Sunshine Canyon Landfill
Independent Monitor
Quarterly Site Monitoring Status Report
July 1, 2019 – September 30, 2019

Prepared For:

City of Los Angeles Department of City Planning
And
County of Los Angeles Department of Regional Planning

Prepared By:

UltraSystems
environmental management planning

16431 Scientific Way
Irvine, California 92618

Prepared On:
December 10, 2019
CERTIFICATION STATEMENT

December 10, 2019

The attached Quarterly Site Monitoring Status Report for the Sunshine Canyon Landfill dated December 10, 2019 is the Third Quarterly Report for 2019, issued by UltraSystems. This report covers the monitoring period from July 1, 2019 through September 30, 2019 and is prepared for the City of Los Angeles Department of City Planning and the County of Los Angeles Department of Regional Planning.

I, James T. Aidukas, Project Manager for the Mitigation Monitoring Services of the Sunshine Canyon Landfill, certify that the statements in the Quarterly Report and the referenced monthly reports reflect the site conditions observed and compliance status noted by me and other qualified experts during the stated site visits.

Signed,

[Signature]

James T. Aidukas
Project Manager

Appendix II  Photo Location Map and Relevant Site Photos
Appendix III Quarterly Site Visits
Attendees by Date and Mitigation Monitoring Site Reports
Appendix IV Meeting Logs
Quarterly Status Report

This Quarterly Status Report is a compilation of the period’s monthly Site Monitoring. After each site visit, the UltraSystems monitors who went to the Sunshine Canyon Landfill site each wrote a Mitigation Monitoring Site Report. The Mitigation Monitoring Summary spreadsheets for the City and County of Los Angeles note any conditions and/or mitigation measures that need further review, and document these areas in an appendix for that site visit date. Any issues that required immediate attention were reported to Republic Services (Republic) staff and the appropriate staff at the City of Los Angeles Planning Department, the County of Los Angeles Department of Regional Planning, the County of Los Angeles Department of Public Works and the Sunshine Canyon Landfill Local Enforcement Agency (SCL–LEA).

The Sunshine Canyon Landfill City and County Mitigation Monitoring Summary spreadsheets record by date each site visit and frequency of monitoring of specific conditions and/or mitigation measures. When a condition and/or mitigation measure is monitored, a check mark is made under the date that it was monitored, and the status of being compliant with the conditions and/or mitigation measures' requirements observed during monitoring is recorded. Tasks with a yearly or non-ongoing monitoring frequency are denoted by a forward slash (/) in subsequent date columns. In the status column, the letter "C" is put next to the task if it is Compliant; the letters "NC" are noted if the task status is Non-Compliant; and the letters "FRN" are used if Further Review is Needed for meeting the requirements of the conditions and/or mitigation measures.

Under the Further Review Needed/Comment column, observed conditions that have been noted as "FRN" in the status column refer to appendices which detail what was observed during the site monitoring. When the conditions and/or mitigation measures that were previously noted as "FRN" are fully compliant, an "R" is placed in the Resolved column and a "C" replaces the "FRN" in the status column. Also noted in the FRN-Comments column are those action items that would improve monitoring efficiency by having reports and documents readily available. These are summarized in the Mitigation Monitoring Summary spreadsheets and the Summary of Requested Documents section of the Quarterly Reports.

This Quarterly Report provides the City of Los Angeles Department of Planning and the County of Los Angeles Department of Regional Planning with a concise status of the Mitigation Measure Monitoring for the period of July 1, 2019 to September 30, 2019. It includes:

1. The City and County Mitigation Monitoring Summary spreadsheets for July 1, 2019 to September 30, 2019. These spreadsheets record the areas of monitoring completed and the status of being compliant during the third quarter of 2019;
2. A Status Summary of Non-Compliant, Further Review Needed and Compliant with the requirements of the conditions and/or mitigation measures;
3. Photo Location Map and Relevant Site Photos showing site conditions of key areas of the landfill during this quarter;
4. Site visit attendees by date of site visit and the mitigation monitoring site report from each monitor;
5. Meeting logs documenting any meetings with Republic staff and/or public agencies, with the topics discussed; and
6. Any site monitoring documenting site changes.
Site Visits During the Quarter

Four site visits were performed by UltraSystems during the July through September 2019 quarter in order to observe operational site activities and determine compliant status with conditions and/or mitigation measures. They were performed on July 9, 2019; August 13, 2019; August 27, 2019; and September 25, 2019. The previously discussed conditions and/or mitigation measures were tracked by each specialist who visited, and observations were documented. Site conditions were noted to be: Compliant, Non-Compliant, or Further Review Needed. If a Condition was found to be Non-Compliant or observed as having Further Review Needed, a reference was made to an appendix which details what was observed by the monitor.

Definition of Terms

Compliant is defined as complying with the City and County conditions and/or mitigation measures.

Non-compliant is defined as not complying with the City and County conditions and/or mitigation measures.

Further Review Needed is defined as implementing plans (agency-approved, if required) to fully comply with a condition and/or mitigation measure. Some plans, especially vegetation, require an extended time frame, and immediate compliance is not possible.

Further Review Needed/Comments is defined as comments documenting site conditions observed during monitoring visits that are not fully compliant, but action is being taken in order to obtain full compliance with conditions and/or mitigation measures. Recommendations from the monitor, as appropriate, and status from Republic may also be given. The comments section of the monitoring report also provides a summary of activities being done onsite to construct or maintain facilities, and a summary of documents, reports and drawings that should be readily available onsite for monitoring reference.

Resolved is defined as action taken or activities completed to fully comply with conditions and/or mitigation measures.

Status Summary

This section summarizes the conditions and/or mitigation measures that were monitored during the quarterly reporting period and their respective statuses. The Sunshine Canyon Landfill Mitigation Monitoring Summary spreadsheets for the City and County show the conditions and/or mitigation measures monitored during the quarter. Also included in this report are relevant photos in Appendix II.

Compliant

The majority of the conditions and/or mitigation measures monitored were observed to be compliant. There are City and County conditions which are compliant, but are noted as having corresponding comments that refer to the appendices. The Compliant with Comments section of the monitoring report provides a summary of activities being done onsite to construct or maintain facilities, and a summary of documents, reports and drawings that should be readily available onsite for monitoring reference.
Non-Compliant
During UltraSystems’ site visits, no Non-Compliant conditions and/or mitigation measures were noted. Also, it must be understood that any monitoring related to landfill gas and odors are not part of the UltraSystems Monitoring Program at this time. These issues are currently being handled by a multi-agency team, which is led by the South Coast Air Quality Management District (SCAQMD).

Further Review Needed
The following conditions and/or mitigation measures were found not to be fully compliant, but were being worked on in order to obtain full compliance. This section summarizes the progress being made toward being fully compliant. When a condition and/or mitigation measure progresses from "FRN" to fully compliant, it is noted as Resolved in this section, and on the City and County Mitigation Monitoring Summary spreadsheets.

Q-B.2.c (City)
Ancillary Uses and Facilities. The subject property may only be used for the following uses and facilities. These ancillary uses and facilities described in the July 1997 Draft Subsequent EIR, pages 2-38 through 2-43, and may be located on the applicant’s property generally in conformance with the diagram attached as Exhibit e-4, and during the life of the landfill, may be moved or relocated following commencement of landfilling operations as necessary to accommodate development of the ultimate landfill footprint.

Geology-1.07 (County)
All grading activities shall be in compliance with specific requirements provided in a comprehensive geotechnical report for the proposed Project, including provisions for excavation approved by the County Department of Public Works, the County Local Enforcement Agency (LEA) and other Responsible Agencies.

Geology-1.11 (County)
Grading allows for ancillary facilities outside of the landfill footprint.

Biota-4.29 (County)
San Diego Horned Lizard: Impact on the San Diego horned lizard can be mitigated to a level of less than significant by restoring coastal sage scrub habitat. This will create a temporal loss of the species, but the population should recover following restoration of this habitat. Topsoils should be selected that are friable to suit lizard habitat requirements.

Biota-4.30 (County)
California Gnatcatcher: Surveys shall be conducted for California gnatcatchers prior to Game Permit onsite grading to determine the status of this Game species within development areas.

Biota-4.33 (County)
Migratory Bird Treaty Act: To prevent the loss of an active migratory bird nest, vegetation shall not be cleared during the breeding season (i.e. March 15 to August 1).

Biota-4.34 (County)
Raptor nests: If habitat removal is proposed during the raptor breeding season (i.e. March to July), a survey shall be conducted for active nesting areas.
Current Status/Comments – During the 3rd Quarter, there was no grading outside of the approved landfill development limits. Cell CC-4 Part 3 was the only development area where grading and liner installation was occurring. Liner installation is scheduled for completion in October. Cover material was being moved from the County top deck.

Q-C.3.h (City)

The access roads extended to new fill areas shall be surfaced with recycled asphalt, aggregate materials, or soft stabilization products to minimize the length of untreated dirt.

Current Status/Comments – In July, early morning disposal trucks that were using dirt roads near the County Bowl area created dust clouds. Water trucks were not yet operating.

In September, trucks hauling wet material to the County top deck stockpiles were creating dust clouds on un-watered roads.

Q-C.5 (City)
Graffiti removal and deterrence on building and structures in public view.

Current Status/Comments – During the 3rd Quarter, no graffiti was observed on site nor on the exterior block walls.

Q-C.10.c (City)
The operator shall submit, as part of its annual report, an evaluation of the feasibility of beneficial uses of the landfill gas collected at the site such as landfill-gas-to-energy.

Odor/Landfill Gas - 7.07 (County)
The permittee will recover and sell as much gas as is technically and economically feasible to reduce total air quality emissions from the landfill operations. It is expected that the technical and economic feasibility of commercial recovery and sale of landfill gas as a renewable energy resource will occur at levels below 40 MMCFD. The gas collection system will be installed in increments to allow for maximum gas recovery.

Gas - 52 (County)
To the extent technically and economically feasible, the Permittee shall use Landfill gas for energy generation at the Facility or other beneficial uses, rather than flaring, and shall obtain all applicable local, state, and/or federal approvals for any such use. Notwithstanding the forgoing, the Permittee shall be exempt from this Condition No. 52 if, as a part of its annual report required by Part X of the IMP, the Permittee determines that any such activity or project is infeasible, which determination shall be subject to the review and approval of the Director of Public Works.

The Permittee shall also install and maintain a landfill gas collection system complying with SCAQMD requirements, which uses best available control technology to control the lateral migration of gases to the satisfaction of the Director of Public Works, County LEA, and SCAQMD. In addition to the other requirements of this Condition No. 52, Landfill gas flares shall be installed below the adjacent interior ridges of the site, unless otherwise required by the SCAQMD, and the flames shall be totally contained within the stacks. Flame arrestors shall be provided to the satisfaction of the County Forester and Fire Warden.
Current Status/Comments – In early July, the gas-to-energy plant was using 9058 SCFM of recovered landfill gas, 44% CH4, 0.8% O2, 88 ppm H2S. Flare 1: not monitored; Flare 3: shut down; Flare 9: 2514 SCFM; Flare 10: 2537 SCFM; Flare 11: 2562. The total volume of landfill gas being recovered was 16,658 SCFM.

In mid-August, the gas-to-energy plant was using 8904 SCFM of recovered landfill gas, 45% CH4, 0.4%, 99 ppm H2S. Flare 1: 2524 SCFM; Flare 3: 2374 SCFM; Flare 9: 2863 SCFM; Flare 10: 2861 SCFM; Flare 11: down for maintenance. The total volume of landfill gas being recovered was 19,427 SCFM.

In late August, the gas-to-energy plant was using 9210 SCFM of recovered landfill gas, 46% CH4, 0.5% O2, 94 ppm H2S. Flare 1: 2526 SCFM; Flare 3: 2294 SCFM; Flare 9: shut down; Flare 10: 2735 SCFM; Flare 11: 2772 SCFM. The total volume of landfill gas being recovered was 19,537 SCFM.

In late September, the gas-to-energy plant was using 7911 SCFM of recovered landfill gas, 44% CH4, 0.9% O2, 100 ppm H2S. Flare 1: 2354 SCFM; Flare 3: 2712 SCFM; Flare 9: 3374 SCFM; Flare 10: down for maintenance; Flare 11: 3411 SCFM. The total volume of landfill gas being recovered was 19,762 SCFM.

The quantity of landfill gas being recovered during the 3rd Quarter has a daily average of 18,846 SCFM, with the gas-to-energy plant usage averaging 8771 SCFM. An expansion of the gas-to-energy plant or different beneficial-use facility should be evaluated.

The conditions state that planning for expanding the renewable energy facilities should begin when the quantity and quality of gas being flared can support the installation of a new facility or an expansion of the existing facility, and that the status of the technical and economic feasibility be included in Republic’s biennial reports. The typical time required for planning, funding and permitting a renewable energy facility is four years, or more.

T-4 (City)
Prepare a plot plan ["fire plan"] to the satisfaction of the Fire Department.
a. immediate access fire plan [now]
b. plot plan for the future facilities will be submitted when these are implemented

Fire Service - 12.03 (County)
The permittee shall maintain onsite fire response capabilities, construct access road, provide water tanks, water mains, fire hydrants and fire flows and perform brush clearance to the satisfaction of the County Forester and Fire Warden. The landfill will comply with all applicable County codes and ordinances which delineated the requirements for fire access, water mains, fire flows and fire hydrants, specifically defined by the County Fire Department. New construction water tanks, water mains and fire hydrants will be completed to meet the fire flow requirements of the Fire Department.

Current Status/Comments – An updated fire plan showing the new locations of all facilities and emergency egress should be prepared and sent to the local City fire department station, and City and County planning departments when construction of the new operation’s facilities currently under construction have been completed. Emergency egress should be posted for employees and customers. It is recommended that the local City fire department station personnel visit the site and be given the latest facility plot plan showing access roads and facilities.
M-4.1.1(2) (City)
Areas outside of and above the cut and fill as shown on the conceptual grading plan shall not be graded, except for the development of ancillary facilities or other related improvements. Additional grading may be necessary for slope stability or drainage purposes. Prior to undertaking any grading activities, the Department of Building and Safety shall be notified and approve any additional grading based on engineering studies (in accordance with CCR Title 27) provided by the project proponent and independently evaluated by the Department of Building and Safety.

M-4.1.1(4) (City)
Grading that allows for construction of ancillary facilities outside of the landfill footprint or that has the potential to impact property beyond the boundary of the landfill shall be approved by the Department of Building and Safety.

M-4.1.1(5) (City)
All grading activities shall be in compliance with specific requirements provided in a comprehensive geotechnical report prepared specifically for the proposed project, including provisions for excavation approved by the Department of Building and Safety, City Engineer, City LEA and other Responsible Agencies.

M-4.1.5(12) (City)
Geologic Hazards - Liquefaction
Alluvium in the canyon bottoms beneath the footprint of the waste containment system and beneath ancillary structures shall be excavated and, if necessary, replaced with compacted structural fill during construction. A qualified geologist shall be onsite during construction activities to observe removal and replacement of alluvium and verify that all alluvium within the landfill footprint has been removed prior to placement of any compacted fill or construction of any containment system elements.

M-4.14.1(155) (City)
Construction of the realigned access roadway shall not exceed 15 percent in grade. An access road shall be constructed and maintained around the working area of the landfill for emergency access for firefighting equipment.

Geology-1.07 (County)
All grading activities shall be in compliance with specific requirements provided in a comprehensive geotechnical report prepared specifically for the proposed Project, including provisions for excavation approved by the County Department of Public Works, the County Local Enforcement Agency (LEA) and other Responsible Agencies.

Current Status/Comments – The only out-of-approved landfill footprint grading occurring in the 3rd Quarter was related to the approved CC-4 Part 3 buttress-related drainage systems. The only other grading occurring was for development of Cell CC-4 Part 3, removal of stockpiled soils for cover, and grooming of slopes. These activities are inside the approved landfill footprint.

M-4.1.4(11) (City)
An operations checklist shall be used by a registered engineering geologist for surveys following all earthquake events measuring 5.0 on the Richter Scale or greater near the project site. A comparison of operating parameters and site conditions before and after major earthquake events shall be made to verify that systems are operational as designed. Final designs for major engineered structures shall be based on the results of the detailed stability analyses of potential seismic events.
**Geology-1.16 (County)**

An operations checklist will be used by a certified engineering geologist, registered civil engineer, or licensed surveyor for surveys following all earthquake events of 5.0 magnitude or greater.

**Current Status/Comments** – The landfill was surveyed by the monitor for any impacts from the Ridgecrest earthquake, and no cracks, fissures, or land movement were observed. Republic had GLA Engineers inspect the landfill after the large earthquake and no site problems were observed.

**M-4.1.1(6) (City)**

Revegetation and erosion control procedures on all exposed slopes shall be implemented. The erosion controls to be implemented at the site shall include soil stabilization measures and revegetation in accordance with the approved revegetation plan as approved by the City Building and Safety Department. Interceptor ditches shall be designed to divert storm runoff to a sedimentation basin.

**M-4.2.11(23) (City)**

Disturbed areas shall be revegetated with an interim ground cover as specified in the proposed revegetation program. Excavation will proceed in a manner to reduce the amount of graded areas at any given time.

**M-4.2.12 (28) (City)**

Site Erosion

c. A temporary vegetation cover shall be established on all slopes that are to remain inactive for a period longer than 180 days.
d. An SCAQMD approved soil stabilization (sealant) product shall be used to retard soil erosion and enhance revegetation. Soil sealant shall be applied when necessary to selected working areas of the landfill. The sealant will also be used as a binder or tackifier to hold seen during revegetation mulch, and fertilizers in-place until grasses become establish and stabilize on the landfill surface.

**Geology-1.13 (County)**

Revegetation and erosion control of all exposed slopes will be an ongoing process. The erosion controls to be implemented at the site will include soil stabilization measures and revegetation in accordance with the approved Revegetation Program. The installation of interceptor ditches shall be designed for the diversion of storm runoff to sedimentation basins. Sediment traps will be used at points of runoff concentration along the perimeter of exposed slopes surfaces. Condition: Approval of drainage plan. Retention of a consulting horticulturalist/Registered Professional Forester and an independent qualified biologist by the permittee for ongoing supervision of revegetation programs. Review and monitoring of planting programs by County Forester.

**Geology-1.14 (County)**

To prevent soil erosion on the face of the landfill, interim vegetation measures will be taken after placement of the temporary soil layer (even though the area may be disturbed by future filling operations). Vegetative cover will be placed as in the approved Revegetation Program. Condition: Retention of a consulting horticulturalist/Registered Professional Forester and an independent qualified biologist by the permittee for ongoing supervision of revegetation programs. Review and monitoring of planting programs by County Forester.
Biota – 4.42 (County)
Areas inactive for 180 days or longer will be planted with interim vegetation as approved by County biologist. Records will be kept to track fill areas of the site which are transferred to an inactive status so that appropriate dust control and revegetation measures can be implemented.

Air Quality - 6.02 (County)
Dust Control will also be accomplished through the temporary revegetation of the landfill surface. A temporary revegetation of the landfill surface, and a temporary vegetation cover will be established on all slopes that are to remain inactive for a period longer than 180 days. Specifications of temporary revegetation measures will be provided in the Revegetation Plan submitted to the County biologist for approval, the Closure and Postclosure Maintenance Plans, the Condition Use Permit, and Conditions of Project Approval.

Visual-10.08 (County)
Cover/Revegetation Requirements
The permittee shall comply with the following cover and re-vegetation requirements at the Landfill:
(1) The permittee shall apply a temporary hydroseed vegetation cover on any slope or other Landfill area that is projected to be inactive for a period greater than 180 days, as set forth in the IMP. The permittee shall promptly notify the County LEA and the Department of Public Works of any such slope or area;
Revegetation Requirements
(5) Notwithstanding the foregoing, the permittee shall not be bound by the previous provisions of this Condition No. 44, but instead by the requirements of the County LEA, so long as the Limits of Fill are not exceeded, if in consultation with the Department of Public Works, the County LEA determines that a different re-vegetation design or plan:
(1) would better protect public health and safety;
(2) would enable revegetation of the final slopes at least as well as shown in Exhibit "B" described in subsection D, above; and/or experts, including an independent, qualified bio (3) would be required because the minimum standards adopted by the CIWMB have been amended;
(6) the permittee shall employ an expert or biologist, to satisfy this Condition No. 44. Soil sampling and laboratory analysis shall be conducted in all areas that are required to be re-vegetated before any re-vegetation occurs to identify chemical or physical soil properties that may adversely affect plant growth or establishment. Soil amendments and fertilizer recommendations shall be applied and plant materials selected, based on the above-referenced testing procedures and results. To the extent possible, plant types shall blend with species indigenous to the area, be drought tolerant, and be capable of rapid growth. The selected plants shall not include nonindigenous species that are likely to be invasive of adjacent natural areas.

Biota - Revegetation - 44.A (County)
A. The Permittee shall apply a temporary hydroseed vegetation cover on any slope or other Landfill area that is projected to be inactive for a period greater than 180 days, as set forth in the IMP. The Permittee shall promptly notify the SCL-LEA and the Department of Public Works of any such slope or area.

Revegetation - 44.F/44.F CUP (County)
F. The Permittee shall employ an expert or experts, including an independent, qualified biologist, to satisfy this Condition No. 44. Soil sampling and laboratory analysis shall be conducted in all areas that are required to be re-vegetated before any re-vegetation occurs to identify chemical or physical soil properties that may adversely affect plant growth or establishment. Soil amendments and fertilizer recommendations shall be applied and plant materials selected, based on the above-referenced testing
procedures and results. To the extent possible, plant types shall blend with species indigenous to the area, be drought tolerant, and be capable of rapid growth. The selected plants shall not include non-indigenous species that are likely to be invasive of adjacent natural areas.

**Current Status/Comments** – During the 3rd Quarter, Closure Turf was being maintained and gas and liquids recovery systems under the turf were performing well. This cover material was in lieu of vegetation, and controlled and eliminated dust and erosion. The soil stockpiled on the County top deck was being used for daily cover. By the end of September, the soil stockpiled from the CC-4 Part 3 buttress construction was gone.

**M-4.1.1 (7) (City)**

Prior to the initiation of grading activities, the project proponent shall undertake, if necessary, reabandonment procedures as required by the California Department of Conservation, Division of Oil, Gas, and Geothermal Resources.

**Current Status/Comments** – The old abandoned oil well casing adjacent to the new secondary access road from the Flare 11 site was not reabandoned. An evaluation of the need to reabandon this well should be done. This well was not leaking oil or gas, and did not pose a current hazard. It is well beyond the approved landfill limits.

**M-4.1.6 / 18 (City)**

Survey monuments shall be installed around the perimeters of the outer fill areas at points where they would not be subject to disturbance by landfill development and marking the 500-foot setback from the more restrictive zone. The exact spacing, location, and characteristics of the survey monuments shall be submitted to and approved by the City Local Enforcement Agency (LEA).

**Current Status/Comments** – The landfill perimeter boundary survey PVC marker pipes have been removed in areas where Edison pole grading took place, near the Flare 11 site pad grading and near the Cell CC-4 Part 3 buttress. These boundary markers have not been replaced. All markers should be replaced once the Cell CC-4 Part 3 buttress drainage and road construction is completed.

**M-4.2.13/29, 30, 32, 33, 34 (City)**

The natural biological processes that generate odors in a landfill through anaerobic decomposition cannot be prevented or avoided. However, the LFGs shall be prevented from escaping to the atmosphere through the use of control measures. These measures include using daily and intermediate cover material over deposited wastes, filling any surface cracks with clean dirt as necessary, and extracting LFG through the use of an LFG collection and recovery system and destroying collected gases by combustion.

Operational techniques shall be utilized to control odor sources at the landfill. The size of the working face shall be limited so that the area of waste exposed to the atmosphere is kept to a minimum. The LFG collection and recovery system shall be installed in phases as each portion of the landfill site is filled. The final system shall contain a network of gas extraction wells, collection system piping, and flaring facilities. Because the LFG generation begins at lower levels of volume and increases during the landfill site life, the gas will be flared initially until sufficient quantities are available for processing into electricity.

If an odor problem should develop, appropriate control measures shall be implemented. These measures include the application of additional dirt daily cover material or more frequent application of the cover material to seal the landfill surface, or adjustments to the wells, equipment, and operation of the LFG collection and recovery system.
To ensure that odors are kept to a minimum, the following odor/LFG monitoring program shall be implemented for the proposed landfill project. The monitoring program shall comply with the requirements of SCAQMD Rule 1150.1 and include:

a. Sample Probe Installation: One monitoring probe per 1,000 feet or as identified by South Coast Air Quality Management District (SCAQMD) and/or Local Enforcement Agency (LEA) in the landfill expansion, and one probe per 650 feet or as identified by SCAQMD and/or LEA in the City Inactive landfill along the landfill perimeter, or whichever is more restrictive shall be installed to identify potential areas of subsurface landfill gas (LFG) migration. These probes shall be monitored to ensure that quantities of LFG beyond regulatory standards do not vent offsite through subsurface soils.

b. Integrated Landfill Surface Sampling: The landfill surface shall be monitored to ensure that the average concentration of total organic compounds over the landfill surface does not exceed SCAQMD’s standard of 25 ppm.

c. Ambient Air Samples: 24-hour integrated gas samples and required meteorological data shall be taken to assess any impact the landfill is having on the ambient air quality at the landfill perimeter.

d. Instantaneous Landfill Surface Monitoring: Spot checks on the landfill surface shall be made to determine the maximum concentration of total organic compounds measured as methane, measured at any one point on the surface of the landfill does not exceed the SCAQMD’s standard of 500 ppm.

e. Regular Monitoring and Annual Testing: LFG concentrations at perimeter probes, gas collection system headers, the landfill surface, and in ambient air downwind of the landfill shall be monitored once per month or less frequently (but no less than quarterly) as required by the SCAQMD. The LFG collection system shall be adjusted and improved based on quarterly monitoring data and annual stack testing results.

Odor/Landfill Gas - 7.06 (County)
If an odor problem should develop, appropriate control measures shall be implemented. These measures include the application of daily cover material or more frequent applicant of the cover material to seal the landfill surface, or adjustments to the wells, equipment, and operation of the LFG collection and recover system.

Amendment 45.N - 4.a, 4.c, 4.d (County)
Identify and provide status on the measures currently being implemented as required by the AQMD’s Order for Abatement.

An odor patrol program, which would include the following at a minimum:
• Provide a trained technician to conduct odor patrols in the surrounding neighborhoods at a frequency of one patrol per hour from 6 a.m. to 10 a.m., Monday through Saturday, and during adverse wind conditions.
• If odor is detected, identify its potential and/or actual source, including those that may not be related to the Landfill’s operation, such as an odorous trash dumpster or transfer trucks.
• If odor is determined to be related to the Landfill’s operation, take immediate action to reduce the odor. Document the streets patrolled on a map, time of the patrol, potential source of odor, and immediate actions taken by the Landfill.
• A landfill gas mitigation plan in preparation for the next rainy season since landfill gas emissions from either the landfill surface or landfill gas control equipment is cited as a potential contributor in the AQMD’s Order for Abatement. The plan should include the following at a minimum:
  • Description of the site’s current Gas Monitoring and Control Plan, including a map showing locations of gas monitoring probes, gas extraction wells, horizontal and vertical gas collection lines, etc.
  • Compliance history of the site’s landfill gas migration control program from January 1, 2009, to the present quarter as well as any corrective actions.
- Discuss the impacts of the most recent heavy rains on the landfill gas collection system, including identifying locations of damage due to soil erosion, as well as any corrective actions or mitigation measures.
- A work plan that includes preventive measures, such as identifying and filling any surface cracks and installing additional extraction wells, as well as contingency measures.
- An implementation schedule for the above work plan.

Amendment 45.N - 5 (County)
Include in the Quarterly Dust and Odor Reports, which are required by CUP Condition No. 45.N, the status and effectiveness of mitigation measures 1 through 3 above, and the Odor Mitigation Plan.

Current Status/Comments – Compliance with these mitigation measures, concerning landfill gas monitoring and odor control and detection, is being monitored by a multi-agency team led by the SCAQMD, with their monitoring results noted in their reports. Only obvious gas emission sources, odorous operations related to gas and/or gas and landfill liquids, lack of cover, or exposed trash resulting in odor observed during UltraSystems’ monitoring visits are reported.

In early July, the monitor drove the Granada Hills neighborhood area from 6:00 to 6:45 a.m. and there were no landfill odors detected. The leachate and condensate Alder tank facility was operating, and strong odors were detected to the northern area of the facility.

In mid-August, the monitor drove the Granada Hills neighborhood areas from 6:15 to 7:00 a.m. and there were no landfill odors detected. The morning operation’s tarps were removed at 9:00 a.m. from waste disposed at 6:00 to 7:00 a.m. Trash was not moved by the tarp and no odor was detected within 150 feet. Localized dust was created in moving the tarps.

In late August, the monitor drove the neighborhood and school areas from 6:30 to 7:00 a.m. and there were no landfill odors detected. At 8:30 a.m., a trash truck was observed leaving a substantial amount of liquid as it queued in the scale area. The liquid was from the waste and was odorous. The monitor drove the adjacent neighborhood and school area at 9:30 a.m. and no landfill odors were detected. The leachate recovery system below the CC-3B slope was operating and no odors were detected. The alluvial seep was stopped. Localized odors were detected at the north tank of the Adler tank farm leachate and condensate treatment system. Localized odors were coming from a liquids transmission line repair. The repair was completed by approximately 1:00 p.m. Localized odors were detected at Well 3013D on the CC-3A top deck.

In late September, the monitor drove the neighborhood and school areas from 6:10 to 6:45 a.m. and there were no landfill odors detected. A new odor control mister system was installed and operating on poles adjacent to the PM-10 berm oak trees. Localized odors were detected near the Basin B outlet channel at approximately 12:00 p.m.

Throughout the 3rd Quarter, the use of Closure Turf to seal inactive fill areas with intermediate cover provided enhanced gas recovery and gas-related odor control.

M-4.3.1(37) (City)
As development of the site proceeds, surface drainage systems shall be maintained so that surface runoff is diverted away from working slopes and isolated from landfilled refuse. Onsite drainage channels would be designed per CCR, Title 23, Division 3, Chapter 15, Article 3, §2533(C), and County of Los Angeles Public Works Department, Flood Control Division requirements.
Surface Water - 2.03 (County)
As development of the site proceeds, surface drainage systems shall be maintained so that surface runoff is diverted away from working slopes and isolated from landfilled refuse. Onsite drainage channels would be designed per CCR, Title 23, Division 3, Chapter 15, Article 3, §2546(C), which mandates the requirements for a capital storm event (100-year 24-hour precipitation).

M-4.3.1(38) (City)
Permanent bench drainage ditches shall be installed when final cover is placed on completed portions of the landfill. These ditches shall be lined. Temporary unlined drainage facilities consisting of diversion ditches (V-ditches) where necessary shall directly intercept natural surface runoff. Any intermittent channel flow in the existing canyon bottom shall be captured, channeled, and conveyed into a sedimentation basin. Diversion ditches shall convey surface runoff from the undisturbed areas to the permanent perimeter ditches for safe transport around the landfill footprint. Surface covers of various types, from mulches to vegetation, shall be used to retard erosion from areas of disturbance. In addition, areas of disturbance shall be kept at a minimum during active filling operations.

Surface Water - 2.12 (County)
Permanent bench drainage ditches shall be installed when final cover is placed on completed portions of the landfill. These ditches shall be lined. Temporary unlined drainage facilities consisting of diversion ditches (V-ditches) where necessary shall directly intercept natural surface runoff. Any intermittent channel flow in the existing canyon bottom shall be captured, channeled, and conveyed into a sedimentation basin. Diversion ditches shall convey surface runoff from the undisturbed areas to the permanent perimeter ditches for safe transport around the landfill footprint. Surface covers of various types, from mulches to vegetation, shall be used to retard erosion from areas of disturbance. In addition, areas of disturbance shall be kept at a minimum during active filling operations.

Current Status/Comments – It is assumed by UltraSystems that the permanent drainage V-ditches and channels are designed in accordance with the referenced regulations. The design drawings and reports should be available for review and use.

During the 3rd Quarter, surface drainage systems were in place to intercept or divert rainwater away from prior landfill cells and current filling operations. Most of these were temporary systems in active areas, and most conveyance V-ditches were unlined. Jute netting and straw wattles have performed well during last year’s heavy rain events, with only moderate erosion occurring. The only area that had erosion from rain events was in the CC-4 Part 3 buttress area due to active grading that was occurring, and the County sage mitigation area’s bare and unprotected slopes. Straw wattles are being placed in the required areas.

M-4.3.1(39) (City)
As filling operations progress upward in elevation and laterally across the canyon, both permanent and temporary drainage facilities shall be used to provide appropriate drainage protection. The lower elevation portions of the landfill working face shall be placed under final cover as soon as final grade is attained, and bench ditches shall be installed that will connect to adjacent, permanent perimeter ditches. These ditches shall connect directly to the temporary diversion drainage ditches that will protect the active landfill areas from natural surface runoff.

M-4.18 / 178 (City)
The maximum permitted elevations for the landfill shall not be allowed to be exceeded at any time during landfill development and shall be verified through survey control points.
**Current Status/Comments** – A map showing areas that are at the final elevations and should have final cover should be available for review. Documents showing current filled elevations should also be available onsite for review. These conditions were not monitored.

**M-4.3.1(40) (City)**

*In order to monitor the effectiveness of those measures designed to prevent pollution from entering the offsite stormwater system, the project proponent shall be required to apply for coverage under the SWRCB General Construction Activities Stormwater Permit Programs.*

**M-4.3.1(45) (City)**

*An erosion control plan would be implemented by the project proponent to prevent stormwater pollution from construction activity. Construction materials, equipment and vehicles would be stored or parked in areas protected from stormwater runoff. Construction material loading and unloading would be in designated areas to minimize any washout due to stormwater runoff. Pre-construction controls would be implemented to include the use of a sandbagging system, including sandbag check dams and sandbag desilting basins, which would be used to limit runoff velocities and minimize sediment in storm water runoff.*

**Surface Water 2.14 (County)**

*An erosion control plan would be implemented by the project proponent to prevent stormwater pollution from construction activity. Construction materials, equipment and vehicles would be stored or parked in areas protected from stormwater runoff. Construction material loading and unloading would be in designated areas to minimize any washout due to stormwater runoff. Pre-construction controls would be implemented to include the use of a sandbagging system, including sandbag check dams and sandbag desilting basins, which would be used to limit runoff velocities and minimize sediment in storm water runoff.*

**Current Status/Comments** – The erosion control measures in place by October of last year performed well during the rainy season. The only area where erosion was not controlled is an unvegetated area on the County sage mitigation slope. All temporary drainage V-ditches were in place by the end of September this year. Straw wattles were being installed on all slopes.

**M-4.3.1(41) (City)**

*The surface water collection system shall be designed to collect runoff and collect/retain suspended solids. Water leaving the sedimentation basins shall be monitored in accordance with NPDES requirements.*

**M-4.3.1(43) (City)**

*Sediment shall be cleaned out of the sedimentation basins after every significant storm.*

**Surface Water 2.10 (County)**

*The surface water collection system shall be designed to collect runoff and collect/retain suspended solids. Water leaving the sedimentation basins shall be monitored in accordance with NPDES requirements. Sediment shall be cleaned out of the sedimentation basins after every significant storm.*

**Current Status/Comments** – In early July, Basin A was dry. There was no removal of sediment. Basin D was dry and free of sediment. The Basin D outlet channel was repaired and ready for winter rain events. Basin B was dry. The areas with sloughed hillside soil piles were not removed. The basin floor had minimal sediment. The terminal basin had standing water at the outlet risers.
Sediment was moved into piles in other areas to allow it to dewater and to dry. The skimmer system had not yet been repaired.

In mid-August, Basin B had a minimal amount of dry sediment stockpiled and ready for removal. The eastside drainage channel from the Adler tank farm south was not yet cleared of sediment. Sediment was being removed from the terminal basin. The basin was approximately 25% cleared. The sediment was wet and spongy from the gabion wall to the outlet risers.

In late August, Basin A had sediment moved to the center of the basin for removal. Basin B had dry sediment moved to a pile ready for removal. The eastside drainage channel was cleaned to the Adler tank farm. Sediment, rock, and debris was not removed from the tank farm to the terminal basin. The terminal basin had the inlet water flow blocked by a dirt berm. Dry sediment was being removed. A significant amount of sediment from the gabion wall to the outlet risers had not been moved into piles to dry. The skimmer system has not yet been repaired.

In late September, Sediment was removed from the center area of Basin A. Sediment around the interior wall was being piled for removal. Rock around the outlet risers was not yet cleaned. Basin B had a small pile of sediment ready for removal. The eastside channel had sediment, debris, and gabion rock not yet removed from the Adler tank farm to the terminal basin. Sediment in the terminal basin had been removed to the gabion wall, and wet sediment east of the wall in the outlet side is being trucked away. The outlet channel had minimal sediment on the channel floor. The outlet skimmers were still buried in sediment and had not yet been repaired.

M-4.3.1(46) (City)
A preventive maintenance program would be implemented by the project proponent, including inspection of facility equipment, systems, and stormwater management devices to detect conditions that may cause breakdowns or failures resulting in discharge of materials into stormwater. This program applies to the onsite drainage ditches; rip-rap; berms and dikes; dust control; silt fences; diversion grading; and pavement surfaces. Each system and piece of stationary equipment would be inspected monthly. Procedures for inspection would vary, due to the piece of equipment or system. However, the major elements of the inspection program would include checking for cracks or structural failures, inspecting parts or pieces of equipment nonfunctioning, checking for the degradation or deterioration of operating units, and investigating the need for cleaning or emptying units. A summary report of these monitoring results and the corrective actions taken will be disseminated in each newsletter with a more detailed report on the website and in the annual report.

Surface Water 2.15 (County)
Surface Water Preventive Maintenance Program
A preventive maintenance program will be implemented by the permittee, including inspection of facility equipment, systems, and stormwater management devices to detect conditions that may cause breakdowns or failures resulting in discharge of materials into stormwater. This program applies to the onsite drainage ditches, rip-rap, berms and dikes, dust control, silt fences, diversion grading, and pavement surfaces. Each system and piece of equipment will be inspected monthly. Procedures for inspection would vary based on the piece of equipment or system. However, the major elements of the inspection program will include checking for cracks or structural failures, inspecting parts or pieces of equipment nonfunctioning, checking for the degradation or deterioration of operating units, and investigating the need for cleaning or emptying units.
conditions that may cause breakdowns or failures resulting in discharge of materials into stormwater should be performed on a monthly basis, with a summary report issued on a quarterly basis. These reports have been reviewed and are available at the landfill’s main office.

The high-flow spillway for Basin D into the westside drainage has cracks and spalling that should be repaired. The outlet riser that discharges into the eastside channel does not have top guards to restrict unauthorized access. The Basin B high-flow outlet spillway was cracked in multiple places. The terminal basin has vegetation growing in the interior concrete sidewalls.

In early July, the Basin D outlet channel was repaired and is ready for winter rains. The concrete outlet structure had the vegetation removed, and cracks and soil erosion repaired. No personnel access limiting guard was on the northern riser.

In mid-August, the old City south soil stockpile south of the office did not have the slope slump increase. The old City south landfill had slopes repaired, and graded and drainage systems repaired and improved. The westside concrete channel with a corrugated pipe downcomer was completed on the old City south landfill. The concrete channel above the CC-4 Part 3 buttress was not complete. The CC-4 Part 3 liner was installed in a southern run-off basin area, and on the north and west slopes.

In late August, the temporary-lined basin in Cell CC-4 Part 3 was completed. The old City south landfill appeared to be ready for winter conditions. The rainwater control gabions were not yet installed on the new paved access road. The drainage channel construction on and adjacent to the CC-4 Part 3 buttress was ongoing.

In late September, the CC-4 Part 1/2 slopes looked manicured with the HDPE drainage systems repaired. No straw wattles had been installed. The Closure Turf looked well-maintained. The depression in the old City south landfill stockpile had not changed. A new section of the permanent westside drainage channel was being installed below the CC-4 Part 3 buttress. The outlet from Basin A was not yet constructed.

**M-4.3.2(50) (City)**

The LCRS shall be installed at the base and side slopes of the landfill. This system shall be designed and installed to collect generated leachate for disposal consistent with LARWQCB requirements. The collection system shall consist of a filter rock blanket embedded with a system of collection pipes or a blanket embedded with a system of collection pipes or geosynthetic alternative that collects and transports the fluid to a holding tank. In accordance with RCRA, Subtitle D, 40 CFR, Part 258, the collection systems shall be designed to limit the hydraulic head on the liner to less than 12 inches. Collection pipes shall be sized and spaced to reduce the hydraulic head in the leachate collection system as specified in WDRs. Leachate shall be recovered and treated onsite. The treated leachate shall be sampled prior to discharge from the holding tank in accordance with the WDRs to determine suitability for reuse onsite per LAWRQCB requirements. Summary results of this sampling shall be disseminated in the newsletter with more detailed reporting on the website and in the Annual Report.

**Current Status/Comments** – The old City north top deck has a tank farm of 16 Alder storage tanks for processing recovered leachate and condensate, with a double-walled pipeline to the sewer connection at the entrance near San Fernando Road. This system operated with no odor detected at the sewer connection. Tank farm liquids were being treated with hydrogen peroxide.
M-4.4.1(60) (City)
Venturan Coastal Sage Scrub
A detailed conceptual mitigation plan shall be prepared by the project proponent and contain specific information on planting, maintenance, and monitoring. A revegetation plan that includes Coastal sage scrub restoration can feasibly occur onsite. The implementation of this plan will provide onsite mitigation greater than 1:1 to offset the loss of coastal sage scrub.

Biota - 4.27 (County)
Venturan Coastal Sage Scrub: A detailed conceptual mitigation plan shall be prepared by the permittee and shall contain specific information on planting, maintenance, and monitoring. A revegetation plan that includes coastal sage scrub restoration can feasibly occur onsite. The implementation of this plan will provide onsite mitigation greater than 1:1 to offset the loss of coastal sage scrub.

Current Status/Comments – In early July, approximately 60% of the County sage mitigation slope had native vegetation. Last year's rain helped to promote new growth. Native plants are going through summer die-back. The unvegetated area had deep erosion rills.

In mid-August, Deck C sage mitigation area was being maintained and the mustard weed was removed. The area is in maintenance status. Deck B sage mitigation was growing with minimal weeds and non-natives.

In late August, Deck C sage mitigation was doing well with new mustard weed being removed. Deck B sage mitigation was doing well. Non-native plants were being controlled.

In late September, the native vegetation on the County sage mitigation slopes was doing well. Deck C sage mitigation area was doing well. Mustard weed was removed. Some natives showed dieback from hot summer conditions. Deck B sage mitigation area was doing well. Some natives showed dieback from hot summer conditions. There was no mustard weed.

M-4.4.3/72 (City)
Native tree species shall be replaced at a 2:1 (replacement: removal) ratio, consisting of 15-gallon or 5:1 3-gallon container trees. Mitigation trees shall be planted prior to impacted trees being removed, thus allowing trees to grow to specimen size in the field. A specimen-size tree shall be defined as a 15-gallon tree with a minimum trunk caliper of 1-inch measure 1 foot above ground. All mitigation trees shall be specimen size within 1 year after tree removal.

Biota - 4.10 (County)
The permittee shall comply with all terms and Conditions of Oak Tree Permit No. 86-312-(5). The permittee is authorized to remove oak trees within the project areas as necessary to conduct landfill operations authorized by this grant and subject to the requirements of Part VII of the Implementation and Monitoring Program attached to Oak Tree Permit 86-312-(5). Prior to approving any excavation of more than five acres containing significant stands of oak and/or Douglas fir trees, the Director of Public Works shall confer with the Los Angeles County Forester and Fire Warden.

Current Status/Comments – An updated mitigation tree report was completed, showing the number and type of mitigation trees required to be planted. A schedule for planting had not been prepared.
Independent Monitor Quarterly Report

M-4.4.2/69 (City)

Potential candidate mitigation sites have been identified by the project proponent in conjunction with resource agencies for consideration to compensate for impacts on riparian and wetland resources as a result of project development. These sites include Bull Creek, Bee Canyon and East Canyon, which are located proximate to the project site. Prior to the development of any detailed mitigation plans and drawings, the final selection will be determined cooperatively by the CDFW, Corps, SWRCB, and other regulatory agencies in conjunction with the City and project proponent.

Current Status/Comments – During the 3rd Quarter, the City was proceeding with an ordinance to allow the wetlands and riparian mitigation to be created in the Chatsworth Reservoir. All environmental analysis has been completed. Republic stated that a change in City staffing has delayed the process of finalizing and adopting the ordinance. Time extension letters from the US Corps of Engineers and the California Department of Fish and Wildlife are in place. New extension letters will be needed in 2020.

M-4.9.3(110) (City)

Landfill employees shall watch for any illegal dumping activities on or around the project site. The landfill litter control crew shall provide cleanup service for areas within one mile of the project site. The phone number where this service will be requested will be provided in the quarterly newsletter and on the website.

Current Status/Comments – In early July, the monitor drove San Fernando Road to Sierra Highway. This area is maintained by Republic and was clear of illegally dumped debris and litter.

In late August, the monitor drove Sierra Highway, and illegally dumped trash and debris was observed near the I-14 overpass.

M-4.9.4(125) (City)

The landfill operator shall maintain perimeter fencing in and around the site in accordance with CCR, Title 14, § 17658 to discourage illegal entry to the landfill. Where existing topography conditions create an effective barrier, no perimeter fencing shall be installed. Entrance and access gates shall remain locked when the landfill facility is not in operation. All existing perimeter fencing shall be inspected on a routine basis by the landfill operator, and necessary repairs shall be made to ensure a continued deterrent for unauthorized entry to the project site. Additionally, the landfill operator shall maintain posted “no trespassing” signage at the exterior perimeter fencing nearest the project site entrance.

Current Status/Comments – Throughout the 3rd Quarter of 2019, the south oil field gate and north perimeter gate were observed to be closed and locked.

M-4.19.2(191) (City)

Prior to the commencement of initial earth excavation, specific sections of the City/County Landfill Project area shall be resurveyed as a precautionary measure to minimize potential loss of undiscovered paleontological resources. Specific sections of the project area to be resurveyed shall be as determined by the intended cut-and-fill areas proposed for landfill development. As new areas for excavation are identified by the project proponent, an evaluation of those areas shall be made based on the prior survey results and consultation with appropriate technical specialists.
Ecological Significance 62 (County)
The Permittee shall develop and implement a program to identify and conserve all significant archaeological and paleontological materials found onsite pursuant to Part VII of the IMP. If the Permittee finds any evidence of aboriginal habitation or fossils during earthmoving activities, Landfill operations shall immediately cease in that immediate area, and the evidence and area shall be preserved until a qualified archaeologist or paleontologist, as appropriate, makes a determination as to the significance of the evidence. If the determination indicates that the archaeological or paleontological resources are significant, the resources shall be recovered to the extent practicable prior to resuming Landfill operations in that immediate area of the Landfill.

Current Status/Comments – Throughout the 3rd Quarter of 2019, the paleontologist was monitoring grading activities in and adjacent to Cell CC-4 Part 3 buttress construction when grading occurred in native, undisturbed areas.
Summary of Requested Documents

Part I – Reports and Plans

Previously requested documents, reports and plans to be made available on site were reviewed in printed and electronic formats. The monitors verified the following to be available to the monitors and agencies’ staff.

a) Current Fill Sequence Plan.

Current Fill Sequence Plans are available electronically and are updated at least weekly.

b) A plan showing areas that are inactive for 180 days or longer, with records tracking fill areas and interim reclamation and revegetation, including the timing of proposed work, as well as a plan showing current and projected areas to be within ten feet of the limits of fill.

These plans are electronically available onsite.

c) Maps showing areas that are at final elevation, and bench ditches that will connect to drainage ditches to protect against natural surface runoff.

Active City and County areas showing areas at final elevations were not observed. To date, no active areas have reached their final elevation. Trash elevations of inactive fill areas that have current or had prior stockpiled soil are not known.

d) The current erosion control plans.

Current erosion control plans were available electronically.

e) Site drainage plans, including surface and underdrain systems, with complementing revegetation plans.

Site drainage plans were available electronically.

f) A plan/report of the liner interceptor ditches design/installation to ensure that surface runoff is appropriately conveyed to the existing flood control channel directly east of the project site entrance.

The plan was available electronically.

g) Comprehensive geotechnical reports.

The reports were available electronically.

h) A preventative maintenance plan and summary of monitoring reports of inspections of facility equipment, systems and stormwater management devices to detect conditions that may cause breakdowns or failures resulting in discharge of materials into stormwater.

Printed copies were available.
Part II – Logs and Records

Previously requested logs, records, safety and procedural documents to be made available on site were reviewed in printed and electronic formats. The monitors verified the following to be available to the monitors and agencies' staff.

a) Refuse Inspection Program (random load checks for prohibited waste)
b) Hazardous Waste Load-Checking (flammable, corrosive and toxic waste)
c) Spill Response Program (spill prevention, control and clean up procedures)
d) Safety Inspections, Training and Checklists (for employees, contractors and vendors)
e) Accident/Injury reports, Inspections (records of accidents and injuries)
f) Personal Protective Equipment (including hard hats, safety vests and safety glasses)
g) Hazardous Waste Disposal (procedures for disposal of toxic, ignitable or reactive ingredients)
h) Hazardous Waste Procedures (procedures for handling toxic, ignitable or reactive ingredients)
i) Injury and Illness Prevention Program (procedures to ensure OSHA compliance with health and safety in the workplace)
j) Prohibited Waste Procedures (procedures for handling prohibited waste such as car batteries, used motor oil, tires and untreated medical waste)
k) Lockout, Tagout and Blackout Procedures (specific practices and procedures to safeguard employees from the unexpected energization or startup of machinery and equipment)
l) Accident Prevention Signs and Tags (included in the OSHA safety training for employees)
m) Fire Response Procedures (included in the OSHA safety training for employees)
n) Fire Hoses on Water Trucks (included in the OSHA safety training for employees)
o) Heat Stress Prevention (included in the OSHA safety training for employees)
p) Fire Extinguisher Training (included in the OSHA safety training for employees)
q) Emergency Response and Evacuation Plan (included in the OSHA safety training for employees)
r) Hearing Conservation (program designed to protect workers from hearing impairment)
s) Stormwater Pollution Prevention (a site-specific document that identifies all of the activities and conditions onsite that could cause water pollution, and the steps the facility will take to prevent such a discharge)
t) Confined Space Requirements (set requirements so employees have enough space to work, and systems to ensure limited or restricted means of entry or exit to confined spaces)
u) Adverse Weather (procedures for maintaining work safety during severe weather conditions)

v) Drug and Alcohol-Free Workplace Procedures (procedures committed to the elimination of drug and alcohol use and abuse in the workplace)

w) Bloodborne Pathogens (procedures to protect employees from infectious microorganisms in human blood that can cause disease in humans. These pathogens include hepatitis B (HBV), hepatitis C (HCV) and human immunodeficiency virus (HIV); needlesticks and other sharps-related injuries may expose workers to bloodborne pathogens)

x) Rollovers (procedures to help prevent truck and equipment rollovers; addresses poor driving conditions, speeding, driver fatigue and distracted driving; part of Republic's Focus 6 Program)

y) Asbestos Safety and Respiratory Protection (procedures to help prevent respiratory injury to employees; includes the use of respirators and specialized clothing)

z) Slips, Trips and Falls (procedures to help prevent slips, trips and falls; includes keeping walkways clear, use of handrails, use of proper footwear and managing power cords)

aa) Conduct Hazardous Assessment (identify hazards and risk factors that have the potential to cause harm)

bb) Industrial Truck Training (safety training for machines such as fork lifts and lift trucks; part of Republic's Focus 6 Program)

cc) Radiation Awareness (procedures and training to increase employee understanding of radiation and radioactivity, and how to manage encounters with radioactive materials)

dd) Hazardous Communication (physical and health hazards; a set of processes and procedures that employers must implement in the workplace to effectively communicate hazards associated with chemicals during handling, shipping, and any form of exposure)
Conclusions

In this reporting period, UltraSystems has monitored the conditions and/or mitigation measures for the City and County, as shown on the Mitigation Monitoring Summary spreadsheets.

As shown by the Non-Compliant and Further Review Needed sections above, the landfill is actively working toward being fully compliant with conditions and/or mitigation measures, with no non-compliant conditions observed, as Republic was in the engineering, planning, or implementation phases of each. Furthermore, monitoring of the tasks on these Mitigation Monitoring Summary spreadsheets tracks progress toward being fully compliant. Notwithstanding the above, air quality compliance status is not being actively monitored by UltraSystems.

The 2019 Third Quarter Mitigation Monitoring Summary spreadsheets track the progress and completion of tasks as they were accomplished during this quarterly period.

#### Column Mapping

- **Line #**: Reference number
- **Reference #**: Line number
- **Mitigation #**: Mitigation number
- **County Mitigation Measures and Conditions Monitored by Discipline**: Description of the mitigation measure
- **Monitoring Frequency**: Frequency of monitoring
- **Second Quarter 2019**
  - **Status**: Status of the mitigation measure
  - **Further Review Needed/Comments**: Further review needed or comments
  - **Resolved**: Resolution of the mitigation measure
- **Third Quarter 2019**
  - **Status**: Status of the mitigation measure
  - **Further Review Needed/Comments**: Further review needed or comments
  - **Resolved**: Resolution of the mitigation measure

**Legend**

- **C** = Compliant
- **NC** = Non-Compliant
- **FRN** = Further Review Needed
- **R** = Resolved

---

**Notes**

- * = Compliant, NC = Non-Compliant, FRN = Further Review Needed, R = Resolved
- ** = Condition or mitigation was monitored
- / = Yearly or non-ongoing monitoring frequency

---

### Mitigation List

1. **Surface Water - 2.05**: Underslab Placement - ongoing
2. **Surface Water - 2.07**: Drainage Control System Design Approval - ongoing
3. **Surface Water - 2.08**: Surface Water Runoff Drainage System - ongoing
4. **Surface Water - 2.10**: Surface Water Collection System Monitoring - ongoing
5. **Surface Water - 2.11**: Surface Water Quality Collection/Monitoring Facilities - ongoing
6. **Surface Water - 2.12**: Permanent/Temporary Drainage Facilities - ongoing
7. **Surface Water - 2.13**: Temporary/Permanent Drainage Facilities - ongoing
8. **Surface Water - 2.14**: Erosion Control Plan - ongoing
9. **Groundwater - 3.03**: Interception of Groundwater Seepage - ongoing
10. **Groundwater - 3.06**: Monitoring Wells - ongoing
11. **Biologist**
12. **Geology - 1.13**: Drainage Plan Approval - ongoing
13. **Geology - 1.14**: Personnel Retention for Monitoring Soil Erosion - ongoing
15. **BIOTA - 4.10**: Oak Tree Permit - ongoing
16. **BIOTA - 4.11**: Oak Tree Mitigation Plan - ongoing
17. **BIOTA - 4.13**: Oak Tree Mitigation Counting - ongoing
18. **BIOTA - 4.20**: Poultry Wire Screen - ongoing
19. **BIOTA - 4.24**: Rip Irrigation - ongoing
20. **BIOTA - 4.27**: Coastal Sage Scrub Mitigation Plan - ongoing
21. **BIOTA - 4.28**: Coastal Sage Scrub Seeding - ongoing

</table>
| Project Manager         | Surface Water - 2.15                      | County DPW EPD/ LARWQCB, SCL - LEA     | I-i through I-l: A preventative maintenance program with inspection of facility equipment, systems, and storm water management devices to detect conditions that may cause breakdowns or failures resulting in discharge of materials into stormwater should be performed on a monthly basis, with a summary report issued on a quarterly basis. These reports have been reviewed and are available at the landfill’s main office.  
  
  The high-flow spillway for Basin D into the westside drainage has cracks and spalling that should be repaired. The outlet riser that discharges into the eastside channel does not have top guards to restrict unauthorized access. The Basin B high-flow outlet spillway was cracked in multiple places. The terminal basin has vegetation growing in the interior concrete sidewalls.  
  
  I-i: The Basin D outlet channel was repaired and is ready for winter rains. The concrete outlet structure had the vegetation removed, and cracks and soil erosion repaired. No personnel access limiting guard was on the northern riser.  
  
  I-j: The old City south soil stockpile south of the office did not have the slope slump increase. The old City south landfill had slopes repaired, and graded and drainage systems repaired and improved. The westside concrete channel with a corrugated pipe downcomer was completed on the old City south landfill. The concrete channel above the CC-4 Part 3 buttress was not complete. The CC-4 Part 3 liner was installed in a southern run-off basin area and on the north and west slopes.  
  
  I-k: The temporary lined basin in Cell CC-4 Part 3 was completed. The old City south landfill appeared to be ready for winter conditions. The rainwater control gabions were not yet installed on the new paved access road. The drainage channel construction on and adjacent to the CC-4 Part 3 buttress was ongoing.  
  
  I-l: The CC-4 Part 1/2 slopes looked manicured with the HDPE drainage systems repaired. No straw wattles had been installed. The Closure Turf looked well-maintained. The depression in the old City south landfill stockpile has not changed. A new section of the permanent westside drainage channel was being installed below the CC-4 Part 3 buttress. The outlet from Basin A was not yet constructed.  
  
| M - 4.4.2 / 69          | City Planning                             | I-i through I-l: The City is proceeding with an ordinance to allow the wetlands and riparian mitigation to be created in the Chatsworth Reservoir. All environmental analysis has been completed. Republic stated that a change in City staffing has delayed the process of finalizing and adopting the ordinance. Time extension letters from the US Corps of Engineers and the California Department of Fish and Wildlife are in place. New extension letters will be needed in 2020.                                                                                                                                                                                                                                                                                                                                 |

</table>
|            | M - 4.3.1 / 43 | LARWQCB | I-i: Basin A was dry. There was no removal of sediment. Basin D was dry and free of sediment. The Basin D outlet channel was repaired and ready for winter rain events. Basin B was dry. The areas with sloughed hillside soil piles were not removed. The basin floor had minimal sediment. The terminal basin had standing water at the outlet risers. Sediment was moved into piles in other areas to allow it to dewater and to dry. The skimmer system had not yet been repaired.  
I-j: Basin B had a minimal amount of dry sediment stockpiled and ready for removal. The eastside drainage channel from the Adler tank farm south was not yet cleared of sediment. Sediment was being removed from the terminal basin. The basin was approximately 25% cleared. The sediment was wet and spongy from the gabion wall to the outlet risers.  
I-k: Basin A had sediment moved to the center of the basin for removal. Basin B had dry sediment moved to a pile ready for removal. The eastside drainage channel was cleaned to the Adler tank farm. Sediment, rock, and debris was not removed from the tank farm to the terminal basin. The terminal basin had the inlet water flow blocked by a dirt berm. Dry sediment was being removed. A significant amount of sediment from the gabion wall to the outlet risers had not been moved into piles to dry. The skimmer system has not yet been repaired.  
I-l: Sediment was removed from the center area of Basin A. Sediment around the interior wall was being piled for removal. Rock around the outlet risers was not yet cleaned. Basin B had a small pile of sediment ready for removal. The eastside channel had sediment, debris, and gabion rock not yet removed from the Adler tank farm to the terminal basin. Sediment in the terminal basin had been removed to the gabion wall, and wet sediment east of the wall in the outlet side is being trucked away. The outlet channel had minimal sediment on the channel floor. The outlet skimmers were still buried in sediment and had not yet been repaired. | |
<p>| Surface Water - 2.10 | LARWQCB | I-i through I-l: See M - 4.3.1/ 37, 38 and 43 above. |
| Surface Water - 2.14 | LARWQCB | I-i through I-l: See M - 4.3.1 / 37, 38 and 43 above. The current erosion control plans should be available for agency and monitor review. |

July Site Visits

July 9, 2019:

James Aidukas (UltraSystems)
Mike Lindsay (UltraSystems)
Tarik Hadj-Hamou (SLR)
Republic General Manager - Chris Coyle

Drove the Granada Hills neighborhood and school areas from 6:00 to 6:45 a.m. and there were no landfill odors detected. The intersection of Balboa at Woodley had stains from liquids, presumably coming from trucks. No odors were detected on this cool morning. Prior dumped debris on San Fernando Road at the I-5 overpass was removed. A small, new pile was observed. Met with Mike Lindsay (UltraSystems), Tarik Hadj-Hamou (SLR), Alex Garcia and Tim Stapleton (LACDRP). We signed in at the office, briefly met with Josh Mills, and proceeded to monitor the site and observed the following:

- The bottom liner system for Cell CC-4 Part 3 was being installed. It appears to be approximately 50% complete. Seeps were observed coming from the buttress slope.
- The landfill was inspected for damage from the Ridgecrest earthquake. No cracks, fissure, or signs of movement were observed at the ridgeline, on slopes, or roadways.
- Basin A was dry. There was no removal of sediment.
- Approximately 60% of the County sage mitigation slope had native vegetation. Last year’s rain helped promote new growth. Native plants are going through summer die-back. The unvegetated area had deep erosion rills.
- Basin D was dry and free of sediment. No access limiting guards were on the northern risers. The concrete outlet structures need maintenance—vegetation removal, cracks repaired, soil erosion repaired.
- The gas collection header to Flares 9, 10, 11 was being modified to have a new header for future flares.
- The Basin D outlet channel was repaired and ready for winter rain events.
- The county top deck had stockpiles of wet weather rock, broken concrete and asphalt. The majority of the soil stockpiled from the buttress grading was removed.
- The dirt access roads on the east side of the County bowl had areas with disposal truck created dust early this morning. Water trucks were not covering this area at that time.
- Basin B was dry. The areas with slough hillside soil piles were not removed. The basin floor had minimal sediment.
- The active fill areas were CC-4 Part 1 and 2 and the County Bowl area north of CC-3A. There were no operational concerns noted.
- The eastside drainage channel had sediment and debris at the channel humps and gabions.
- The leachate and condensate Alder tank facility was operating and odors were detected.
- The terminal basin had standing water at the outlet risers. Sediment was moved into piles in other areas to allow it to dewater and to dry.
• Sierra Highway and San Fernando Road were clear of illegally dumped debris and litter.

Flare Operating Conditions:
  o Flare 1 - not monitored
  o Flare 3 - shut down
  o Flare 9 - 1657°F, 2514 SCFM, ~65.0" vacuum, 38.53" out
  o Flare 10 - 1653°F, 2537 SCFM
  o Flare 11 - 1659°F, 2562 SCFM

The gas-to-energy plant was using 9,058 SCFM of recovered landfill gas, 44% CH₄, 0.8% O₂, 88 ppm H₂S. Total gas volume recovered was 16,658 SCFM (not including Flare 1.)
SITE LOG

1. Met with Jim Aidukas and Tarik Hadj-Hamou (UltraSystems), and checked into office and with Joshua Mills (Republic).
2. Met with Alex Garcia and Tim Stapleton (LAC DRP).
3. Cell CC-4 Part 3 construction is progressing, with new liner trench complete.
4. Flare 3 is offline.
5. Area above buttress is in good order.
6. Sediment basin A has completely drained of ponding water, with some vegetation growing in sediment.
7. Water trucks are applying water throughout site for dust control.
8. County sage mitigation area is showing some stress due to hotter weather.
9. Westside drainage channel is in good order.
10. Sediment basin D is in good order.
11. No safety caps are present on top of the two vertical riser drains at north side of sediment basin D.
12. A new trench has been dug at the south base of the Flare 9 pad, exposing a 36-inch header and valve.
13. Flare 9 is operating at 2525 scfm, 1646 °F. Gas sample measured at 44 % Vol. CH4, 0.8 % Vol. O2, 88 ppm H2S and 183 ppm CO. Gas inlet temperature is 134 °F.
14. Flare 10 is operating at 2619 scfm, 1644 °F. Gas inlet temperature is 139 °F.
15. Flare 11 is operating at 2544 scfm, 1650 °F.
16. Street sweepers are cleaning the haul roads.
17. Sediment basin B is in good order.
18. The working area at Cell CC-4 Part 1/2 is in good order, including four tippers, traffic controllers, water misters and water trucks. Packer trucks and transfer trucks are dumping in two separate areas.
19. The eastside drainage channel is in good order.
20. A vacuum truck is performing a clean-out on the forced main line along the eastside drainage channel.
21. No odors are present at the Alder tank farm.
22. The terminal basin has sediment being placed into piles to dry out. The standing water level is just below the top of the riser drains. The skimmer system is not operating.
23. The low-point liquid collection system is in good order with no odors detected.
24. Weed removal is occurring along the drainage channel and haul road.
25. No odors are present at adjacent neighborhood and school.
26. Sierra Highway is clear of debris.
27. Traffic spotters are onsite to control traffic.
28. Met with Joshua Mills (Republic), and discussed our site monitoring observations.
1. Install safety caps on vertical riser drains at sediment basin D.

Signed: Michael W. Lindsay
SUNSHINE CANYON LANDFILL
SITE REPORT

Monitor: Tarik Hadj-Hamou, Ph.D., P.E.  
Discipline: Civil – Geotechnical and Hydrology  
Date: July 9, 2019

Site Conditions: Partly cloudy to Sunny and warm

SITE LOG

7:00 – 8:20
- Meet with UltraSystems team members Jim Aidukas and Mike Lindsay, prepare tour of landfill, review of previous visits, discuss potential issues, organize areas and features to inspect.
- Sign-up at landfill
- Meet with LA County personnel who came to inspection: Tim Stapleton and Alex Garcia
- Discuss possible impact of recent earthquakes at landfill and identify areas to inspect such as the ridge on the south side of landfill above the Cell CC4 buttress, the depression/settlement observed on slope along the access road to the administration pad.

8:20– 2:00 Site inspection
- Tour neighborhood to check for odor and illegal waste dumping
- Tour of landfill
- Access Roads
- Waste placement
- Drainage systems (Basins, channels)
- Construction at Cell CC4
- Erosion protection system
- Landfill for geotechnical and hydrological issues
- Other observations
- Meet with Republic staff

Access Roads.
- Main access road: No additional sloughing observed on the embankment on the Terminal Basin side, just at the edge of the previously repaired area at the limit of the jute netting. No stability concerns
- Access road to administration pad – no additional depression/settlement observed on slope.

Waste Placement
- Two waste faces were active in Cells CC3 and CC4.
- 4 Tilts were set-up (Photo 1) at Cell CC4
- ADC is in used at Cell CC4 (Photo 1)

Drainage System
- Terminal Basin (Photo 2)
  - Sediments have accumulated upstream of the separator gabion wall reaching over the gabion wall on the south side of the basin
  - The three skimmers were raised – it is our understanding that they are still out of commission and cannot be repaired until the sediments are removed and the basin cleaned
  - Water is pumped of the basin and used for dust control
- Cell CC3 Earthen basin
  - The basin is clean and available for storage
- East portion of the perimeter channel between Basin B and Terminal basin
  - Sediments and some detritus have accumulated at the location of the asphalt berm/gabion
    installed to slow down the velocity in of water in the channel (Photo 3)
  - Vegetation has also established itself. (Photo 4)
- Basin B
  - Basin empty of water but contains a small amount of sediment but not enough to affect the
    anticipated performance of the basin to store stormwater.
  - Vegetation if growing through cracks in the spillway (Photo 5)
- Basin D
  - Basin is clean and available for water storage
  - Southern Half
    ✓ There is a gap between the shotcrete and the soil at the spillway which may cause
      problem is additional undermining occurs (Photo 6).
    ✓ Vegetation is growing through crack in downstream side of spillway (Photo 7)
  - Northern Half
    ✓ Safety bars are missing on top of the decant towers (Photo 8)
- Ditch along access road to Flare 9-11
  - The drain at the end of the concrete on side of road is plugged by sediments.
- Basin A
  - Basin held no water but still contains a fair amount of sediments (Photo 9)
  - As noted previously, the basin will be reconnected to the drainage system when the new
    channel will be built around cell CC4 Part 4
  - The slopes towards Flare 3 near Basin A have been reworked and track rolled eliminating the
    deep gullies observed in previous visits.
  - New concrete ditches have been constructed along the road that will control drainage and
    reduce the potential for erosion of roadway (Photo 10)
  - A corrugate metal pipe down chute has been installed along the contact between the ridge
    separating the Basin from the graded slope to Flare 3 (Photo 11) an area where a deep
    erosion gully would forma after every significant rainstorm
- Perimeter Channel between Basin A and Basin D
  - Channel in very good shape and clean, no vegetation and no cracks
- Channel near the scale station
  - Accumulated sediments were being removed (Photo 12)

Cell 4 Phase 3 Construction
- The lower clay layer of the double composite liner system (Photo 13) was in place undergoing
  final grading and compaction (Photo 14)
  - The anchor trench for the geosynthetic component has been excavated along a bench on
    west side of the future cell. (Photo 15). The outside edge is properly rounded to minimizes
    risk of damage to the geosynthetics

Erosion Protection Systems
- No changes since the last visit in May 2019, some erosion gullies have developed despite the
  protection blankets and wattles installed on numerous slopes.

Landfill for geotechnical and hydrological issues
- No cracks, fissures or any sign of impact from the Ridgecrest Earthquake were observed on the
  ridge on the south side of landfill above the Cell CC4 buttress (Photo 16)
- The landfill is within the modified Mercalli Intensity II-III zone per the USGS map (Photo 17) and
  therefore though the event was felt at the site the ground motion generated had to be
extremely low and well below those corresponding to the threshold event of Magnitude 5

- No fissures or cracks were observed in any of the slope or roadways

Other Observations
- Wall along San Fernando Road
  - No changes since last visit. drainage swale partially full of sediments
- No odor detected outside of landfill
- No illegal dumping along Sierra Highway noted except for a burned camper

Close-out meeting with Republic Staff representative to discuss findings of visit

FURTHER REVIEW NEEDED
- None

COMMENTS
- None

August Site Visits

August 13, 2019:

James Aidukas (UltraSystems)

Mike Lindsay (UltraSystems)
Drove the Granada Hills neighborhood and school areas from 6:15 to 7:00 a.m. and there were no landfill odors detected. Met with Mike Lindsay (UltraSystems), Gabriel Esparza and Vu Truong (LACDPW). We signed in at the office, had a brief conversation with Valerie Moore (Republic), and proceeded to monitor the site and observed the following:

- The working area was CC-4 Part 1 and 2 north and adjacent to the top deck of Deck CC-3A.
- The tarp was removed at 9:00 a.m. from waste disposed at 6:00-7:00 a.m. Trash was not moved by the tarp and no odor was detected. Localized dust was created in moving the tarps.
- The old city south soil stockpile south of the office did not have the slump increase.
- The old city south landfill had slopes repaired and graded and drainage systems repaired and improved.
- The westside concrete channel with a corrugated pipe downcomer was completed on the old city south landfill. The concrete channel above the CC-4 Part 3 buttress was not complete.
- No localized odors were detected on the CC-3A top deck.
- The CC-3B top deck had no stockpiled material and was graded. No odors were detected.
- CC-4 Part 3 liner was installed in a southern run-off basin area and on the north and west slopes. The floor was ready for the final liner installation.
- Sediment was being removed from the terminal basin. The basin was approximately 25% cleared. The sediment was wet and spongy from the gabion wall to the outlet risers.
- An open flame flare was installed in the oil field by the field operator.
- The southern perimeter oil field gate was locked.
- Deck C sage mitigation area was being maintained and the mustard weed was removed.
- Deck B sage mitigation was growing with minimal weeds and non-natives.
- Basin A had dry sediment stockpiled and ready for removal.
- Basin C had a minimal amount of dry sediment stockpiled and ready for removal.
- The eastside drainage channel from the Adler tank farm south was not yet cleared of sediment.
Flare Operating Conditions:
  o Flare 1 - 1684°F, 2425 SCFM, -57.48 vacuum, 38.44" out, 31% CH₄
  o Flare 3 - 1669°F, 2374 SCFM, -77.8 vacuum, 46% CH₄
  o Flare 9 - 1647°F, 2863 SCFM, -63.16" vacuum, 38.62" out
  o Flare 10 - 1652°F, 2861 SCFM
  o Flare 11 - Down for maintenance

The gas-to-energy plant was using 8,904 SCFM of recovered landfill gas, 45% CH₄, 0.4% O₂, 99 ppm H₂S. Total gas volume recovered was 19,427 SCFM.
### SITE LOG

1. Met with Jim Aidukas (UltraSystems), and checked into office and with Valarie Moore (Republic).
2. Met with Gabriel Esparza and Vu Truong (LAC DPW).
3. The working area at Cell CC-4 Part 1/2 is in good order, including four tippers, traffic controllers, water misters and water trucks. A tarp is covering the trash that was dumped earlier in the morning, with the tarp being removed at 9:03 AM.
4. ADC is 60% covered with new trash at 9:25 AM.
5. Cell CC-3A is in good order, with no localized odors present.
6. Cell CC-4 Part 3 construction is progressing, with new liner being tied into the upper west bench.
7. Large dump trucks are hauling soil out of terminal basin.
8. Water trucks are applying water throughout site for dust control.
9. The terminal basin has sediment placed into piles to dry out.
10. Oil field perimeter gate is closed.
11. City deck C sage mitigation area is in good growing condition, with mustard weed removed.
12. PM-10 berm oak trees are doing well, with a few smaller trees that have died out.
13. Flare 1 is operating at 2429 scfm, 1683 °F. Gas sample measured at 31 % Vol. CH4, 0.5 % Vol. O2, 100 ppm H2S and 58 ppm CO. Gas inlet temperature is 133 °F.
14. Observed new westside drainage channel construction southeast of sediment basin A.
15. Sediment basin A has soil piled into center of basin for removal.
16. Flare 3 gas sample measured at 46 % Vol. CH4, 0.4 % Vol. O2, 70 ppm H2S and 163 ppm CO. Gas inlet temperature is 147 °F.
17. Drainage channels east of Flare 3 are in good order.
18. Traffic spotters are onsite to control traffic.
19. Flare 9 is operating at 3071 scfm, 1680 °F. Gas sample measured at 45 % Vol. CH4, 0.4 % Vol. O2, 99 ppm H2S and 265 ppm CO. Gas inlet temperature is 145 °F.
20. Flare 10 is operating at 3081 scfm, 1678 °F.
21. Flare 11 is offline.
22. Street sweepers are cleaning the haul roads.
23. A new blowout pad has been installed near Flare 11.
24. Sediment basin B is in good order, with some soil clean-out required in corners of basin.
25. The eastside drainage channel has been cleaned at its west end, and still needs cleaning at its east end, including vegetation at the old City north deck.
26. Met with Joshua Mills (Republic), and discussed our site monitoring observations.

### FURTHER REVIEW NEEDED

1. None.

August 27, 2019:

James Aidukas (UltraSystems)

Mike Lindsay (UltraSystems)

Tarik Hadj-Hamou (SLR)
Drove the Granada Hills neighborhood and school areas from 6:30 to 7:00 a.m. and there were no landfill odors detected. Met with Mike Lindsay (UltraSystems), Tarik Hadji-Hamou (SLR), and Tim Stapleton (LACDRP.) We signed in at the office and proceeded to monitor the site and observed the following:

- After the initial one hour of morning operations (6:00-7:00 a.m.), no odors were detected at 7:30 a.m.
- The liner floor of CC-4 Part 3 was being worked on. The slope liner installation was progressing well. A temporary lined basin was installed in the eastern floor area.
- At 8:30, a Republic Services trash truck was observed leaking a substantial amount of liquid as it queued in the scale area.
- Drove the adjacent neighborhood and school area at 9:30 and no landfill odors were detected.
- Drove Sierra Highway and illegally dumped trash and debris was observed near the I-14 overpass.
- The terminal basin had the inlet water flow blocked by a dirt berm. Dry sediment was being removed. A significant amount of sediment from the gabion wall to the outlet risers had not yet been moved into piles to dry.
- The leachate recovery system below the CC-3B slope was operating and no odors were detected. The alluvial seep was stopped.
- Localized odors were detected at the north tank of the Adler Tank farm leachate and condensate treatment system.
- The eastside drainage channel was cleaned to the Adler Tank farm. Sediment, rock, and debris was not removed from the tank farm to the terminal basin.
- The Old City South landfill appeared to be ready for winter conditions. The rainwater control gabions were not yet installed on the new pave road.
- The Closure Turf was being maintain and was in good condition.
- Waste was being placed in CC-4 Part 1/2. The active area was operating approximately 40' below the CC-3A top deck.
- Localized odors were coming from a liquids transmission line repair. The repair was completed by approximately 1:00 p.m.
- Localized odors were detected at Well 3013D on the CC-3A top deck.
- Drainage channel construction on and adjacent to the CC-4 Part 3 buttress was ongoing.
- Basin A had sediment moved to the center of the basin for removal.
• The County top deck had wet weather rock and asphalt stockpiles.
• Basin B had dry sediment moved to a pile ready for removal.
• Sage mitigation Deck C was doing well with mustard weed removed.
• Sage mitigation Deck B was doing well. Non-native plants were being controlled.

Flare Operating Conditions:
  o Flare 1 - 1682°F, 2526 SCFM, -57.71 vacuum, 38.59" out, 31% CH₄
  o Flare 3 - 1640°F, 2294 SCFM, -77.5 vacuum, 46% CH₄
  o Flare 9 - shut down
  o Flare 10 - 1638°F, 2735 SCFM, -62.85 vacuum, 38.27" out
  o Flare 11 - 1658°F, 2772 SCFM

The gas-to-energy plant was using 9,210 SCFM of recovered landfill gas, 46% CH₄, 0.5% O₂, 94 ppm H₂S. Total gas volume recovered was 19,537 SCFM.

SUNSHINE CANYON LANDFILL

SITE REPORT

Monitor: Tarik Hadj-Hamou, Ph.D., P.E. | Date: August 27, 2019

Discipline: Civil – Geotechnical and Hydrology

Site Conditions: Sunny and warm

SITE LOG

7:00 – 8:00
• Meet with UltraSystems team members Jim Adukas and Mike Lindsay, prepare tour of landfill, review of previous visits, discuss potential issues, organize areas and features to inspect.
  • Sign-up at landfill
  • Meet with Tim Stapleton of LA County Planning Department

8:20 – 2:00 Site inspection
• Tour neighborhood to check for odor and illegal waste dumping
• Tour of landfill
• Access Roads
• Waste placement
• Drainage systems (Basins, channels)
• Construction at Cell CC4
• Erosion protection system
• Landfill for geotechnical and hydrological issues
• Other observations
• Review documentation
• Meet with Republic staff

Access Roads.
• Main access road: No additional sloughing observed on the embankment on the Terminal Basin side, just at the edge of the previously repaired area at the limit of the jute netting. No stability concerns
• Access road to administration pad – no additional depression/settlement observed on slope.

Waste Placement
• One waste face was active in Cells CC3/CC4.
• 4 Tilters were set-up (Photo 1)
• The landfill now operated also form 6:00 to 7:00 AM. Tarp is used to cover the morning waste until the arrival of the regularly scheduled waste after 9:00 AM (Photo 2)

Drainage System
• Terminal Basin (Photo 3)
  • Sediments have accumulated upstream of the separator gabion wall reaching over the gabion wall on the south side of the basin
  • Removal is taking place (Photo 4)
  • Vegetation has sprouted on top of the sediments (Photo 5)
  • The three skimmers are still buried in sediments and will be repaired until the sediment are removed and the basin cleaned
• Cell CC3 Earthen basin
  • The basin is clean and available for storage
  • We noted that the deep erosion swale mentioned in previous visit has been graded (Photo 6)
• East portion of the perimeter channel between Basin B and Terminal basin
  – Sediments and some detritus that had accumulated at the location of the asphalt berm have been removed (Photo 7)
  – Few areas still need cleaning, but the work is on-going and according to Republic staff all the channels will be cleaned by the beginning of the official rainy season
• Basin B
  – Basin empty of water and the sediments noted during the last visit have been collected in a pile in the middle of the basin which is slated for removal before long (Photo 8).
• Basin D
  – Basin is clean and available for water storage
  – We noted that some maintenance issues noted during the last visit still need to be addressed: still Southern Half
    ✓ There is a gap between the shotcrete and the soil at the spillway which may cause problem is additional undermining occurs (Photo 9).
    ✓ Vegetation is growing through crack in downstream side of spillway (Photo 9)
  – Northern Half
    ✓ Safety bars are missing on top of the decant towers (Photo 10)
• Ditch along access road to Flare 9-11
  – The drain at the end of the concrete on side of road is plugged by sediments.
• Basin A
  – The sediments have been gathered in the middle of the basin and are ready for removal (Photo 11)
  – The new perimeter channel that will drain Basin A is under construction and will be finished by the beginning of the rainy season (photos 12 and 13)
• Perimeter Channel between Basin A and Basin D
  – Channel in very good shape and clean, no vegetation and no cracks
• Channel along the main access road
  – Accumulated sediments were being removed (Photo 14)

Cell 4 Phase 3 Construction
• The upper geomembrane (80 mil) of the liner system (Photo 15) was being deployed (Photo 16)
• Sand bags were placed in the trenches installed to keep the geomembrane from bridging in the leachate collection system due to temperature variation during the day (Photo 17)
• Construction Quality Assurance was provided as demonstrated by air testing of seams and collection of destructive samples (Photo 18)
• The line system on the slopes differs an include a geosynthetic clay liner in lieu of a clay layer because of constructability and stability issues (Photo 19)
• The anchor trench for the geosynthetic component has been excavated along a bench on west side of the future cell. (Photo 20). The outside edge is properly rounded to minimizes risk of damage to the geosynthetics

Erosion Protection Systems
• No changes since the last visit in May 2019, systems are in place.

Landfill for geotechnical and hydrological issues
• No fissures or cracks were observed in any of the slope or roadways

Other Observations
• Wall along San Fernando Road
  – No changes since last visit. drainage swale partially full of sediments
  – No odor detected outside of landfill
- No illegal dumping along Sierra Highway

**Documentation Review**
- Per the technical committee comments, we reviewed the geotechnical report prepared in support of the design of the excavation for Cell CC4 Part 4 and construction of the buttress.
- The geomechanical parameters selected for the different materials (native, fill, and waste) are consistent with previous studies at the site and are state of knowledge and practice.
- The methods used for the analyses are also consistent with state of the art and state of practice.
- The section analyzed for stability were developed based on current topography, proposed grading and available boreholes and are representative of the study area.

**Close-out meeting with Republic Staff representative to discuss findings of visit**

**FURTHER REVIEW NEEDED**
- None

**COMMENTS**
- None

September Site Visits

September 25, 2019:

James Aidukas (UltraSystems)

Mike Lindsay (UltraSystems)
Republic General Manager - Chris Coyle

Drove the Granada Hills neighborhood and school areas from 6:10 to 6:45 a.m. and there were no landfill odors detected. Met with Mike Lindsay (UltraSystems) and Tim Stapleton (LACDRP.) Also met with Gabriel Esparza (LACDPW) at approximately 10:00 a.m. We signed in at the office, had a brief conversation with Josh Mills (Republic) and proceeded to monitor the site and observed the following:

- CC-4 Part 1/2 slopes looked manicured with the HDPE drainage systems repaired. No straw wattles have been installed. There was no odor from this morning operations (6:00-7:00 a.m.)
- The Closure Turf looked well maintained.
- The depression in the Old City South landfill stockpile has not changed.
- Liquid and gas removal gabions were being installed on the floor liner of CC-4 Part 3. Slopes in this area are being lined.
- Sediment in the terminal basin has been removed to the gabion wall and wet sediment east of the wall in the outlet side is being trucked away. The outlet channel has minimal sediment on the channel floor. The concrete base for the chain link fence had lifted approximately twelve inches along the basin's top walkway. The outlet skimmers are still buried in sediment.
- The oil field flare was operating burning production gas. All oil well pumping jacks were not operating.
- The southern perimeter oil field gate was locked.
- Deck B sage mitigation area was doing well. Some natives show dieback from hot summer conditions. There was no mustard weed.
- Deck C sage mitigation area was doing well. Mustard weed was removed. Some natives show dieback from hot summer conditions.
- A new odor control mister system was installed and operating on poles adjacent to the PM-10 berm oak trees.
- Waste was being placed in CC-4 Part 1/2. The active area was approximately 1 1/2 lifts from the CC-3A top deck elevation.
- Sediment was removed from the center area of Basin A. Sediment around the interior wall was being piled for removal. Rock around the outlet risers was not yet cleaned.
- A new section of the permanent westside drainage channel was being installed below the CC-4 Part 3 buttress. The outlet from Basin A was not yet constructed. Wind-blown litter was seen in the small canyon vegetation near the construction.
- The county top deck had additional wet weather rock and asphalt stockpiled. Trucks were using dirt access roads not watered, and dust clouds were seen.
Page 2 of 2, 9/25/19:

- The soil stockpiled from the CC-4 Part 3 buttress construction was removed from the County top deck.
- The native vegetation on the County sage mitigation slopes was doing well.
- Basin B had a small pile of sediment ready for removal.
- Localized odors were detected near the Basin B outlet channel at approximately 12:00 p.m.
- The eastside channel had sediment, debris, and gabion rock not yet removed from the Adler Tank farm to the terminal basin.

Flare Operating Conditions:
  o Flare 1 - 1687°F, 2354 SCFM, -57.93 vacuum, 38.60" out, 32% CH₄, 0.4% O₂, 100 ppm H₂S  
  o Flare 3 - 1641°F, 2712 SCFM, -84.5 vacuum, 41% CH₄  
  o Flare 9 - 1656°F, 3374 SCFM, -62.71 vacuum, 37.63" out  
  o Flare 10 - down for maintenance  
  o Flare 11 - 1646°F, 3411 SCFM  

The gas-to-energy plant was using 7,911 SCFM of recovered landfill gas, 44% CH₄, 0.9% O₂, 100 ppm H₂S. Total gas volume recovered was 19,762 SCFM.
**SUNSHINE CANYON LANDFILL**
**MITIGATION MONITORING SITE REPORT**

**Monitor:** Mike Lindsay  
**Page:** 1 of 1  
**Discipline:** Environmental Engineer  
**Date:** 09-25-2019  
**Wednesday**  
**Site Conditions:** Clear, 69–84 °F, 3–10 mph, 58% RH

### SITE LOG

1. Met with Jim Aidukas (UltraSystems), and checked into office and with Joshua Mills (Republic).
3. Traffic spotters are onsite to control traffic.
4. Observed Cell CC-4 Part 3 construction, including liner and gabion block installation.
5. Street sweepers are cleaning the haul roads.
6. The terminal basin continues to be cleared of wet soil, with about 50% remaining.
7. Vegetation is growing out of concrete joints near terminal basin outlet upper deck.
8. Oil field flare is operating, with all pumping jacks offline.
9. Flare 1 is operating at 2354 scfm, 1693 °F. Gas sample measured at 32 % Vol. CH4, 0.4 % Vol. O2, 100 ppm H2S and 202 ppm CO. Gas inlet temperature is 126 °F.
10. Water trucks are applying water throughout site for dust control.
11. City deck B sage mitigation area is in good condition.
12. City deck C sage mitigation area is in good condition.
13. Observed new water mister lines elevated along the PM-10 berm for odor control.
15. The working area at Cell CC-4 Part 1/2 is in good order, including three tippers, traffic controllers, water misters and water trucks for odor and dust control, and a hand unload area.
16. Flare 3 is operating at 41 % Vol. CH4, 0.5 % Vol. O2, 71 ppm H2S and 264 ppm CO. Gas inlet temperature is 155 °F.
17. Sediment basin A has soil being removed.
18. New westside drainage channel construction is being completed.
19. Flare 9 is operating at 3413 scfm, 1653 °F. Gas sample measured at 44 % Vol. CH4, 0.9 % Vol. O2, 100 ppm H2S and 294 ppm CO. Gas inlet temperature is 151 °F.
20. Flare 10 is offline.
21. Flare 11 is operating at 3500 scfm, 1661 °F.
22. Sediment basin B has soil piled up, ready for removal.
23. Localized landfill gas odors are present south of sediment basin B at 11:55 AM.
24. Alder tank farm is in good order.
25. Met with Chris Coyle (Republic), and discussed our site monitoring observations.

### FURTHER REVIEW NEEDED

1. Remove vegetation from concrete at terminal basin.

Signed: [Signature]

---
Appendix IV
Meeting Logs
Sunshine Canyon Landfill  
Meeting Log for July 2019 Site Monitoring

July 9, 2019

Post-monitoring meeting with Joshua Mills (Republic).

Attendees:
Alex Garcia, LACDRP
Tim Stapleton, LACDRP
James Aidukas, UltraSystems
Tarik Hadj-Hamou, SLR
Mike Lindsay, UltraSystems

Discussion:
We had a post-monitoring meeting with Republic Services and provided them with our monitoring observations. We asked questions regarding site activities and mitigation status, and received comments and updates as follows:

a. James Aidukas stated that we surveyed the landfill for any impacts from the Ridgecrest earthquake and no cracks, fissures, or land movement were observed.
   - Joshua Mills stated that Republic had GLA Engineers inspect the landfill after the large earthquake and no site problems were observed.

b. James Aidukas asked why the main header pipe and valve were unearthened below Flares 9, 10, and 11.
   - Joshua Mills stated that they are adding a 4-port 42-inch manifold at this point for future blowers and flares. A new blower skid and Flare 12 is scheduled for installation next year.

c. James Aidukas stated that we observed that roadwork was being performed at the entrance and asked what was being done.
   - Joshua Mills stated that the roadway box channel under the grate was failing and was being replaced with a new concrete box channel.

d. James Aidukas stated that we observed that there was standing water in the terminal basin at the outlet risers and asked if it was being pumped out and used for dust control.
   - Joshua Mills acknowledged the statement, and said that it was being used on site.

e. Mike Lindsay asked what the airspace volume was for the new Cell CC-4 Part 3.
   - Joshua Mills stated that it is approximately five million cubic yards.

f. Tarik Hadj-Hamou stated that we observed that the construction crews were digging deep in the east corner of Cell CC-4 Part 3 and asked if this was for a temporary cell basin.
   - Joshua Mills stated that that location is the low-point drainage collection area.

g. Tarik Hadj-Hamou stated that vegetation is growing out of concrete cracks at the eastside drainage channel, with some debris present at the humps and gabions.
   - Joshua Mills acknowledged the statement.
h. Mike Lindsay stated that we observed a clean-out vacuum truck that was working along the eastside drainage channel.
   o Joshua Mills stated that a jetting and vacuum truck was cleaning out the landfill liquids forced main pipeline, and that they are now also using FlowMate calcium carbonate descalers to keep the pipelines from plugging.

i. Tarik Hadj-Hamou stated that there is an erosion gully at sediment basin 3B.
   o Joshua Mills stated that they will rework that area when the admin buildings are relocated.

j. Tarik Hadj-Hamou stated that the northern outlet riser at sediment basin D have no personnel guards on top to limit access.
   o Joshua Mills acknowledged the statement.

k. Tarik Hadj-Hamou stated that vegetation is growing out of the sediment basin D concrete overflow drainage channel.
   o Joshua Mills acknowledged the statement.

l. James Aidukas stated that there was some comingled trash in the soil at the working area.
   o Joshua Mills stated that they will follow-up with how that occurred.

m. James Aidukas stated that the abandoned motorhome on Sierra Highway is still on the roadway.
   o Joshua Mills acknowledged the statement.

The meeting was then adjourned.
August 13, 2019

Post-monitoring meeting with Joshua Mills, Tuong-phu Ngo and Valarie Moore (Republic).

Attendees:
- Gabriel Esparza, LACDPW
- Vu Truong, LACDPW
- James Aidukas, UltraSystems
- Mike Lindsay, UltraSystems

Discussion:

We had a post-monitoring meeting with Republic Services and provided them with our monitoring observations. We asked questions regarding site activities and mitigation status, and received comments and updates as follows:

a. James Aidukas asked what the status was for completion of the liner for Cell CC-4 Part 3.
   - Valerie Moore stated that the cell's floor will be complete in mid-September and the slopes in mid-October. The project is about half-way complete at this time.

b. James Aidukas asked if the gabion liquid removal and gas recovery system will be installed at the floor liner in Cell CC-4 Part 3.
   - Valerie Moore stated that yes, they will be installed.

c. James Aidukas asked what the schedule was for installing a drainage connection from Basin A to the westside drainage channel.
   - Joshua Mills stated that they are currently looking at the drainage design, and the capacity has been increased. The construction should be completed by October 15th.

d. James Aidukas stated that we observed that the buttress drainage channel was under construction.
   - Joshua Mills stated that that drainage system currently includes some temporary channels and all will be completed by October 15th.

e. Gabriel Esparza asked if Republic had received the County’s comments regarding Cell CC-4 Part 3.
   - Joshua Mills stated that yes, Republic was working on their responses to the comments.

f. James Aidukas stated that Flare 3 was at 46% CH4.
   - Joshua Mills acknowledged the statement.

g. James Aidukas stated that a new HDPE lined drainage channel on the old City south slope has been built in a sharp Z-configuration.
   - Joshua Mills stated that the water was flowing down the slopes in that configuration and the HDPE was placed to stop erosion.
h. James Aidukas stated that we observed that the gabion blocks to divert rain run-off have been removed on the roadway up to City deck C.
   o Joshua Mills stated that they are realigning and widening the roadway, and that storm water controls will be installed when the road is completed.

i. James Aidukas stated that the eastside drainage channel was cleared of sediment and debris to the Alder tank farm, but from the tank farm south sediment, debris, and vegetation has not been removed.
   o Joshua Mills stated that they will have all of the storm water controls cleaned by October 15th.

j. James Aidukas asked if water level markings could be painted onto the terminal basin side wall to gauge the sediment height.
   o Joshua Mills stated that Republic will discuss the idea internally.

k. James Aidukas stated that the City deck B and City deck C sage mitigation areas are doing well.
   o Joshua Mills acknowledged the statement.

l. James Aidukas stated that the PM-10 berm oak trees have tall, thick brush around the trees that needs to be cleared.
   o Joshua Mills stated that Mike DeYoung (Republic) is coordinating the removal of the brush.

m. Mike Lindsay stated that we observed that a new blower pad has been installed by Flare 11.
   o Joshua Mills stated that it is for additional capacity and will serve the future Flare 12.

n. Mike Lindsay asked how much soil is planned for the final toe berm project.
   o Joshua Mills stated that about 1.8 million cubic yards is planned, with the project about three years out, with the administration buildings and scale facilities relocation occurring much sooner.

The meeting was then adjourned.
August 27, 2019

Post-monitoring meeting with Chris Coyle, Tuong-phu Ngo, Mike DeYoung, Dennis Montano and Valarie Moore (Republic).

Attendees:
Tim Stapleton, LACDRP  
James Aidukas, UltraSystems  
Tarik Hadj-Hamou, SLR  
Mike Lindsay, UltraSystems

Discussion:

We had a post-monitoring meeting with Republic Services and provided them with our monitoring observations. We asked questions regarding site activities and mitigation status, and received comments and updates as follows:

a. Tarik Hadj-Hamou requested to see the liner design as-built drawings currently being used for Cell CC-4 Part 3.
   o Chris Coyle stated that Republic will send the drawings.

b. Tarik Hadj-Hamou stated that we observed that the sediment basins were in the process of being cleaned.
   o Chris Coyle stated that they are chipping away at it and were scheduled to be completed before October 15.

c. James Aidukas asked if the terminal basin skimmer system will be utilized this year.
   o Chris Coyle stated that the contractor will be cleaning and doing any repairs to the skimmers and they will be ready for use in October.

d. James Aidukas asked if the two new 48-inch corrugated drainage pipes east of the CC-4 Part 3 buttress are part of the permanent westside drainage system.
   o Tuong-phu Ngo stated that yes, they are part of the permanent westside perimeter drainage.

e. James Aidukas asked if the new sediment basin A outlet channel will be constructed as part of the westside drainage project.
   o Chris Coyle stated that yes, it will be part of the permanent perimeter drainage project.

f. James Aidukas stated that a Republic packer truck was leaking liquid while queued at the scales at 8:30 AM.
   o Chris Coyle stated that they will track it down after they are provided the truck number.

g. James Aidukas stated that illegally dumped debris is present along Sierra Highway. Some is located in the Santa Clarita area and some within the Republic clean-up area.
h. James Aidukas stated that no odors were present in the adjacent neighborhood or school this morning between 6:30-7:00 and 9:30-10:00 a.m.
   o Chris Coyle acknowledged the statement, and said that Republic’s odor patrol reported the same.

i. James Aidukas stated that the Cell CC-3A top deck had localized odors at 11:00 AM.
   o Chris Coyle acknowledged the statement.

j. James Aidukas stated that there were localized odors detected in the area of the north Alder tanks at 10:30 AM.
   o Tuong-phu Ngo stated that they had to temporarily shut down the flares to remove a generator around that time, causing the vacuum recovery at the tanks to be shut down.

k. James Aidukas stated that the eastside drainage channel east of the tank farm needs to be cleaned out.
   o Chris Coyle stated that all of the cleanout work has been scheduled.

l. James Aidukas stated that localized odors were detected near Cell CC-3B trenching work at 10:25 a.m.
   o Mike DeYoung stated that they were making a tie-in and that they will increase the use of deodorizer.

m. Tim Stapleton stated that the storage yard by sediment basin D has broken-down trucks being stored.
   o Chris Coyle stated that they will be disposed of properly.

n. Chris Coyle stated that no one will trim the oak trees at the front entrance due to the slope of the terrain and the proximity to San Fernando Road.
   o James Aidukas acknowledged the statement.

o. James Aidukas stated that Edison is predicting power outages in the area.
   o Chris Coyle stated that Republic has additional backup generators on call if needed.

p. James Aidukas asked how the 6:00 to 7:00 a.m. trash receiving program was going.
   o Chris Coyle stated that everything was going well, with no complaints.

q. Mike Lindsay asked to review the records and logs related to landfill conditions of approval.
   o Tuong-phu Ngo, Mike DeYoung and Dennis Montano presented the necessary documents for review. These documents were well organized, current and in compliance with the necessary conditions of approval.
September 25, 2019

Post-monitoring meeting with Chris Coyle, Joshua Mills, Mike DeYoung and Dennis Montano (Republic).

Attendees:
- Tim Stapleton, LACDRP
- Gabriel Esparza, LACDPW
- James Aidukas, UltraSystems
- Mike Lindsay, UltraSystems

Discussion:

We had a post-monitoring meeting with Republic Services and provided them with our monitoring observations. We asked questions regarding site activities and mitigation status, and received comments and updates as follows:

a. James Aidukas stated that the Flare 9 deck had fresh localized trash odors coming from the operating area at 11:40 AM. These odors were not leaving the site.
   - Chris Coyle acknowledged the statement.

b. James Aidukas stated that the gas wells south of sediment basin B and east of the County bowl area had localized gas odors at 11:50 AM. The exact source could not be determined.
   - Joshua Mills stated that they believe it is a sulphur odor, and they are planning on placing additional soil in the swales between well connections to eliminate the odors.

c. James Aidukas asked if the Cell CC-3A top deck corner well (number 2013) is still producing a substantial gas output.
   - Joshua Mills stated that they are planning to drill 12 wells in this area. Seven (7) wells on the north side of CC-3A and five-to-six (5-6) wells at the perimeter.

d. Chris Coyle stated that Republic has a well-defined gas well drilling protocol to drill, cap and make operational every new well, each completed in one day.
   - James Aidukas acknowledged the statement.

e. Chris Coyle stated that Republic has installed and is operating a water mister line on the PM-10 berm to provide additional odor control. The SCAQMD current odor-related calls have added extra attention and focus to the effort.
   - James Aidukas acknowledged the statement.

f. James Aidukas stated that large, empty dump trucks used to remove soil from the terminal basin were traveling at 30-plus miles per hour, causing dust clouds on dry dirt roads and a safety concern.
   - Chris Coyle stated that they will take care of these issues.

g. James Aidukas stated that the eastside drainage channel has been cleaned up to the Alder tank farm. From the tank farm to the terminal basin had not been cleaned.
o Joshua Mills stated that they have that scheduled to be completed by October.

h. James Aidukas stated that the City south roadway looks good with the new realigned road, and asked if K-rails would be used to control stormwater.
   o Joshua Mills stated that new gabion blocks will be installed soon.

i. James Aidukas stated that the new westside drainage channel currently transitions into 36" pipes. Also, there are two drainage pipes going directly into the temporary basin.
   o Joshua Mills stated that all water will eventually pass through sediment basin A on its way to the permanent westside channel.

j. James Aidukas stated that City decks B and C look fantastic.
   o Chris Coyle acknowledged the statement.

k. James Aidukas stated that all the oilfield pumping jacks were offline, and the oilfield temporary flare was operating burning production gas.
   o Chris Coyle acknowledged the statement.

The meeting was then adjourned.
