services, Inc., July, 1985 (Contract Number A2-155-32).

11. SCAQMD's Rules and Regulations

12. SCAQMD's staff reports (the most recent) for applicable source specific rules.

* Many of these sources also include emission factors for mobile equipment utilized at stationary sources

Note: These sources are available at the District library located at 21865 Copley Drive in Diamond Bar, California 91765.

AR0073108

PERCENT REDUCTION FROM THE IMPLEMENTATION
OF
MITIGATION MEASURE
{[100 x (Emissions Reduction After Mitigation)]/[Nonmitigated Emissions]}

AR0073109

TABLE A11 - 5

METHODOLOGIES TO ESTIMATE EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE VEHICULAR EMISSIONS

Implementation of mitigation measures will have direct impacts on emissions from on-road mobile sources. These direct impacts may be expressed as increases in average vehicle ridership (AVR), reductions in average daily trips, trip lengths, or congestion. It is assumed that indirect impacts may include a slight increase in nonwork trips and increased work trips by substitute traveling modes and activities. For example the 1991 AQMP projects that employer trip reduction programs, may result in an approximate 5% increase in nonwork trips. Nevertheless, there will be an overall benefit from these strategies. In addition, whenever a methodology for calculating reactive organic gases includes removal of diurnal emissions, they are also added back, as a vehicle still emits ROC emissions when not in use. Separate methodologies are provided in this table to estimate net emissions after implementation of a mitigation measure.

MITIGATION MEASURES THAT REDUCE TRIPS

Tables A11 - 5 - A and A11 - 5 - B identify mitigation measures that reduce vehicle trips to or from a facility.

Table A11 - 5 - A includes measures that reduce vehicle trips by shifting the mode of transportation from a single occupancy vehicle to a high occupancy vehicle. While emissions are reduced from eliminating a trip, new emissions are created by utilizing a motorized vehicle for the substitute trip. Therefore, the entire range of emissions associated with the replacement mode must be factored added back in. Examples include measures that increase carpooling, transit ridership, or shuttle services.

Table A11 - 5 - B includes mitigation measures that reduce vehicle trips by eliminating the need to travel altogether or shifting the mode of transportation from a single occupancy vehicle to a non-motorized mode. These mitigation measures eliminate emissions from a vehicle trip with no trip (i.e., telecommuting, alternative work weeks), or a non-emitting mode (i.e., bicycling, walking).

NON-MITIGATED EMISSIONS

To determine net emissions after implementation of mitigation measure, all methodologies will begin with non-mitigated emissions. Non-mitigated emissions are obtained by using Table A9 - 5 of Appendix 9. The following summarizes how these emissions were estimated.

A = Total Non-mitigated Vehicular Emissions = W + X + Y + Z;

where,

W = Non-mitigated Average Daily One-way Trips x Multiplier (Use 2.0 to obtain two-way or round trips, otherwise multiply by 1.0) x Original Trip length x Running Emission Factors

X = Non-mitigated Average Daily One-way Trips x Multiplier (Use 2.0 to obtain two-way or round trips, otherwise multiply by 1.0) x Start-up Emission Factors

Y = Non-mitigated Average Daily One-way Trips x Multiplier (Use 2.0 to obtain two-way or round trips, otherwise multiply by 1.0) x Hot-Soak Emission Factors. (only ROC)

Z = Non-mitigated Average Daily Trips/Divider (Use 2.0 only for two-way or round trips, otherwise divide by 1.0) x Diurnal Emission Factors. (only ROC)

AR0073110

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE TRIPS BY UTILIZING SUBSTITUTE MOTORIZED VEHICLES

Mitigation Measures That Reduce Emissions Associated With Reduction in Average Daily Trips With an Increase in Vehicle Miles Traveled by Substitute Vehicles

- Establish or Contribute to Shuttle Service from Residential Subdivisions to or Non-Residential Developments to Rail or Multi-Modal Transit Stations
- Establish or Contribute to Shuttle Service from Residential Subdivision to Commercial Core Areas
- Require Retail and Special Event Centers to Offer Consumers Travel Incentives (Discounted or Free Transit Passes to Clients, Discounts on Purchases for Transit Riders, and Other Promotional Events)
- Provide On-Site Bus and Shuttle Turnouts, Passenger Benches, and Shelters or Contribute to Off-Site Improvements
- Provide Preferential Parking Spaces for Carpools and Vanpools
- Develop a Trip Reduction Plan to Achieve a 1.5 AVR or Higher for Multi-Tenant Buildings or Businesses with Fewer than 100 Employees
- Include Residential Units Within Commercial Developments or Contribute Towards its Development Off-Site
- Require Retail Facilities and Special Event Centers to Offer Transit Incentives (e.g., Discounted or Free Transit Rides, Discounts on Purchases or Admission for Transit Riders)
- Implement or Contribute to Public Outreach and Ridesharing Education Programs
- Employers Provide Employees Incentives for Ridesharing or Charge for Single Occupant Vehicles to Encourage Ridesharing
- Charge to Park for Non-Employees or Provide Discounts to High Occupancy Vehicles
- Require Future Employers Not Subject to Regulation XV to Provide Centrally Located Commuter Area Offering Information on Transportation Alternatives
- Reduce Employee Parking Spaces for Those Employers Subject to Regulation XV
- Contribute to Regional Transit Systems (e.g., Funding for Capital Improvements, Dedication of Right-of-Way)
- Implement a Trip Reduction Plan to Achieve a 1.5 AVR or Higher for Construction Employees (Construction Activities)
- Establish or Contribute to Shuttle Service to and From Construction Sites to Retail and Food Establishments During Lunch Hours (Construction)

AR0073111

TABLE A11 - 5 - A

METHODOLOGY FOR VEHICLE TRIP REDUCTION BY UTILIZING SUBSTITUTE MOTORIZED VEHICLES

This methodology calculates net emissions after implementation of mitigation measures that reduce vehicle trips, however substitute vehicle trips cause an increase in vehicle miles traveled. While a vehicle trip is eliminated, the mode shift to a high occupancy vehicles i.e., buses, carpools, shuttles, result in an incremental increase in VMT and emissions. Diurnal emissions need to be added because a vehicle still emits emissions sitting in a carport or garage.

$$N = \{[(A \times \{1-[C/B]\})] + [(\{C/D\} \times Q) + \{R + S\} + \{X\}]/[454]\} + \{I\}$$

Where,

- N = Net Emissions In Pounds Per Day After Implementation of Average Daily Trip (ADT) Reduction Measures
- A = Total Non-mitigated Vehicular Emissions
  (Resulted from Table A9 - 5 or Appendix 9 Methodologies); or,
  = (A x {1-[C/B]}) of the above calculations; Residual Emissions of the above calculations, if emission reductions caused by other mitigation measures are reduced.
  (Resulted from Table A11 - 5 or Appendix 11 Methodologies).
- B = Total Original Number of Average Vehicle Trips Generated By the Project
  (Trips used to estimate value for "A" in Table A9 - 5 from Appendix 9 Methodologies)
  To estimate ADT reduced due to the participation in Trip Reduction program, Use Table A9 - 5 Methodologies from Appendix 9, and the Needed Data from Table A11 - 5 - A - 1.
- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (See Table A11 - 5 - A - 4 for methodologies to calculate "C" that are specific to individual mitigation measures
  To estimate diurnal emissions associated with trip reduction
- D = 2.0, if non-mitigated vehicular emissions were for 2-way or round trips; or
  = 1.0, if non-mitigated vehicular emissions were for 1-way trips
- Q = EMFAC7EP Diurnal Emission Factors *(Applicable only to ROG)* in grams per NOV.
  Please estimate running exhaust, running evaporative, start-up, and hot soak emissions for the following modes. (Also estimate diurnal emissions for all replacement modes i.e., R, S and X.)
  To Estimate Emissions Associated with the Following Travel Modes, Use Table A9 - 5 Methodologies from Appendix 9 and the Needed Data from Table A11 - 5 - A - 3.
- R = Replacement or Additional Emissions in grams per day Associated with Employees Traveling in Personal Cars (reduced from original work trips) to other work sites with shorter traveling distance, or to original work sites work with improved AVR. (If not applicable to your project, enter 0.0); and/or
- S = Replacement or Additional Emissions in grams per day Associated with Employees Traveling in Buses to other work sites with shorter traveling distance, or to original work sites with improved AVR. (If not applicable to your project, enter 0.0); and/or Any other traveling mode
  To Estimate Emissions Associated with Replacement Trips to Other Work Sites with Shorter Traveling Distance or to Original Work Sites with Improved AVR, Use Table A9 - 5 Methodologies from Appendix 9 and the Appropriate Data from Table A11 - 5 - A - 2.

AR0073112

X = Replacement or Additional Emissions in grams per day Associated with Employees Traveling in Personal Cars to other work sites with shorter traveling distance. Please estimate all (running exhaust and evaporative, start-up, and hot soak emissions and do not estimate diurnal emissions associated with these trips (If not applicable to your project, enter 0.0).
To Estimate Emissions Associated with Nonwork Trips Made by the Personal Vehicles of Home-based employees, Use Table A9 - 5 Methodologies from Appendix 9 and the Needed Data from TABLE A11 - 1 - B.

I = Non-Work Related Emissions in pounds per day Associated with use of Reduced Cars for personal trips; (If not applicable to your project, enter 0.0);
= [(B x D x E x F x H)/(454)];

where,

B = Number of Vehicles Reduced After Implementation of Mitigation Measure = (L - O)

D = 0.05; Five percent of cars reduced and used for personal travel such as home to other or shop travel

E = Number of Trips per Vehicle per Day (*For Round-trip Use 2, and One-way Trip Use 1*)

F = Trip Length for Home to Shop or Home to Other

H = Running Emission Factors In Grams Per Mile At New Speed (based on New Speed for the Non-work Trip).

TABLE A11 - 5 - A - 4

TRIP DEPENDENT INPUT ASSUMPTIONS MEASURES FOR VEHICLE TRIP REDUCTION BY UTILIZING SUBSTITUTE MOTORIZED VEHICLES

Mitigation measures for which,

$$C = K \times (L/M) \times O \times 2$$

Where,

- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (*See Table A11 - 5 - A methodology to use "C"*)
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day
- L = Number of Days per Week Employees will Participate in the Mitigation Measure (*Based on 5-day work week assumption*)
- M = Number of Days per Week for which Work Trips are Estimated in Appendix 9
- O = Number of Daily Trips per Worker
  (*Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker*)

Mitigation Measure	Emission Source	Range of Input Assumptions K	L	Favorable Factors
Trip reduction plan to achieve a 1.5 AVR for construction employees	Work Trips Construction	1-5%	1-2	Large construction site with a substantial pool of workers with long construction phases and limited parking in staging area or vicinity
Preferential parking spaces for carpools and vanpools and provide a minimum vertical clearance of 72" in parking facilities to permit access to vanpools	Work Trips	1-5%	1-2.5	Large employers that must draw from regional employment base that results in significant commutes. Employers of 1,000+ best for vanpool results. Worksites in dense, urban CBDs where parking demand exceeds supply and transit alternatives are not readily available. Parking pricing that provides discounts to HOVs, bus stop location no more than 1,000 feet from employee entrance. Free or reduced transit fare passes.
Provide on-site bus transit stops with turnouts, passenger shelters, or benches to encourage use or contribute to off-site development	Work Trips	1-5%	1-2.5	

AR0073115

Mitigation measures for which,

$$C = K \times E \times (L / M) \times 2$$

Where,

C= Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
(See Table A11 - 5 - A methodology to use "C")

K = Number of construction workers anticipated to Participate in Trip Reduction mitigation measure per day

or

K1 = Number of workers anticipated to Participate in Trip Reduction mitigation measure per day.

E = Average Non-Work Lunch Trip Rate per Day per Worker
(Use TIA Report or assume 2)

L = Number of Days per Week Construction Workers will Participate in the Mitigation Measure
(Assume 1 to 2.5, based on 5-day work week)

M = Number of Days per Week for which Work Trips are Estimated in Appendix 9

Mitigation Measures	Emission Source	Range of Input Assumptions K	Favorable Factors
Establish or contribute to shuttle service from construction site to retail and food services during lunch hours	Non-Work Trips Construction	1-5%	Large construction site with substantial pool of workers. Areas with significant lunch and food services. Remote construction where mobile food service is difficult or prohibited

Mitigation Measures	Emission Source	Range of Input Assumptions K1	Favorable Factors
Establish or contribute to shuttle service from general worksites to retail and food services during lunch hours	Non-Work Trips	5-50%	Large employers in office park settings more than 1/4 mile from lunchtime destinations. Any worksites without on-site food services.

AR0073116

Mitigation measures for which,

$$C = G \times (H + I) \times F \times O \times 2$$

Where,

- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (See Table A11 - 5 - A methodology to use "C")
- G = Estimated Trip Reduction from Mitigation Measure
- H = Average Daily Work Trip Generation from a Residence
  (See Table A9 - 5 - A - 2 or assume 1.62)
- I = Average Daily Non-Work Trip Generation from a Residence
  (See Table A9 - 5 - A - 2 or assume 7.39)
- F = Units of Size of Affected Existing or New Land Use(s) for Trip Geacration per Attraction Rate
- O = Number of Daily Trips per Worker
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker)

Mitigation Measures	Emission Source	Range of Input Assumptions G	Favorable Factors
Include residential units within commercial development or contribute towards its development to reduce VT and/or VMT	Work Trips Non-Work Trips	4-18%	Land use mixes, sizes, numbers of employees, proximity and length of bike/walking lanes/paths Pedestrian-friendly urban design. Comparable match between employment & resident job skills. Most effective when housing to jobs ratio exceeds 1:3

AR0073117

Mitigation measures for which,

$C = J \times K \times L \times O \times W \times 2$

Where,

- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (See Table A11 - 5 - A methodology to use "C")
- J = Percentage Required Trip Reduction
  ([Target AVR - Baseline AVR]/[Baseline AVR])
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day
- L = Percentage of single occupant vehicles arriving per day at worksite *(default, 70%)*
- O = Number of Daily Trips per Worker
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker)
- W = Worksite's long-term ability to meet the Required Trip Reduction AVR target (percentage)
  (For example, 10% for a worksite that is able to reduce 10% of its necessary 27% target (1.5-1.1)/1.5)

Mitigation Measures	Emission Source	Range of Input Assumptions for K	Favorable Factors
Develop a trip reduction plan to achieve a 1.5 AVR for multi-tenant worksites with businesses not subject to Regulation XV or with fewer than 100 employees	Work Trips Commute Trips	1-25%	Worksites with common parking facilities and nearby transit alternatives within 1,000 ft of employee entrance. Multi-tenant worksites where aggregate total exceeds 200 and where business operating hours are standard for most employers

AR0073118

Mitigation measures for which,

$$C = G \times K \times L \times O \times 2$$

Where,

- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (See Table A11 - 5 - A methodology to use "C")
- G = Estimated Trip Reduction from Mitigation Measure
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day
- L = Percentage of single occupant vehicles arriving per day at worksite
  (Default, 70%)
- O = Number of Daily Trips per Worker
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker)

Mitigation Measure	Emission Source	Range of Input Assumptions G	K	Favorable Factors
Require future employers not subject to Regulation XV to provide centrally located commuter area offering information on transportation alternatives	Work Trips	1-20%	2-3%	Worksites in jurisdictions that require trip reduction plans from non-Regulation XV employers. Those with standard business hours. Worksites in dense urban areas where transit alternatives, parking deficits, large local employee base, and congestion increase ridesharing mode split. Worksites where TMOs planned or required with at least 1 coordinator per 4,000 employees

AR0073119

Mitigation measures for which,

$$C = (K \times P \times O \times 2) + (K1 \times P1 \times O1 \times 2)^*$$

Where,

- C = Number of Trips Reduced from the Original Work Site after Implementation of the Mitigation Measure
  (See Table A11 - 5 - A methodology to use "C")
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day
- P = Average Percent Increase in Daily Employee Work Trips on Transit Expected With Shuttle
- O = Number of Daily Work Trips per Dwelling Unit
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.62 trips/DU)
- K1 = Number of residents anticipated to Participate in Trip Reduction mitigation measure per day
- P1 = Average Percent Increase in Daily Resident Non-Work Trips on Transit Expected With Shuttle
- O1 = Number of Daily Non-Work Trips per Dwelling Unit
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 7.39 trips/DU)

* This two-part formula accounts for potential vehicle trip reductions from both work and non-work trips from a new residential development to a transit station or worksite. If work trips /ffrom home only will be reduced, use the first half of the formula; if non-work trips are to be reduced, use the second half.

Mitigation Measures	Emission Source	Range of Input Assumptions K/K1	P/P1	Favorable Factors
Establish or contribute to shuttle service from residential subdivisions to rail or multi-modal transit stations	Work Trips Non-Work Trips	1-5%	1-5%	Large projects located in major or housing employment centers where access to rail station within 5 miles can increase commuter rail ridership
Establish or contribute to a shuttle service from residential subdivision to commercial core areas	Work Trips Non-Work Trips	1-5%		Dense subdivision or area with significant adjoining housing core within 5 miles of significant work centers

Quantification was based on previous case studies.
(Including estimates of "C," or percentage reduction in unmitigated vehicle trips)

AR0073120

QUANTIFIED MITIGATION MEASURES

Mitigation Measures	Emission Source	Range of Input Assumptions C	Favorable Factors
Reduce employee parking spaces for those employers subject to Regulation XV	Work Trips		Worksites in dense CBDs where parking demand exceeds supply, employees are charged to park, significant transit alternatives exist, and on-street parking on nearby residential streets is restricted
Implement or contribute to public outreach and ridesharing education programs	Work Trips Non-Work Trips	1 2.5%	Extent of ridesharing program and promotions.
Employers provide employees incentives for ridesharing or charge for single occupant vehicles to encourage ridesharing	Work Trips	2.5-15%0	For vanpool or carpool subsidy programs, trip reduction is dependent on extent of the incentive. Programs that don't charge HOVs, large employers of 500+, employers that draw on regional labor pool, resulting in longer average commutes of over 15 miles.
Charge to park for non-employees or provide discounts to high occupancy vehicles	Non-Work Trips	2.5 - 15%	Project sites in dense, CBDs where parking options are limited and parking charges exceed $6.0.

UNQUANTIFIED MITIGATION MEASURES

Mitigation Measures	Emission Source	Range of Input Assumptions C	Favorable Factors
Require retail facilities or special event centers to offer transit incentives (e.g., discounted or free transit rides, discounts on purchases or admissions for transit riders)	Non-Work Trips		
Contribute to regional transit systems (e.g., funding for capital improvements, dedication of right-of-way)	Work Trips Non-Work Trips		

AR0073121

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE TRIPS BY ELIMINATING A TRIP ALTOGETHER OR UTILIZING A SUBSTITUTE NON-MOTORIZED MODE

Mitigation Measures That Reduce Emissions Associated With Reduction in Average Daily Trips Without an Increase in Vehicle Miles Traveled

- Include Neighborhood Telecommunication Centers in Residential Subdivisions.
- Provide On-Site Child Care Facilities and/or After-School Care Facilities or Contribute to Development Within 1/4 Mile of the Worksite to Reduce VT and/or VMT
- Include Retail Services within or Adjacent to Residential Subdivisions such as Grocery Markets, Copy Centers, Restaurants, Banks, and Day-care, or Contribute to Its Development Within 1/4 Mile to Allow Residents to Walk or Bicycle
- Include Residential Development Within Commercial Core Areas, or Business Districts.
- Provide On-site Employee Services such as Cafeterias, Banks, Grocery Stores, and Other Common Services.
- Implement Compressed Work Week Schedules in Which Weekly Full-Time Hours are Compressed into Fewer than the Normal Five Days (4/40, 9/80, 3/36).
- Establish a Home-Based Telecommuting Program for Employees.
- Construct Off-site Pedestrian Facilities, such as, Overpasses, Wider Sidewalks, Safe Lighting, and Access to Buildings that are Physically Separated From Street and Parking Lot Traffic.
- Construct, Contribute, or Dedicate Land for the Provision of Off-site Bicycle Trails Linking the Facility to Designated Bicycle Commuting Routes.
- Provide Bicycle Parking Facilities, Some of Which are Secured Lockers
- Provide Shower Facilities in Non-Residential Development to Support Bicycle or Pedestrian Travel Modes
- Provide Video Conferencing Facilities

AR0073122

TABLE A11 - 5 - B

METHODOLOGY FOR VEHICLE TRIP REDUCTION BY ELIMINATING A TRIP ALTOGETHER OR UTILIZING A SUBSTITUTE NON-MOTORIZED MODE

This methodology calculates net emissions after implementation of mitigation measures that cause a reduction in vehicle trips only and does not add vehicle miles traveled by replacement trips. Implementation of these mitigation measures will have direct impacts on emissions from on-road mobile sources, including a reduction in average daily trips, trip lengths, or congestion. It is assumed that indirect impacts may include a slight increase in nonwork trips. It is assumed that indirect impacts may include a slight increase in nonwork trips and increased work trips by substitute traveling modes and activities. In addition, whenever calculating reactive organic compound emissions, removal of diurnal emissions are always added back, as a vehicle still emits ROC emissions when not in use. Separate methodologies are provided in this table to estimate net emissions after implementation of a mitigation measure.

$$N = \{[(A \times \{1-[C/B]\})] + [(\{C/D\} \times Q)]/[454]\} + \{I\}$$

N = Net Emissions In Pounds Per Day After Implementation of Average Daily Trip (ADT) Reduction Measures

A = Total Non-mitigated Vehicular Emissions In Pounds Per Day
(From Table A9 - 5 or Appendix 9 Methodologies);

or,

= (A x {1-[C/B]}) of previous calculations; Residual Emissions of previous calculations, if emission reductions caused by other mitigation measures are eliminated in Table A11- 5 - A from Appendix 11 Methodologies.

B = Total Number of Original Average Vehicle Trips Generated By the Project
(Trips Used to Estimate value for "A" in Table A9 - 5 from Appendix 9 Methodologies)
To Estimate ADT Eliminated due to the Participation in Trip Reduction Programs, Use Table A9 - 5 Methodologies from Appendix 9, and the Needed Data from Table A11 - 5 - B - 1.

C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
(To calculate "C", see Table A11 - 5 - B - 2 for methodologies specific to individual mitigation measures
To estimate diurnal emissions associated with eliminated trips use

D = 2.0, if non-mitigated vehicular emissions were for 2-way or round trips; or
= 1.0, if non-mitigated vehicular emissions were for 1-way trips.

Q = EMFAC7EP Diurnal Emission Factors (*Applicable only to ROC*) In grams per NOV
To Estimate Emissions Associated with Nonwork Trips Made by the Personal Vehicles of Home-based employees, Use Table A9 - 5 Methodologies from Appendix 9 and the Needed Data from Table A11 - B - 1

I = Non-Work Related Emissions In Pounds Per Day Associated with use of Eliminated Cars for personal trips; (If not applicable to your project, enter 0.0);
= {(B x D x E x F x H)/(454)};

Where,

B = Eliminated Vehicles After Implementation of Mitigation Measure
= (L - O)

D = 0.05; Five percent of eliminated cars used for personal travel such as home to other or shop travel.

E = Number of Trips per Vehicle per Day
(For Round-trip Use 2, and One-way Trip Use 1)

F = Trip Length for Home to Shop or Home to Other (*1-way*)

H = Running Emission Factors In Grams Per Mile With New Speed for New Non-Work Trip

AR0073123

TRIP DEPENDENT INPUT ASSUMPTIONS MEASURES FOR VEHICLE TRIP REDUCTION BY ELIMINATING A TRIP ALTOGETHER OR UTILIZING A SUBSTITUTE NON-MOTORIZED MODE

Mitigation measures for which,

$C = K \times (L / M) \times O \times 2$

Where

C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
(To use the value of "C", see Table A11 - 5 - B methodology)

K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day

L = Number of Days per Week Employees will Participate in the Mitigation Measure

M = Number of Days per Week for which Work Trips are Estimated in Appendix 9

O = Number of Daily Trips per Worker.
(Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker)

AR0073124

Mitigation Measures	Emission Source	Range of Input Assumptions K	L	Favorable Factors
ANY TWO OF THE FOLLOWING:				
Develop or contribute to off-lighted site bicycle improvements (e.g., development of bicycle route system, bicycle trails linking the facility to designated bicycle routes) or on-site bicycle paths = = & = = Provide bicycle parking facilities, some of which are secured lockers = = & = = Provide shower facilities in non-residential development to support bicycling or pedestrian travel modes	Work Trips	3-10%	1-3	Worksites with existing, bike paths nearby. Nearby residential areas within 5 of worksite with local street miles on thoroughfares with low speed access limits (35 mph and below). Comfortable climate and reasonable air quality in vicinity, and bicycle paths which logically connect neighborhoods and destinations. 1 shower and 8 lockers per 200 employees
BOTH OF THE FOLLOWING:				
Develop or contribute to off-site pedestrian improvements (e.g., overpasses, wider sidewalks) or on-site pedestrian improvements (e.g., exclusive walkway, building access physically separated from street and parking lot traffic = = & = = Shower facilities in non-residential development to support bicycling or pedestrian travel modes	Work Trips Non-Work Trips	2-5%	1-3	Worksites with existing, lighted pedestrian paths nearby. Residential areas within 1/4 mile of worksite with local street access on thoroughfares with low speed limits (35 mph and below). Comfortable climate and reasonable air quality in vicinity, walkable streets and pedestrian-friendly amenities. Areas with grid street system that maximizes access to destination while minimizing walking distance
Require a telecommuting program that allows employees to work at home	Work Trips	1-10%	1-2	Worksites with general office and information industries that accommodate work-at- home strategies where computers, telephones, faxes, etc. can link employees to the workplace. Large employers that attract workers from a regional base, necessitating long commutes for many

AR0073125

Mitigation measures for which,

$C = K \times (L / M) \times O \times 2$

Where,

- C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
  (To use the value of "C", see Table A11 - 5 - B methodology)
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure per day
- L = Number of Days per Week Employees will Participate in the Mitigation Measure
- M = Number of Days per Week for which Work Trips are Estimated in Appendix 9
- O = Number of Daily Trips per Worker
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.26 trips/worker)

Mitigation Measures	Emission Source	Range of Input Assumptions K	L	M	Favorable Factors
Implement compressed work week schedules where weekly full-time hours are compressed into fewer working days (e.g., 4/40, 9/80, or 3/36)	Work Trips (9/80 schedule)	10-100%	1	10	Worksites with employers on flexible work schedules where a business can either close for an entire day or operate with a smaller employee pool each day. Maximum VT reductions occur only when the worksite is closed to allow all employees to have same day off
	(4/40 schedule)	10-100%	1	5	
	(3/36 schedule)	10-100%	2	5	

AR0073126

Mitigation measures for which,

$$C = (R / S) \times (L / M) \times O \times 2$$

Where,

- C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
  (To use the value of "C", see Table A11 - 5 - B methodology)
- R = Number of Residents who Are New Telecommuters
- S = Average vehicle occupancy for work trips
  (Before implementation, default = 1.13)
- L = Number of Days per Week Residents will Participate in the Mitigation Measure
- M = Number of Days per Week for which Work Trips are Estimated in Appendix 9
- O = Number of Daily Trips per Dwelling Unit
  (Use TIA Report or ITE Manual 5th Edition or Table A9 - 5 - A - 2 or assume 1.62 trips/DU)

Mitigation Measures	Emission Source	Range of Input Assumptions R	L	Favorable Factors
Include neighborhood telecommunications center in residential subdivision or contribute to development within 1/4 mile to allow local residents to walk/bike to center	Work Trips	1-5%	1-2	Comparable match between resident job skills and white-collar, information-based employers likely to use such a center. Large subdivision

AR0073127

Mitigation measures for which,

$C = (G \times H \times F \times (L/M) \times 2) + (G1 \times H1 \times F \times (L/M) \times 2)^*$

Where,

C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
(To use the value of "C", see Table A11 - 5 - B methodology)

G = Estimated Work Trip Reduction from Mitigation Measure

H = Average Daily Work Trip Generation per Dwelling Unit
(See Table A9 - 5 - A - 2 or assume 1.62)

F = Units of Size of Affected Existing or New Land Use(s) for Trip Generation Rate
(i.e., Dwelling Units)

L = Number of Days per Week Residents will Participate in the Mitigation Measure
(Assume 5 days for work trips and 1-2 days for non-work trips)

M = Number of Days per Week for which Work or Non-Work Trips are Estimated in Appendix 9

G1 = Estimated Non-Work Trip Reduction from Mitigation Measure

H1 = Average Daily Non-Work Trip Generation per Dwelling Unit
(See Table A9 - 5 - A - 2 or assume 7.39)

---

* This two-part formula estimates the reduction in daily vehicle trips assuming the inclusion of commercial uses in a residential subdivision will attract both work (new employment) and non-work trips. If work or non-work trips are not expected to decrease from this measure, enter "0" for G or G1.

Mitigation Measures	Emission Source	Range of Input Assumptions G/G1	Favorable Factors
Include retail services within or adjacent (1/4 mile) of residential subdivisions such as grocery markets, copy centers, restaurants, banks, etc.	Work Trips Non-Work Trips	4-13%	Projects which include commercial uses likely to be used everyday or on frequent basis, & which are centrally located to increase the appeal of walking/bicycling to the use. Also dependent on match of new jobs to the job skills of potential residents

AR0073128

Measures measures for which,

$C = G \times H \times K \times H2 \times (L/M) \times 2$

Where,

- C = Number of Trips Eliminated from the Original Work Site after Implementation of the Mitigation Measure
  (To use the value of "C", see Table A11 - 5 - B methodology)
- G = Estimated Trip Reduction from Mitigation Measure
- H = Average Daily Non-Work Trip Generation per Worker
  (See Table A9 - 5 - A - 2 or assume 5.72)
- K = Number of employees anticipated to Participate in Trip Reduction mitigation measure/day
- L = Number of Days per Week Workers will Participate in the Mitigation Measure
  (Default assumption: 3-5 days)
- M = Number of Days per Week for which Non-Work Trips are Estimated in Appendix 9
- H2 = Percent of Daily Non-Work Trips Performed During Work Day e.g., Lunch, breaks
  (Default assumption, 35%)

QUANTIFIED MITIGATION MEASURES

Mitigation Measures	Emission Source	Range of Input Assumptions G	K	Favorable Factors
Provide on-site employee services such as cafeterias, banks, grocery stores, and other common services	Non-Work Trips	10-50%	25-50%	On-site services needed by employees on a regular basis. Extent of services, size of cafeteria, lack of similar services within 5 mile radius of worksite
Provide on-site child care facilities and/or after school care facilities or contribute to such development within 1/4 mile of worksite to reduce VT and/or VMT	Non-Work Trips	1-10%	1-10	Worksites with large employers, locations in office parks where pooling of resources to create common child care facility. Employers who rely on regional labor force, necessitating longer commutes for some employees. Proximity to pre- or elementary schools. Pleasant environment and amenities at the center

AR0073129

UNQUANTIFIED MITIGATION MEASURES

Mitigation Measures	Emission Source	Range of Input Assumptions G	K	Favorable Factors
Provide video conference facilities or contribute to development in office parks or multi-tenant worksites	Work Trips	29%*		* Up to 29% reduction in work trips from meeting participants has been documented

AR0073130

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE VEHICLE MILES TRAVELED

Mitigation Measures That Reduce Emissions Associated With Reduction in Average Daily Vehicle Miles Traveled with No Decrease in Average Daily Trips

- Implement Home Dispatching Systems Where Employees Receive Routing Schedule by Phone Instead of Driving to Work.
- Utilize Satellite Offices Rather than Regular Worksite for Multi-Sited Employers to Reduce Employee VMT.
- Construct or Contribute to Development of Off-Site Park-n-Ride Lots or Designate Parking Spaces in Excess of Code Requirements for Park-n-Ride.

AR0073131

TABLE A11 - 5 - C

METHODOLOGY FOR VEHICLE MILES TRAVELED REDUCTION (VMT REDUCTION)

This methodology calculates net emissions after implementation of mitigation measures that reduce vehicle miles traveled (VMT) without reducing vehicle trips. As these measures do not affect the number of vehicles and employees, average daily trips will be the same as those used to estimate non-mitigated emissions, though new and weighted average trip lengths will be less. Emission reductions are due to reductions in trip length, running exhaust, and evaporative emissions. Diurnal emissions do not need to be added, having been estimated in the non-mitigated emissions. Since the travel mode remains the same, there are no additional or substitute emissions from increased nonwork trips.

$N = [A - \{Y \times (E / F)\}]$

- N = Net Emissions In Pounds Per Day After Implementation of Vehicle Miles Traveled (VMT) Reduction Measures
- A = Total Non-mitigated Vehicular Emissions *(From Table A9 - 5 or Appendix 9 Methodologies)* In Pounds Per Day;
- Y = Total Non-mitigated Vehicular Running Exhaust and Evaporative Emissions In Pounds Per Day; *(From Table A9 - 5 or Appendix 9 Methodologies)*
- F = Original Trip Length *(Used to determine VMT in Table A9 - 5 of Appendix 9 to estimate non-mitigated running exhaust and running evaporative emissions in "A.")*.
- E = Average (Shorter or Reduced) Daily Trip Length or Traveling Distance After Implementation of Mitigation Measure *(See Table A11 - 5 - C - 1 and A11 - 5 - C - 2 for more variables specific to particular mitigation measures)*
  $= P1 \times [F - (H \times I/G)]$ *(Weighted Average Daily Trip Length)*

  Where,
  - P1 = Number of Employees Participating in VMT Reduction Measures
  - F = Original Trip Length *(Used to determine VMT in Table A9 - 5 of Appendix 9 to estimate non-mitigated running exhaust and running evaporative emissions in "A.")*.
  - G = Number of Days Traveled with Original Trip Length or the Distance to the project site.
  - H = New Trip Length or New Traveling Distance *(Associated with the mitigation measure)*
  - I = Number of Days Traveled with New Trip Length or New Distance to Other Work Sites.
    (I and G should equal to Number of Days [Maximum 7.0] used to Determine Non-mitigated Vehicular Emissions Using Original Trip Length in Table A9 - 5 of Appendix 9.)

TABLE A11 - 5 - C - 1

DATA NEED FOR DETERMINING DIRECT IMPACTS (REDUCTION IN AVERAGE TRIP LENGTH)

Impacts	Data Need	Other Work Sites	Project Site
	Non-mitigated Vehicular Emissions (A)	_____	_____
	Non-mitigated Running Vehicular Emissions (Y)	_____	_____
	% of Employees Participating (P1)	_____	_____
	New Trip Length (H)	_____	_____
	# of Days of the Week with New Trip Length (I)	_____	_____
	Original Trip Length (F)	_____	_____
	# of Days of the Week with Original Trip Length (G)	_____	_____

AR0073132

TABLE A11 - 5 - C - 2

TRIP DEPENDENT INPUT ASSUMPTIONS (E)
MEASURES THAT REDUCE VEHICLE MILES TRAVELED WITHOUT A DECREASE IN VEHICLE TRIPS

Mitigation Measures	Emission Source	Range of Input Assumptions P1	J	H	Favorable Factors
Implement home dispatching system where employees receive routing schedule by phone instead of driving to work ** Assume anywhere from 1/10 to 1/4 of "F"	Work Trips	1-25%	1-3	**	Worksites where construction and sales employers expected. Employers in urbanizing areas, commercial/industrial areas that rely on workers to commute from outlying residential areas

Mitigation Measures	Emission Source	Range of Input Assumptions P1	J	H	Favorable Factors
Require use of satellite offices rather than regular worksite for multi-sited employers to reduce VMT by allowing them to report to the nearest worksite ** Assume anywhere from 1/10 to 1/4 of "F"	Work Trips	1-5%	1-5	**	Worksites where large employers of 1000+ & multiple branch offices throughout the region are anticipated. Work-geared to information-based industries that can reassign worksite destinations for its employees or permit occasional use of other satellite offices

AR0073133

Mitigation Measures for which

$$E = [(0.5 \times V \times I) + \{(1 - 0.5) \times F \times G\}]/(1 + G)$$

where

V = Number of Parking Spaces Set Aside for Park-N-Ride Spaces (Project-specific Input)

Mitigation Measures	Emission Source	Range of Input Assumptions G	I	H	Favorable Factors
Construct or contribute to development of off-site park-n-ride lots or designate parking in excess of code requirements for park-n-ride	Work Trips Non-Work Trips	1-3	**		Park-n-ride location near transit station or freeway w/convenient access/proximity to residential concentrations w/i 5 mi. HOV lanes on freeways enhance use of park-n-rides, larger lots of 300+ spaces

** Assume 1/6 of "F"

AR0073134

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT IMPROVE AVERAGE VEHICLE RIDERSHIP

Mitigation Measures
That Reduce Emissions Associated With Increased
Average Vehicle Ridership

- Establish or Contribute to Shuttle Service from Residential Subdivision to Commercial Core Areas.
- Construct On-site or Off-site Bus Turn-outs, Passenger Benches and Shelters or Contribute to Off-Site Development.
- Require Retail and Special Event Facilities to Offer Customers Travel Incentives such as Discounted or Free Transit to Clients, or Discounts on Purchases or Admission for Transit Riders and Other Promotional Type Events.
- Reduce Employee Parking Spaces for Those Employers Subject to Regulation XV.
- Require Future Employers Not Subject to Regulation XV to Provide Centrally Located Commuter Information Area Offering Information on Transportation Alternatives.
- Develop a Trip Reduction Plan to Achieve 1.5 AVR or Higher, for Multi Tenant Worksites or Businesses with Less than 100 Employees.
- Provide or Contribute to Shuttle Service from Residential Subdivisions to Major Transit Centers.
- Contribute to Regional Transit Systems (i.e., Right of Way, Capital Improvements, etc.).
- Provide Preferential Parking Spaces for Carpools and Vanpools.
- Provide Minimum Vertical Clearance of 72" in Parking Facilities to Permit Access for Vanpools
- Develop a Trip Reduction Plan to Achieve a 1.5 AVR or Higher for Construction Employees (CONSTRUCTION)

AR0073135

TABLE A11 -5 - D

METHODOLOGY FOR AVERAGE VEHICLE RIDERSHIP IMPROVEMENT (INCREASED AVR)

This methodology calculates net emissions after implementation of mitigation measures that improve Average Vehicle Ridership (AVR). AVR is defined as the number of employees arriving at a site divided by the number of cars arriving at the project site. Even after implementation of mitigation measures, the number of employees arriving at the project site will be the same as that assumed for non-mitigated emissions. However, the average number of cars arriving at the project site will be less, resulting in emission reductions. Since this methodology removes all emissions associated with eliminated trips, diurnal emissions associated with these eliminated vehicles must be added back. Net emission reductions will be affected if vehicle trips are eliminated, as increased availability of vehicles at home may increase non-work trips by up to 5%.

It must be noted that while these measures reduce the number of cars arriving to the worksite, the reduction in vehicle trip emissions will be largely negated if ridesharers drive individually to carpool meeting points or park-n-ride lots, as there are additional emissions from these travel modes. All mitigation measures that a) reduce Vehicle Trips with an Increase in VMT and b) reduce VMT result in secondary impacts, namely an increase in Average Vehicle Ridership. Consequently, mitigation measures that increase AVR will have the same direct impacts as indicated in either Table A11 - 5 - A or A11 - 5 - C.

$N = [A \times (J/M)] + [V] + [W] + [X] + [Y] + [Z] + [I]$, or
$N = [A \times (O/L)] + [V] + [W] + [X] + [Y] + [Z] + [I]$, if K is equal to N; or
$N = [A \times (J/M) \times (N/K)] + [V] + [W] + [X] + [Y] + [Z] + [I]$, if K is not equal to N.
(*For Mitigation Measure to Work Effectively, the Value for K Should be Equal or Greater than the Value for N*)

- N = Net Emissions After Implementation of Mitigation Measures That Improve Average Vehicle Ridership
- A = Total Non-mitigated Vehicular Emissions (*Resulted from Table A9 - 5 or Appendix 9 Methodologies*);
- J = Original Average Vehicle Ridership
  - = K/L; Where,
    - K = Original Number of Persons Arriving at the Project Site Before Implementation of Mitigation. (*Used to Estimate Non-mitigated Emissions, "A," using Table A9 - 5 of Appendix 9*).
    - L = Original Number of Cars Arriving at the Project Site Before Implementation of Mitigation. (*Used to Estimate Non-mitigated Emissions in Appendix 9*)
- M = New Improved Average Vehicle Ridership After Implementation of Mitigation Measure
  - = N/O; Where,
    - N = Weighted Average Daily Number of Persons Arriving at the Project Site
      - = $\{[P \times Q] + [K \times R]\}/\{Q + R\}$
      - P = New (Reduced) Number of Persons Arriving at the Project Site After Implementation of Mitigation Measure.
      - Q = Number of Days New (Reduced) Number of Persons Traveled to the Project Site After Implementation of Mitigation Measure.
      - R = Number of Days Original (Appendix 9) Number of Persons Traveled to the Project Site After Implementation of Mitigation Measure.
    - O = Weighted Average Daily Number of Cars Arriving at the Project Site
      - = $\{[S \times T] + [L \times U]\}/\{T + U\}$
      - S = Reduced No. of Cars Arriving at the Site After Implementation of Mitigation Measure.

AR0073136

T = Number of Days New (Reduced) Number of Cars Traveled to the Project Site After Implementation of Mitigation Measure.

U = Number of Days Original (Appendix 9) Number of Cars Traveled to the Project Site After Implementation of Mitigation Measure.
(The Total of Q and R, and T and U Should be Equal to Number of Days [Maximum Would be 7.0] Used to Determine Non-mitigated Vehicular Emissions Using Original Number of Cars in Table A9 - 5 of Appendix 9.)

V = Diurnal ROC Emissions Pounds Per Day Associated with Removed Cars
(This Addition is Only for ROC)
= (B x C)/454; where,
B = Removed Vehicles After Implementation of Mitigation Measure = (L - O)
C = Diurnal ROC Emission Factor In Grams Per NOV
(This Emission Factor is Only for ROC)

Please estimate running exhaust, running evaporative, start-up, and hot soak emissions with the following modes. Also estimate diurnal emissions for all other modes except for R and X mode of transport, i.e., removed vehicles reused with shorter trip lengths.

To estimate emissions associated with the following (various) Travel Modes, Use Table A9 - 5 Methodologies from Appendix 9 and the Needed Data from TABLE A11 - 1 - C.

W = Additional Emissions In Pounds Per Day After Implementation of Mitigation Measure or with Improved AVR Associated with Certain Number of Employees Traveling in Personal Cars (Removed) to Other Work Sites with Shorter Traveling Distance
(If not applicable to the project, enter 0.0); and/or

X = Additional Emissions In Pounds Per Day After Implementation of Mitigation Measure or with Improved AVR Associated with Certain Number of Employees Traveling in Buses (Removed) to Other Work Sites with Shorter Traveling Distance
(If not applicable to the project, enter 0.0); and/or

Y = Additional Emissions In Pounds Per Day After Implementation of Mitigation Measure or with Improved AVR Associated with Certain Number of Employees Traveling in Shuttles (Removed) to Other Work Sites with Shorter Traveling Distance
(If not applicable to the project, enter 0.0); and/or

Z = Additional Emissions In Pounds Per Day Associated with Certain Number of Employees Traveling in Personal Cars to to Pick Up Employees At Their Houses
(If not applicable to the project, enter 0.0); and/or

To estimate emissions associated with Nonwork Trips made by the Personal Vehicles of Home-based employees, Use Table A9 - 5 Methodologies from Appendix 9 and the Needed Data from TABLE A11 - 1 - B.

I = Non-Work Related Emissions Associated with Use of Removed Cars for Personal Trips;
(If not applicable to the project, enter 0.0);
= (B x D x E x F x H)/454; where,
B = Removed Vehicles After Implementation of Mitigation Measure = (L - O)
D = 0.05; Five Percent of Removed Cars Used for Personal Travel Such as Home to Other or Shop Travel
E = Number of Trips per Vehicle per Day
(For Round-Trip Use 2, and One-way Trip Use 1)
F = Trip Length for Home to Shop or Home to Other
G = New Speed For this Short Travel
H = Emission Factors In Grams Per Mile With New Speed

AR0073137

TABLE A11 -5 - D - 1

AVERAGE VEHICLE RIDERSHIP DEPENDENT DATA NEEDED TO DETERMINE DIRECT IMPACTS (REDUCTION IN CARS ARRIVING AT THE PROJECT SITE)

(AVR = Number of Persons Arriving At a Site/Number of Cars Arriving at That Site)

Mitigation Measures	Participation	Current or Original Impact		Estimated Impact	
		# Cars Arriving	Current AVR	# Cars Ariving	New AVR
e.g., Shuttle Service from Home to Work	15 out of 100	100	100/100+1.0	(100-30)=70	100/70=1.4

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT RELY ON PRICING STRATEGIES

Mitigation Measures
That Rely on Pricing Strategies
Reduce Emissions Associated With
Average Daily Trips and Vehicle Miles Traveled

- Provide Employees with Cash Allowances for Ridesharing
- Charge Employees or Visitors to Park, or Provide Discounts to High Occupancy Vehicles
- Pay or Provide Employer Incentives Not to Drive Once a Week

AR0073139

TABLE A11 - 5 - E

METHODOLOGY TO DETERMINE IMPACT OF PRICING STRUCTURES

Mitigation measures with pricing structures will have the same direct impacts as indicated for those same measures in Tables A11 - 5 - A, B, C or D of Appendix 11 (i.e., increase in Average Vehicle Ridership (AVR), and/or reduction in Average Daily Trips (ADT) with increase in VMT by substitute travel modes, Average Daily Trips (ADT) without an increase in VMT or Vehicle Miles Traveled (VMT) with no reduction in ADT). Methodologies and data needed should be the same as described in those four tables. Because the variables that determine vehicle trips and/or VMT reductions from a pricing standpoint are dependent on a myriad of influences, methodologies based on pricing are not provided. For example, the efficiency of a mitigation measure in reducing vehicle trips may be dependent on the allowance paid to employee by the employer or vice versa. If an employer increases the allowance for parking by 50 cents, it may linearly increase AVR by 0.1 or remove 10 average daily trips and 5 cars, or reduce average trip length by 2 miles. These results are largely based on demand elasticities. Consequently, any data that follows is based on published studies that compared pricing strategies with travel demand.

AR0073142

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE CONGESTION AND IMPROVE SPEED WITH INCREASED NUMBER OF VEHICLES

Mitigation Measures That Reduce Emissions Associated With On- and Off-Road Congestion

OPERATION

- Implement On-Site Circulation Plan in Parking Lots to Reduce Emissions From Queuing Vehicles
- Improve Traffic Flow at Drive-Throughs by Designing Separate Windows for Different Functions and Providing Temporary Parking for Orders That Are Not Immediately Ready for Pickup
- Construct On- or Off-Site Bus Turnouts, Passenger Benches, and Shelters
- Synchronize Traffic Lights on Streets Impacted by Development
- Reschedule Truck Deliveries and Pickups for Off-Peak Hours
- Implement Staggered Work Hours So That Employees Arrive and Depart From Work Stations at Different Times and Reduce Vehicle Queuing
- Set Up Paid Parking System Where Drivers Pay at a Walkup Kiosk and Exit Via a Stamped Ticket to Reduce Vehicle Queuing
- Require On-Site Truck Loading Zones

CONSTRUCTION

- Configure Construction Parking to Minimize Traffic Interference
- Provide Temporary Traffic Control During All Phases of Construction Activities to Improve Traffic Flow, Such as Providing a Flag Person to Direct Traffic and Ensure Safe Movements Off the Site
- Schedule Off-Site Cut-and-Fill Transport and Other Construction Activities to Off-Peak Hours (i.e., Between 7:00 p.m. and 6:00 a.m. and Between 10:00 a.m. and 3:00 p.m.)
- Develop a Construction Traffic Management Plan That Includes, But Is Not Limited to: a) Rescheduling Goods Movements for Off-Peak Hours; b) Rerouting Construction Trucks Off Congested Streets; c) Consolidating Truck Deliveries; d) Providing Dedicated Turn Lanes for Movement of Construction Trucks and Equipment On- and Off-Site

AR0073143

TABLE A11 - 5 - F

METHODOLOGY FOR REDUCED CONGESTION (INCREASED NUMBER OF VEHICLES WITH IMPROVED SPEED)

This methodology calculates the net emissions after implementation of mitigation measures that cause a reduction only in traffic congestion. The number of vehicles traveling on roadways over a given period of time will increase due to improved speeds and improved circulation. Improved speed will improve the corresponding emission factor for the traveling vehicle, causing a reduction in emissions.

$$N = [A \times (E/F) \times (G/H)]$$

- N = Net Emissions After Implementation of Average Daily Trip (ADT) Reduction Measures
- A = Total Non-mitigated Vehicular Emissions *(Resulting from Table A9 - 5 of Appendix 9 Methodologies)*
- E = New Number of Vehicles on the Same Road After Implementation of Mitigation Measure *(Traffic Study)*
- F = Original Number of Vehicles on That Road Used for Original LOS *(Traffic Study Input)*
- E = New Number of Vehicles on the Same Road After Implementation of Mitigation Measure *(Traffic Study)*
- G = New Speed-Dependent Emission Factors
- H = Original Speed-Dependent Emission Factor *(Table A9-5 of Appendix 9)*

TABLE A11 - 5 - F - 1

RELATIONSHIP BETWEEN TRIP SPEED AND NUMBER OF VEHICLES (ROAD CAPACITY) PASSING A CERTAIN POINT IN ONE HOUR, BY ROAD TYPE (MPH AND NUMBER OF VEHICLES PER HOUR)

Traffic impact analysis should provide number of vehicles on nearby roads. To determine fleet mix (passenger and trucks) on the following road types please use EPA report Contract Number A2-155-32 on Assessment of Heavy-Duty Gasoline and Diesel Vehicles in California: Population and Use Patterns, Prepared in July 1985 by Yuji Horie, Richard Rapoport of Pacific Environmental Services, Inc. Passenger vehicles include all autos and light-duty trucks; trucks include all medium-duty, light-heavy, medium-heavy, and heavy-heavy-duty trucks.

TABLES FOR ESTIMATING VEHICULAR EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE THE USE OF GASOLINE- AND DIESEL-FUELED VEHICLES

Mitigation Measures That Reduce Emissions Associated With Gasoline- and Diesel-Fueled Vehicles By Utilizing Alternate Fuel-Fueled Vehicles

- Use Low-Emission Vehicles (LEVs) (Scheduled Penetration Between 1998 and 2004)
- Use Ultra Low Emission Vehicles (ULEVs) (Scheduled Penetration Between 1998 and 2010)
- Use Zero Emission Vehicles (ZEVs) (Scheduled Penetration Between 1998 and 2010)
  (*For Percent Penetration See Attached Table*)

SOURCE: ARB's Staff Report for Proposed Regulations for Low-Emission Vehicles and Clean Fuel

AR0073145

TABLE A11 - 5 - G

METHODOLOGY FOR REDUCED NUMBER OF GASOLINE-FUELED AND DIESEL-FUELED VEHICLES WITH INCREASED NUMBER OF ALTERNATE FUEL-FUELED VEHICLES

This methodology is for net emissions after implementation of mitigation measures that cause a reduction only in the number of gasoline- and diesel-fueled vehicles.

N = [A x (1 - L)] + [((F x L) x (ADT Rate*) x (Trip Length**) x (New Running Exhaust and Evaporative Emission Factor***)] + {(F x L) x (ADT Rate*) x (New Start-Up Emission Factor***)} + {(F x L) x (ADT Rate*) x (New Hot-Soak Emission Factor***)} + {(F x L) x (New Diurnal Emission Factor***)}; Where,

N = Net Emissions After Implementation of Measures that Reduce Diesel- and Gasoline-fueled Vehicles.

A = Total Nonmitigated Vehicular Emissions
(*Resulting from Table A9 - 5 or Appendix 9 Methodologies* for the First Mitigation Measure);
Please repeat the same formula for each type of alternatively fueled vehicle. When repeating the formula use net emissions from previous calculations as nonmitigated emissions.

(Note: Please note all vehicle categories (LEVs, ULEVs and ZEVs) fueled with varieties of fuels will have the same emissions factor, i.e., emission factor will be dependent on vehicle category and not fuel category. The emission factor is not fuel dependent.)

F = Original Number of Project-Related Gasoline-and Diesel-Fueled Vehicles (*Traffic Study Input*)

L = Fraction or Percent Vehicles Replaced With Alternate Fuel-Fueled Vehicles
(Mitigations should at least utilize the same percent substitutions for that build-out year as indicated in Table A11 - 5 - G - 1. If a lower percent is utilized, please provide reasons for not utilizing available percent penetration rate.)

(F x L) = New (Reduced) Number of Alternatively Fueled Vehicles
After Implementation of Mitigation Measure (*Traffic Study*)

* For ADT Rates, Please See Table A9 - 5 of Appendix 9 or Traffic Analysis Used to Estimate Nonmitigated Emissions (A)

** For Trip Length, Please See Table A9 - 5 of Appendix 9 or Traffic Analysis Used to Estimate Nonmitigated Emissions (A).

*** For Emission Factors Contact California Air Resources Board or Manufacturers of the New Vehicles.

(If Emission Factors are not available, please indicate potential emission reduction by using Fractions provided in ARB's Staff Report on Clean Fuel Regulation, and make a statement to indicate that additional emissions from substitute vehicles will be estimated when emission factors are available for substitute vehicles.)

Note: ADT and Trip Length data should be weighted for the average of seven days, i.e., five days for workdays and two days for weekends.

AR007315

EXAMPLES OF EMPLOYERS WHO HAVE IMPLEMENTED SUCCESSFUL MITIGATION PROGRAMS THAT INVOLVE PACKAGES OF TRANSPORTATION DEMAND MANAGEMENT INCENTIVES

AR0073160

TABLE A11 - 5 - I

ESTIMATING EMISSIONS FROM THE TCM PACKAGES

Tables A11 - 5 - A through A11 - 5 - F attempt to quantify the effectiveness of a variety of individual, transportation-based mitigation measures. These measures, defined by the California Clean Air Act as "transportation control measures (TCMs)," involve strategies to reduce vehicle trips, vehicle use, vehicle miles traveled, vehicle idling, and traffic congestion for the purposes of reducing motor vehicle emissions. Many TCMs are effective when implemented without supporting measures. However, most are ineffective or less effective when implemented in isolation. This helps to explain the difficulty in quantifying the impact of a particular, isolated mitigation measure, as measures are usually effected as part of a transportation program. Therefore disaggregating the impacts of a multi-pronged TCM program is difficult.

To address this issue, the following table summarizes a variety of employers who have implemented and monitored the results of successful programs which utilized a package of transportation-based mitigation measures. The success of each program is attributed to a specific menu of related measures. Based on monitored results, the impacts of each case study are characterized in terms of reductions in vehicle trip (VT), vehicle miles traveled (VMT) and/or improvements in average vehicle ridership (AVR).

The purpose of this table is to supplement Tables A11 - 5 - A through A11 - 5 - F and assist local government decision-makers, air quality analysts, employers, and other private entities to determine the best package of transportation-based mitigation measures for their needs. To this end, the summary reflects a variety of circumstances, based on the following criteria:

- Type of land use or employer,
- Size of employer,
- Local conditions surrounding the employer, based on the following definitions:

  Urban: Jurisdiction characterized by moderate to dense population and development intensity.

  Urbanizing: Jurisdiction characterized by low to moderate population and development density, with significant growth projected over the next 20 years.

  Rural: Characterized by low population and development intensity, with significant growth projected by the year 2010.

- Accessibility to rail or bus transit facilities.

AR0073161

TABLE A11 - 5 - I

Land Use Site Description	Mitigation Measures (TDM Package)	Factors	Impacts/ Results
o Industrial office o 13,000 employees o Urban community	o Subscription bus Program o "Ride-Guide" carpooling program o Vanpool program o Staggered work hours	o Employer flextime policy - min 8 hr. o contract with transit operator - pick-up at home, three fare options max. ridership 250 employees o Avg round trip of van 50 miles - monthly charge $ 46 vanpool.	o 1,124 VTs reduced or 9.7% reduction in vehicle trips; AVR 1.21
o Office o 400 employees o Urban (CBD) o Transit accessible	o Transportation allowance program o Restricted on-site parking (limitation in parking capacity) o HOV subsidies	o Parking facility is limited o Parking is priced - $ 40 per month; Transit users $ 15 monthly pass discount, carpoolers park free	o AVR 1.40
o Office o 980 employees o Urbanizing community o Transit accessible	o Direct subsidy to employees using commute alternatives (coupon system) o Preferential parking o Vanpool o Marketing through posters, memos, brochures	o Monthly reimbursement = $ 30, depending on mix modes used by employees; o Subsidized van service; o Avg round trip of van ranges between 60-80 miles- o Passengers charged $40 a month	o AVR 1.55; o Reduction of vehicle trip rate from 82.4 daily one-way trips per employee to 63.4, a 22% reduction.
o Office o Urban community (CBD) o Transit accessible o 1,100 employees	o Constrained on-site parking o Parking charge o Transit subsidies o Vanpool subsidy o Good marketing and promotion by management - corporate-supported plan.	o Additional offsite parking available through lease - $ 30 a month per employee; o On site spaces = $110 per month per employee; 36% of all employees use transit to work o Constrained parking - 223 spaces - 5 employees per space = 1.05 spaces per 1,000 Sq. Ft. o Parking charge: 2-person carpool = $ 75 per month 3-person = $ 40 per month 4-person or more = $ 10 per month o Transit subsidies: $15 - $30 per month o Vanpool subsidies $10 - $30 per month	o Removal of 7.8 ADTs per 100 employees = 86 ADTs reduced per day; o 13.6% VT reduction

AR0073162

TABLE A11 - 5 - I (CONT.)

Land Use Site Description	Mitigation Measures (TDM Package)	Factors	Impacts/ Results
o Manufacturing o 125 employees o Urban community	o Preferential parking spaces o Promotional commuter fairs, bulletin boards, newsletter o Guaranteed ride home o Rideshare subsidy o Transit subsidy	o On-site transportation coordinator o Rideshare subsidy $15 monthly o Transit subsidy $15 monthly o 200 parking spaces o Limited rail and bus service opportunities o 15 preferential parking spaces	o 1.09 AVR increased to 1.23 AVR
o Office o 321 employees o Urbanizing community o Transit accessible	o ETC on-site o Direct ridesharing/vanpooling subsidy o Free passes to special activities o Discounted transit and train passes o Preferential parking	o Drawings and promotional support o $20 per month to employees for ridesharing o $25 per month to employees for vanpooling 20 parking spaces reserved for ridesharers o Computerized rideshare matching o 438 parking spaces o Bicycle paths and wide sidewalks to site o Transit, signalized intersections, and light rail available	o 1.03 AVR increased to 1.24 AVR o 40 daily trips reduced
o Municipal Government o Urban community o 166 employees	o ETC on-site o Raffles and giveaways o Preferential parking spaces o Transit discounts o Guaranteed ride home o Commuter shuttle service o Flextime	o Ride matching service o Daily raffle tickets o Awarded for ridesharing o 124 parking spaces	o 1.09 AVR increased to 1.15 AVR o 8 daily one-way trips o 5% VT reduction
o Utility company o 134 employees o Urban community	o Preferential parking spaces o Guaranteed ride home o Transit subsidy o Flextime o On-site cafeteria o Vanpool program	o $63 a month per employee for transit o Commuter hot-line 24 - hour telephone line (trip reduction plan) o Free pick-up and delivery service to light rail transit o 97 parking spaces o On-street parking	o AVR 1.28

AR0073163

TABLE A11 - 5 - I (CONT.)

Land Use Site Description	Mitigation Measures (TDM Package)	Factors	Impacts/ Results
o Insurance office o 249 employees o Urban community	o Compressed work week o Vanpool/carpool subsidies o Quarterly drawings for prizes	o Subsidize carpool participants - $5 per month drivers - $20 per month o Management support o News bulletin, flyers, active promotion of program o Sidewalks, signalization and crosswalks	o 1.19 AVR
o New car dealership o 228 employees o Urban community	o Preferential parking o Flextime o Guaranteed ride home	o Employee recognition o Prize drawings o Rideshare matching services o 140 parking spaces o Freeway accessibility o Transit accessible o Special driving privileges for management personnel that rideshare	o 1.03 AVR increase to 1.38 AVR o 56 one-way trips reduced o 25% VT reduction
o Industrial/Manufacturing o 217 employees o Urban community	o Vanpool/carpool subsidies o Compressed work week o Preferential parking o Guaranteed ride home o ETC on-site	o Rideshare subsidy of $15 a month o Quarterly prizes for ridesharing o Ridesharing match service o Brochures, posters, announcements to promote ridesharing o Freeway accessibility o 144 parking spaces	o 1.03 AVR increase to 1.18 o 27 one-way trips reduced; o 13% VT reduction
o Industrial/Manufacturing o Urbanizing community o 171 employees	o Preferential parking o Compressed work week o Guaranteed ride home	o 48 preferential parking spaces o Quarterly drawing for prizes	o 1.09 AVR increase to 1.33 AVR o 28 one-way trips reduced; o 17% VT reduction

AR0073164

Land Use Site Description	Mitigation Measures (TDM Package)	Factors	Impacts/ Results
o Retail discount store o Urban community o 200 employees o Transit accessible	o Preferential parking o Transit pass subsidy o Flextime o ETC on-site	o 11 preferential parking spaces o Monthly transportation contest o Transportation center for employees o Education in new-hire orientation o Transit subsidy - $15 per month o Transit pass drawing o 900 parking spaces o "User friendly" pedestrian site	o AVR 1.16 increased to 1.39 AVR; o 29 one-way trips reduced; o 17% VT
o Manufacturing/Industrial o Urbanizing community o 192 employees	o Guaranteed ride home o Compressed work week o Telecommuting	o Carpooling information o 162 parking spaces	o AVR 1.37 increased to 1.97 AVR o 40 one-way trips reduced o 30% VT reduction
o Medical supplies o Manufacturing o Urbanizing o Transit oriented o Employees	o Transit subsidy o Carpooling subsidy o Preferential parking o Flextime o Guaranteed ride home o Vanpooling pilot program o Bike racks, lockers, showers	o $1 per day for ridesharing o Matchlist services o Displays, posters, and newsletter promoting ridesharing o Drawings for cash o 50% transit subsidy - $10 per month o 712 parking spaces	o AVR 1.05 increased to 1.22 AVR o 62 one-way trips reduced o 13% VT reduction

AR0073165

TABLES FOR ESTIMATING EMISSIONS FROM REDUCTION IN PETROLEUM PRODUCTS PUMPED AT SERVICE STATIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Petroleum Product Fueling Activities (SCAQMD Rule 461 Emissions)

- Provide Electric Outlets for Electric Vehicles in Garages
- Provide Electric Outlets at Service Stations
- Provide Service Stations that Supply Alternate Fuels

AR0073166

TABLE A 11 - 6

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM PETROLEUM PRODUCTS FUELING ACTIVITIES
(Pounds Per Day)

This methodology is for net emissions after implementation of mitigation measures that cause a reduction in emissions associated with the amount of gasoline and diesel dispensed due to a reduction in the number of gasoline- and diesel-fueled vehicles.

$N = [A \times \{1 - [O/F]\}] + [\{A \times [O/F]\} \times ((E \underline{OR} M)/(G \underline{OR} D))]$, OR
$N = [A \times \{(1 - L)\}] + [\{A \times L\}] \times ((E \text{ OR } M)/(G \underline{OR} D))$

Where,

- A = Total Non-Mitigated Diesel or Gasoline Fuel Dispensing Fugitive Emissions.
  (*Use Rule 461 Staff Reports* or See Table A9 - 17 in Appendix 9)
  (*Resulting from Table A9 - 5 or Appendix 9 Methodologies* for the First Mitigation Measure);
  Please repeat the same formula for each type of alternate fuel-fueled vehicle penetration. when repeating the formula, use net emissions from previous calculations as non-mitigated emissions.
- D = Original Diesel Emission Factor in Pounds per Million BTUs
- E = New or Electricity Consumption Emission Factor in Pounds per Million BTUs
- F = Original Number of Project-Related Gasoline- or Diesel-Fueled Vehicles (*Traffic Study Input*)
- G = Original Gasoline or Diesel Emission Factor in Pounds per Million BTUs
- O = Removed from Original Number of Project-Related Gasoline- or Diesel-Fueled Vehicles
- L = Percent Vehicles Replaced With Alternate Fuel-Fueled Vehicles:
  (F x L) = Alternate Fuel-Fueled Vehicles (contact ARB to obtain fueling emission factors for altern fuels, i.e., natural gas, methanol, Phase 2 fuel, LPG, etc.).
  (Mitigations should at least utilize the same percent substitutions for that build-out year as indicated in Table A11 - 5 - G - L. If lower percent is utilized, please provide reasons for not utilizing available percent penetration rate.)
- M = New or Alternate Fuel Emission Factor in Pounds per Million BTUs (contact ARB for fueling emission factors)
- N = Net Emissions After Implementation of Measures that Reduce Diesel and Gasoline Fuel Dispensing Fugitive Emissions.

Note: Dispensing data should be weighted for the average of seven days, i.e., five days for workdays and two days for weekends.

TABLE A11 - 6 - A

DISPENSING EMISSION FACTORS FOR VARIOUS FUELS
(Pounds Per Million BTUs)

Fuel Type	CO	ROC	NOx	SOx	PM10
Gasoline (G) (Vapor Control Transfer)	N/A	0.008	N/A	N/A	N/A
Diesel (D) (No Vapor Control Transfer)	N/A	0.079	N/A	N/A	N/A
Electricity (E) (Battery Charging)	0.059	0.0029	0.34	0.035	0.012
Alternate Fuel (M) (Phase 2 Gasoline, Alcohol, CNG (Natural Gas) or LPG (Propane or Butane))*					

* Use California Air Resources Board Staff Report for the Proposed Regulations for Low-Emission Vehicles and Clean Fuels, August 13, 1990.

AR0073167

TABLES FOR ESTIMATING AVERAGE VEHICLE RIDERSHIP AFTER THE IMPLEMENTATION OF MITIGATION MEASURES
(After Reduction in Number of Vehicles Traveled)

- Walk to work or destination
- Bicycle to work or destination
- Telecommute
- Report to another site for work
- Implementation of:
  - 3/36 work week
  - 4/40 work week
  - 9/80 work week
- Use of LPG powered vehicles
- Use of methanol-powered vehicles
- Use of natural gas-powered vehicles
- Use of electricity-powered vehicles
- Travel in 2 to 40 persons per vehicle format

AR0073168

TABLE A11 - 7

ESTIMATING PROJECT-RELATED AVERAGE VEHICLE RIDERSHIP OR OCCUPANCY AFTER THE IMPLEMENTATION OF VARIOUS MITIGATION MEASURES (Based on District Regulation XV)

AVR = Number of Persons Traveled/Number of Cars or Vehicles
(The Lower the Number of Vehicles, the Greater the AVR)

AVR = [A + B + C + D + E + F + M + G + H + L1]/[(A/1 + B/1 + C/2 + D/3 + E/4 + F/4 + M/7 + G/12 + H/40 + L1/1)

Where,

AVR	=	Average Vehicle Ridership after implementation of mitigation measures. To improve the AVR, trips associated with the following should be eliminated or reduced.
A	=	Remaining Number of 1-Way Trips in 1-Person 1-Vehicle Format
B	=	Remaining Number of 1-Way Trips in 1-Person 1-Motorcycle Format
L1	=	No survey response 1-Way Trips (Report these trips as "A"; If not applicable, use 0.0) To improve the AVR, more trips associated with the following combination of mitigation measures are needed. If not applicable, use 0 for the following, and use Appendix 11 methodologies for emission reduction
C	=	Number of 1-Way Trips in 2-Person 1-Vehicle Format
D	=	Number of 1-Way Trips in 3-Person 1-Vehicle Format
E	=	Number of 1-Way Trips in 4-Person 1-Vehicle Format
F	=	Number of 1-wAY Trips in More Than 4-Person 1-Vehicle Format
M	=	Number of 1-Way Trips in More Than 7-Person 1-Vehicle Format
G	=	Number of 1-Way Trips in More Than 12-Person 1-Vehicle Format
H	=	Number of 1-Way Trips in More Than 40-Person 1-Vehicle Format

---

The following mitigation measures should be used to determine emission reductions and should not be used to determine post-mitigation AVR.

I	=	Walk 1-way trips
J	=	Bicycle 1-way trips
K	=	Telecommute 1-way trips
L	=	Report to another site 1-way trips
M	=	1-way trips for persons with days off due to a 3/36 work week
N	=	1-way work trips for persons with days off due to a 4/40 work week
O	=	1-way trips for persons with days off due to a 9/80 work week
S	=	Total # of clean fuel vehicles used for commuting from home to work per day of the week
T	=	Number of workdays of the week on which "clean fuel vehicles" are used for commuting from home to work *(if unknown, use 5.0)*
U	=	Total liquid petroleum gas (LPG) vehicles
V	=	Total methanol vehicles
W	=	Total compressed natural gas (CNG) vehicles
Y	=	Total electricity powered vehicles
Z	=	Number of workdays in a week chosen to determine AVR *(if unknown, use 5.0)*
P	=	*1-way trips for persons on vacation*
Q	=	*1-way trips for persons who are on sick leave*
R	=	*1-way trips for persons who are absent for other than vacation and sick leaves*

AR0073169

TABLES FOR ESTIMATING MOBILE EQUIPMENT EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Gasoline- and Diesel- Powered Mobile Equipment

- Replace Gasoline- and Diesel-Powered Mobile Equipment With Natural-Gas-Powered Mobile Equipment;
- Replace Gasoline- and Diesel-Powered Mobile Equipment With LPG (Propane and Butane)-Gas-Powered Mobile Equipment; or,
- Replace Gasoline- and Diesel-Powered Mobile Equipment With Battery-Powered Mobile Equipment (*Electricity usage from existing power outlets supplied by SCE, LADWP, etc. to recharge batteries*)

AR0073170

TABLE A11 - 8

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM MOBILE EQUIPMENT
(Pounds Per Day)

M = R + N

Where,

M = Mitigated Mobile Equipment Emissions After Implementation of Mitigation Measures *(Use Table A9 - 8 to Estimate Non-Mitigated Emissions from Original Mobile Equipment)*

R = Remaining or Residual Non-Mitigated Emissions From Unreplaced Original Mobile Equipment

= {[E x {1 - (F/G)}]; Where,

E = Non-Mitigated Emissions from Table A9-8 of Appendix 9 *(The District Prefers F Being Equal to G)*

F = Number of Removed Original (and Replaced with New) Mobile Equipment

G = Number of Original Mobile Equipment *(Used to Estimate Non-Mitigated Emissions (E) in Table 9-8 of Appendix 9)*

N = New Emissions From Replaced Equipment *(Replacing Removed Original Equipment)*

= (V x (H OR J/I OR K)); Where,

V = Removed Emissions *(Emissions of Removed Original Equipment)*

= [E x {F/G}]

H = New Emission Factor per Million BTU** for New *(For Replaced)* Equipment *(See Table A11 - 8 - A)*;

J = New Emission Factor (EF) per "Converted" unit to EF "Unit" of Original Equipment; Converted unit is in the same unit as that for Original Emission Factor; for example, if original EF is in lbs per 1000 gals the new EF should be also in lbs/1000 gals *(See Table A11 - 8 - C)*

I = Original Emission Factor per Million BTU for Original (for Removed) Equipment*, OR Use Table A11 - 8 - B***

K = Original Emission Factor per Unit for Original (for Removed) Equipment*, OR Use Table A11 - 8 - D***

* *Use emission factors from Table A9 - 8 - A or Table A9 - 8 - B and/or their conversions into per million BTUs per hour*

** *BTU = British Thermal Unit*

*** *Use stationary equipment emission factors found in Table A11-8-B and Table A11 - 8 - D only if emissions for mobile equipment cannot be derived from Tables A9 - 8 - A and A9 - 8 - B*

AR0073171

TABLE A11 - 8 - A

Emission Factors (H) for Each Criteria Pollutant for New Mobile Equipment (Pounds Per Million BTUs)

Pollutant Type / Fuel Type	CO	ROC	NOx	SOx	PM10
	(Industrial/Commercial Type)				
Propane	1.267	0.815	1.365	0.003	0.025
Butane	1.267	0.815	1.365	0.003	0.025
	(Cogeneration or Non-cogeneration Type)				
Natural Gas (Methane)	0.4095	0.079	3.2381	0.0006	0.0048

TABLE A11 - 8 - B

Emission Factors (I) for Each Criteria Pollutant for Original (Removed) Equipment (Pounds Per Million BTUs)

Pollutant Type / Fuel Type	CO	ROC	NOx	SOx	PM10
Distilled Oil, or Diesel	0.735	0.23	3.38	0.225	0.12
Gasoline	34.26	1.28	0.89	0.046	0.028

TABLE A11 - 8 - C

Emission Factors (J) for Each Criteria Pollutant for New Mobile Equipment (The following emission factors should be converted to emissions per million BTUs)

Pollutant Type / Fuel Type	CO	ROC	NOx	SOx	PM10
	(Pounds/Megawatt-Hours [1] and [2]*)*				
Electricity	0.2	0.01	1.15	0.12	0.04
Dual Fuel (Oil/Gas)	7.9	2.0	24.14	0.94	1.48
	(Pounds/One Thousand [1,000] Gallons)				
Propane	129.0	83.0	139.0	0.35	2.5
Butane	129.0	83.0	139.0	0.35	2.5
	(Pounds/Million [1,000,000] Cubic Feet)				
Process Gas*	--	83.0	--	--	--
Landfill Gas	--	--	--	--	--
	(Cogeneration and noncogeneration Type)				
Natural Gas (Methane)	430.0	82.9	3,400.0	0.6	5.0

[1] When using emissions factors expressed in megawatt-hour, they should be adjusted using efficiency factors "S" from Table A9-3-C.

[2] For generators, when using emissions factors expressed in megawatt-hour, they should be further adjusted using efficiency factor "U" from Table A9-3-C.

* 525 BTUs per cubic feet of process gas

AR0073172

TABLE A11 - 8 - D

Emission Factors (K) for Each Criteria Pollutant for Original (Removed) Mobile Equipment
(The following emission factors should be converted to emissions per million BTUs)

Pollutant Type / Fuel Type	CO	ROC	NOx	SOx	PM10
	(*Pounds/Megawatt-Hours* [1] and [2])				
(Reciprocating)					
Diesel	2.51	0.79	11.55	0.77	0.41
Gasoline	117.0	4.39	3.03	0.16	0.10
	(*Pounds/1,000 Gallons*)				
(Reciprocating)					
Diesel	102.0	32.1	469.0	31.2	16.75
Gasoline	3,940.0	147.7	102.0	5.31	3.235
Residual Crude Oil	102.0	32.10	469.0	155.0	16.75
Keronaptha Jet Fuel (Diesel/Kerosene Mixture)	102.0	32.1	469.0	6.2	16.75
	(*Pounds/Ton*)				
(Turbine)					
Jet Fuel	150.0	1.7	1.0	0.5	2.5

[1] When using emissions factors expressed in megawatt-hour, they should be adjusted using efficiency factors "S" from Table A9-3-C.

[2] For generators, when using emissions factors expressed in megawatt-hour, they should be further adjusted using efficiency factor "U" from Table A9-3-C.

[s] Percent sulfur content of the fuel. (*Please see Rule 431.2 for the applicable project related fuel sulfur content factor, and multiply 140.0 by [s] to obtain project-related SOx emission factor.*)

AR0073173

TABLE A11 - 8 - E

TYPICAL LOAD FACTORS, ETC FOR MOBILE (OFF-ROAD) EQUIPMENT

(All values are taken from November 1991 Nonroad Engine and Vehicle Emission Study and averaged)

(NTIS PB92 - 126960, EPA 460/3-91-02, or EPA 21A - 2001)

The following information should be used only if emission factors expressed in megawatt-hours are used. Content of this table will be updated as each equipment is made capable of utilizing LPG (Propane and Butane) and CNG (Natural Gas or Methanol).

LPG/CNG		LPG/CNG
Equipment Type	**Load Factor (Percent or %)**	**Load Factor (Percent or %)**
Skid-Steer Loader Wheel/Rubber-Tired Loader Tractors/Loaders Airport Terminal Tractors Excavators Trenchers Rollers Other Construction Equipment Cement and Mortar Mixer Paving Equipment Asphalt Pavers Plate Compactors Concrete Saws (Cutting Concrete) Crushing Equipment	78

TABLE A11 - 9

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE PM10 EMISSIONS FROM CONSTRUCTION ACTIVITIES

(This methodology also estimates emissions from one source category if more than one mitigation measure is implemented towards that same source category.)

$M^* = E \times C$

$M^{**} = E \times C \times (1-(D \times L)$

M^*	=	Mitigated PM10 Emissions from Source After Implementation of One Mitigation Measure Affecting the Source
M^{**}	=	Mitigated PM10 Emissions from Source After Implementation of Two Mitigation Measures Affecting the Same Source. Assume that Three or More Mitigation Measures Affecting the Same Source Will Not Increase the Efficacy Beyond the First Two Measures
E	=	Unmitigated PM10 Emissions from One Source *(from Passenger Vehicles on Paved Surfaces, Table A9 - 9 - C; from Trucks on Paved Surfaces, Table A9 - 9 - C; from Passenger Vehicles on Unpaved Surfaces, Table A9 - 9 - D; and from Bulldozing or Dirt Piling, Tables A9 - 9 - F and A9 - 9 - G)*
C	=	Control Efficiency of First Mitigation Measure Applied to Emission Source *(For more mitigation measures please see Table A11 - 9 - A)*
D	=	Control Efficiency of Second Mitigation Measure Applied to Emission Source *(For more mitigation measures please see Table A11 - 9 - A)*
L	=	Percent of Unmitigated PM10 affected by the Second Mitigation Measure That Was Not Affected by the First Measure Applied to the Same Source Category (If second mitigation measure is not used, "L" should be 0.0%)

AR0073175

TABLE A11 - 9 - A

CONTROL EFFICIENCY OF PM10 MITIGATION MEASURES
Percentage Efficiencies Within the Emission Source Category (C)

Emission Source	Mitigation Measure	Reduction Efficiency	Favorable Factors
Fugitive Dust/ Construction	Apply non-toxic chemical soil stabilizers according to manufacturers' specifications, to all inactive construction areas (previously graded areas inactive for ten days or more)	30% - 65%*	Stabilizers applied in sufficient concentration to provide erosion protection for at least one year
Fugitive Dust/ Construction	Replace ground cover in disturbed areas as quickly as possible	15% - 49%*	Small, densely planted ground cover
Fugitive Dust/ Construction	Enclose, cover, water twice daily, or apply non-toxic soil binders, according to manufacturers' specifications, to exposed stock piles (i.e., gravel, sand, dirt) with 5% or greater silt content	30% - 74%*	Automatic water mist or sprinkler systems should be installed in areas with stock piles
Fugitive Dust/ Construction	Water active sites at least twice daily	34% - 68%*	Water at sufficient frequency to keep soil moist enough so visible plumes are eliminated
Fugitive Dust/ Construction	Suspend all excavating and grading operations when wind speeds (as instantaneous gusts) exceed 25 mph	NQ	
Fugitive Dust/ Construction	Monitor for particulate emissions according to District-specified procedures	NQ	
Fugitive Dust from Roads	All trucks hauling, dirt, sand, soil, or other loose materials are to be covered, or should maintain at least two feet of freeboard in accordance with the requirements of CVC section 23114, (freeboard means vertical space between the top of the load and top of the trailer)	7% - 14%*	Tightly secured covering to truck
Fugitive Dust from Roads	Sweep streets once a day if visible soil materials are carried to adjacent streets (recommend water sweepers with reclaimed water)	25% - 60%*	Sweep streets immediately after period of heaviest vehicular track-out activity

AR0073176

TABLE A11 - 9 - A
(continued)

Emission Source	Mitigation Measure	Reduction Efficiency	Favorable Factors
Fugitive Dust from Roads	Install wheel washers where vehicles enter and exit unpaved roads onto paved roads, or wash off trucks and any equipment leaving the site each trip.	40 - 70%*	Set up truck washing area on paved access road area so subsequent truck travel on unpaved roads can be eliminated
Fugitive Dust from Roads	Pave construction roads that have a traffic volume of more than 50 daily trips by construction equipment, or 150 total daily trips for all vehicles	92.5% (91% for trucks) 94% for Passenger Vehicles)	
Fugitive Dust from Roads	Pave construction access roads at least 100 feet onto the site from main road	92.5% (91% for trucks) (94% for Passenger Vehicles)	
Fugitive Dust from Roads	Pave construction roads that have a daily traffic volume of less than 50 vehicular trips.	92.5% (91% for trucks) (94% for Passenger Vehicles)	
Fugitive Dust stabilizers from Roads use on	Apply water three times daily, or non-toxic soil stabilizers according to manufacturers' specifications to all unpaved parking or staging areas or unpaved road surfaces	45%-85%*	Use non-toxic chemical that are formulated for unpaved road surfaces
Fugitive Dust or signage from Roads	Traffic speeds on all unpaved roads to be reduced to 15 mph or less	40%-70%*	Effective traffic control

* Use the lowest value if better information is not known. If higher than lowest value is used, please provide the supporting analysis and data in the environmental documentation.

AR0073177

EXAMPLE 1

Sample Calculation: PM10 Emissions After Implementation of One Mitigation Measure:

E = 10 lbs of PM10 from unpaved roads
C = 50% reduction from trucks on unpaved roads

$M^* = E \times C$
$M^* = 10 \times 0.5$
$M^* = 5$ lbs of mitigated PM10 emissions

EXAMPLE 2

Sample Calculation: PM10 Emissions After Implementation of Two Mitigation Measures:

E = 10 lbs of PM10 from unpaved roads
C = Measure 1 reduces 50% from trucks on unpaved roads
D = Measure 2 reduces 40% from trucks on unpaved roads
L = Measure 2 will affect 10% of the unmitigated PM10 after implementing Measure 1

$M^{**} = E \times C \times (1 - (D \times L))$
$M^{**} = 10 \times 0.5 \times (1 - (0.4 \times 0.1))$
$M^{**} = 4.8$ lbs of unmitigated PM10 emissions

AR0073178

AR0073179

TABLES FOR ESTIMATING ASBESTOS EMISSIONS AFTER THE IMPLEMENTATION OF MITIGATION MEASURES
(During Physical Removal of Asbestos-Containing Objects in Sections, or Units, or by Scrapping or Chipping Prior to Demolition or Renovation)

- To Prevent the Release of Fibers, Wet the Asbestos Sufficiently with a Wetting Agent or Other Liquid Such as a Removal Encapsulant with a Fine Spray for Several Hours Before Removal Begins. Use Low-Pressure or Airless Spray Equipment. Cut the Impermeable Outer Jacket or Coating Prior to Wetting. Add Surfactant or Wetting Agent to Water (use 1 ounce of polyoxyethylene ester in 5 gallons of water, or use ethylene glycol).
- Use LEV and a Collection System at Or Near the Point of Asbestos Generation; Use Portable or Mobile Vacuum System or Transportable Pneumatic Conveying Systems.
- Use Manometers to Indicate the Need for Cleaning Main Filter.
- Use Space Exhaust Ventilation and Air Cleaning System with Enclosure of the Asbestos Removal Area.
- Use Portable or Designed Exhaust Ventilation Systems.
- Use Transparent Containment Barriers.
- Use Glove Box or Glove Bag Techniques.
- Use Power Grinding, Sanding, Cutting and Drilling Tools with LEV Systems Connected to a Vacuum Source.
- Use Field Cutting Tools Especially Designed for Cutting Asbestos-Containing Materials Pipes, Sheets, etc.
- Wet Cutting Methods Should Be Used During Construction.
- Use EPA-Recommended Substitute for Asbestos and Asbestos Products.
- Spray Asbestos-Containing Material in Which the Asbestos Is Encapsulated With a Bituminous or Resinous Binder.
- Encapsulate Asbestos-Containing Materials by Spraying a Sealant Onto the Material.

AR0073180

TABLE A11 - 10

ESTIMATING ASBESTOS EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES

(Based on the EPA Report, National Emission Standards For Asbestos -- Background Information For Proposed Standards, 1987)

M = E x [J/H]; If Wetting or Polyethylene Barriers Are Used
M = E x [(100 - F)/100]; If Control Device is Used

During Demolition, Renovation and Construction Activities

Where,

M = Mitigated Emissions (Tons Per Year)
E = Non-Mitigated Emissions from Table A9 -10 of Appendix 9, or,
E = Non-Mitigated Emissions; if Control Device is Used
= (G x H)/1 - I; If Control Device is Used;
(For Input Assumptions, Use Table 3-3 of Above-Mentioned Report.)
where,
G = Waste Collected in Control Device in Pounds/Year
H = Asbestos Content of G, i.e., Control Device Waste in Decimal Fraction (if 10%, use 0.10 rather than 10.0)
I = Control Device Efficiency (in Decimal Fraction) (if 15%, Use 0.15 rather than 15.0)
F = Time-Weighted-Average Efficiency by Gas Volumes in Percent *(If 85%, use 85 rather than 0.85)*
J = New Fiber Count After Implementation of Mitigation Measure *(Use Table A11 - 10 - A)*
H = Original Fiber Count Before Implementation of Mitigation Measure *(Use Table A11 - 10 - A)*

TABLE A11 - 10 - A

INPUT ASSUMPTIONS FOR FIBER COUNTS
(Use the Following Information to Determine Percent Reduction of Impacts)

Source	Asbestos Handling Method	Fibers per Cubic Centimeters
8 x 12 Foot Ceiling	Dry Removal (H)	82.2
8 x 12 Foot Ceiling	Untreated Water (J)	23.1
8 x 12 Foot Ceiling	Treated Water (J)	8.1
Inner Room	Dry with Polyethylene Barriers (H or J)	74.4
Middle Room (Entry)	Dry with Polyethylene Barriers (H or J)	6.4
Outer Room (Staging)	Dry with Polyethylene Barriers (H or J)	2.0
Inner Room	Wet with Treated Water & Polyethylene Barriers (H or J)	8.2
Middle Room (Entry)	Wet with Treated Water & Polyethylene Barriers (H or J)	2.0
Outer Room (Staging)	Wet with Treated Water & Polyethylene Barriers (H or J)	0.0

AR0073181

ENVIRONMENTAL IMPACTS
NATIONWIDE ASBESTOS EMISSIONS FROM DEMOLITION AND RENOVATION
(Use the Following Information to Determine Percent Reduction of Impacts)
(Kilograms per Year)

Control Method	Asbestos Removal		Waste Disposal	
	Demolition	Renovation	Demolition	Renovation
No Regulation (1987 NESHAP)	1,713	13	509,800	1,400
Anticipated Reduction (Full Compliance with 1987 NESHAP)	700	9	380	2.0
Actual Reduction (Current Practices of Compliance)	1,300	13	226,000	1,000
Negative Pressure & High-Particulate Air (HEPA) With Freezing Weather	400	8	380	2.0
Negative Pressure & HEPA All Removals	0.2	0.003	380	2.0

TABLE A11 - 10 - C

ENVIRONMENTAL IMPACTS
NATIONWIDE ASBESTOS EMISSIONS FROM
MILLING MANUFACTURING AND FABRICATION
(Use the Following Information to Determine Percent Reduction of Impacts)
(Kilograms per Year)

Control Method	Emissions After Implementation of Controls in Year 1987		
	Current Regulation (1987 NESHAP) Best Estimates (Range)	HEPA Filter Best Estimates (Range)	Waste Disposal Estimates
Milling	2,390 (2,220 to 16,420)	0.7 (0.7 to 4.9)	160.0
Fabrication	7,410 (380 to 1,590)	2.2 (0.1 to 0.05)	3.0
	(Manufacturing)		
Friction	3,590 (3,390 to 19,280)	1.1 (0.2 to 5.0)	54.0
A/C Pipe	260 (240 to 1,790)	0.08 (0.07 to 0.5)	5.0
A/C Sheet	190 (190 to 1,130)	0.06 (0.06 to 0.3)	4.0
Paper	60 (60 to 620)	0.02 (0.02 to 0.2)	0.5
Coatings/Sealant	120 (120 to 170)	0.04 (0.04 to 0.05)	0.7
Plastics	250 (200 to 850)	0.07 (0.06 to 0.3)	3.0
Textiles	20 (20 to 480)	0.01 (0.01 to 0.1)	0.4
Packings, Gaskets	10 (10 to 290)	0.01 (0.01 to 0.1)	0.2
V/A Tile	60 (50 to 180)	0.02 (0.01 to 0.05)	0.5
Other Manufacturing			0.1

AR0073182

TABLES FOR ESTIMATING EMISSIONS FROM HOUSEHOLD ELECTRICITY CONSUMPTION AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Electricity Consumption

- Use Compact Fluorescent Lighting
- Use R-30 Ceiling and R-19 Walls with Central H/C Pump System
- Use Refrigerator with Vacuum Powet Insulation
- Heat Water with Combined Space/Water Heater Unit
- Install High-Efficiency Air Conditioners
- Improve Evapotranspiration by Planting Three Trees to Provide Shade and Shadow on Building
  (*If Planting of Three Trees Does Not Provide Shade or Shadow on Building, this Mitigation Measure Does Not Apply. See Next Mitigation Measure*)
- Improve House Albedo by Choosing Light Colors for Exterior of Buildings
- Improve Overall Albedo Effect by:
  - Improving House Albedo or by Choosing Light Colors for Exterior of Buildings
  - Planting Trees to Provide Shade and Shadow on Buildings
  - Using Soil and Building Materials that Reduce the Roughness of Exterior of Buildings
  - Planting Trees in Surrounding Areas, and
  - Avoiding the Use of Dark-Colored Asphalt on Roofs or Surrounding Streets
- Install Fuel Cell For Residential Subdivisions or Office Buildings to Generate Electricity
- Recover Heat Produced in the Fuel Cell and Recycle it for Space Heating
- Recover and Condense the Steam Generated in the Fuel Cell and Recycle it as Hot Water
- Utilize Window Treatment (Reflective Window Film and High-Performance Glazing)

AR0073183

TABLE A11 - 11

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM ELECTRICITY USAGE

(Note: Reduction efficiencies [in percents or in decimal fractions] are not needed for the formula to estimate remaining emissions from remaining Electricity consumption, but reduction efficiencies can be included in environmental documents for additional information)

(Pounds Per Day)

$M = \{[N] + [(O) \times (P)]\}$

(If Mitigation Measures Are Included In The Environmental Documents To Reduce Emissions From Only One Source Category)

$M = \{[N] + [(O_1) \times (P_1)] + [(O_2) \times (P_2)] + [(O_3) \times (P_3)] + \ldots\ldots\ldots + [(O_n) \times (P_n)]\}$

(If Mitigation Measures Are Included In The Environmental Documents To Reduce Emissions From Multiple Source Categories)

Where,

M = Total Mitigated Emissions from New Electricity Consumption After Implementation of Mitigation Measures and Non-Mitigated Portion of Original Electricity Consumption

N = Remaining Non-Mitigated Emissions from Original Electricity Consumption After the Removal of All Source Categories for Which Mitigation Measures Are Included in the Environmental Documents
(From the Use of Table A9 - 11 - C in Appendix 9)

O = Non-mitigated Emissions for Each Source Category From Table A9 - 11 - D in Appendix 9
(Use non-mitigated emissions from Table A9 - 11 - D for each source category O_1, O_2, O_3, ...O_n for which mitigation measures included in the environmental documents)

P = Combined Remaining Emissions Fraction or Remaining Electricity Consumption Fraction for That Source Category for which Mitigation Measure Are Included in the Environmental Document
(Use remaining Electricity consumption fractions from Table A11 - 11 - A for each mitigation measure P_1, P_2, P_3, ...P_n)
$= Q_1 \times Q_2 \times Q_3 \times \ldots \times Q_n$

Where,

Q_1 = Remaining Emission Fraction or Remaining Electricity Consumption Fraction for the First Mitigation Measure for That Source Category

Q_2 = Remaining Emission Fraction or Remaining Electricity Consumption Fraction for the Second Mitigation Measure for That Source Category

Q_n = Remaining Emission Fraction or Remaining Electricity Consumption Fraction for the Last Mitigation Measure for That Source Category

Example: For Source Category, Space Cooling:

	P_1 Remaining E.	O_1 # of Measures
Reorient Buildings Facing North (Q_1)	0.65	1
Double Paned Windows (Q_2)	x 0.90	1
Window Glazing Treatment (Q_3)	x 0.90	1
White-washing of Buildings (Q_4)	x 0.998	1
Total Remaining Emissions Fraction	0.525	4

Thus, for this example, since Value for P_1 = 0.525,

- Combined Remaining Emissions would be 52.5 percent; and,
- Combined Emission Reduction Efficiency from Implementation of 4 different mitigation measures would be
  {[100] - [52.5]} = 47.5 Percent (%).
  (See note below the Table Title)

Similarly, continue to determine value for P_1, P_2, P_3, ...P_n, for all source categories O_1, O_2, O_3, ...O_n for which mitigation measures are included in the environmental document.

AR0073184

TABLE A11 - II - A

REMAINING (NEW) ELECTRICITY CONSUMPTION IN RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SECTORS

(Committee Draft Electricity Efficiency Report, 1990, California Energy Commission)

(Percent of the pre-mitigation Electricity use for that source category)

Note: **The following percentages are provided to determine remaining emissions after the implementation of mitigation measures. These are not percent reductions**

(One hundred minus the following values will provide percent reductions)

Source Category/ Mitigation Measures	Electricity Use (Percent)	Source Category/ Mitigation Measures	Electricity Use (Percent)
Space Cooling		**Space Heating**	
Face buildings to north	65.0	Face buildings to north	45.0
Insulation beyond Title 24	70.0	Insulation beyond Title 24	70.0
Double-paned windows	90.0	Double-paned windows	90.0
Fuel cell	93.0	Fuel cell	92.4
Window glazing treatment	90.0	**Water Heating**	
Efficient air-conditioners	94.0	Solar water heaters	50.0
Three trees per structure	95.0	Central & low-flow showerheads	56.4
White-washing of buildings	99.8	Fuel cell	96.8
Improved overall albedo	99.4	Light-colored roofs	97.0
Refrigeration		**Cooking**	
Efficient appliances	73.0	Efficient appliances	89.0
Fuel cell	79.6	Fuel cell	95.5
Freezing		**Clothes Dryer**	
Efficient appliances	84.0	Efficient appliances	89.0
Fuel cell	96.1	Fuel cell	93.2
Dishwashers w/Hot-Water Cycle		**Clothes Washer w/Hot-Water wash**	
Efficient appliances	89.0	Efficient appliances	89.0
Fuel cell	99.2	Fuel cell	98.7
Dishwasher Motor		**Clothes Washer Motor**	
Efficient appliances	89.0	Efficient appliances	89.0
Fuel cell	97.6	Fuel cell	99.1
Lighting		**Miscellaneous**	
Face buildings to north	69	Ventilation in parking lots	99.31 (R)
Lighting controls	96.0(R)	Fuel cell	86.3
Low-sodium parking lights	98.0 (R & C)	Ventilation in parking lots	99.5 (C)
Fuel cell	86.3	Ventilation in parking lots	99.5 (I)
Low-sodium lighting	87.5 (I)	**Lighting**	
Lighting controls	61.5 (I)	Lighting controls	50.0 (C)
		Use of Fuel cell	
For Swimming Pool Heating:		**For Solar Water Heating:**	
Solar	99.1	Water heating	99.8
Pump	96.6	Water heater's pump	99.96
Water Bed (fuel cell)	97.2	**Color TV**	95.2
Furnace Fan	98.4	**Other**	99.9
		Industrial	
Process Motors		**Process Heat**	
Modify processes	56.0	Use heat recovery systems	85.0

(R) = Residential (C) = Commercial (I) = Industrial

Bolded words describe source categories and remaining describe potential mitigation measures for those source categories. Impact should be analyzed for each source category separately. To determine remaining emissions from a source category, efficiencies of several mitigation measures for that source category can be combined.

AR0073185

TABLES FOR ESTIMATING EMISSIONS FROM HOUSEHOLD NATURAL GAS CONSUMPTION AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Natural Gas Consumption

- Use R-30 Ceiling and R-19 Walls with Central H/C Pump System
- Heat Water with Combined Space/Water Heater Unit
- Improve Evapotranspiration by Planting Three Trees to Provide Shade and Shadow on Building
  (If Planting of Three Trees Does Not Provide Shade or Shadow on Building, this Mitigation Measure Does Not Apply. See Next Mitigation Measure)
- Improve House Albedo by Choosing Light Colors for Exterior of Buildings
- Improve Overall Albedo Effect by:
  - Improving House Albedo or by Choosing Light Colors for Exterior of Buildings
  - Planting Trees to Provide Shade and Shadow on Buildings
  - Using Soil and Building Materials that Reduce the Roughness of Exterior of Buildings
  - Planting Trees in Surrounding Areas, and
  - Avoiding the Use of Dark-Colored Asphalt on Roofs or Surrounding Streets
- Recover Heat Produced in the Fuel Cell and Recycle it for Space Heating
- Recover and Condense the Steam Generated in the Fuel Cell and Recycle it as Hot Water
- Utilize Window Treatment (Reflective Window Film and High-Performance Glazing)

AR0073186

TABLE A11 - 12

ESTIMATING EMISSIONS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM NATURAL GAS USAGE

(Reduction efficiencies either in percents or in decimal fractions are not needed for the formula to estimate remaining emissions from remaining Natural Gas consumption, but reduction efficiencies can be included in environmental documents for additional information)

(Pounds Per Day)

$M = ([N] + [(O) \times (P)])$

(If Mitigation Measures Are Included In The Environmental Documents To Reduce Emissions From Only One Source Category)

$M = \{[N] + [(O_1) \times (P_1)] + [(O_2) \times (P_2)] + [(O_3) \times (P_3)] + \_\_\_\_\_ + [(O_n) \times (P_n)]\}$

(If Mitigation Measures Are Included In The Environmental Documents To Reduce Emissions From Multiple Source Categories)

Where,

- M = Total Mitigated Emissions from New Electricity Consumption After Implementation of Mitigation Measures and Non-Mitigated Portion of Original Electricity Consumption
- N = Remaining Non-Mitigated Emissions from Original Electricity Consumption After the Removal of All Source Categories for Which Mitigation Measures Are Included in the Environmental Documents
  (From the Use of Table A9 - 11 - C in Appendix 9)
- O = Non-mitigated Emissions for Each Source Category From Table A9 - 11 - D in Appendix 9
  (Use non-mitigated emissions from Table A9 - 11 - D for each source category O_1, O_2, O_3, $\_\_O_n$ for which mitigation measures included in the environmental documents)
- P = Combined Remaining Emissions Fraction or Remaining Electricity Consumption Fraction for That Source Category for which Mitigation Measure Are Included in the Environmental Document
  (Use remaining Natural Gas consumption fractions from Table A11 - 11 - A for each mitigation measure P_1, P_2, P_3, $\_\_P_n$)
  $= Q_1 \times Q_2 \times Q_3 \times \ldots\ldots \times Q_n$
  Where,
  - Q_1 = Remaining Emission Fraction or Remaining Natural Gas Consumption Fraction for the First Mitigation Measure for That Source Category
  - Q_2 = Remaining Emission Fraction or Remaining Natural Gas Consumption Fraction for the Second Mitigation Measure for That Source Category
  - Q_n = Remaining Emission Fraction or Remaining Natural Gas Consumption Fraction for the Last Mitigation Measure for That Source Category

Example:

For Source Category, Space Cooling:	P_1 Remaining E.	O_1 # of Measures
Reorient Buildings Facing North (Q_1)	0.65	1
Double Paned Windows (Q_2)	x 0.90	1
Window Glazing Treatment (Q_3)	x 0.90	1
White-washing of Buildings (Q_4)	x 0.998	1
Total Remaining Emissions Fraction	0.525	4

Thus, for this example, since Value for P_1 = 0.525,

- Combined Remaining Emissions would be 52.5 percent; and,
- Combined Emission Reduction Efficiency from Implementation of 4 different mitigation measures would be
  $\{[100] - [52.5]\}$ = 47.5 Percent (%).
  (See note provided under Table Title)

Similarly, continue to determine value for $P_1, P_2, P_3, \_\_P_n$, for all source categories O_1, O_2, O_3, $\_\_O_n$ for which mitigation measures are included in the environmental document.

AR0073187

TABLE A11 - 12 - A

SOURCE CATEGORIES (P) OF POST-MITIGATION (NEW) NATURAL GAS USE IN RESIDENTIAL, COMMERCIAL AND INDUSTRIAL SECTORS
(Committee Draft Natural Gas Efficiency Report, 1990, California Energy Commission)
(Percent of the pre-mitigation Natural Gas use for that source category)

Note: The following percentages are provided to determine remaining emissions after the implementation of mitigation measures. These are not percent reductions
(One hundred minus the following values will provide percent reductions)

Source Category/ Mitigation Measures	Electricity Use (Percent)	Source Category/ Mitigation Measures	Electricity Use (Percent)
Space Cooling		**Space Heating**	
Face buildings to north	65.0	Face buildings to north	40.0
Insulation beyond Title 24	70.0	Insulation beyond Title 24	70.0
Double-paned windows	90.0	Double-paned windows	90.0
Window glazing treatment	90.0	**Water Heating**	
Efficient air-conditioners	94.0	Solar water heaters	50.0
Three trees per structure	95.0	Central & low-flow showerheads	58.4
White-washing of buildings	99.8	Light-colored roofs	97.0
Improved overall albedo	99.4		
Refrigeration		**Cooking**	
Efficient appliances	N/A	Efficient appliances	89.0
Freezing		**Clothes Dryer**	
Efficient appliances	N/A	Efficient appliances	89.0
Dishwashers w/Hot-Water Cycle		**Clothes Washer w/Hot Water Wash**	
Efficient appliances	89.0	Efficient appliances	89.0
Dishwasher Motor		**Clothes Washer Motor**	
Efficient appliances	89.0	Efficient appliances	89.0
Lighting		**Miscellaneous**	
Face buildings to north	69	Ventilation in parking lots	99.02 (R)
Lighting controls	N/A (R)	Ventilation in parking lots	N/A (C)
Low-sodium parking lights	N/A (R & C)	Ventilation in parking lots	N/A (I)
Low-sodium lighting	N/A (I)		
Lighting controls	N/A (I)	**Lighting**	
		Lighting controls	N/A (C)

(R) = Residential (C) = Commercial (I) = Industrial N/A Not Available

Bolded words describe source categories and remaining describe potential mitigation measures for those source categories. Impact should be analyzed for each source category separately. To determine remaining emissions from a source category, efficiencies of several mitigation measures for that source category can be combined.

AR0073188

TABLES FOR ESTIMATING EMISSIONS FROM COATINGS AND SPRAY EQUIPMENT AFTER IMPLEMENTATION OF MITIGATION MEASURES

Mitigation Measures That Reduce Emissions Associated With Coatings and Spray Equipment

- Eliminate the Use of Paints and Solvents By Utilizing Precoated Building Materials
- Eliminate the Use of Paints and Solvents By Utilizing Naturally Colored Building Materials
- Use Water-Based or Low-VOC Coatings
- Use Coating Transfer or Spray Equipment with High Transfer Efficiency
- Employ Skilled Operators Who Are Well-Versed in Rule 1113 Requirement (Not Quantifiable, However, the Anticipated Emission Reductions Are from Improved Transfer Efficiency and from Less Paint and Solvent Spills)

AR0073189

TABLE A11 - 13

ESTIMATING EVAPORATIVE EMISSIONS FROM ARCHITECTURAL COATINGS AND BUILDING MATERIALS AFTER IMPLEMENTATION OF MITIGATION MEASURES THAT REDUCE EMISSIONS FROM COATINGS AND SPRAY EQUIPMENT

(These emissions occur during exterior finish and interior finish phases of project construction. If these phases overlap other phases of the construction, these emissions should be combined with ROC emissions from the other phases. These combined emissions should be used to determine project significance.)

(Pounds Per Day)

$$M1 = [E \times \{1 - (G + H + I + J)\}] + [F \times \{(G \times K) + (H \times L) + (I \times N) + (J \times O)\}]$$

(Use this formula if non-mitigated emissions are estimated first)

$$M2 = [(P \times Q)/(R)] \times [S]$$

(Use this formula if mitigated emissions are estimated without estimating non-mitigated emissions, or to estimate new coating and spray equipment-specific emissions. Convert these emissions per 1000 square foot with project-specific thickness in mils for value of K, L, N, and O for estimating M1 in above formula)

Where,

- M1 = Mitigated Coatings Emissions After Implementation of Mitigation Measures
- M2 = Mitigated emissions of Volatile Reactive Organic Compounds (ROC) from architectural coatings
- E = Non-Mitigated Emissions Before Implementation of Mitigation Measure
  (From Table A9 - 13)
- F = Original Total Area (in Square Feet) To Be Coated with Original Coating Material Per Project Before the Implementation of that Mitigation Measure
  (The area used for estimating non-mitigated emissions (E) in Table A9 - 13 of Appendix 9. If unknown, use Table A11 - 13 - E methodologies for estimating this area)
- G = Decimal Fraction of Original Amount of Area Not Coated with Original Coating Material due to the Use of Pre-coated Building Materials or Natural-Colored Building Materials
  (If the percent is expressed as 19.0, use 0.19 for G, and not 19.0. Natural-colored materials should not have additional emissions. Also, there is no need to add off-site emissions associated with the pre-coated building materials. However, vehicular emissions associated with hauling of these materials should be estimated using Table A9 - 5 of Appendix 9 and these vehicular emissions should be mitigated and mitigated emissions should be estimated using Table A11 - 5 of Appendix 11)
- K = 0.0, natural-colored or pre-coated materials' emission rate
- H = Decimal Fraction of Original Amount of Area Not Coated with Original Coating Material due to the Use of Water Based or Low VOC Coating Materials
  (If the percent is expressed as 21.0, use 0.21 for H, and not 21.0)
- L = Emission Rate of Water-Based or Low-VOC Coating Materials
  (Use value of M2 converted into per 1000 square feet or see Table A9 - 13 - C, A11 - 13 - D, and A11 - 13 - E)
- I = Decimal Fraction of Original Amount of Area Not Coated with Original Spraying Equipment due to the Use of High Transfer Efficiency Equipment
  (If the Percent is Expressed as 21.0, Use 0.21 for I, and not 21.0)
- N = Emission Rate of Original Coating with Greater or Improved-Transfer-Efficiency Spray Equipment
  (Use value of M2 converted into per 1000 square feet or see Table A9 - 13 - C, A11 - 13 - D, and A11 - 13 - E)

AR0073190

TABLE A11 - 13 (Continued-)

J = Decimal Fraction of Original Amount of Area not Coated with Original Coating Materials and Spray Equipment due to the Use of Water-Based or Low-VOC Coating Materials Along With the Use of High Transfer Efficiency Equipment For the Same Area
(If the percent is expressed as 21.0, use 0.21 for J, and not 21.0)

O = Emission Rate of New Water-Based or Low-VOC Coating with Greater or Improved-Transfer-Efficiency Spray Equipment
(Use value of M2 converted into per 1000 square feet or see Table A9 - 13 - C, A11 - 13 - D, and A11 - 13 - E)

P = Pounds of ROC emissions
(If unknown, use Table A11 - 13 - C and Table A11 - 13 - D for this value. These values are expressed for 1 mil thick 1000 square feet area to be coated.)

O = One mil (0.001 inch) thick total exterior and/or interior area to be coated
(If unknown, use Table A11 - 13 - F methodology to determine this value. Also, thickness should always be expressed in "mils" of thickness for this methodology to work. Also, see Table A11 - 13 - B for percent transfer efficiency default values.)

R = One thousand (1,000) square feet
(This value is needed because value for P is for one mil thick 1,000 square feet surface area.)

S = Required "mils" of coating thickness for the project
(If unknown, use 17.5 mils for exterior and interior walls, and 3 mils for wood and metal surfaces. Also, use Table A11 - 13 - A for mil thickness default values for coatings on various surfaces.)

TABLE A11 - 13 - A

Dry Film Thickness (Mils)

Surface Type	Thickness
Wood/Metal	1 < 4
Concrete/Masonry	5 < 30

TABLE A11 - 13 - B

Transfer Efficiency Fractions (Percent)

Coating Equipment Type	Transfer Efficiency
Air Atomized Gun	25
HVLP	65
Brush/Roller	100

AR0073191

TABLE A11 - 13 - C

EMISSIONS OF VOLATILE REACTIVE ORGANIC COMPOUNDS (ROC) FROM ARCHITECTURAL COATINGS

(Value for "F" in Pounds for 65 % Transfer Efficiency For Spray Equipment Similar to HVLP.)

(This table provides VOC (ROC) emissions for 1 mil thick 1000 square feet area for all VOC limits included in Rule 1113. Rule 1113 should be consulted for corresponding coating types.)

AR0073193

TABLE A11 - 13 - C and D (Continued-)

ASSUMPTIONS:

1. The use of solvents in the cleaning and painting of the structures will generate Volatile Organic Compound (VOC) or Reactive Organic Compound (ROC) emissions.
2. Non-mitigated VOCs are those which should not exceed Rule 1113 limits as coating is applied to the surface.
3. After removing % volume of VOC (non-exempt solvent), water and exempt solvents, what remains is the % volume of solids.
4. Non-exempt solvent density is 7.36 pounds per gallon of solvent.
5. Exempt solvent (1, 1, 1 -TCA) density is 11.06 pounds per gallon of solvent.
6. Water density is 8.337 pounds per gallon.
7. Water percent by weight is assumed to be 3.5 times higher than that of exempt solvent in the coating. (ARB's test results in 1988 report for Rule 1113 sales survey.)
8. For non-mitigated emissions, transfer efficiency is 25 % of solids applied to the surface.
9. Mathematical formulation indicates that 1 gallon of solids will cover 1 mil (0.001 inch) thick a 1604 square foot area. For the same amount of coating, if thickness is increased, the size of the area that can be coated with that amount of paint will be proportionally decreased. For the same size area if thickness is increased, the amount of coating will be proportionally increased.

TABLE A11 - 13 - E

ESTIMATING SURFACE AREA TO BE COATED

Estimate interior and exterior area to be covered by using the following methodologies:

Residential Structures:

Method 1.

It was estimated that every square foot of floor space would require the coating equivalent to that of 2.7 square feet of surface area. This may actually be an underestimate, but allows for non-coated surfaces such as windows, fireplaces, cabinets, overhead recessed ceiling lighting, etc.

For single family units consider 1/7 acre of floor surface or lot size per unit (ARB Report March 1990).

For multi-family units 1/20 acre lot size per unit (ARB Report March 1990).

Method 2.

Exterior Wall

1,280 square feet of exterior wall per single-family unit; or,
1,800 square feet of exterior wall on average for other than single-family units.
(Energy and Labor in the Construction Sector, Hannon, et al).

Interior Wall

The exterior wall amount can be tripled to consider interior walls, ceiling coatings, trim, etc.

Non-residential Structures:

For nonresidential structures (schools, shopping malls, etc.) rooms will be larger in size, ceilings will be acoustic panels type. In this case, each of the floor area can be multiplied by 2.0 to obtain the total area to be coated.

Emissions from exterior and interior walls should be estimated and reported separately. These emissions should be combined with emissions from other construction activities.

Control Technologies. Some projects that may be encountered by local planners may include point sources requiring permits from the District, as well as air pollution control equipment. A point source has one or more permitted pieces of equipment in a fixed identifiable location. Pursuant to the District's Regulation XIII, all major new or modified emission sources in the Basin must install best available control technology (BACT) to reduce emissions to the lowest achievable emission rate (LAER). BACT consists of a variety of air pollution control technologies, including process changes and substitution of high-polluting materials with low-polluting materials. BACT can also consist of air pollution control equipment that captures or oxidizes criteria pollutants to reduce air pollution emissions. The District periodically publishes a BACT Guideline document (available from the District's Public Information Center) for commonly encountered industrial processes or equipment categories. The purpose of the BACT Guideline is to provide the public with an up-to-date listing of current BACT requirements.

The District has determined that in some situations various air pollution control technologies may generate cross-media or indirect environmental impacts that may require analysis in a CEQA document to determine the significance of the impact and, if necessary, identify mitigation measures to minimize these cross-media impacts to the greatest extent feasible. For the purposes of this discussion, a cross-media impact is the removal of a contaminant or hazardous substance from one medium, e.g., air, and transferring it to another medium, e.g., water, which is typically released to a public sewer system. The purpose of this appendix, therefore, is to identify some common types of air pollution control equipment, or BACT equipment, and to summarize potential cross-media or other indirect adverse environmental impacts they may create, which may warrant a CEQA analysis.

A.13.1 Volatile Organic Compound (VOC) Control Technologies Add-On Control Technologies

For facilities unable to use reformulated materials or with operations that do not use coatings, two basic types of add-on control technologies are available, carbon adsorption and incineration. Many of the VOC control technologies can also be used to control air toxics. These technologies are briefly described in the following subsections.

Carbon Adsorption

Carbon adsorption is a control process typically used for organic contaminants (an organic compound is a chemical compound containing carbon and, typically, hydrogen). This control technology operates by collecting air containing VOCs and venting them to a carbon bed where the organic contaminants in the air stream are separated from the remaining effluent and adsorbed onto the surface of the carbon particles. Depending on the application, carbon adsorbers can achieve a removal efficiency of essentially 100% until breakthrough occurs (a situation where the carbon particles are completely saturated with organic contaminants and are no longer able to remove these contaminants from the exhaust air). Carbon adsorption is commercially available and is used in a wide variety of industrial applications. Although carbon adsorption devices for most applications have a similar design, two general categories of applications have been identified that differ significantly in their potential to create adverse environmental impacts. The two categories are:

(1) Vapor solvent recovery, and

(2) Liquid solvent recovery

Gaseous phase vapor recovery systems use a carbonized organic material (carbonized coconut shell, for example) as an activated carbon source to remove organic substances from gas streams. When the activated carbon of vapor solvent recovery becomes saturated with organic material, it is removed and regenerated (usually off-site) typically using a rotary kiln to oxidize (destroy by combustion) the organic material. Once the organic material is oxidized, the activated carbon can be reused. During the regeneration process, approximately five percent of the activated carbon is lost. This loss is replaced with new activated carbon and the entire amount is then reused. Vapor solvent recovery carbon can be continuously regenerated and replenished.

AR0073204

Liquid solvent recovery uses a moderately hard type of coal as a source of activated carbon to capture solvents. When carbon is saturated with solvent it is regenerated by heating the carbon and injecting either steam or hot gas into the carbon bed. The resulting hot solvent mixture is vented to a condenser, which cools the hot gases to a liquid/solvent mixture (known as regenerant). The solvent is then separated from the regenerant by gravity or distillation. The recovered solvent is then recycled or can be used in another application.

Carbon adsorption solvent recovery systems are most effective when only a single solvent is involved and the solvent does not break down during the heating process. For a system in which VOC compounds have a molecular weight less than or equal to eight carbon atoms, no polymer formers, or excessive particulates, a carbon life of 5-10 years is possible.

Depending on the type of carbon adsorption system used, several types of secondary impacts may occur. Carbon adsorption systems used for liquid solvent recovery have the potential to generate water quality impacts because water is often used to clean the spent carbon. Water contaminated with organic compounds could then be released to a public sewer system, not only affecting water quality, but water treatment utilities (often called Publicly Owned Treatment Works or POTWs).

Regenerating spent carbon for each type of carbon adsorption system has the potential to create air quality impacts because the regeneration process requires a combustion source which can generate criteria pollutant emissions or emissions of other products of incomplete combustion. For example, liquid and aqueous phase vapor recovery systems require a combustion source to heat water to steam which is then used to purge adsorbed organics from the carbon. Gaseous phase vapor recovery uses a combustion device to directly oxidize the organic compounds adsorbed to the carbon.

Liquid solvent carbon adsorption systems also have the potential to generate solid waste impacts because the coal eventually loses its effectiveness at capturing organic compounds and must then be disposed of. As previously indicated, carbon used in the liquid and aqueous phase can be regenerated and reused for approximately 5-10 years depending upon specific operating parameters, the components of the waste stream, control requirements, etc. Since spent carbon is typically considered a hazardous waste, it would most likely be disposed of in a Class 1 landfill. Therefore, hazardous waste disposal utilities could be adversely affected.

Solid waste impacts are, typically, not a problem with vapor recovery systems because the activated carbon can be used continuously until it is incinerated in the rotary kiln in the regeneration process.

Any incinerated carbon ash is generally produced in small quantities and, therefore, is typically not a significant solid waste impact.

Risks of upset impacts could occur during handling and transport of spent carbon because in many cases the organic compound may be flammable, thus creating risks of fire or explosion.

Incineration

Incineration is the most universally applied control method for organics because it is a "destructive" control technique in which the pollutants are destroyed, i.e., oxidized (burned) to carbon dioxide, water vapor and other products of combustion. Given the proper conditions, any organic compound will oxidize. Two of the most common types of incinerator technologies are identified here.

Thermal Incineration

Thermal incineration has a wide range of applications and is frequently used to oxidize organic compounds emitted from process industries. The organic compounds are collected and vented to a combustion chamber where the compound is oxidized. Supplemental fuel, generally natural gas, may be added to the combustion chamber to maintain the combustion process. The rate at which the compound is oxidized is greatly affected by the temperature within the combustion device. Thermal incineration destroys most organic compounds at temperatures between 1,100°F and 1,500°F. At these temperatures, efficiency levels of up to 99% are possible.

AR0073205

Catalytic Incineration

A catalytic incinerator is essentially identical to a thermal incinerator except that combustion of the exhaust gas takes place in the presence of a catalyst (a catalyst is a substance that promotes/accelerates a chemical reaction without being changed in the reaction itself). The presence of the catalyst allows the incinerator to operate at a lower temperature range (500°F-900°F compared to 1,100°F-1,500°F for thermal incinerators), consequently reducing supplemental fuel consumption and associated operating costs. Reduction efficiencies of up to 99% are also possible with catalytic incinerators.

Both types of incinerators have the potential to create air quality impacts because both generate criteria pollutant and reactive organic pollutant products. Because catalytic incinerators operate at lower combustion temperatures, they typically produce lower oxides of nitrogen emissions, which contribute to NO2 and ozone concentrations. Although newer incinerators burn natural gas very efficiently (thus producing fewer emissions) emissions should be calculated and compared with the District's emissions threshold of significance (Refer to Chapter 6 of this Handbook).

A drawback of catalytic incinerators is that the catalyst becomes less effective over time. Eventually the catalyst must be replaced and the spent catalyst must be disposed of, thus creating the potential for solid waste impacts.

Coating Solvent Reformulation

Methods of reducing VOC emissions from operations using coatings (paints) and cleaning solvents include reducing the VOC content and/or increasing the solids content of coating and cleanup solvent materials. Reformulating coatings or solvents with new or alternative compounds is another method that can be used to comply with District emission reduction requirements.

Product reformulation may result in adverse environmental impacts depending on the characteristics and chemical composition of the reformulated materials. For example, compounds such as 1,1,1-trichloroethane (TCA), methylene chloride (dichloromethane), and other chlorofluorocarbons (CFCs) could produce environmental impacts, including adverse human health effects. Worker safety and human health could be affected because some reformulated compounds may be toxic, carcinogenic, or have other adverse effects on human health. In addition, both TCA and CFCs are considered ozone depleting substances and CFCs contribute to global warming. Some reformulated compounds may be flammable, thus, increasing the risk of fire or explosions. Other risk of upset impacts could occur if any hazardous reformulated compounds are accidentally released during transport, which may also adversely affect public health.

A.13.2 NOx Control Technologies

NOx is formed by the oxidation of atmospheric nitrogen during combustion and from the oxidation of bound nitrogen in organic fuels. Thermal NOx formation is negligible below a peak flame temperature of approximately 2800°F, but rises exponentially above this temperature. Fuel NOx formation is typically a function of the type of fuel used for combustion.

Therefore, the actual amount of NOx formed depends, in part, upon the amount of available air supply, the type of fuel used, and the combustion temperature. Two major categories of NOx control options are currently available: (1) combustion modification and (2) flue gas treatment systems.

Combustion Modification

Combustion modification methods reduce NOx emissions, either by lowering the combustion temperature or by reducing the amount of oxygen available for combustion. The actual NOx reduction achieved is case-specific and depends upon the technology employed. In general, combustion modification reduces NOx emissions approximately 10-70% from baseline emission values. Combustion modification technologies have found widespread industrial applications. An overview of six widely used combustion modification technologies and one experimental technology is briefly described below.

AR0073206

Low Excess Air Burners

Low-excess air (LEA) burners require less oxygen for combustion because air and fuel are thoroughly mixed prior to combustion, thus requiring less excess air. Although fuel is more completely burned in this process, reducing excess oxygen tends to reduce combustion efficiency while increasing CO and particulate emissions. LEA burners have a maximum NOx emission reduction efficiency of approximately 25%.

Staged Air Burners

Staged air (SA) burners divide the combustion fuel mixture into two or more streams before combustion. The first stream flows into a fuel-rich zone where the fuel is partially burned. At this stage, thermal NOx formation is reduced because of the lack of excess oxygen. The remainder of the combustion air is mixed with the partially burned combustion air downstream of the fuel-rich zone where combustion is then completed. At this stage, NOx formation is reduced because of a lower flame temperature. SA burners have a maximum NOx reduction efficiency of about 30%.

Flue Gas Recirculation

Flue Gas Recirculation (also called exhaust gas recirculation when applied to internal combustion engines) is a control technique in which the flue gas is mixed with incoming combustion air. This process limits the oxygen level, resulting in a lower flame temperature and a lower peak combustion temperature, thus reducing thermal NOx formation. This method alone reduces NOx formation approximately 50% for gaseous fuel firing. In some circumstances, flue gas recirculation in conjunction with other control techniques, SA for example, can achieve a NOx reduction efficiency approaching 70%.

Water/Steam Injection

NOx formation rates can be lowered by the instantaneous cooling of the combustion temperatures. This cooling can be accomplished through the injection of water or steam into the combustion zone. The injected water acts as the inert mass and results in lower NOx production through lower peak combustion temperatures. Water injection, when used alone, can reduce NOx emissions 33-67%, but there is a slight increase in CO emissions due to the lowered combustion temperatures. Steam injection has an even higher NOx reduction efficiency. The primary impact associated with this type of control technology is increased water demand as substantial volumes of water may be necessary to achieve the desired NOx control efficiency. No other direct or indirect impacts are associated with this NOx control technology.

Stratified Combustion

Stratified combustion modification, used primarily for NOx control in internal combustion engines (ICEs), involves layering the fuel such that one layer is fuel-rich and the other layer is fuel-lean during and just after the combustion process. The fuel-rich layer is situated near the spark plug so that the elements burned as the flame moves out from the spark are subject to low-NOx formation rates because of the lower temperature and lack of oxygen. The stratified combustion process must be monitored frequently because improper stratification can actually cause NOx emissions to increase. No adverse environmental impacts, either direct or indirect, are associated with this type of control technology.

Lean Combustion

Air/fuel adjustments are applicable primarily to spark-ignited engines. Lean combustion requires increasing the air mass relative to the fuel concentration, thus creating a lean fuel mixture. One method of increasing the air/fuel ratio is through the application of turbocharging. Turbocharging involves recovering the energy of the exhaust gas stream by passing it through a turbine mechanically coupled to a compressor. The energy extracted from the exhaust is used to increase the pressure of the incoming air, increasing the quantity of air in the cylinder. Turbocharging is often used in conjunction

AR0073207

with an intercooler to offset the temperature rise associated with increasing the compression. Turbocharging reduces NOx emissions by reducing the brake specific emission rate. As with stratified combustion, no direct or indirect adverse environmental impacts are associated with this type of control technology.

Low NOx Burners

Low NOx burners use a combination of fuel rich mixtures and staged combustion to control combustion and reduce NOx flue gas concentrations. This method reduces NOx formation approximately 50%. This technology can be used in conjunction with flue gas recirculation to achieve additional NOx reductions.

Oxygen Trim. Mechanical equipment can be used to reduce the excess oxygen by using oxygen trim. This method involves combustion at a low air to fuel ratio, still allowing for complete fuel combustion. Oxygen trim can increase boiler fuel combustion efficiency, which can result in a fuel savings of 1-2%. This method has a NOx emission reduction efficiency of 10-25%.

Staged Fuel Burners. Staged fuel (SF) burners divide the fuel into two or more streams. One fuel stream flows into, and is burned in a lean primary combustion zone. The remainder of the fuel is then mixed with the partially burned fuel downstream of the lean primary combustion zone. This process lowers the peak flame temperature, which reduces thermal NOx formation. SF burners have a maximum NOx emission reduction efficiency of approximately 55%.

Ceramic Fiber Burner. An emerging NOx control technology that requires additional retrofit demonstration on boiler equipment is a new ceramic fiber burner. Low NOx levels are achieved due to the slow kinetics of thermal NOx formation. The largest unit tested so far is a 10 million Btu burner. Test results indicate NOx emission levels of 50 ppm. Impacts. Few adverse environmental impacts have been identified for combustion modification technologies. The only exception is possibly for ceramic fiber burners. Ceramic fiber burners may pose worker health concerns because they contain ceramic fibers that could be released into the work place at a rate that may adversely affect worker health. Ceramic fibers are a health concern because of their structural similarity to asbestos, a carcinogen. However, there have been no human studies investigating the carcinogenicity of ceramic fibers. Furthermore, tests of ceramic fiber burners indicated that releases of ceramic fibers from radiant burners were typically 2-4 orders of magnitude less than the two fibers per cubic centimeter of air threshold limit value (TLV) established for ceramic fibers and recommended by the American Conference of Governmental Industrial Hygienists. This result should be periodically re-evaluated in case the conclusions regarding ceramic fibers are modified in the future.

Post-Combustion Flue Gas Treatment

Post-combustion flue gas treatment systems use a reducing agent, usually ammonia (NH_3), to react with NOx, reducing it to molecular nitrogen (N_2) and water (H_2O). There are two basic types of post-combustion flue gas treatment technologies: selective catalytic reduction and selective noncatalytic reduction. Both technologies, discussed below, involve injecting a reducing agent, such as ammonia or urea, directly into the flue gas stream.

Selective Catalytic Reduction (SCR). This technology reduces NOx in the flue gas by using either anhydrous ammonia (a gaseous form free of water or moisture) or aqueous ammonia (a liquid mixture of ammonia and water) as a reducing agent. The reduction reaction occurs in the presence of a proprietary catalyst. In general, ammonia vapor, often diluted with air or steam, is injected into the flue gas in an approximately equimolar[1] ratio, depending upon the NOx removal requirements. To ensure maximum efficiency, the flue gas and ammonia should be thoroughly mixed to ensure uniform gas distribution prior to entering the catalyst grid system. For optimum results, this reaction must occur in a relatively narrow temperature window of between 200°C to 450°C. NOx emissions are reduced by the ammonia to molecular nitrogen (N_2) and water vapor over the catalyst surface. NOx reduction efficiencies up to 95% have been obtained in some practical applications.

Impacts. Anhydrous ammonia is considered an acutely hazardous material according to state law. Therefore, technologies using this substance may have a number of adverse impacts associated with them. For example, an accidental release of ammonia during transport, storage, or handling may

AR0073208

create significant risk of upset impacts because the released ammonia could form a dense gas that is passively transported close to the ground by wind. In addition, significant human health impacts could occur if anyone is exposed to released ammonia gas clouds. A site-specific analysis may be necessary to evaluate these potential impacts.

The catalyst of SCR systems typically contains small amounts of vanadium pentoxide, which is also classified as an acutely hazardous material. The District has assessed the possibility of risk of upset impacts and human health impacts from catalyst materials and has determined that they are not significant. However, the catalyst generally loses its effectiveness over time and must be replaced and properly disposed of, thus creating solid waste impacts. It may be necessary to determine the volume of spent catalyst generated each year to assess whether or not this exceeds any solid waste utility's significance threshold.

Selective Non-Catalytic Reduction - Ammonia Injection. Selective non-catalytic reduction (SNCR) reduces NOx emissions by injecting a reducing agent, such as ammonia, directly into the flue gas stream, usually at a temperature greater than 500°C. There is no catalyst, but the high temperature acts as a "catalyst" to reduce the NOx to molecular nitrogen and water. This technique is often used in situations where there are "dirty" flue gases which may plug or poison an SCR catalyst. NOx flue gas concentrations are reduced approximately 50% to possibly 80%.

Technologies that use ammonia as a NOx reducing agent may also create air quality impacts. For example, to ensure the efficiency of the NOx reduction reaction, small quantities of extra ammonia are injected into the exhaust gas. As a result, not all ammonia reacts with the NOx molecules and, therefore, is released into the atmosphere. This is known as an ammonia slip. Generally, the ammonia slip can be maintained at 5-10 ppm or slightly greater, which is not expected to adversely affect air quality. Ammonia slip, however, should be calculated for any project using ammonia.

High ammonia slip levels that could cause adversely affect human health or, at the very least, could create an odor nuisance. The District has determined that, because exhaust gases are typically very hot and buoyant, ground-level concentrations would not be expected to adversely affect human health or create an odor nuisance. Ground-level concentrations of ammonia from ammonia slip may need to be estimated to ensure that adverse impacts do not occur.

Selective Non-Catalytic Reduction - Urea Injection. Urea injection involves injecting a reducing agent, aqueous urea (an ammonia-based chemical compound) in this case, into the flue gas where it reacts with NOx, reducing it to molecular nitrogen, water, and carbon dioxide. The reduction reaction is maximized when the urea is thoroughly mixed in the flue gas and the temperature range is between 1,400°F-1,800°F. This process has a NOx reduction efficiency range of 50% to as high as 80% in some specific cases.

Urea itself is not considered to be a hazardous substance under state or federal law. In addition, it is typically transported in solid pellet form so, if an accidental release occurs, it is relatively easily cleaned up and does not pose a significant public health problem. One of the by-products of urea injection technologies, similar to SCR, is the production of ammonia slip. Typically, the amount of ammonia slip generated by urea injection is in the 10-20 ppm range and because of the buoyancy of the exhaust does not present an adverse air quality impact or a human health hazard at these low levels. However, a site-specific assessment may be necessary to ensure that ammonia slip levels do not pose a significant human health impact.

A.13.2 Particulate Control.

Filters, scrubbers, and mist eliminators are used primarily to reduce particulate emissions, as well as other criteria pollutant and toxic air contaminants. Particulate control devices can also be used to control air toxics. Each device is discussed briefly in the following paragraphs.

Baghouse Filters

Suspended dust and fumes may be removed from an air stream by a number of different devices. When high collection efficiency on small particles size is required, the most widely used method consists of separating the dust from the air by means of a fabric filter. Fibrous or fabric filter media formed into

AR0073209

cylindrical sleeves or bags are the most widely used type of dry-particle collector for air cleaning. Baghouses (the structure supporting the filter) remove solid particulate contaminants from gas streams by filtering them through a fabric media which is generally a woven or felted material. Several different types of filters may be used within a baghouse depending on the particular source and composition of the particulates or gases to be controlled.

Baghouse filters collect dry particulates that must ultimately be disposed of as a solid waste. If care is not exercised during disposal of the waste particles, they could be blown from the trucks during transport to a waste disposal facility, creating secondary environmental impacts, e.g., re-entrainment to the atmosphere. In addition, depending upon the type of pollutant being collected, the resulting solid waste may be considered a hazardous waste, requiring disposal in a Class I landfill. If the amount of solid waste generated exceeds any threshold levels of significance established by any waste management agencies, solid waste impacts may be considered significant and, therefore, may warrant further investigation.

Scrubbers

Scrubbers have a number of advantages over other types of air pollution control devices: they do not create a secondary dust problem when disposing of the contaminant; they can handle high-temperature or moisture-laden air; and they can handle corrosive gases or aerosols. Scrubbers commonly used to control particulate emissions include spray towers, packed bed and venturi (high energy) scrubbers. These devices work by pumping a reagent such as sodium or calcium compounds into the device which condenses the air contaminant. Wet scrubbers use water "sprays" to collect and remove particulates. However, wet scrubbers are not well suited to control very fine particulates. Packed-bed scrubbers are generally used to remove pollutant gases. The packed-bed scrubber, or column, is generally a vertical column that has been filled with packing or materials with large surface areas. The gas stream that contains the pollutant moves upward through the packed bed against an absorbing or reacting liquid that is injected at the top of the packed column.

Installation of scrubbers as control equipment may require the use of caustic alkali solutions such as sodium hydroxide, calcium hydroxide, or magnesium hydroxide for removing dioxin compounds from incinerator exhausts. These alkali solutions are inorganic alkali compounds that are primary irritants to the skin. The alkali liquid can be recycled and reused until the pH exceeds a specified level or it becomes too concentrated. The liquid, called blowdown, is either shipped off-site as a hazardous waste or treated on-site to neutralize it, and is then reused in the system or released to a public sewage system. Disposal of the wastewater or its clarification for reuse may be difficult or expensive. Use of wet scrubbers may, therefore, pose a water quality impact, a solid waste impact, or a risk of upset impact if the alkali waste is accidentally released during transport to a disposal facility.

Mist Eliminators

Mist eliminators are "impaction" collectors that place barriers in the path of the mist particulates in the flowing gas. These barriers intercept the particulates and remove them from the gas stream. A demister is often used as part of a packed scrubbing device to increase its efficiency in removing fine particulate matter.

Impacts for mist eliminators will be similar to those described for scrubbers except that they do not use alkali materials.

---

[1] In this case, equimolar means that the number of moles of ammonia needed is equal to the number of moles of NOx to be reduced. One mole of a substance contains 6.023×10^{23} molecules.

[redacted]

GLOSSARY OF TERMS
AS USED IN THE
CEQA AIR QUALITY HANDBOOK

ADVISORY COUNCIL -
A group of technical and scientific specialists who advise the District on long- and short-term matters affecting Clean Air programs.

AIR BASIN - An area designated by the Air Resources Board for air quality planning purposes.

AIR MONITORING - Sampling for and measuring of air pollutants present in the ambient air.

AIR POLLUTANT - A material in the ambient air that produces air pollution. Common air pollutants are ozone (O_3), nitrogen dioxide (NO_2), particulate matter (PM10), sulfur dioxide (SO_2), and carbon monoxide (CO). Air pollution is defined in the California Health and Safety Code as any discharge, release, or other propagation into the atmosphere, and includes, but is not limited to, smoke, charred paper, dust, soot, grime, carbon, fumes, gases, odors, particulate matter, acids or any combination thereof.

AIR QUALITY MANAGEMENT PLAN (AQMP) -
A document describing how the SCAQMD plans to achieve federal and state air quality standards by the year 2010, as required by the CAAA and CCAA. The complete AQMP consists of more than 30 documents, including the plan itself, appendices and technical reports. Portions of the Plan are contributed by other agencies (e.g., SCAG produces the transportation and land use portions; ARB produces the mobile source regulations.) State law requires that the Plan be updated every three years.

AIR QUALITY STANDARD -
The specified average concentration of an air pollutant in ambient air during a specified time period at or above which undesirable effects may be produced. The two sets of air quality standards with which the District is concerned are the National Ambient Air Quality Standards and the California State Air Quality Standards.

AIR RESOURCES BOARD (ARB) -
Was subsumed into the California Environmental Protectiona Agency (Cal EPA) in 1991 and is responsible for setting state ambient air quality standards and allowable emission levels from new motor vehicles in California. The ARB is responsible for overseeing the efforts of local air pollution control districts and air quality management districts in regulating emissions from non-vehicular sources of air pollution. Also known as the California Air Resources Board (CARB), and State Air Resources Board (ARB), the Air Resources Board is the agency responsible for developing the State Implementation Plan and transmitting it to the federal Environmental Protection Agency for approval.

AMBIENT AIR - Any unconfined portion of the atmosphere; the outside air.

AR0073220

AREA-WIDE SOURCES -

Those sources that individually emit relatively small quantities of air pollutants. This includes small items such as home heaters and consumer products.

AUXILIARY LANES - Traffic lanes that provide egress and ingress for vehicles entering or leaving a roadway.

AVERAGE VEHICLE RIDERSHIP -

The number of employees who report to a worksite or another work-related activity divided by the number of vehicles driven by those employees, typically averaged over an established time period. This calculation typically includes crediting vehicle trip reductions from telecommuting, compressed work weeks, and non-motorized transportation.

AVERAGE VEHICLE OCCUPANCY -

The average number of persons occupying a passenger vehicle along a roadway segment intersection, or area, as typically monitored during a specified time period. For the purpose of the California Clean Air Act, passenger vehicles includes autos, light duty trucks, passenger vans, buses, passenger rail vehicles, and motorcycles.

BASELINE INFORMATION -

Information regarding the project's existing setting such as current air quality, transportation system serving the project, etc.

BEST AVAILABLE CONTROL TECHNOLOGY (BACT) -

Under District rules, BACT is defined as the most stringent emissionscontrol which, for a given class of source, has been: 1) achieved in practice; 2) identified in a state implementation plan; or 3) found by the District to be technologically achievable and cost-effective. This definition is more closely aligned to the federal Lowest Achievable Emission Rate (LAER) definition and is far more stringent than the federal BACT definition.

BUILD-OUT YEAR - The year in which the project construction has been completed and the project is ready to be occupied.

CAL3QHC - An evolution of the CALINE 3 model enhanced by the EPA to incorporate vehicle traffic queuing emissions (at intersections) using recommended procedures as described in the Highway Capacity Manual.

CALIFORNIA CLEAN AIR ACT -

A law setting forth a comprehensive program to assure that all areas within the State of California will attain federal and state ambient air quality standards by the earliest practicable date. Also known as the Sher Bill or AB-2595, the law mandates comprehensive planning and implementation efforts, and empowers local districts to adopt transportation control measures and indirect source control measures to achieve and maintain ambient air quality standards. The law provides annual emission reduction targets and regular review and evaluation of local programs by the Air Resources Board. The Act added and amended various sections in Division 26 of the Health and Safety Code.

AR0073221

CALINE MODEL - A model developed by Caltrans which calculates ambient concentrations of carbon monoxide from vehicular traffic on a roadway segment, intersection, or parking lot.

CARBON DIOXIDE - A colorless gas whose chemical formula is CO_2. It enters the atmosphere as the result of natural and artificial combustion processes and is also a normal part of the ambient air.

CARBON MONOXIDE - An invisible, odorless, tasteless, and toxic gas; its chemical formula is CO. It is primarily generated by motor vehicles but is found in trace quantities in the natural atmosphere.

CARCINOGENIC - Cancer producing.

CHLOROFLUOROCARBON (CFC) - A gas which when released into the troposphere, gradually migrates upward into the stratosphere. The CFCs participate and react with other complex chemicals (e.g., chlorinated compounds, nitrous oxide, etc.) and lead to the destruction of upper level ozone.

CLEAN AIR ACT - The federal statute which mandates a program to attain and maintain federal ambient air quality standards in all areas of the country. The Act establishes several programs. With respect to controlling emissions from non-vehicular sources, states are given primary authority to develop plans and regulations to attain federal ambient air quality standards by a specific date. These plans are called "state implementation plans" or "SIPs." With respect to emissions of motor vehicles, EPA sets emission standards for all states except California, which can adopt stricter standards. The Act also sets forth minimum standards for large new pollution sources by requiring EPA to adopt New Source Performance Standards or "NSPS." In addition, EPA is mandated to adopt regulations governing toxic air pollutants (National Emission Standards for Hazardous Air Pollutants, or NESHAPS). This Act is found beginning at 42 U.S.C. 7401.

CO HOT SPOTS - An area, usually an intersection or congested segment of a highway that exceeds the federal or state carbon monoxide standard.

CONFORMITY - A requirement in the federal Clean Air Act that no department, agency, or instrumentality of the federal government shall engage in, support in any way or provide financial assistance for, license or permit or approve any activity which does not conform with the State Implementation Plan (SIP) by causing or contributing to an increase in air pollutant emissions, or violation of an air pollutant standard, or frequency of violating that standard.

CONGESTION MANAGEMENT PROGRAM (CMP) - A state mandated program that requires each county to prepare a plan to relieve congestion and air pollution.

CONSISTENCY - A term used in CEQA to determine if a project is consistent by furthering the goals and objectives, and will not interfere with the implementation of, applicable regional plans.

AR0073222

CRITERIA POLLUTANTS -
Air pollutants for which the federal or state governments have established ambient air quality standards, or criteria, for outdoor concentration in order to protect public health.

DISAGGREGATE - Separate into component parts.

EMISSION STANDARD -
The maximum amount of an emittant legally permitted to be discharged from a single source.

EMISSION THRESHOLDS -
An amount of emissions established by the District, for use by local government planners, to compare with the emissions that could be emitted from a particular project to determine if that project could have a significant impact on air quality.

EMISSIONS - The mass of a specific material released to the atmosphere.

EMISSIONS INVENTORY -
A tabular listing, by source category, of all emissions within a specified political jurisdiction for an average annual day within a specified year.

ENVIRONMENTAL PROTECTION AGENCY (EPA) -
The federal agency responsible for coordinating pollution control activities at the federal level and for carrying out the terms of the federal Clean Air Act, Clean Water Act, and Superfund laws, among others. The EPA operates through regional offices located throughout the country. California is the responsibility of Region IX, which is headquartered in San Francisco.

EVAPORATIVE EMISSIONS -
Release of hydrocarbon (or reactive organic gas) emissions which occurs when fuel is exposed to the air, based on a variety of processes: when fuel entering a fuel tank displaces vapors into the air; when diurnal temperature variations on the fuel and fuel vapors in the fuel tank release hydrocarbons; or in the hot stabilized mode, after the engine and catalytic converter have warmed up to normal operating temperature (e.g., "blow-by" and crankcase emissions).

GLOBAL WARMING - The gradual buildup of "greenhouse" gases that absorb energy, and preventing it from passing into space. As a result, more solar energy is retained near the earth's surface than is lost into space, and there is a general warming of the earth's atmosphere.

GROWTH MANAGEMENT PLAN (GMP) -
A plan developed by SCAG that contains demographic projections (i.e., housing units, employment, and population) through the year 2010 for a six county region (i.e., L.A. County, Orange County, Riverside County, San Bernardino County, Ventura County, and Imperial County). The plan also provides recommendations for local governments to better accommodate the growth projected to occur and reduce environmental impacts.

HALONS - A family of compounds containing bromine used in fire extinguishers; and are both ozone depleting and greenhouse gases.

AR0073223

HAZARDOUS AIR POLLUTANT -
Defined by the Clear Air Act as an air pollutant to which no ambient air quality standard is applicable and which, in the judgement of the administrator of the Environmental Protections Agency, may result in an increased in mortality, serious irreversible illness, or incapacitating reversible illness.

HEAT ISLAND - An area, generally around a center of urban buildup, in which the average temperature is higher than that of the surrounding area.

HOT SPOT - A localized concentration of an air pollutant associated with restricted dispersion conditions, often occurring in such places as street canyons or close to sources of emissions.

INDIRECT SOURCE - Defined by the Clean Air Act as a facility, building, structure, installation, real property, road, or highway that attracts, or may attract, mobile sources of pollution. Examples of indirect sources are major highways and airports, large regional shopping center, major sports complexes and stadiums, large amusement and recreational facilities, and major parking facilities. Also known as a complex source.

INVERSION - A condition of the atmosphere in which the temperature increases with altitude.

INVERSION LAYER - A layer in the atmosphere through which the temperature remains constant or increases with altitude.

ITE TRIP GENERATION MANUAL -
A document produced by the Institute Of Transportation Engineers (ITE) that provides trip generation numbers by land use based on trip generation studies conducted nationwide.

LEVEL OF SERVICE (LOS) -
A scale that is used to rate the service (i.e., speed and maneuverability) on roadways. An LOS of "A" means that traffic is free flowing, while "F" refers to severely congested conditions.

LEWIS-PRESLEY AIR QUALITY MANAGEMENT ACT -
The legislation which established the South Coast Air Quality Management District in 1977, and which sets forth those powers, authorities, and responsibilities of the District which may be different from those possessed by other air pollution control districts in California. It has been amended from time to time, most notably by legislation introduced by Senator Robert Priestly to expand the authorities of the District. The Act is found in Chapter 5.5 of Part 3 of Division 26 of the Health and Safety Code, beginning with Section 40400.

MITIGATE - Reduce the air quality impact on the environment through the application of programs and other mechanisms. Alleviate, ease, reduce, lighten, minimize.

MOBILE SOURCES - Those sources that emit pollution from vehicles. There are two types of mobile source emissions, those from on-road sources (e.g., passenger automobiles, trucks, busses, etc.) and off-road sources (e.g., airplanes, trains, construction equipment, etc.)

AR0073224

OZONE - A highly reactive, bluish-colored gas with a pungent odor. Its chemical formula is O_3. Ozone is a major constituent of photochemical oxidants. Ozone is formed in the atmosphere by a complex series of photo-chemical reactions involving oxides of nitrogen and reactive organic gases in the presence of sunlight. A National Ambient Air Quality Standard has been established for ozone.

OZONE DEPLETING GASES - Gases released into the ambient air which are considered as global-warming and stratospheric ozone-depleting. These gases include chlorofluorocarbon, halons, methyl chloroform, and carbon tetrachloride.

OZONE LAYER - Located in the stratosphere, approximately 10-30 miles above the earth's surface, is the ozone layer. This layer prevents most of the solar ultraviolet radiation (in the 290 to 320 nm wavelength range (UV-B)) from reaching the earth's surface. Increased exposure to UV-B could have serious public health and environmental effects.

PERMIT - Written authorization from the District for the construction or operation of equipment which controls or may cause regulated emissions.

PHOTOCHEMICAL OXIDANTS (OX) - A collective term for a group of oxidizing gases produced by photochemical reactions involving reactive organic compounds and oxides of nitrogen, also referred to as an oxidant. Photochemical oxidants include ozone and other more complex compounds such as organic peroxides and peroxyacyl nitrates. A California State Air Quality Standard has been established for photochemical oxidants.

POINT SOURCE - A term used to designate a sizeable stationary emission source at a specific location.

POLLUTANT STANDARDS INDEX (PSI) - A scale ranging between 0 and 500 that is used to indicate the air quality at a given time and location relative to National Ambient Air Quality Standards. A PSI of 100 for any air pollutant represents a concentration equal to its respective air quality standard.

QUANTIFIABLE - The expression of air emissions either generated or mitigated from a project in numerical terms.

REACTIVE ORGANIC COMPOUNDS (ROC) - Species of organic compounds that undergo photochemical reactions.

REASONABLE FURTHER PROGRESS (RFP) - Defined in the Clean Air Act as annual incremental reductions in emissions of an air pollutant that are sufficient to provide attainment of the applicable National Ambient Air Quality Standard by a specified date.

REGIONAL MOBILITY PLAN (RMP) - A plan developed by SCAG that contains a listing of infrastructure improvements, travel forecasts, and other programs to regain mobility for a six county region (i.e., L.A. County, Orange County, Riverside County, San Bernardino County, Ventura County, and Imperial County).

AR0073225

SENSITIVE RECEPTORS -

Refers to sensitive populations such as children, athletes, elderly, and sick, that are more susceptible to the effects of air pollution than the population at large.

SMOG - A general term used to describe dense, visible air pollution. In the South Coast Air Basin, smog is formed when combustion products and gaseous emissions such as nitrogen oxides, sulphur oxides, and various hydrocarbons undergo photochemical reactions. Particles such as soil, dust, and various exhaust particles may mix with the ozone, carbon monoxide, and other compounds that are produced, creating a brownish, irritating haze. Smog poses health risks and damages crops, rubber, and other materials.

SMOG EPISODE LEVELS -

An occurrence of high concentration of air pollutants that could endanger or cause significant harm to the public. Alerts are classified by severity: Stage 1 is described a "Unhealthful," Stage 2 is "Very Unhealthful," and Stage 3 is classified as "Hazardous." Stationary Source Curtailment Plans and Traffic Abatement Plans are required to be implemented to reduce the severity of air pollution levels whenever episodes of high pollution are forecast.

SOIL STABLIZERS -

Chemical or other agents which are applied to soil surfaces to stabilize and mitigate PM10 fugitive dust emissions by creating a wind-resistant crust. Typically applied to disturbed surface areas next to roadways, bare ground areas, dirt parking lots and roadway shoulders, and exposed construction areas.

SOURCE - Any particular individual or group of organisms, mechanisms, devices, structures, installations, operations, facilities, or processes that emit air pollutants.

SOURCE CATEGORIES -

There are two primary source categories relating to projects; construction and operation. Refer to Figure 9-1 for an identification of source categories associated with construction and Figure 9-2 for source categories associated with operation.

SOUTH COAST AIR BASIN (SCAB) -

A geographic area defined by the San Jacinto Mountains to the east, the San Bernardino Mountains to the north, and the Pacific Ocean to the west and south. The entire SCAB is under the jurisdiction of the South Coast Air Quality Management District.

SOUTHEAST DESERT AIR BASIN (SEDAB) -

The air basin containing Imperial County and specific desert portions of Los Angeles, Kern, Riverside, and San Bernardino Counties. The full description is contained in the California Administrative Code.

SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS (SCAG) -

The organization, known in federal law as a Council of Governments, representing Los Angeles, Ventura, San Bernardino, Riverside, Orange, and Imperial Counties and the cities of the six counties.

AR0073226

STATE IMPLEMENTATION PLAN (SIP) -
A state's plan to attain the federal air quality standards for all non-attainment areas within the state. The 1991 AQMP is integrated into the SIP once it is approved by the EPA and becomes the SIP for the South Coast Air Basin.

STATEMENT OF OVERRIDING CONSIDERATIONS -
Written statement by lead agency giving reasons for its approval of a project having environmental impacts which have not been mitigated to a level of insignificance.

STATIONARY SOURCES -
Those sources that emit pollution from equipment, or industrial or commercial processes. There are two types of stationary source emissions, those from area sources (e.g., water heaters, consumer products, architectural coatings, etc.) and point sources (e.g., boilers, refinery flairs, etc.)

SULFATES (SO_4) - The chemical designation for compounds containing sulfur and oxygen found in the atmosphere in the form of particulate matter. A California State Air Quality Standard has been established for sulfates. Sulfates are formed mainly by the oxidation of sulfur dioxide in the atmosphere.

SULFUR DIOXIDE - A colorless, extremely irritating gas or liquid; its chemical formula is SO_2. Sulfur dioxide enters the atmosphere as a pollutant mainly as a result of burning high sulfur-content fuel oils and coal and from chemical processes occurring at chemical plants and refineries. National Ambient Air Quality Standards and California State Air Quality Standards have been established for sulfur dioxide.

TELECOMMUTE - A work mode where individuals perform job requirements for part or all of the work week at off-site facilities, such as private residences or satellite centers (rather than commuting to the primary work site), thereby reducing vehicle trips or vehicle miles traveled, respectively.

TOXICS - Air pollutants that are carcinogens or produce acute effects. Toxic air pollutant thresholds are based on a quantative risk assessment rather than ambient air standards as with criteria pollutants.

TRANSPORTATION CONTROL MEASURES (TCM) -
Control measures in the AQMP that are directed at reducing emissions by reducing vehicle travel. Both the federal and state law specify requirements for TCMs.

VISIBILITY - The distance that atmospheric conditions permit a person to see at a given time and location. The visibility reduction from air pollutions is due to the presence of sulfates, nitrates, and particulate matter in the atmosphere.

WIND ROSE - A graphic depiction of the direction and speed of wind in a given area. Wind roses are particularly important when assessing toxic emissions and odor problems.

RE: **Transmittal of Second Quarter 2006 Groundwater Monitoring Report**
ARCO Service Station No. 1057
6100 Franklin Avenue
North Hollywood, CA
LARWQCB ID No. 900280034

Dear Mr. Piroton:

SECOR International Incorporated (SECOR), on behalf of Atlantic Richfield Company (Atlantic Richfield), is pleased to submit the Second Quarter 2006 Groundwater Monitoring Report for the above referenced site (Attachment A). On June 29, 2006, SECOR sent an electronic correspondence discussing the issues with the first set of data from the laboratory analysis of groundwater on and off-Site. These issues included the following:

- MS&MSD for the samples were spiked with only ½ the correct amount; and
- Samples were analyzed past the hold times due to instrument failure. The purge and trap had to be refurbished and a new column was installed.

Due to the importance of the groundwater data necessary for the closure of the adjacent parcel, SECOR rescheduled and re-sampled the groundwater wells on and off-Site on July 6, and 7, 2006. The Second Quarter Groundwater Monitoring Report is included at Attachment A. SECOR will complete the Third Quarter Report and submit the report as directed by October 15, 2006.

SECOR and Atlantic Richfield look forward to continuing working with the LARWQCB toward the successful closure of the adjacent parcel to ARCO Station No. 1057. If you have any questions regarding this letter or the attached Second Quarter 2006 Groundwater Monitoring Report, please do not hesitate to contact Mr. Kelly Brown at (714) 230-0321.

Respectfully Submitted,

SECOR International Incorporated

Andrew J. Modugno, R.G. #7036
Senior Geologist

ATTACHMENT A

Second Quarter 2006 Groundwater Monitoring and Remediation Report

SECOR

SECOR INTERNATIONAL INCORPORATED

ATLANTIC RICHFIELD COMPANY QUARTERLY REPORT
Quarter 2, 2006 (July 15, 2006)

Station No.: 1057 Address: 6100 Franklin Avenue, Hollywood, CA
Atlantic Richfield Company Environmental Engineer/Phone No.: Mr. Darrell Fah / (714) 378-6105
Consulting Co./Contact Person/Phone No.: SECOR/ Kelly Brown (714) 379-3366
SECOR Project No.: 37BP.01057.06
Primary Agency/Regulatory ID No.: LARWQCB/ Mr. Dan Flotton/ 900280034
Other Agencies to Receive Copies: None

WORK PERFORMED THIS QUARTER [Second - 2006]:
1. Completed quarterly groundwater sampling and prepared Quarterly Status Report.
2. Submitted Well Destruction and System Decommissioning Work Plan on 7/24/06.
3. Submitted a Work Plan for Soil and Soil Gas Investigations on 7/28/06.
4. Completed System Shutdown

WORK PROPOSED FOR NEXT QUARTER [Third- 2006]:
1. Conduct quarterly groundwater sampling and prepare Quarterly Status Report.
2. Remove AS/SVE System and Compound.
3. Remove all Groundwater and AS/SVE wells from adjacent property.
4. Site re-assigned Priority B Status by the LARWQCB

REGISTERED GEOLOGIST ANDREW JAMES MORGAN No. 7036 STATE OF CALIFORNIA

Current Phase of Project:	Soil and GW Remediation	(Assmn., Remed. etc)
Frequency of Sampling:	GW-Quarterly	(Quarterly, etc.)
Frequency of Monitoring:	GW-Quarterly	(Monthly, etc.)
Liquid Phase Hydrocarbon Present On-Site	No	(Yes/No)
Cumulative LPH Recovered to Date:	0.15	(gallons)
LPH Recovered This Quarter:	0.00	(gallons)
Bulk Soil Removed to Date:	76.2	(cubic yards)
Bulk Soil Removed This Quarter:	None	(cubic yards)
Water Wells or Surface Waters (4000-ft radius)	Hollywood Reservoir	
Radius & Their Respective Directions:	~5,000 feet north-northwest	(Distance and Direction)
Current Remediation Techniques:	Post-SVE/AS	(SVFS, LPH Removal, etc.)
Permits for Discharge:	N/A	(NPDES, POTW, etc.)
Approximate Depth to Groundwater:	Range: 32.38 to 41.44	(Measured Feet)
Groundwater Gradient:	Southeast	(Direction)
	0.015 feet/foot	(Magnitude)
Agency Directive Requirements:	Complete Quarterly GW monitoring and sampling.
