Notes:

Detections are indicated in **bold**.

Shaded cells exceed the DTSC / USEPA Commercial Soil Vapor Screening Level.

Italicized cells exceed the allowable leak check compound concentration of 13.6 µg/m³ (10-times the reporting limit of target analyte PCE [CalEPA, 2015]).

Volatile organic compounds (VOCs) measured by EPA Method TO-15.

-- = No available DTSC SL or USEPA RSL

µg/m³ = micrograms per cubic meter.

<1.00 = Not detected above indicated laboratory reporting limit.

PCE = Tetrachloroethene.

TCE = Trichloroethene.

DTSC SL = Department of Toxic Substances Control Screening Level

USEPA RSL = United States Environmental Protection Agency Regional Screening Level

¹ The soil vapor screening level is calculated by dividing the air screening level by the USEPA default attenuation factor of 0.03 (USEPA, 2015). In order of priority, the screening level represents the DTSC-modified screening level (DTSC, 2020) followed by USEPA Regional Screening Level (RSL; USEPA, 2020).

² The analytical results indicated for SV-1 and SV-6 may be biased low due to potential ambient air leakage during sampling.

³ Probes SS-1 through SS-4 were installed beneath slab at grade. Probes SS-5 and SS-6 were installed beneath the subterranean garage slab, situated approximately 4 feet below grade. Probes SS-7 and SS-8 were installed beneath the subterranean garage slab, situated approximately 8 feet below grade.

ATTACHMENT B
BUILDING SURVEY FORMS

APPENDIX L - BUILDING SURVEY FORM

Preparer's Name: Paola Gomez-Birenbaum Date/Time Prepared: 3/27/21 8-
Affiliation: RMD Environmental Solutions Inc Phone Number: 310 678 9367

Occupant Information

Occupant Name: Stratford School Interviewed: Yes No
Mailing Address: 1200 Cahunga Blvd
City: Los Angeles State: CA Zip Code: 90038
Phone: 323 462 3075 Email: _____

Owner/Landlord Information (Check if same as occupant)

Occupant Name: _____ Interviewed: Yes No
Mailing Address: _____
City: _____ State: _____ Zip Code: _____
Phone: _____ Email: _____

Building Type (Check appropriate boxes)

- Residential Residential Duplex Apartment Building Mobile Home Commercial (office)
 Commercial (warehouse) Industrial Strip Mall Split Level Church School

Building Characteristics

Approximate Building Age (years): 30 yrs Number of Stories: western portion (2), eastern (2+ garage)
Approximate Building Area (square feet): 13,500 Number of Elevators: 1

Foundation Type (Check appropriate boxes)

- Slab-on-Grade Crawl Space Basement *eastern portion has subterranean garage.*

Basement Characteristics (Check appropriate boxes)

- Dirt Floor Sealed Wet Surfaces Sump Pump Concrete Cracks Floor Drains

Factors Influencing Indoor Air Quality

- | | | |
|--|---|---|
| Is there an attached garage? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Is there smoking in the building? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Is there new carpet or furniture? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |
| Have clothes or drapes been recently dry cleaned? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |
| Has painting or staining been done with the last six months? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |
| Has the building been recently remodeled? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |
| Has the building ever had a fire? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Is there a hobby or craft area in the building? | <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No | Describe: <i>art supplies for children in class rooms</i> |
| Is gun cleaner stored in the building? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Is there a fuel oil tank on the property? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Is there a septic tank on the property? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | |
| Has the building been fumigated or sprayed for pests recently? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |
| Do any building occupants use solvents at work? | <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No | Describe: _____ |

Sampling Locations

Draw the general floor plan of the building and denote locations of sample collection. Indicate locations of doors, windows, indoor air contaminant sources and field instrument readings.

See attached maps

Primary Type of Energy Used (Check appropriate boxes)

Natural Gas Fuel Oil Propane Electricity Wood Kerosene

Meteorological Conditions

Describe the general weather conditions during the indoor air sampling event.

63°F; clear, no wind

General Comments

Provide any other information that may be of importance in understanding the indoor air quality of this building.

APPENDIX M – BUILDING SCREENING FORM

Occupant of Building Stratford School

Address 1200 Cahuenga Blvd,

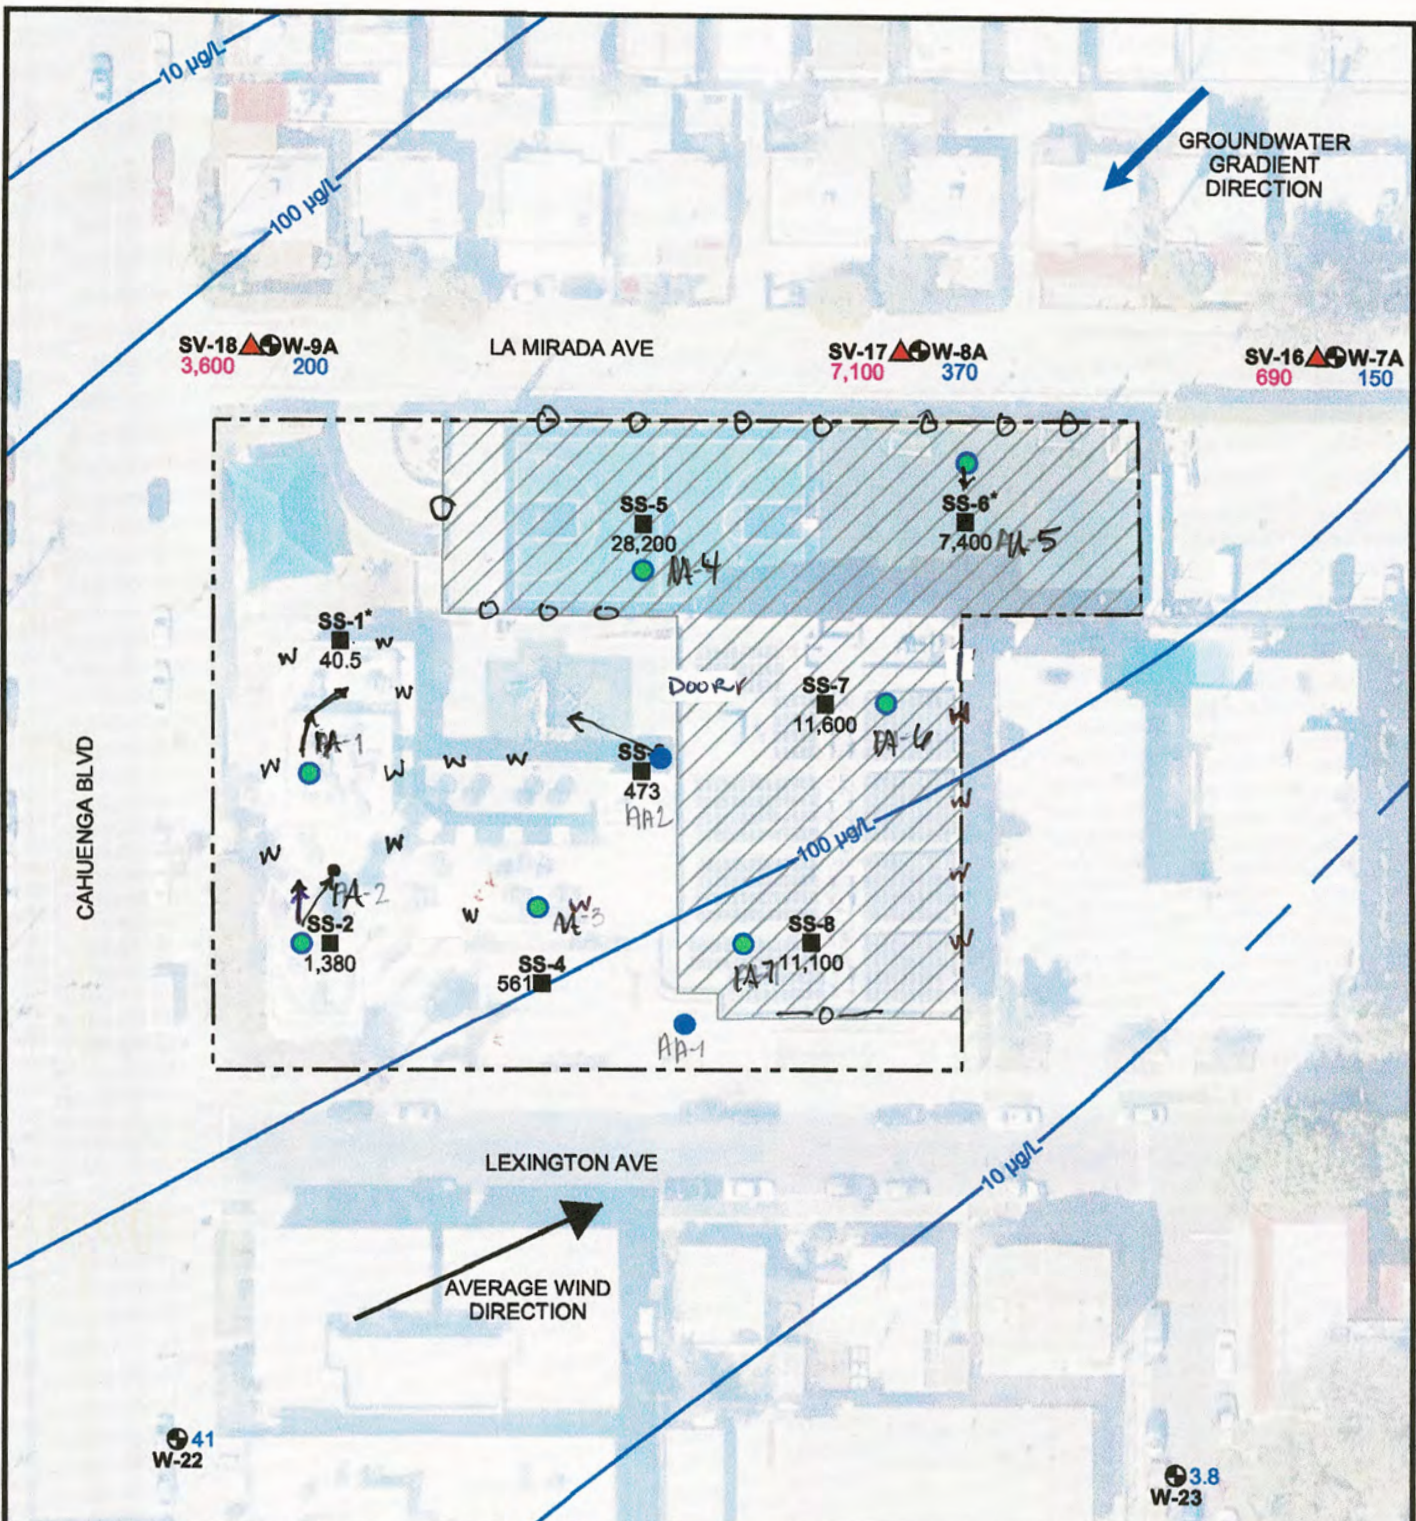

City Los Angeles

Field Investigator Paola Gomez-Buenbaum Date 8/27/2021

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

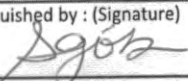

* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: RMD Environ. SOLUTIONS Project: _____
 Date Received: 3/29/21 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? _____ No (skip section 2) Sample Temp (°C) (No Cooler) N/A
 Sample Temp (°C), One from each cooler: #1: _____ #2: _____ #3: _____ #4: _____
 (Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: ambient

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: _____ #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?			✓
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email (email sent to/on): _____ / _____
 Project Manager's response:

Completed By: Uma Cane Date: 3/29/21

GEOKINETICS VIMS CONCEPTUAL DESIGN LETTER, OCTOBER 4, 2022

October 4, 2022

Mr. Collin Monsour
Bardas Investment Group
1015 North Fairfax Ave
West Hollywood, California 90046

SUBJECT: VAPOR INTRUSION MITIGATION SYSTEM (VIMS) CONCEPTUAL DESIGN AND EXPECTED PERFORMANCE FOR THE PROPOSED OFFICE BUILDINGS AT 1200 CAHUENGA BOULEVARD - LOS ANGELES, CALIFORNIA

Dear Mr. Monsour:

As requested, the purpose of this letter is to discuss the expected performance and overall conceptual design of the proposed Vapor Intrusion Mitigation System (VIMS) to be installed at the above referenced site. We understand the proposed buildings are being constructed in an area of extensive commercial / industrial development. As such, it is our understanding that Volatile Organic Compounds (VOCs), most notably PCE (Tetrachloroethylene), exist in soil gas and groundwater on site. GeoKinetics has reviewed the soil vapor data collected in March 2021 by RMD Environmental Solutions (RMD). The maximum PCE soil gas detection on site was found to be 28,200 $\mu\text{g}/\text{m}^3$, approximately 420 times the commercial / industrial screening level. A vapor intrusion mitigation system (VIMS) was recommended to be installed under the buildings due to the recently collected PCE soil gas detections.

Based on discussions with RMD and considering the planned project development, the following conceptual VIMS is recommended:

1. Building A shall have a vapor barrier and sub-slab collection / ventilation system under the slab and on the walls of the structures.
2. Building B shall have a vapor barrier and sub-slab collection / ventilation system under the slab. It is expected that the existing waterproofing barrier along the walls of Building B's subterranean garage is sufficient for vapor intrusion mitigation purposes. Follow up testing should be conducted to confirm.
3. Building C shall have a vapor barrier and sub-slab collection / ventilation system beneath the retail and office space.

4. For the portion of Building C which overlies an open-air subterranean parking garage, localized mitigation consisting of a vapor barrier should be considered under the stairwells and elevators that extend to overlying spaces in the building.

GeoKinetics has prepared plans and specifications for the proposed VIMS system at the site. Key considerations regarding bullets 2 and 4 above are summarized in the following pages.

CONSIDERATIONS REGARDING VIMS DESIGN AT BUILDING B

Although the slab of Building B will be provided with a new barrier and venting, the walls of existing Building B are required to remain in place as originally constructed. Although no investigation has been performed, it is our understanding that an existing waterproofing barrier exists on the walls of Building B. It is standard practice to install a waterproofing barrier on all subterranean garages. It is also standard construction practice to install a drainboard between the soil and the barrier. It is also our understanding that no evidence of efflorescence has been observed against the walls of the subterranean portions of the structure. Because of this, it is likely that the barrier and drainboard are in good shape and continue to protect the building from water infiltration. It is our opinion that this waterproofing barrier will likely be sufficient for the expected project soil gas vapors. The barrier and venting system under the slab of Building B will provide most of the protection from vapor intrusion and any vapor trapped against the side of the building will be vented to the surface by the drainboard.

In order to confirm the protection provided by the existing walls, we recommend that radon testing be performed in the garage of the existing building B after the VIMS installation beneath the slab. We have found that the measurement of the concentrations of radon gas beneath the vapor barrier and in the indoor air of a building provides a more reliable means of evaluating the soil gas-to-indoor air attenuation factor that is associated with a passive barrier system immediately following building construction. Radon is a naturally-occurring gas that is present in the subsurface at detectable levels at most locations. It is generally not found in building materials so there are few, if any, potential sources of radon gas on the interiors of buildings. Radon is not sorbed onto soil or building materials so it can serve as a conservative tracer. The concentration of radon gas can be quantified easily, reliably, and relatively inexpensively.

The concentrations of radon in the soil gas beneath each building, in the indoor air, and in the outdoor air will be measured using DurrIDGE RAD7 Electronic Radon Detectors. This instrument detects alpha particles associated with the natural decay of radon gas isotopes. Radon-222 is the most plentiful isotope with a half-life of approximately 3.8 days. Since radon gas concentrations can vary to some degree over time, the sub-slab soil gas and indoor/outdoor air samples will be collected through the detector for a period of approximately 24-hours in order to obtain representative average concentrations with a high confidence level. The indoor radon samples will be collected from as close to the center of the unit as possible. The RAD7 units will be programmed to output the radon concentrations detected over 5-minute intervals. The effective attenuation factor (and attenuation rate) will then be estimated using the average measured radon concentrations.

CONSIDERATIONS REGARDING VIMS DESIGN AT BUILDING C

A completed VIMS system will be installed beneath the portion of the building with at-grade retail and office space. For the portion of the building which sits above an open-air parking garage, vapor barriers will be installed beneath stairwells and elevators extending into overlying enclosed spaces with the exception of the stairwell between gridlines C9-C11 & CM. This stairwell is shown to be located entirely on a structural footing. Per standard practice, vapor barriers typically are installed under the floor slab and extend approximately 6" onto the top of structural footing, but not under the footings.

We hope this information is helpful to you. Please do not hesitate to contact the undersigned if you have any questions or comments.

Sincerely,
GEOKINETICS, INC.

Kevin Lea, RCE
Senior Engineer

1. INTRODUCTION

1.1. PROJECT DESCRIPTION

The proposed Project is located on the northeast corner of North Cahuenga Boulevard and West Lexington Avenue. The Project would replace and refurbish an existing vacant private school complex (previously with 200 students) to provide three buildings (building A, B, and C) with a total 74,762 square feet of creative office and 500 square feet of ground floor retail uses, for a total of 75,262 square feet. As such, the Project would demolish the vacant private school's free-standing subterranean parking lot and access ramp, topped with a recreation field and basketball court, and two playgrounds. The Project would demolish 8,941 square feet of an existing approximately 28,389 square foot, two-story school building, but would preserve and upgrade with a few exterior modifications to the remaining approximately 19,448 square feet of the building and is subterranean parking garage to be a creative office building (Building B). Building A would be a new four-story creative office building of approximately 35,000 square feet located along the northern border of the Project Site with one level of at-grade parking and one level of subterranean parking. Building C is proposed as a new four-story building located at the southwest corner of the Project Site with approximately 20,814 square feet of creative office and accessory retail. The retail component of the Project would be provided primarily for the use of the office employees and their guests. Building C would include at-grade parking on its first level, along with the retail use component.

1.2. SCOPE OF WORK

This report provides a description of the existing surface water hydrology, surface water quality, groundwater level, and groundwater quality at the Project Site. It also analyzes the Project's potential impacts related to surface water hydrology, surface water quality, groundwater level, and groundwater quality.

2. REGULATORY FRAMEWORK

2.1. SURFACE WATER HYDROLOGY

County of Los Angeles Hydrology Manual

Per the City of Los Angeles (City) Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County (County) Department of Public Works Hydrology Manual as its basis of design for storm drainage facilities. The 2006 LACDPW Hydrology Manual requires projects to have drainage facilities that meet the Urban Flood level of protection. The Urban Flood is runoff from a 25-year frequency design storm falling on a saturated watershed. A 25-year frequency design storm has a probability of 1/25 of being equaled or exceeded in any year. Areas with sump conditions are required to have a storm

drain conveyance system capable of conveying flow from a 50-year storm event.¹ The County also limits the allowable discharge into existing storm drain facilities based on the municipal separate storm sewer systems (MS4) Permit, which is enforced on all new developments that discharge directly into the County's storm drain system. Any proposed drainage improvements of County owned storm drain facilities such as catch basins and storm drain lines require approval/review from the County Flood Control District department.

Los Angeles Municipal Code

Any proposed drainage improvements within the street right of way or any other property owned by, to be owned by, or under the control of the City requires the approval of a B-permit (Section 62.105, Los Angeles Municipal Code (LAMC)). Under the B-permit process, storm drain installation plans are subject to review and approval by the City of Los Angeles Department of Public Works, Bureau of Engineering (BOE). Additionally, any connections to the City's storm drain system from a property line to a catch basin or a storm drain pipe requires a storm drain permit from BOE.

2.2. SURFACE WATER QUALITY

Clean Water Act

The Clean Water Act (CWA) was first introduced in 1948 as the Water Pollution Control Act. The CWA authorizes Federal, state, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries. The primary goals of the CWA are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and to make all surface waters fishable and swimmable. As such, the CWA forms the national framework for the management of water quality and the control of pollutant discharges. The CWA also sets forth a number of objectives in order to achieve the above-mentioned goals. These objectives include regulating pollutant and toxic pollutant discharges; providing for water quality that protects and fosters the propagation of fish, shellfish and wildlife; developing waste treatment management plans; and developing and implementing programs for the control of non-point sources of pollution.²

Since its introduction, major amendments to the CWA have been enacted (e.g., 1961, 1966, 1970, 1972, 1977, and 1987). Amendments enacted in 1970 created the U.S. Environmental Protection Agency (USEPA), while amendments enacted in 1972 deemed the discharge of pollutants into waters of the United States from any point source unlawful unless authorized by a USEPA National Pollutant Discharge Elimination System (NPDES) permit. Amendments enacted in 1977 mandated development of a "Best Management Practices"

¹ Los Angeles County Department of Public Works Hydrology Manual, January 2006, <http://ladpw.org/wrd/publication/index.cfm>

² Non-point sources of pollution are carried through the environment via elements such as wind, rain, or stormwater and are generated by diffuse land use activities (such as runoff from streets and sidewalks or agricultural activities) rather than from an identifiable or discrete facility.

Program at the state level and provided the Water Pollution Control Act with the common name of “Clean Water Act,” which is universally used today. Amendments enacted in 1987 required the USEPA to create specific requirements for discharges.

In response to the 1987 amendments to the CWA and as part of Phase I of its NPDES permit program, the USEPA began requiring NPDES permits for: (1) municipal separate storm sewer systems (MS4) generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. Phase II of the USEPA’s NPDES permit program, which went into effect in early 2003, extended the requirements for NPDES permits to: (1) numerous small MS4s,³ (2) construction sites of one to five acres, and (3) industrial facilities owned or operated by small municipal separate storm sewer systems. The NPDES permit program is typically administered by individual authorized states.

In 2008, the USEPA published draft Effluent Limitation Guidelines (ELGs) for the construction and development industry. On December 1, 2009 the EPA finalized its 2008 Effluent Guidelines Program Plan.

In California, the NPDES stormwater permitting program is administered by the State Water Resources Control Board (SWRCB). The SWRCB was created by the Legislature in 1967. Its joint authority over water distribution and water quality protection allows the Board to provide protection for the State’s waters, through its nine Regional Water Quality Control Boards (RWQCBs). The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California’s waters, acknowledging areas of different climate, topography, geology, and hydrology. The RWQCBs develop “basin plans” for their hydrologic areas, issue waste discharge requirements, enforce action against stormwater discharge violators, and monitor water quality.⁴

Federal Anti-Degradation Policy

The Federal Anti-Degradation Policy (40 Code of Federal Regulations 131.12) requires states to develop statewide anti-degradation policies and identify methods for implementing them. Pursuant to the Code of Federal Regulations (CFR), state anti-degradation policies and implementation methods shall, at a minimum, protect and maintain (1) existing in-stream water uses; (2) existing water quality, where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is

³ A small MS4 is any MS4 not already covered by the Phase I program as a medium or large MS4. The Phase II Rule automatically covers on a nationwide basis all small MS4s located in “urbanized areas” as defined by the Bureau of the Census (unless waived by the NPDES permitting authority), and on a case-by-case basis those small MS4s located outside of urbanized areas that the NPDES permitting authority designates.

⁴ USEPA. U.S. Environmental Protection Agency - Clean Water Act. July 2011.
<http://www.epa.gov/lawsregs/laws/cwa.html>

necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource.

California Porter-Cologne Act

The Porter-Cologne Water Quality Control Act established the legal and regulatory framework for California's water quality control. The California Water Code (CWC) authorizes the SWRCB to implement the provisions of the CWA, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants.

As discussed above, under the CWC, the SWRCB is divided into nine RWQCBs, governing the implementation and enforcement of the CWC and CWA. The Project Site is located within Region 4, also known as the Los Angeles Region. Each RWQCB is required to formulate and adopt a Basin Plan for its region. This Basin Plan must adhere to the policies set forth in the CWC and established by the SWRCB. The RWQCB is also given authority to include within its regional plan water discharge prohibitions applicable to particular conditions, areas, or types of waste.

California Anti-Degradation Policy

The California Anti-Degradation Policy, otherwise known as the *Statement of Policy with Respect to Maintaining High Quality Water in California* was adopted by the SWRCB (State Board Resolution No. 68-16) in 1968. Unlike the Federal Anti-Degradation Policy, the California Anti-Degradation Policy applies to all waters of the State, not just surface waters. The policy states that whenever the existing quality of a water body is better than the quality established in individual Basin Plans, such high quality shall be maintained and discharges to that water body shall not unreasonably affect present or anticipated beneficial use of such water resource.

California Toxics Rule

In 2000, the USEPA promulgated the California Toxics Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State. The USEPA promulgated this rule based on the USEPA's determination that the numeric criteria are necessary in the State to protect human health and the environment. The California Toxics Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the Los Angeles RWQCB (LARWQCB) as having beneficial uses protective of aquatic life or human health.

Board Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties

As required by the California Water Code, the LARWQCB has adopted a plan entitled "Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties" (Basin Plan). Specifically, the Basin Plan designates

beneficial uses for surface and groundwater, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's anti-degradation policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.⁵

The Basin Plan is a resource for the LARWQCB and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

NPDES Permit Program

The NPDES permit program was first established under authority of the CWA to control the discharge of pollutants from any point source into the waters of the United States. As indicated above, in California, the NPDES stormwater permitting program is administered by the SWRCB through its nine RWQCBs.

The General Permit

SWRCB Order No. 2012-0006-DWQ known as “The General Permit” was adopted on July 17, 2012. This NPDES permit establishes a risk-based approach to stormwater control requirements for construction projects by identifying three project risk levels. The main objectives of the General Permit are to:

1. Reduce erosion
2. Minimize or eliminate sediment in stormwater discharges
3. Prevent materials used at a construction site from contacting stormwater
4. Implement a sampling and analysis program
5. Eliminate unauthorized non-stormwater discharges from construction sites
6. Implement appropriate measures to reduce potential impacts on waterways both during and after construction of projects
7. Establish maintenance commitments on post-construction pollution control measures

⁵ Los Angeles Regional Water Quality Control Board. LARWQCB Basin Plan.
<http://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/>

California mandates requirements for all construction activities disturbing more than one acre of land to develop and implement Stormwater Pollution Prevention Plans (SWPPP). The SWPPP documents the selection and implementation of Best Management Practices (BMPs) for a specific construction project, charging owners with stormwater quality management responsibilities. A construction site subject to the General Permit must prepare and implement a SWPPP that meets the requirements of the General Permit.^{6, 7}

Los Angeles County Municipal Storm Water System (MS4) Permit

As described above, USEPA regulations require that MS4 permittees implement a program to monitor and control pollutants being discharged to the municipal system from both industrial and commercial projects that contribute a substantial pollutant load to the MS4.

On November 8, 2012, the LARWQCB adopted Order No. R4-2012-0175 under the CWA and the Porter-Cologne Act. This Order is the NPDES permit or MS4 permit for municipal stormwater and urban runoff discharges within Los Angeles County. The requirements of this Order (the Permit) cover 84 cities and most of the unincorporated areas of Los Angeles County. Under the Permit, the Los Angeles County Flood Control District (LACFCD) is designated as the Principal Permittee. The other permittees are the 84 Los Angeles County cities (including the City of Los Angeles) and Los Angeles County. Collectively, these are the “Co-Permittees”. The Principal Permittee helps to facilitate activities necessary to comply with the requirements outlined in the Permit but is not responsible for ensuring compliance of any of the Co-Permittees.

Stormwater Quality Management Program (SQMP)

In compliance with the Permit, the Co-Permittees are required to implement a stormwater quality management program (SQMP) with the goal of accomplishing the requirements of the Permit and reducing the amount of pollutants in stormwater runoff. The SQMP requires the County of Los Angeles and the 84 incorporated cities to:

- Implement a public information and participation program to conduct outreach on storm water pollution;
- Control discharges at commercial/industrial facilities through tracking, inspecting, and ensuring compliance at facilities that are critical sources of pollutants;
- Implement a development planning program for specified development projects;

⁶ State Water Resources Control Board. State Water Resources Control Board. July 2012, http://www.swrcb.ca.gov/water_issues/programs/npdes/.

⁷ USEPA. U.S. Environmental Protection Agency - NPDES. July 2012, <https://www.epa.gov/npdes>.

- Implement a program to control construction runoff from construction activity at all construction sites within the relevant jurisdictions;
- Implement a public agency activities program to minimize storm water pollution impacts from public agency activities; and
- Implement a program to document, track, and report illicit connections and discharges to the storm drain system.

The Permit contains the following provisions for implementation of the SQMP by the Co-Permittees:

1. General Requirements:

- Each permittee is required to implement the SQMP in order to comply with applicable stormwater program requirements.
- The SQMP shall be implemented and each permittee shall implement additional controls so that discharge of pollutants is reduced.

2. Best Management Practice Implementation:

- Permittees are required to implement the most effective combination of BMPs for stormwater/urban runoff pollution control. This should result in the reduction of storm water runoff.

3. Revision of the SQMP:

- Permittees are required to revise the SQMP in order to comply with requirements of the RWQCB while complying with regional watershed requirements and/or waste load allocations for implementation of Total Maximum Daily Loads (TMDLs) for impaired waterbodies.

4. Designation and Responsibilities of the Principal Permittee:

The Los Angeles County Flood Control District is designated as the Principal Permittee who is responsible for:

- Coordinating activities that comply with requirements outlined in the NPDES Permit;
- Coordinating activities among Permittees;
- Providing personnel and fiscal resources for necessary updates to the SQMP;

- Providing technical support for committees required to implement the SQMP; and
- Implementing the Countywide Monitoring Program required under this Order and assessing the results of the monitoring program.

5. Responsibilities of Co-Permittees:

Each Co-Permittee is required to comply with the requirements of the SQMP as applicable to the discharges within its geographical boundaries. These requirements include:

- Coordinating among internal departments to facilitate the implementation of the SQMP requirements in an efficient way;
- Participating in coordination with other internal agencies as necessary to successfully implement the requirements of the SQMP; and
- Preparing an annual Budget Summary of expenditures for the storm water management program by providing an estimated breakdown of expenditures for different areas of concern, including budget projections for the following year.

6. Watershed Management Committees (WMCs):

- Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).
- Each WMC is required to facilitate exchange of information between co-permittees, establish goals and deadlines for WMAs, prioritize pollution control measures, develop and update adequate information, and recommend appropriate revisions to the SQMP.

7. Legal Authority:

- Co-Permittees are granted the legal authority to prohibit non-storm water discharges to the storm drain system including discharge to the MS4 from various development types.

City of Los Angeles Water Quality Compliance Master Plan for Urban Runoff

On March 2, 2007, a motion was introduced by the City of Los Angeles City Council to develop a water quality master plan with strategic directions for planning, budgeting and funding to reduce pollution from urban runoff in the City of Los Angeles (City Council File 07-0663). The Water Quality Compliance Master Plan for Urban Runoff (Master Plan) was developed by the Bureau of Sanitation, Watershed Protection Division in collaboration with stakeholders to address the requirements of this Council motion. The primary goal of the

Master Plan is to help meet water quality regulations. Implementation of the Master Plan is intended over the next 20 to 30 years to result in cleaner neighborhoods, rivers, lakes and bays, augmented local water supply, reduced flood risk, more open space, and beaches that are safe for swimming. The Master Plan also supports the Mayor and Council's efforts to make Los Angeles the greenest major city in the nation.

- The Master Plan identifies and describes the various watersheds in the City, summarizes the water quality conditions of the City's waters, identifies known sources of pollutants, describes the governing regulations for water quality, describes the BMPs that are being implemented by the City, discusses existing TMDL Implementation Plans and Watershed Management Plans. Additionally, the Master Plan provides an implementation strategy that includes the following three initiatives to achieve water quality goals:
- Water Quality Management Initiative, which describes how Water Quality Management Plans for each of the City's watershed and TMDL-specific Implementation Plans will be developed to ensure compliance with water quality regulations.
- The Citywide Collaboration Initiative, which recognizes that urban runoff management and urban (re)development are closely linked, requiring collaborations of many City agencies. This initiative requires the development of City policies, guidelines, and ordinances for green and sustainable approaches for urban runoff management.
- The Outreach Initiative, which promotes public education and community engagement with a focus on preventing urban runoff pollution.
- The Master Plan includes a financial plan that provides a review of current sources of revenue, estimates costs for water quality compliance, and identifies new potential sources of revenue.

City of Los Angeles Stormwater Program

The City of Los Angeles supports the policies of the Construction General Permit and the Los Angeles County NPDES permit through the *Development Best Management Practices Handbook. Part A Construction Activities*, 3rd Edition (Handbook), and associated ordinances were adopted in September 2004. *Part B Planning Activities*, 4th Edition was adopted in June 2011. The Handbook provides guidance for developers in complying with the requirements of the Development Planning Program regulations of the City's Stormwater Program. Compliance with the requirements of this Handbook is required by City of Los Angeles Ordinance No. 173,494. The Handbook and ordinances also have specific minimum BMP requirements for all construction activities and require dischargers whose construction projects disturb one acre or more of soil to prepare a SWPPP and file a Notice of Intent (NOI) with the SWRCB. The NOI informs the SWRCB of a particular project and results in the issuance of a Waste Discharger Identification (WDID) number, which is needed to demonstrate compliance with the General Permit.

Los Angeles Municipal Code

Section 64.70 of the LAMC sets forth the City's Stormwater and Urban Runoff Pollution Control Ordinance. The ordinance prohibits the discharge of the following into any storm drain system:

- Any liquids, solids, or gases which by reason of their nature or quantity are flammable, reactive, explosive, corrosive, or radioactive, or by interaction with other materials could result in fire, explosion or injury.
- Any solid or viscous materials, which could cause obstruction to the flow or operation of the storm drain system.
- Any pollutant that injures or constitutes a hazard to human, animal, plant, or fish life, or creates a public nuisance.
- Any noxious or malodorous liquid, gas, or solid in sufficient quantity, either singly or by interaction with other materials, which creates a public nuisance, hazard to life, or inhibits authorized entry of any person into the storm drain system.
- Any medical, infectious, toxic or hazardous material or waste.

Additionally, unless otherwise permitted by a NPDES permit, the ordinance prohibits industrial and commercial developments from discharging untreated wastewater or untreated runoff into the storm drain system. Furthermore, the ordinance prohibits trash or any other abandoned objects/materials from being deposited such that they could be carried into the storm drains. Lastly, the ordinance not only makes it a crime to discharge pollutants into the storm drain system and imposes fines on violators, but also gives City public officers the authority to issue citations or arrest business owners or residents who deliberately and knowingly dump or discharge hazardous chemicals or debris into the storm drain system.

Earthwork activities, including grading, are governed by the Los Angeles Building Code, which is contained in LAMC, Chapter IX, Article 1. Specifically, Section 91.7013 includes regulations pertaining to erosion control and drainage devices, and Section 91.7014 includes general construction requirements, as well as requirements regarding flood and mudflow protection.

Low Impact Development (LID)

In October 2011, the City of Los Angeles passed an ordinance (Ordinance No. 181,899) amending LAMC Chapter VI, Article 4.4, Sections 64.70.01 and 64.72 by imposing rainwater Low Impact Development (LID) strategies on projects that require building permits. The LID ordinance became effective on May 12, 2012.

LID is a stormwater management strategy with goals to mitigate the impacts of increased runoff and stormwater pollution as close to its source as possible. LID promotes the use of

natural infiltration systems, evapotranspiration, and the reuse of stormwater. The goal of these LID practices is to remove nutrients, bacteria, and metals from stormwater while also reducing the quantity and intensity of stormwater flows. Through the use of various infiltration strategies, LID is aimed at minimizing impervious surface area. Where infiltration is not feasible, the use of bioretention, rain gardens, green roofs, and rain barrels that will store, evaporate, detain, and/or treat runoff may be used.⁹

The intent of the City of Los Angeles LID standards is to:

- Require the use of LID practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff;
- Reduce stormwater/urban runoff while improving water quality;
- Promote rainwater harvesting;
- Reduce offsite runoff and provide increased groundwater recharge;
- Reduce erosion and hydrologic impacts downstream; and
- Enhance the recreational and aesthetic values in our communities.

The City of Los Angeles Bureau of Sanitation, Watershed Protection Division has adopted the LID standards as issued by the LARWQCB and the City of Los Angeles Department of Public Works. The LID Ordinance conforms to the regulations outlined in the NPDES Permit.

2.3. GROUNDWATER

Board Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties

As noted above, and as required by the CWC, the LARWQCB has adopted the Basin Plan. Specifically, the Basin Plan designates beneficial uses for surface and groundwaters, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's anti-degradation policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.

The Basin Plan is a resource for the Regional Board and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

⁹ City of Los Angeles. "Development Best Management Practices Handbook." May, 2016

Safe Drinking Water Act (SDWA)

The Federal Safe Drinking Water Act, established in 1974, sets drinking water standards throughout the country and is administered by the USEPA. The drinking water standards established in the SDWA are referred to as the National Primary Drinking Water Regulations (Primary Standards, Title 40, CFR Part 141) and the National Secondary Drinking Water Regulations (Second Standards, 40 CFR Part 143). California passed its own Safe Drinking Water Act in 1986 that authorizes the State's Department of Health Services (DHS) to protect the public from contaminants in drinking water by establishing maximum contaminants levels (MCLs), as set forth in the California Code of Regulations (CCR), Title 22, Division 4, Chapter 15, that are at least as stringent as those developed by the USEPA, as required by the federal SDWA.

California Water Plan

The California Water Plan (the Plan) provides a framework for water managers, legislators, and the public to consider options and make decisions regarding California's water future. The Plan, which is updated every five years, presents basic data and information on California's water resources including water supply evaluations and assessments of agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. The Plan also identifies and evaluates existing and proposed statewide demand management and water supply augmentation programs and projects to address the State's water needs.

The goal for the California Water Plan Update is to meet Water Code requirements, receive broad support among those participating in California's water planning, and be a useful document for the public, water planners throughout the state, legislators and other decision-makers.

3. ENVIRONMENTAL SETTING

3.1. SURFACE WATER HYDROLOGY

3.1.1. REGIONAL

The Project Site is located within the Ballona Creek Watershed (Watershed) in the Los Angeles Basin. The Watershed covers approximately 130 square miles in the coastal plain of the Los Angeles Basin. Its boundaries are the Santa Monica Mountains to the north, the Harbor Freeway (110) to the east, and the Baldwin Hills to the south. The watershed includes the cities of Beverly Hills, West Hollywood, portions of the cities of Los Angeles, Culver City, Inglewood and Santa Monica, unincorporated areas of Los Angeles County, and areas under the jurisdiction of Caltrans.

The watershed is highly developed: residential (64%), industrial (4%), vacant/open space (17%), and commercial (8%) are the predominant land uses. Overall, 49% of the watershed is covered by roads, rooftops and other impervious surfaces.

Ballona Creek flows as an open channel for just under 10 miles from mid-Los Angeles (south of Hancock Park) through Culver City, reaching the Pacific Ocean at Playa del Rey (Marina del Rey Harbor). The Estuary portion (from Centinela Avenue to the outlet) is soft bottomed, while the remainder of the creek is lined in concrete. Ballona Creek is fed by a network of underground storm drains, which reaches north into Beverly Hills and West Hollywood. Major tributaries of the Creek and Estuary include Centinela Creek, Sepulveda Channel, and Benedict Canyon Channel.¹⁰ Refer to Figure 1 for Ballona Creek Watershed Map.

3.1.2. ON SITE

The Project Site is approximately 53,556 sq. ft. (1.229 acres) and is predominantly made up of classroom buildings and hardscape. The parking structure on the north border of the project site has a sports court and recreation field on the roof. Lastly, there two at-grade playgrounds.

Generally, the Project Site slopes from north to south approximately 5.5’ with the northeast corner being the high point and the southeast corner being the low point. Within the Project Site, there are various area drains and roof downspouts that collect stormwater and direct it to an underground structure located near drive entry at the southern border. It appears overflow from the underground structure discharges to the curb face along the Lexington Avenue frontage. The existing Project Site has been analyzed as 1 drainage area. Table 1 below shows the existing volumetric flow rate generated by a 50-year storm event.

Table 1- Existing Drainage Stormwater Runoff Calculations		
Drainage Area	Area (Acres)	Q50 (cfs) (volumetric flow rate measured in cubic feet per second)
DA-1	1.229	3.88
TOTAL	1.229	3.88

3.2. SURFACE WATER QUALITY

3.2.1. REGIONAL

As described above, the Project Site lies within the Ballona Creek Watershed. Constituents of concern listed for Ballona Creek under California’s Clean Water Act Section 303(d) List include cadmium (sediment), coliform bacteria, copper (dissolved), cyanide, lead, selenium, toxicity, trash, viruses (Enteric), and zinc.¹¹

¹⁰ <http://www.ladpw.org/wmd/watershed/bc/>

¹¹ https://www.waterboards.ca.gov/water_issues/programs/tmdl/2010state_ir_reports/category5_report.shtml;

3.2.2. LOCAL

In general, urban stormwater runoff occurs following precipitation events, with the volume of runoff flowing into the drainage system depending on the intensity and duration of the rain event. Contaminants that may be found in stormwater from developed areas include sediments, trash, bacteria, metals, nutrients, organics and pesticides. The source of contaminants includes surface areas where precipitation falls, as well as the air through which it falls. Contaminants on surfaces such as roads, maintenance areas, parking lots, and buildings, which are usually contained in dry weather conditions, may be carried by rainfall runoff into drainage systems. The City typically installs catch basins with screens to capture debris before entering the storm drain system. In addition, the City conducts routine street cleaning operations, as well as periodic cleaning and maintenance of catch basins, to reduce stormwater pollution within the City.

3.2.3. ON SITE

A preliminary site investigation indicated that existing Best Management Practices (BMPs) are present. Refer to Figure 2 for the existing on-site drainage pattern and location of existing underground drainage structure.

3.3. GROUNDWATER HYDROLOGY

3.3.1. REGIONAL

Groundwater use for domestic water supply is a major beneficial use of groundwater basins in Los Angeles County. The City of Los Angeles overlies the Los Angeles Coastal Plain Groundwater Basin (Basin). The Basin is comprised of the Hollywood, Santa Monica, Central, and West Coast Groundwater Subbasins. Groundwater flow in the Basin is generally south-southwesterly and may be restricted by natural geological features. Replenishment of groundwater basins occurs mainly by percolation of precipitation throughout the region via permeable surfaces, spreading grounds, and groundwater migration from adjacent basins, as well as injection wells designed to pump freshwater along specific seawater barriers to prevent the intrusion of salt water. Refer to Figure 3 for the groundwater basin exhibit.

3.3.2. LOCAL

The Project Site specifically overlies the Hollywood Subbasin. The Hollywood Subbasin is bounded on the north by the Santa Monica Mountains and the Hollywood fault, on the east by the Elysian Hills, on the west by the Inglewood fault zone, and on the south by the La Brea high, formed by an anticline that brings impermeable rocks close to the surface.¹²

¹² https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Groundwater-Management/Bulletin-118/Files/2003-Basin-Descriptions/4_011_02_HollywoodSubbasin.pdf

Groundwater in the Subbasin is replenished by percolation of precipitation and stream flow from the Santa Monica Mountains to the north. Over time, urbanization has decreased the amount of pervious surfaces limiting natural recharge through direct percolation.

3.3.3. ON-SITE

The existing site is approximately 96 percent impervious. The Project Site is approximately 53,556 sq. ft. (1.229 acres) and is predominantly made up of classroom buildings and hardscape. The parking structure on the north border of the project site has a sports court and recreation field on the roof. Lastly, there two at-grade playgrounds.

As described in the Geotechnical Engineering Investigation Report by Geotechnologies, Inc., groundwater was encountered during exploration at depths of 25-27 feet below the ground surface, which relates to elevations 286-288 feet. The Seismic Hazard Zone Report by the California Geological Survey indicated the historically highest groundwater level in the area is roughly 40 feet beneath the ground surface.¹³

Considering the historic high groundwater level at a depth of roughly 40 feet, the depth to groundwater encountered in the borings at 25-27 feet, and the depth of the proposed structure, groundwater is unlikely to be encountered during construction. However, it is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the immediate site vicinity.

3.4. GROUNDWATER QUALITY

3.4.1. REGIONAL

As stated above, the City of Los Angeles overlies the Los Angeles Coastal Plain Groundwater Basin, which falls under the jurisdiction of the LARWQCB. According to LARWQCB's Basin Plan, water quality objectives applying to all ground waters of the region include bacteria, chemical constituents and radioactivity, mineral quality, nitrogen (nitrate, nitrite), and taste and odor.¹⁴

3.4.2. LOCAL

As stated above, the Project Site specifically overlies the Hollywood Subbasin. The City of Beverly Hills is the only water purveyor with drinking water wells in this groundwater basin. Based on historical and current treatment provided by the City of Beverly Hills the

¹³ Geotechnical Engineering Investigation – Proposed Adaptive Re-Use Development– 1200-1210 North Cahuenga Boulevard, 6337-6351 West Lexington, and 6332-6356 West La Mirada Avenue Los Angeles, California, September 24, 2021

¹⁴http://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/electronics_documents/Final%20Chapter%203%20Text.pdf

constituents of concern (COCs) are iron, manganese, arsenic, color, odor, VOC's, and TDS.¹⁵

3.4.3. ON-SITE

The existing Project Site is predominantly made up of classroom buildings and concrete walkways apart from a few landscape planters and two small playgrounds. Therefore, the existing Project Site does not contribute to groundwater recharge, and as a result does not contribute to groundwater pollution or otherwise adversely impact groundwater quality.

4. SIGNIFICANCE THRESHOLDS

4.1. SURFACE WATER HYDROLOGY

In accordance with Appendix G of the State of California's CEQA Guidelines, a Project would have a significant impact related to surface water hydrology if it would:

- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would: Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;
- Result in substantial erosion or siltation on- or off-site;
- Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

In assessing impacts related to surface water hydrology in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City's 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide identifies the following factors to evaluate surface water hydrology:

- Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;
- Substantially reduce or increase the amount of surface water in a water body; or

¹⁵ <https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/G13.pdf>

- Result in a permanent, adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.

4.2. SURFACE WATER QUALITY

In accordance with Appendix G of the State of California’s CEQA Guidelines, a Project would have a significant impact related to surface water quality if it would:

- Violate any water quality standard or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;
- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
 - Result in substantial erosion or siltation on- or off-site;
 - Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
- In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan;

In assessing impacts related to surface water quality in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City’s 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide states that a project would normally have a significant impact on surface water quality if it would result in discharges that would create pollution, contamination or nuisance, as defined in Section 13050 of the CWC or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

The CWC includes the following definitions:

- “Pollution” means an alteration of the quality of the waters of the state to a degree which unreasonably affects either of the following: 1) the waters for beneficial uses or 2) facilities which serve these beneficial uses. “Pollution” may include “Contamination”.
- “Contamination” means an impairment of the quality of the waters of the state by waste to a degree, which creates a hazard to the public health through poisoning or through the spread of disease. “Contamination” includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected.

- “Nuisance” means anything which meets all of the following requirements: 1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; 2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; and 3) occurs during, or as a result of, the treatment or disposal of wastes.¹⁶

4.3. GROUNDWATER HYDROLOGY

In accordance with Appendix G of the State of California’s CEQA Guidelines, a Project would have a significant impact related to groundwater hydrology if it would:

- Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

In assessing impacts related to groundwater hydrology in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City’s 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide identifies the following factors to evaluate groundwater hydrology:

- Change potable water levels sufficiently to:
 - Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/winter peaking, or to respond to emergencies and drought;
 - Reduce yields of adjacent wells or well fields (public or private); or
 - Adversely change the rate or direction of flow of groundwater; or
- Result in demonstrable and sustained reduction of groundwater recharge capacity.

4.4. GROUNDWATER QUALITY

In accordance with Appendix G of the State of California’s CEQA Guidelines, a Project would have a significant impact related to groundwater quality if it would:

¹⁶ City of Los Angeles, [L.A. CEQA Thresholds Guide](https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/A07.pdf). 2006
<https://planning.lacity.org/eir/CrossroadsHwd/deir/files/references/A07.pdf> Accessed November 30, 2022.

- Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;
- Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan;

In assessing impacts related to groundwater quality in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City’s 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide identifies the following factors to evaluate groundwater quality:

- Affect the rate or change the direction of movement of existing contaminants;
- Expand the area affected by contaminants;
- Result in an increased level of groundwater contamination (including that from direct percolation, injection or salt water intrusion); or
- Cause regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations (CCR), Title 22, Division 4, and Chapter 15 and in the Safe Drinking Water Act.

5. METHODOLOGY

5.1. SURFACE WATER HYDROLOGY

The Project Site is located within the City of Los Angeles, and drainage collection, treatment and conveyance are regulated by the City. Per the City’s Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works (LACDPW) Hydrology Manual as its basis of design for storm drainage facilities. The LACDPW Hydrology Manual requires projects to have drainage facilities that meet the Urban Flood level of protection. The Urban Flood is runoff from a 25-year frequency design storm falling on a saturated watershed. A 25-year frequency design storm has a probability of 1/25 of being equaled or exceeded in any year. The *L.A. CEQA Thresholds Guide*, however, establishes the 50-year frequency design storm event as the threshold to analyze potential impacts on surface water hydrology as a result of development. To provide a more conservative analysis, this report analyzes the larger storm event threshold, i.e., the 50-year frequency design storm event.

The Modified Rational Method was used to calculate storm water runoff. The “peak” (maximum value) runoff for a drainage area is calculated using the formula, $Q = CIA$

Where,

Q = Volumetric flow rate (cfs)

C = Runoff coefficient (dimensionless)

I = Rainfall Intensity at a given point in time (in/hr)

A = Basin area (acres)

The Modified Rational Method assumes that a steady, uniform rainfall rate will produce maximum runoff when all parts of the basin area are contributing to outflow. This occurs when the storm event lasts longer than the time of concentration. The time of concentration (Tc) is the time it takes for rain in the most hydrologically remote part of the basin area to reach the outlet.

The method assumes that the runoff coefficient (C) remains constant during a storm. The runoff coefficient is a function of both the soil characteristics and the percentage of impervious surfaces in the drainage area.

LACDPW has developed a time of concentration calculator, Hydrocalc, to automate time of concentration calculations as well as the peak runoff rates and volumes using the Modified Rational Method design criteria as outlined in the Hydrology Manual. The data input requirements include: sub-area size, soil type, land use, flow path length, flow path slope and rainfall isohyet. The Hydrocalc Calculator was used to calculate the storm water peak runoff flow rate for the Project conditions by evaluating an individual sub-area independent of all adjacent subareas. See Figure 4 for the Hydrocalc Calculator results and Figure 5 for the Isohyet Map.

5.2. SURFACE WATER QUALITY

5.2.1. CONSTRUCTION

Construction BMPs will be designed and maintained as part of the implementation of the SWPPP in compliance with the Construction General Permit. The SWPPP shall begin when construction commences, before any site clearing and grubbing or demolition activity. During construction, the SWPPP will be referred to regularly and amended as changes occur throughout the construction process. The Notice of Intent (NOI), Amendments to the SWPPP, Annual Reports, Rain Event Action Plans (REAPs), and Non-Compliance Reporting will be posted to the State's SMARTS website in compliance with the requirements of the Construction General Permit. Refer to Exhibit 1 for typical SWPPP BMPs.

5.2.2. OPERATION

The Project will be required to implement the City's LID standards.¹⁷ Under section 3.1.3. of the LID Manual, post-construction stormwater runoff from a new development must be infiltrated, evapotranspired, captured and used, and/or treated through high efficiency BMPs onsite for at least the volume of water produced by the greater of the 85th percentile

¹⁷ The Development Best Management Practices Handbook, Part B Planning Activities, 5th edition was adopted by the City of Los Angeles, Board of Public Works on May 9, 2016 to reflect Low Impact Development (LID) requirements that took effect May 12, 2012.

storm or the 0.75 inch storm event. The LID Manual prioritizes the selection of BMPs used to comply with stormwater mitigation requirement. The order of priority is:

1. Infiltration Systems
2. Stormwater Capture and Use
3. High Efficient Biofiltration/Bioretenion Systems
4. Combination of Any of the Above

Feasibility screening delineated in the LID manual is applied to determine which BMPs will best suit the Project. Specifically, LID guidelines require that infiltration systems maintain at least 10 feet of clearance to the groundwater, property line, and any building structure.

The historic high groundwater level is roughly 40 feet below the ground surface.¹⁸ Additionally, it is the opinion of the soils engineer that the underlying soils will have poor infiltration capabilities, which would result in a perched water condition. Therefore, the soils engineer has determined that infiltration is infeasible. In addition, the Phase 1 ESA performed by Partner Engineering and Science, Inc.¹⁹ concluded that a recognized environmental condition (REC) was present at a nearby site. According to information obtained from the SWRCB GeoTracker website, an open Cleanup Program site identified as Paragon Cleaners at 1310 Vine Street, is located approximately 750 feet to the northeast of the hydrologically upgradient of the subject property. Past releases of chlorinated solvents, including tetrachloroethylene (PCE), at this site have resulted in subsurface groundwater and soil impacts at the Paragon Cleaners Site. Based on review of the most recent groundwater monitoring report (dated July 8, 2020), PCE has migrated in groundwater and has impacted groundwater underlying the subject Property.²⁰ Due to recommendations from the soils engineer and conclusions from the Phase 1 Environmental Site Assessment, infiltration will not be feasible for the Project.

Based on the size of the Project Site, the LID system implemented would be required to mitigate 27,207 gallons of runoff generated by the design storm event. See Figure 6 for LID calculations.

Capture and use would be the BMP implemented and approximately 5,692 square feet of landscaping would be provided to justify the feasibility of a stormwater Capture and Use system per LID guidelines.

According to the City's LID Handbook, the mitigated volume generated from the greater of the 85th percentile storm and the 0.75-inch storm event is calculated as follows:

¹⁸ Geotechnical Engineering Investigation – Proposed Adaptive Re-Use Development– 1200-1210 North Cahuenga Boulevard, 6337-6351 West Lexington, and 6332-6356 West La Mirada Avenue Los Angeles, California, September 24, 2021

¹⁹ Phase I Environmental Site Assessment Report, by Partner Engineering and Science, Inc., dated September 24, 2020.

²⁰ Ibid.

$$V_{\text{design}} \text{ (gallons)} = (85\text{th percentile or } 0.75 \text{ inch} * 7.48 \text{ gallons/cubic foot}) * \text{Catchment Area (sq. ft.)}$$

Where:

$$\text{Catchment Area} = (\text{Impervious Area} * 0.9) + [(\text{Pervious Area} + \text{Undeveloped Area}) * 0.1]$$

For catchment areas given in acres, multiply the above equation by 43,560 sq. ft./acre.

5.3. GROUNDWATER

The significance of this Project as it relates to the level of the underlying groundwater table of the Hollywood Groundwater Subbasin included a review of the following considerations:

Analysis and Description of the Project's Existing Condition

- Identification of the Hollywood Subbasin as the underlying groundwater basin, and description of the level, quality, direction of flow, and existing uses for the water;
- Description of the location, existing uses, production capacity, quality, and other pertinent data for spreading grounds and potable water wells in the vicinity (usually within a one mile radius), and;
- Area and degree of permeability of soils on the Project Site, and;

Analysis of the Proposed Project Impact on Groundwater Level

- Description of the rate, duration, location and quantity of extraction, dewatering, spreading, injection, or other activities;
- The projected reduction in groundwater resources and any existing wells in the vicinity (usually within a one mile radius); and
- The projected change in local or regional groundwater flow patterns.

In addition, this report discusses the impact of both existing and proposed activities at the Project Site on the groundwater quality of the underlying Hollywood Subbasin.

Short-term groundwater quality impacts could potentially occur during construction of the Project as a result of soil being exposed to construction materials, wastes, and spilled materials. These potential impacts are qualitatively assessed.

6. PROJECT IMPACT ANALYSIS

6.1. CONSTRUCTION

6.1.1. SURFACE WATER HYDROLOGY

Construction activities for the Project would include demolition of the existing buildings and hardscape surfaces. The deepest portion of excavation is anticipated to be approximately 22 feet below the adjacent grade for subterranean parking. Additionally, the Project will consist of building up of the structure, and constructing hardscape and landscape around the buildings. The mass excavation for the proposed subterranean parking is estimated to generate approximately 12,678 cubic yards of net export. These activities have the potential to temporarily alter existing drainage patterns and flows on the Project Site by exposing the underlying soils, modifying flow direction, and making the Project Site temporarily more permeable. Also, exposed and stockpiled soils could be subject to erosion and conveyance into nearby storm drains during storm events. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff.

As noted above, the Project would implement an Erosion Control Plan that specifies BMPs and erosion control measures to be used during construction to manage runoff flows and prevent pollution. BMPs would be designed to reduce runoff and pollutant levels in runoff during construction. The Erosion Control Plan measures are designed to (and would in fact) contain and treat, as necessary, stormwater or construction watering on the Project Site so runoff does not impact off-site drainage facilities or receiving waters. Construction activities are temporary and flow directions and runoff volumes during construction will be controlled.

In addition, the Project would be required to comply with all applicable City grading permit regulations that require necessary approvals, and inspections to reduce sedimentation and erosion. Thus, through mandatory compliance with all NPDES General Construction Permit requirements, mandatory implementation of BMPs, such as perimeter control, vehicle tracking, runoff water sampling, dust control, street sweeping...etc., and mandatory compliance with applicable City grading regulations, the Project would not substantially alter the Project Site drainage patterns in a manner that would result in substantial erosion, siltation, or flooding on- or off-site. Therefore, construction-related impacts to surface water hydrology would be less than significant.

6.1.2. SURFACE WATER QUALITY

Construction activities such as earth moving, maintenance/operation of construction equipment, potential dewatering, and handling/storage/disposal of materials could contribute to pollutant loading in stormwater runoff.

As discussed in Section 6.1.3 below, the Project is not expected to require dewatering during construction. Dewatering operations are practices that discharge non-stormwater,

such as groundwater, that must be removed from a work location to proceed with construction into the drainage system. Discharges from dewatering operations can contain high levels of fine sediments, which if not properly treated, could lead to exceedance of the NPDES requirements. If groundwater is encountered during construction, temporary pumps and filtration would be required to be utilized in compliance with the NPDES permit. Any such temporary system would be required to comply with all relevant NPDES requirements related to construction and discharges from dewatering operations.

With implementation of the Erosion Control Plan, site-specific BMPs would reduce or eliminate the discharge of potential pollutants from stormwater runoff. In addition, the Project Applicant would be required to be comply with City grading permit regulations and inspections to reduce sedimentation and erosion. Construction of the Project would not result in discharges that would cause: (1) pollution which would alter the quality of the water of the State (i.e., Ballona Creek) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the water of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes. Furthermore, construction of the Project would not result in discharges that would cause regulatory standards to be violated in the Ballona Creek Watershed. Project construction would not provide substantial additional sources of polluted runoff, nor would it conflict with the implementation of a water quality control plan. In addition, implementation of the Erosion Control Plan would ensure that construction activities would not result in substantial erosion or siltation on- or off-site, or risk release of other pollutants due to inundation. Therefore, temporary construction-related impacts on surface water quality would be less than significant.

6.1.3. GROUNDWATER HYDROLOGY

As stated above, construction activities for the Project would include excavating down approximately 22 feet for subterranean parking, building up the structure, and hardscape and landscape around the structure. Based on the Seismic Hazard Zone Report, the historic high groundwater level in the vicinity of the Project Site is roughly 40 feet below grade.²¹ The Project's proposed excavation would not reach this depth; therefore, groundwater is not expected to be encountered during construction that would require either temporary or permanent dewatering operations. If groundwater is encountered during construction, temporary pumps and filtration would be utilized in compliance with all applicable regulations and requirements, including with all relevant NPDES requirements related to construction and discharges from dewatering operations. Therefore, Project construction would not substantially deplete groundwater supplies in a manner that would result in a net deficit in aquifer volume or lowering of the local groundwater table and impacts related to groundwater would be less than significant.

²¹ Geotechnical Engineering Investigation – Proposed Adaptive Re-Use Development– 1200-1210 North Cahuenga Boulevard, 6337-6351 West Lexington, and 6332-6356 West La Mirada Avenue Los Angeles, California, September 24, 2021

6.1.4. GROUNDWATER QUALITY

As discussed above, the Project would include excavations for subterranean parking. The Project would also result in a net export of approximately 12,678 cubic yards of soil. Any contaminated soils found would be captured within that volume of excavated material, removed from the Project Site, and remediated at an approved disposal facility in accordance with regulatory requirements.

During on-site grading and building construction, hazardous materials, such as fuels, paints, solvents, and concrete additives, could be used and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous wastes could increase the opportunity for hazardous materials releases into groundwater. Compliance with all applicable federal, state, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. In addition, as there are no groundwater production wells or public water supply wells within one mile of the Project Site, construction activities would not be anticipated to affect such existing wells. Therefore, the Project would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade groundwater quality. As construction activities are not expected to encounter existing groundwater supplies, those activities would not conflict with the implementation of a sustainable groundwater management plan. Therefore, impacts on groundwater quality would be less than significant.

6.2. OPERATION

6.2.1. SURFACE WATER HYDROLOGY

The Project will increase the permeability of the site due to an increase in planter areas from 4 percent to 10 percent. All building roof drains will be directed to underground drainage devices, which will eliminate the potential for run-off from the site at the surface level. Additionally, all hardscape surfaces will sheet flow toward nearby area drains and be directed to underground drainage devices capable of treated and storing the 85th percentile rain event. (Refer to Figure 7 for illustration of proposed drainage concept).

Table 2 shows the proposed 50-year frequency design storm event peak flow rate within the Project Site. Table 3 shows a comparison of the pre- and post-peak flow rates, and indicates that there would be a decrease in stormwater runoff.

Table 2- Proposed Drainage Stormwater Runoff Calculations		
Drainage Area	Area (Acres)	Q50 (cfs) (volumetric flow rate measured in cubic feet per second)
DA-1	1.229	3.76
TOTAL	1.229	3.76

Table 3 – Existing and Proposed Drainage Stormwater Runoff Comparison			
Project Site Area (Acres)	Pre-Project Q50 (cfs) (volumetric flow rate measured in cubic feet per second)	Post-Project Q50 (cfs) (volumetric flow rate measured in cubic feet per second)	Incremental Decrease from Existing to Proposed Condition
1.229	3.88	3.76	- 3.09%

Based on site investigations, it appears the existing site stormwater runoff is collected through various site and roof drains and directed to an underground structure located near the drive entry off Lexington Avenue. The post-Project condition will manage stormwater flow from the building roofs through roof drains. Additionally, the ground level will be graded such that any sheet flow will be directed to site drains. The collected stormwater will be piped underground to a below-grade storage tank located within the central courtyard. Therefore, the Project would not cause flooding during a 50-year storm event or result in a permanent adverse change to the movement of surface water on the Project Site.

As noted above, the Project would not increase the rate or volume of stormwater runoff. In other words, the Project would not substantially reduce or increase the amount of surface water discharged into the existing infrastructure or any waterbody, and would not substantially alter the pattern or quantity of runoff. Therefore, impacts related to stormwater infrastructure improvements would be less than significant.

The LID requirements for the Project Site would outline the stormwater treatment post-construction BMPs required to control pollutants associated with storm events up to the 85th percentile storm event, per the City’s Stormwater Program. The Project BMPs will control stormwater runoff with no increase in runoff resulting from the Project. Refer to Exhibit 2 for typical LID BMPs. The Project would not impact existing storm drain infrastructure serving the Project Site and runoff would continue to follow the same discharge paths and drain to the same stormwater systems.

The Project would not trigger any of the thresholds listed in Section 4.1. Therefore, potential operational impacts to site surface water hydrology would be less than significant.

6.2.2. SURFACE WATER QUALITY

The Project Site will not increase concentrations of the items listed as constituents of concern for the Ballona Creek Watershed.

Due to the incorporation of the required LID BMP(s)²³, operation of the Project would not result in discharges that would cause: (1) pollution which would alter the quality of the waters of the State (i.e., Ballona Creek) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes.

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. Anticipated and potential pollutants generated by the Project are sediment, nutrients, pesticides, metals, pathogens, and oil and grease. The Project does not have an adverse impact on water quality, and would in fact improve the quality of on-site flows due to the introduction of new BMPs that would collect, treat, and discharge flows from the Project Site (which are not being treated under existing conditions). Also, it is anticipated that the Project and other future development projects would also be subject to LID requirements and implementation of measures to comply with TMDLs.

Furthermore, operation of the Project would not result in discharges that would cause regulatory standards to be violated. The existing Project Site is approximately 96 percent impervious. The Project will reduce the percentage of impervious surface. Additionally, a portion of the Project Site will be allocated for stormwater BMPs specifically intended to control and treat stormwater runoff in compliance with LID requirements. As stated above, it appears the existing site stormwater runoff is collected in an underground structure near the drive entry off Lexington Avenue prior to discharging to the curb face. The Project would include the installation of LID BMPs, which would mitigate at minimum the first flush or the equivalent of the greater between the 85th percentile storm and first 0.75-inch of rainfall for any storm event. The installed BMP systems will be designed with an internal bypass or overflow system to prevent upstream flooding due to large storm events. The stormwater which bypasses the BMP systems would discharge to an approved discharge point in the public right-of-way. As such, the Project would not interfere with the implementation of a water quality control plan.

Therefore, with the implementation of the SWPPP and LID BMPs, there will be no operational impacts on surface water quality.

²³ https://www.lastormwater.org/wp-content/files_mf/lidmanualfinal.pdf

6.2.3. GROUNDWATER HYDROLOGY

Since the Project will reduce the imperviousness of the site, the potential for groundwater recharge would, be improved. Therefore, the Project's potential impact on groundwater recharge is less than significant.

As discussed above, Project development would require excavations of up to 22 feet for the subterranean parking. As described in the Geotechnical Investigation for the Project Site, the historic high groundwater level in the vicinity of the Project site is approximately 40 feet below grade. Due to the fact that the Project's excavation would not likely reach this depth, it is expected that groundwater would not be encountered during construction that would require either temporary or permanent dewatering operations²⁴. If groundwater is encountered during construction, temporary pumps and filtration would be utilized in compliance with the NPDES permit. The temporary system would comply with all relevant NPDES requirements related to construction and discharges from dewatering operations. Furthermore, there are no existing wells or spreading grounds within one mile of the Project Site and the Project would not include new injection or supply wells.

Therefore, operation of the Project would result in a less than significant impact on groundwater hydrology, including groundwater levels.

6.2.4. GROUNDWATER QUALITY

The Project does not include the installation or operation of water wells, or any extraction or recharge system that is in the vicinity of the coast, an area of known groundwater contamination or seawater intrusion, a municipal supply well or spreading ground facility.

Operational activities which could affect groundwater quality include spills of hazardous materials and leaking underground storage tanks. No underground storage tanks are currently operated or anticipated to be operated by the Project. In addition, while the development of new building facilities would slightly increase the use of on-site hazardous materials as described above, compliance with all applicable existing regulations at the Project Site regarding the handling and potentially required cleanup of hazardous materials would prevent the Project from affecting or expanding any potential areas of contamination, increasing the level of contamination, or causing regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. Furthermore, as described above, operation of the Project would not require extraction from the groundwater supply based on the depth of excavation for the proposed uses and the depth of groundwater below the Project Site.

The Project is not anticipated to result in violations of any water quality standards or waste discharge requirements or otherwise substantially degrade groundwater quality.

²⁴ Geotechnical Engineering Investigation – Proposed Adaptive Re-Use Development– 1200-1210 North Cahuenga Boulevard, 6337-6351 West Lexington, and 6332-6356 West La Mirada Avenue Los Angeles, California, September 24, 2021

Additionally, the Project does not involve drilling to or through a clean or contaminated aquifer. Therefore, the Project's potential impact on groundwater recharge is less than significant.

6.3. CUMULATIVE IMPACT ANALYSIS

6.3.1. SURFACE WATER HYDROLOGY

The geographic context for the cumulative impact analysis on surface water hydrology is the Ballona Creek Watershed. The Project in conjunction with forecasted growth in the Ballona Creek Watershed could cumulatively increase stormwater runoff flows. However, as noted above, the Project would have no net impact on stormwater flows. Also, in accordance with City requirements, related projects and other future development projects would be required to implement BMPs to manage stormwater in accordance with LID guidelines. The City of Los Angeles Department of Public Works would review each future development project on a case-by-case basis to ensure sufficient local and regional infrastructure is available to accommodate stormwater runoff. Similar to the Project, related projects are located on sites that are fully developed and impervious. Any new development on the related project sites would need to implement LID BMPs to meet the City's requirements. Implementation of the LID BMPs would, at a minimum, maintain existing runoff conditions. Therefore, the impact of the Project combined with the related projects on surface water hydrology would be less than significant.

6.3.2. SURFACE WATER QUALITY

Future growth in the Ballona Creek Watershed would be subject to NPDES requirements relating to water quality for both construction and operation. In addition, since the Project is located in a highly urbanized area, future land use changes or development are not likely to cause substantial changes in regional surface water quality. As noted above, the Project does not have an adverse impact on water quality, and would in fact improve the quality of on-site flows due to the introduction of new BMPs that would collect, treat, and discharge flows from the Project Site (which are not being treated under existing conditions). Also, it is anticipated that the Project and other future development projects would also be subject to LID requirements and implementation of measures to comply with TMDLs. Increases in regional controls associated with other elements of the MS4 Permit would improve regional water quality over time. The Project combined with the related projects would comply with all applicable laws, rules, and regulations, and therefore, cumulative impacts to surface water quality would be less than significant.

6.3.3. GROUNDWATER HYDROLOGY

The geographic context for the cumulative impact analysis on groundwater level is the Hollywood Subbasin. The Project in conjunction with forecasted growth in the region above the Hollywood Subbasin could cumulatively increase groundwater demand. However, as noted above, no water supply wells, spreading grounds, or injection wells are located within a one mile radius of the Project Site and the Project would not have an

adverse impact on groundwater level. Any calculation of the extent to which the related projects would extract or otherwise directly utilize groundwater would be speculative. Therefore, potential cumulative impacts associated with the Project on groundwater hydrology would be less than significant.

Furthermore, as previously discussed, implementation of the Project would result in a reduction in impervious surface area. Development of the related projects could result in changes in impervious surface area within their respective project sites. While any calculation of the extent to which the related projects would increase or decrease impervious or pervious surfaces that might affect groundwater hydrology would be speculative, the development of such related projects would be subject to review and approval pursuant to all applicable regulatory requirements, including any required mitigation of potential groundwater hydrology impacts. In addition, as the related projects are located in a highly urbanized area, any potential reduction in groundwater recharge due to the overall net change in impervious area within the area encompassed by the related project sites would be minimal in the context of the regional groundwater basin, and would thus not result in a significant cumulative effect to groundwater hydrology.

Therefore, cumulative impacts to groundwater hydrology would be less than significant.

6.3.4. GROUNDWATER QUALITY

Future growth in the Hollywood Subbasin would be subject to LARWQCB requirements relating to groundwater quality. In addition, since the Project Site is located in a highly urbanized area, future land use changes or development are not likely to cause substantial changes in regional groundwater quality. As noted above, the Project does not have an adverse impact on groundwater quality. Also, it is anticipated that, like the Project, other future development projects would also be subject to LARWQCB requirements and implementation of BMPs to ensure that COCs are not exceeded. In addition, the Project, and other future development projects must comply with requirements of California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. The Project would comply with all applicable laws, rules, and regulations, therefore cumulative impacts to groundwater quality would be less than significant.

7. LEVEL OF SIGNIFICANCE

Based on the analysis contained in this report, no significant impacts have been identified for surface water hydrology, surface water quality, groundwater hydrology or groundwater quality for this Project.

**FIGURE 7
PROPOSED DRAINAGE EXHIBIT**

Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.
- Plan the project and develop a schedule showing each phase of construction. Clearly show how the rainy season relates

Preservation Of Existing Vegetation EC-2

Description and Purpose

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs, and grasses that protect soil from erosion.

Suitable Applications

Preservation of existing vegetation is suitable for use on most projects. Large project sites often provide the greatest opportunity for use of this BMP. Suitable applications include the following:

- Areas within the site where no construction activity occurs, or occurs at a later date. This BMP is especially suitable to multi year projects where grading can be phased.
- Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
- Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc. These areas are usually designated on the plans, or in the specifications, permits, or environmental documents.
- Where vegetation designated for ultimate removal can be temporarily preserved and be utilized for erosion control and sediment control.

Description and Purpose

An earth dike is a temporary berm or ridge of compacted soil used to divert runoff or channel water to a desired location. A drainage swale is a shaped and sloped depression in the soil surface used to convey runoff to a desired location. Earth dikes and drainage swales are used to divert off site runoff around the construction site, divert runoff from stabilized areas and disturbed areas, and direct runoff into sediment basins or traps.

Suitable Applications

Earth dikes and drainage swales are suitable for use, individually or together, where runoff needs to be diverted from one area and conveyed to another.

- Earth dikes and drainage swales may be used:
 - To convey surface runoff down sloping land
 - To intercept and divert runoff to avoid sheet flow over sloped surfaces
 - To divert and direct runoff towards a stabilized watercourse, drainage pipe or channel
 - To intercept runoff from paved surfaces
 - Below steep grades where runoff begins to concentrate
 - Along roadways and facility improvements subject to flood drainage

Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations

- None identified.

Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.

The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runoff and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.

Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of precast concrete, steel, or timber. Driven sheet piles are also used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce or eliminate the discharge of potential pollutants to the storm drain system, watercourses, and waters of the United States.

Suitable Applications

These procedures apply to all construction sites near or adjacent to a watercourse or groundwater where permanent and temporary pile driving (impact and vibratory) takes place, including operations using pile shells as well as construction of cast-in-steel-shell and cast-in-drilled-hole piles.

Limitations

None identified.

Implementation

- Use drip pans or absorbent pads during vehicle and equipment operation, maintenance, cleaning, fueling, and storage. Refer to NS-8, Vehicle and Equipment Cleaning, NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.

Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A sediment trap is a containment area where sediment-laden runoff is temporarily detained under quiescent conditions, allowing sediment to settle out or before the runoff is discharged by gravity flow. Sediment traps are formed by excavating or constructing an earthen embankment across a waterway or low drainage area.

Trap design guidance provided in this fact sheet is not intended to guarantee compliance with numeric discharge limits (numeric action levels or numeric effluent limits for turbidity). Compliance with discharge limits requires a thoughtful approach to comprehensive BMP planning, implementation, and maintenance. Therefore, optimally designed and maintained sediment traps should be used in conjunction with a comprehensive system of BMPs.

Suitable Applications

Sediment traps should be considered for use:

- At the perimeter of the site at locations where sediment-laden runoff is discharged offsite.
- At multiple locations within the project site where sediment control is needed.
- Around or upslope from storm drain inlet protection measures.
- Sediment traps may be used on construction projects where the drainage area is less than 5 acres. Traps would be

SE-2 Sediment Basin (for larger areas)

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A gravel bag berm is a series of gravel-filled bags placed on a level contour to intercept sheet flows. Gravel bags pond sheet flow runoff, allowing sediment to settle out, and release runoff slowly as sheet flow, preventing erosion.

Suitable Applications

Gravel bag berms may be suitable:

- As a linear sediment control measure:
 - Below the toe of slopes and erodible slopes
 - As sediment traps at culvert/pipe outlets
 - Below other small cleared areas
 - Along the perimeter of a site
 - Down slope of exposed soil areas
 - Around temporary stockpiles and spoil areas
 - Parallel to a roadway to keep sediment off paved areas
 - Along streams and channels
- As a linear erosion control measure:
 - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways, and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations

Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).

Implementation

- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused, and perhaps save money.
- Inspect potential sediment tracking locations daily.
- Visible sediment tracking should be swept or vacuumed on a daily basis.

Description and Purpose

A sandbag barrier is a series of sand-filled bags placed on a level contour to intercept or to divert sheet flows. Sandbag barriers placed on a level contour pond sheet flow runoff, allowing sediment to settle out.

Suitable Applications

Sandbag barriers may be a suitable control measure for the applications described below. It is important to consider that sand bags are less porous than gravel bags and ponding or flooding can occur behind the barrier. Also, sand is easily transported by runoff if bags are damaged or ruptured. The SWPPP Preparer should select the location of a sandbag barrier with respect to the potential for flooding, damage, and the ability to maintain the BMP.

- As a linear sediment control measure:

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Storm drain inlet protection consists of a sediment filter or an impounding area in, around or upstream of a storm drain, drop inlet, or curb inlet. Storm drain inlet protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Some filter configurations also remove sediment by filtering, but usually the ponding action results in the greatest sediment reduction. Temporary geotextile storm drain inserts attach underneath storm drain grates to capture and filter storm water.

Suitable Applications

- Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas should be protected. Inlet protection should be used in conjunction with other erosion and sediment controls to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.

Limitations

- Drainage area should not exceed 1 acre.
- In general straw bales should not be used as inlet protection.
- Requires an adequate area for water to pond without encroaching into portions of the roadway subject to traffic.
- Sediment removal may be inadequate to prevent sediment discharges in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Active Treatment Systems (ATS) reduce turbidity of construction site runoff by introducing chemicals to stormwater through direct dosing or an electrical current to enhance flocculation, coagulation, and settling of the suspended sediment. Coagulants and flocculants are used to enhance settling and removal of suspended sediments and generally include inorganic salts and polymers (USACE, 2001). The increased flocculation aids in sedimentation and ability to remove fine suspended sediments, thus reducing stormwater runoff turbidity and improving water quality.

Suitable Applications

ATS can reliably provide exceptional reductions of turbidity and associated pollutants and should be considered where turbid discharges to sediment and turbidity sensitive waters cannot be avoided using traditional BMPs. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.

Limitations

Dischargers choosing to utilize chemical treatment in an ATS must follow all guidelines of the Construction General Permit Attachment F – Active Treatment System Requirements. General limitations are as follows:

Stabilized Construction Entrance/Exit TC-1

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

Description and Purpose

A tire wash is an area located at stabilized construction access points to remove sediment from tires and undercarriages and to prevent sediment from being transported onto public roadways.

Suitable Applications

Tire washes may be used on construction sites where dirt and mud tracking onto public roads by construction vehicles may occur.

Limitations

- The tire wash requires a supply of wash water.
- A turnout or doublewide exit is required to avoid having entering vehicles drive through the wash area.
- Do not use where wet tire trucks leaving the site leave the road dangerously slick.

Implementation

- Incorporate with a stabilized construction entrance/exit. See TC-1, Stabilized Construction Entrance/Exit.
- Construct on level ground when possible, on a pad of coarse aggregate greater than 3 in. but smaller than 6 in. A geotextile fabric should be placed below the aggregate.
- Wash rack should be designed and constructed/manufactured for anticipated traffic loads.

TC-1 Stabilized Construction Entrance/Exit

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.

California’s Mediterranean climate, with a short “wet” season and a typically long, hot “dry” season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

Description and Purpose

Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease

Targeted Constituents

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called “cold mix” asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Suitable Applications

Contaminated soil management is implemented on construction projects in highly urbanized or industrial areas where soil contamination may have occurred due to spills, illicit discharges, aerial deposition, past use and leaks from underground storage tanks.

Limitations

Contaminated soils that cannot be treated onsite must be disposed of offsite by a licensed hazardous waste hauler. The presence of contaminated soil may indicate contaminated water as well. See NS-2, Dewatering Operations, for more information.

The procedures and practices presented in this BMP are general. The contractor should identify appropriate practices and procedures for the specific contaminants known to exist or discovered onsite.

Implementation

Most owners and developers conduct pre-construction environmental assessments as a matter of routine. Contaminated soils are often identified during project planning and development with known locations identified in the plans, specifications and in the SWPPP. The contractor should review applicable reports and investigate appropriate call-outs in the

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

Sanitary/Septic Waste Management WM-9

Description and Purpose

Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.

Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

EXHIBIT 2

TYPICAL LID BMPs

Dry Wells

A dry well is defined as an excavated, bored, drilled, or driven shaft or hole whose depth is greater than its width. Drywells are similar to infiltration trenches in their design and function, as they are designed to temporarily store and infiltrate runoff, primarily from rooftops or other impervious areas with low pollutant loading. A dry well may be either a drilled borehole filled with aggregate or a prefabricated storage chamber or pipe segment.

Bioretention

Bioretention stormwater treatment facilities are landscaped shallow depressions that capture and filter stormwater runoff. These facilities function as a soil and plant-based filtration device that removes pollutants through a variety of physical, biological, and chemical treatment processes. The facilities normally consist of a ponding area, mulch layer, planting soils, plantings, and, optionally, a subsurface gravel reservoir layer.

Planter Boxes

Planter boxes are bioretention treatment control measures that are completely contained within an impermeable structure with an underdrain (they do not infiltrate). They are similar to bioretention facilities with underdrains except they are situated at or above ground and are bound by impermeable walls. Planter boxes may be placed adjacent to or near buildings, other structures, or sidewalks.

4.5 CAPTURE AND USE BMPs

Capture and Use refers to a specific type of BMP that operates by capturing stormwater runoff and holding it for efficient use at a later time. On a commercial or industrial scale, capture and use BMPs are typically synonymous with cisterns, which can be implemented both above and below ground. Cisterns are sized to store a specified volume of water with no surface discharge until this volume is exceeded. The primary use of captured runoff is for subsurface drip irrigation purposes. The temporary storage of roof runoff reduces the runoff volume from a property and may reduce the peak runoff velocity for small, frequently occurring storms. In addition, by reducing the amount of stormwater runoff that flows overland into a stormwater conveyance system, less pollutants are transported through the conveyance system into local streams and the ocean. The onsite use of the harvested water for non-potable domestic purposes conserves City-supplied potable water and, where directed to unpaved surfaces, can recharge groundwater in local aquifers.

EXECUTIVE SUMMARY

This Noise Impact Study (Study) analyzes potential short-term and long-term environmental noise impacts associated with the proposed 1200 Cahuenga project (Project), located in the City of Los Angeles (City), California. The proposed Project includes the development of a creative office at 1200 North Cahuenga Boulevard (between La Miranda Avenue and Lexington Avenue), as shown in Figure 1 (on page 2). This Study has been prepared pursuant to the requirements of the California Environmental Quality Act (CEQA).

Findings

In order to analyze the potential noise impacts of Project construction and operations, the existing ambient noise environment at sensitive noise receptors in the vicinity of the Project Site was measured and tabulated for this report.

The key findings of the noise analysis are as follows:

Existing Ambient Noise Environment

- Ambient noise measurements were taken at five selected off-site locations, representing the nearest noise sensitive (residential use) receptors to the Project Site, on October 19, 2022. The locations of the five off-site noise-sensitive receptors are shown on Figure 2 (on page 14), as R1 through R5. The existing daytime ambient noise levels at the off-site receptor locations ranged from 56.4 dBA L_{eq} (at receptor R2) to 68.3 dBA L_{eq} (at receptor R5) while the measured nighttime ambient noise levels ranged from 52.6 dBA L_{eq} (at receptor R2) to 62.8 dBA L_{eq} (at receptor R5). The existing ambient noise environment measurements currently exceed the City's exterior presumed daytime ambient noise standard of 50 dBA (L_{eq}) and the presumed nighttime ambient noise standard 40 dBA (L_{eq}) at all off-site receptors. Therefore, consistent with the LAMC, the measured existing ambient noise levels are used as the baseline conditions for the purposes of determining the Project's potential impacts.

Construction Noise Impacts

- The estimated noise levels from the Project's on-site temporary construction activities would temporarily increase current ambient daytime noise levels in the immediate vicinity of the Project Site. The estimated Project construction noise levels at off-site noise sensitive receptors R1, R2, R3 and R5 would exceed the significance criteria by up to 11.6, 13.8, 10.1, and 6.7 dBA, respectively, without the mitigation measures incorporated into the Project. However, the Project's incorporation of noise Mitigation Measure MM-NOI-1 (as described below) would avoid these potential construction-

Source: Google Map, 2022

Figure 1. Project Site Map

related noise impacts at receptors R1, R2, R3 and R5, as Mitigation Measures MM-NOI-1 would result in the noise levels at receptors R1, R2, R3 and R5 being reduced by a minimum of 12, 14, 11 and 7 dBA, respectively, to below the Project significance threshold. Therefore, potential temporary noise impacts associated with Project construction activities would be less than significant.

- Noise generated by construction trucks along the anticipated haul route, Santa Monica Boulevard and North Cahuenga Boulevard leading to the Project Site, would be approximately 60.3 dBA (hourly L_{eq}), which would be below the existing ambient of 64.9 dBA measured along North Cahuenga Boulevard (the measured daytime ambient noise level at receptor R4). Ambient noise along Santa Monica Boulevard would be higher than the ambient noise level along North Cahuenga Boulevard, as this traffic roadway has higher traffic volume. As such, significant noise impacts would not be expected from off-site construction traffic, and no additional noise control measures are required.

Construction Vibration Impacts

- Project construction activities would generate ground-borne vibration associated with the use of heavy construction equipment. However, the estimated vibration velocity levels from Project construction equipment would be below the significance criteria for building damage at the nearest off-site buildings. Therefore, the potential on-site vibration impacts, pursuant to the significance criteria for building damage, during construction of the Project would be less than significant.
- The estimated vibration velocity levels from the Project construction equipment would exceed the 72 VdB significance criteria for human annoyance at receptors R1, R2 and R3, without the mitigation measures incorporated into the Project. However, the Project's incorporation of vibration Mitigation Measure MM-NOI-2 (as described below) would avoid these potential construction-related vibration impacts at receptors R1, R2, and R3, as Mitigation Measures MM-NOI-2 would reduce the vibration velocity levels at receptors R1, R2, and R3, to below the Project significance criteria. Therefore, potential temporary vibration impacts, pursuant to the significance criteria for human annoyance would be less than significant.

Operation Noise Impacts

- On-site stationary noise sources including, but not limited to, building services mechanical equipment, parking facilities, and outdoor uses, were evaluated against the City's exterior noise standard. The estimated noise levels from on-site stationary noise sources would be below the Project significance criteria at all off-site noise sensitive uses. Therefore, potential noise impacts associated with the Project on-site stationary sources would be less than significant.

- Off-site roadway traffic noise impacts were also analyzed based on traffic volumes provided by the Project Traffic Consultant (Overland Traffic Consultants, Inc.).¹ Traffic volumes from the Project would result in a maximum noise increase of 0.1 dBA along Fountain Avenue (between Wilcox Avenue and North Cahuenga Boulevard) and along Lexington Avenue (between North Cahuenga Boulevard and Vine Street), which is considered a negligible increase. In addition, the cumulative traffic volumes would result in a maximum noise increase of 0.8 dBA CNEL along North Cahuenga Boulevard (between De Longpre Avenue and Fountain Avenue) and along Fountain Avenue (between North Cahuenga Boulevard and Vine Street). Generally, a minimum of a 3 dBA change in the noise environment (increase and/or decrease) is considered as a threshold of human perception. The estimated noise increases would be below the 3 dBA significance threshold at both the Project and Cumulative levels. Therefore, potential off-site traffic noise impacts associated with the Project would be less than significant.
- A composite noise analysis was performed to evaluate the noise impacts from all Project-related on-site noise sources. The Project composite noise levels would range from 55.0 dBA at receptor R2 to 62.6 dBA at receptor R5, which levels would be similar to the existing ambient noise levels, as reported in Table 12, below. In addition, the Project plus ambient noise levels would be below the significance criteria at all receptor locations. Therefore, the potential composite noise level impacts due to Project operation would be less than significant.

1 INTRODUCTION

This Noise Impact Study (Study) has been prepared to evaluate potential noise impacts associated with the proposed 1200 Cahuenga project (Project), located in the City of Los Angeles (City), California. This Study has been prepared pursuant to the requirements of the California Environmental Quality Act (CEQA).

1.1 Project Description

The Project, a creative office project, is located at 1200 North Cahuenga Boulevard, in the City of Los Angeles, as shown in Figure 1 (on page 2). The Project would replace and refurbish an existing vacant private school complex to provide three buildings (building A, B and C) with a total of 74,762 square feet of creative office and 500 square feet of ground floor retail uses, for a total of 75,262 square feet.

1.2 Purpose

The objectives of this noise study are to:

- a) Evaluate the Project's potential construction-related noise impacts on existing off-site noise sensitive uses in the vicinity of the Project Site.
- b) Determine potential Project operation-related on-site stationary sources (i.e., building services mechanical equipment, parking operation, and outdoor uses) and off-site mobile sources (auto traffic) noise impacts on existing off-site noise sensitive uses.
- c) Evaluate the noise mitigation measures incorporated into the Project to avoid its potential noise impacts or ensure they are less than significant.

2 ENVIRONMENTAL SETTING

2.1 Fundamentals of Sound and Environmental Noise

Noise is commonly defined as sound that is undesirable because it interferes with speech communication and hearing, causes sleep disturbance, or is otherwise annoying (unwanted sound). The decibel (dB) is a conventional unit for measuring the amplitude of sound because it accounts for the large variations in sound pressure amplitude and reflects the way people perceive changes in sound amplitude. The human hearing system is not equally sensitive to sound at all frequencies. Therefore, to approximate this human frequency-dependent response, the A-weighted filtering system is used to adjust measured sound levels (dBA). The term “A-weighted” refers to filtering the noise signal in a manner that corresponds to the way the human ear perceives sound. Examples of various sound levels in different environments are² provided in Table 1 (on page 7).

Generally, people judge the relative magnitude of sound sensation by subjective terms such as “loudness” or “noisiness.” To a person with normal hearing, a change in sound level of 3 dB is considered “just perceptible,” a change in sound level of 5 dB is considered “clearly noticeable,” and a change (i.e., increase) of 10 dB is generally recognized as “twice as loud” as the original sound.³

2.1.1 Outdoor Sound Propagation

In an outdoor environment, sound levels attenuate (reduce) through the air as a function of distance. Such attenuation is commonly referred to as “distance loss” or “geometric spreading,” and is based on the noise source configuration (e.g., point source, or line source). For a point source, such as a piece of mechanical/electrical/construction equipment (e.g., air conditioner, electrical transformer, or bulldozer), the rate of sound attenuation is about 6 dB per doubling of distance from the noise source. For example, an outdoor condenser fan that generates a sound level of 60 dBA at a distance of five feet would attenuate to 54 dBA at a distance of 10 feet. For a line source, such as a constant flow of traffic on a roadway, the rate of sound attenuation is about 3 dB per doubling of distance.⁴

In addition, structures (e.g., buildings and solid walls) and natural topography (e.g., hills) that obstruct the acoustics line-of-sight between a noise source and a receptor further reduce the noise level at the receptor if the receptor is located within the “shadow” of the obstruction, such as behind a sound wall. This type of sound attenuation is known as “barrier insertion loss.” If

² All sound levels measured in decibel (dB) in this study are relative to 2×10^{-5} N/m².

⁴ Caltrans, *Technical Noise Supplement (TeNS)*, Chapter 2.1.4.1, 2013. [Technical Noise Supplement to the Caltrans Traffic Noise Analysis Protocol](#)

a receptor is located behind the wall but still has a view of the source (i.e., line-of-sight is not fully blocked), some barrier insertion loss would still occur, however to a lesser extent. Additionally, a receptor located on the same side of the wall as a noise source may actually experience an increase in the perceived noise level as the wall reflects noise back to the receptor, thereby compounding the noise. Outdoor noise barriers can provide noise level reductions ranging from approximately 5 dBA (where a barrier just breaks the acoustic line-of-sight between the noise source and receiver) to an upper range of 20 dBA with a more substantial barrier.⁵

2.1.2 Environmental Noise Descriptors

Several rating scales have been developed to analyze the adverse effect of environmental noise on people. Since environmental noise fluctuates over time, these scales consider the total acoustical energy content, as well as the time and duration of occurrence. The most frequently used noise descriptors, including those used by the City, are summarized below.

Equivalent Sound Level (L_{eq}). L_{eq} is a measurement of the acoustic energy content of noise averaged over a specified time period. Thus, the L_{eq} of a time-varying sound and that of a steady sound are the same if they deliver the same amount of energy to the receptor's ear during exposure. L_{eq} for one-hour periods, during the daytime or nighttime hours, and 24 hours are commonly used in environmental noise assessments. L_{eq} can be measured for any time period, but is typically measured for an increment of no less than 15 minutes for environmental studies.

Community Noise Equivalent Level (CNEL). CNEL is the time average of all A-weighted sound levels for a 24-hour day period with a 10 dBA adjustment (increase) added to the sound levels that occur in the nighttime hours (10:00 p.m. to 7:00 a.m.) and a 5 dBA adjustment (increase) added to the sound levels that occur in the evening hours (7:00 p.m. to 10:00 p.m.). These adjustments attempt to account for increased human sensitivity to noise during the quieter nighttime periods, when the ambient background noise is lower and where sleep is the most probable activity. CNEL has been adopted by the State of California as the rating scale to be used to define the community noise environment for development of the community noise element of a General Plan and is also used by the City of Los Angeles for its land use planning.⁶

2.2 Ground-borne Vibration

Vibration is commonly defined as an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. The peak particle velocity (PPV) or the root-mean square (RMS) velocity is usually used to describe vibration amplitudes. PPV is defined as the maximum instantaneous peak of the vibration signal and is typically used for evaluating potential building damage.⁷ The RMS velocity is defined as the square-root of the average of the squared amplitude of the vibration signal and is used for evaluating human response to ground-borne vibration.⁸ Decibel notation (VdB) is commonly used to express RMS vibration velocity amplitude. The relationship of PPV to RMS velocity is expressed in terms of the "crest factor," defined as the ratio of the PPV amplitude to the RMS amplitude. PPV is typically a factor of 1.7 to 6 times greater than RMS vibration

⁶ State of California, *General Plan Guidelines, 2017*. [General Plan Guidelines \(ca.gov\)](#)

⁷ *Vibration levels described in this report are in terms peak particle velocity level in the unit of inches per second.*

⁸ FTA, "Transit Noise and Vibration Impact Assessment," Section 5, September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

velocity⁹; FTA uses a crest factor of 4.¹⁰ Ground-borne vibration generated by man-made activities (e.g., road traffic, construction operations) typically weakens with greater horizontal distance away from the source of the vibration. The vibration impact studies show in most circumstances common ground-induced vibrations related to roadway traffic and construction activities pose no threat to buildings or structures.¹¹

2.3 Applicable Noise Regulations

Various government agencies have established noise regulations and policies to protect citizens from potential hearing damage and other adverse effects associated with noise. An overview of the State and City regulations and policies that are relevant to construction and operation of the Project is provided below. The City of Los Angeles has adopted a number of regulations and policies, which are based in part on federal and State regulations and are intended to control, minimize, or mitigate environmental noise effects. The Noise Element of the City of Los Angeles General Plan (General Plan) includes a number of goals, objectives, and policies for land use planning purposes. The City also has regulations to control unnecessary, excessive, and annoying noise, as set forth in the Los Angeles Municipal Code (LAMC) Chapter XI.

2.3.1 City of Los Angeles General Plan Noise Element

The overall purpose of the Noise Element of the General Plan is to guide policymakers in making land use determinations and adopting noise ordinances that would limit exposure of citizens to excessive noise levels. The following policies and objectives from the Noise Element of the General Plan are applicable to the Project:¹²

1. Objective 2 (Non-airport): Reduce or eliminate non-airport related intrusive noise, especially relative to noise-sensitive uses.
2. Policy 2.1: Enforce and/or implement applicable City, State, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.
3. Objective 3 (Land Use Development): Reduce or eliminate noise impacts associated with proposed development of land and changes in land use.

⁹ V_{dB} (velocity level in decibel) = $20 \times \text{Log}(V / V_{ref})$, where V is the RMS velocity amplitude in micro-inch per second and V_{ref} is the reference velocity amplitude of 1×10^{-6} inch per second (1 micro-inch per second).

¹⁰ FTA, "Transit Noise and Vibration Impact Assessment," Section 5, September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

¹¹ FTA, "Transit Noise and Vibration Impact Assessment," Section 5, September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

¹² Noise Element of the Los Angeles City General Plan, adopted February 3, 1999. [Noise Element \(lacity.org\)](#)

4. Policy 3.1: Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

Table 2 (below) provides the exterior noise standard associated with various land uses, as provided in the City’s Noise Element. According to the City, an exterior noise environment up to 70 dBA CNEL is “conditionally acceptable” for noise sensitive uses (e.g., residential, hotel, school). In addition, noise levels up to 75 dBA CNEL are “normally unacceptable”, while noise levels at 75 dBA CNEL and above are “clearly unacceptable” for residential.

Table 2. City of Los Angeles Noise Land Use Compatibility

Land Use	Day-Night Average Exterior Sound Level (CNEL dBA)

Agriculture, Industrial, Manufacturing, Utilities	A	A	A	A	A/C	C/N	N

¹ Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

² Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

³ Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

⁴ Clearly Unacceptable: New construction or development should generally not be undertaken.

Source: City of Los Angeles, General Plan Noise Element, adopted February 1999.

2.3.2 City of Los Angeles Municipal Code

Chapter XI, Noise Regulation, of the LAMC (referred to herein as the Noise Regulations) establishes acceptable ambient sound levels and is intended to regulate intrusive noises (e.g., stationary mechanical equipment and vehicles other than those traveling on public streets) within specific land use zones and to provide procedures and criteria for the measurement of the sound level of noise sources. These procedures recognize and account for differences in the perceived level of different types of noise and/or noise sources. In accordance with the

Noise Regulations, a noise level increase from certain regulated noise sources of 5 dBA over the existing or presumed ambient noise level at an adjacent property line is considered a violation of the Noise Regulations. The 5-dBA increase above ambient is applicable to City-regulated noise sources (e.g., mechanical equipment), and is applicable any time of the day.¹³

The Noise Regulations state that the baseline ambient noise environment shall be the actual measured ambient noise level or the City’s presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes, L_{eq} (15-minute). The Noise Regulations state that in cases where the actual measured ambient conditions are not known, the City’s presumed daytime (7:00 A.M. to 10:00 P.M.) and nighttime (10:00 P.M. to 7:00 A.M.) ambient noise levels defined in Section 111.03 of the LAMC should be used. The City’s presumed ambient noise levels for specific land use zones, as set forth in LAMC Section 111.03, are provided in Table 3 (below).

Table 3. City of Los Angeles Presumed Ambient Noise Levels

Zone	Daytime(7:00 A.M. to 10:00 P.M.)dBA (L_{eq})	Nighttime(10:00 P.M. to 7:00 A.M.)dBA (L_{eq})
Residential, School, Hospitals, Hotels	50	40
Commercial	60	55
Manufacturing (M1, MR1, and MR2)	60	55
Heavy Manufacturing (M2 and M3)	65	65

Source: LAMC Section 111.03.

The Noise Regulations also address off-road vehicle-related noise, including in Section 114.02, which prohibits the operation of any motor-driven vehicles upon any property within the City in a manner that would cause the noise level on the premises of any occupied residential property to exceed the ambient noise level by more than 5 dBA, and in Section 114.06, which requires that vehicle theft alarm systems be silenced within five minutes.

In addition, the Noise Regulations (LAMC Section 112.05) set a maximum noise level from construction equipment (powered equipment or powered hand tools) operating between the hours of 7:00 A.M. and 10:00 P.M., in any residential zone of the City or within 500 feet thereof, of 75 dBA, measured at a distance of 50 feet from the source, unless compliance with this limitation is technically infeasible. Section 41.40 of the LAMC prohibits construction noise that disturbs persons occupying sleeping quarters in any dwelling, hotel, or apartment or other place of residence between the hours of 9:00¹⁴ P.M. and 7:00 A.M. Monday through Friday,

¹³ Los Angeles Municipal Code, Chapter XI, Section 112.02. [CHAPTER XI NOISE REGULATION \(amlegal.com\)](http://amlegal.com)

¹⁴ In accordance with the Noise Regulations (LAMC Chapter XI, Section 112.05), “technically feasible” means that the established noise limitations can be complied with at a project site, with the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques employed during the operation of equipment.

before 8:00 A.M. and after 6:00 P.M. on Saturday or national holiday, and at any time on Sunday. Construction hours may be extended with approval from the Executive Director of the Board of Police Commissioners.

2.4 Applicable Vibration Standards

The City currently does not have any adopted standards, guidelines, or criteria relative to ground-borne vibration. As such, available guidelines from the Federal Transit Administration (FTA) are utilized in this report to assess the Project’s potential impacts due to ground-borne vibration. The FTA has published a technical manual titled, “Transit Noise and Vibration Impacts Assessment,” that provides ground-borne vibration impact criteria related to building damage during construction activities.¹⁵ Table 4 (below) provides those vibration impact criteria (based on FTA) applicable to building category. According to FTA guidelines and as shown in Table 4, a vibration level of 0.30 PPV should be used as the threshold indicating a significant structural damage impact for engineered concrete and masonry buildings, and a vibration level of 0.50 PPV should be used as the threshold indicating a significant structural damage impact to structures or buildings constructed of reinforced concrete, steel, or timber.

Table 4. FTA Construction Vibration Impact Criteria for Building Damage

Building Category	Peak Particle Velocity (PPV), (in/sec)
I. Reinforced concrete, steel or timber (no plaster)	0.50
II. Engineered concrete and masonry (no plaster)	0.30
III. Non-engineered timber and masonry buildings	0.20
IV. Buildings extremely susceptible to vibration damage	0.12
<i>Source: FTA, 2018</i>	

In addition, the FTA guidance manual also provides vibration criteria for human annoyance for various uses. These criteria were established primarily for rapid transit (rail) projects and, as indicated in Table 5 (on page 13), are based on the frequency of vibration events. Specific criteria are provided for three land use categories: (1) Vibration Category 1—High Sensitivity; (2) Vibration Category 2—Residential; and (3) Vibration Category 3—Institutional.

¹⁵ FTA, “Transit Noise and Vibration Impact Assessment,” Table 7-5, September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](https://www.fdot.gov/docs/default-source/transit-noise-and-vibration-impact-assessment-manual-dot-gov)

Table 5. FTA Construction Vibration Impact Criteria for Human Annoyance

Land Use Category	Ground-Borne Vibration Impacts Levels (VdB)		
	Frequent Events ^a	Occasional Events ^b	Infrequent Events ^c
Category 1: Building where vibration would interfere with interior operations	65 ^d	65 ^d	65 ^d
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83
^a "Frequent Events" are defined as more than 70 vibration events of the same source per day. ^b "Occasional Events" are defined as between 30 and 70 vibration events of the same source per day. ^c "Infrequent Events" are defined as fewer than 30 vibration events of the same source per day. ^d This criterion limit is based on the levels that are acceptable for most moderately sensitive equipment such as optical microscopes. Source: FTA, 2018			

2.5 Existing Ambient Noise Levels

Some land uses are considered more sensitive to intrusive noise than others based on the types of activities typically engaged in at those land uses. Typically, noise-sensitive uses include residences, transient lodgings, schools, libraries, churches, hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks. Based on a review of the land uses in the Project area, there are noise-sensitive land uses (i.e., residential uses and park) surrounding the Project Site to the north, south, east and west. A total of five off-site noise-sensitive receptor locations surrounding the Project Site were selected to represent the multiple noise-sensitive uses surrounding the Project Site. The locations of the five off-site noise-sensitive receptor locations are described in Table 6 (on page 16) and shown on Figure 2 (on page 14), as R1 through R5.

Figure 2. Noise Measurement Locations

Ambient noise measurements were taken at the five selected off-site locations on October 19, 2022. The ambient noise measurements were conducted using a Larson-Davis Model 870 and a Quest Model 2900 Integrating/Logging Sound Level Meters. These sound level meters meet and exceed the minimum industry standard performance requirements for “Type 1” and “Type 2” standard instruments as defined in the American National Standard Institute (ANSI) S1.4. A 24-hour measurement was conducted at receptor R2. Two 15-minute measurements were conducted at off-site receptors R1, R3, R4 and R5, one during the daytime hours and another during the nighttime hours. The daytime ambient noise levels were measured between 10:00 A.M. and 12:00 P.M., and the nighttime ambient noise levels were measured between 10:00 P.M. and 12:00 A.M. The ambient noise measurements were taken in accordance with the City’s standards.

The results of the ambient sound measurements are summarized in Table 6 (on page 16). As indicated in Table 6, the existing daytime ambient noise levels at the off-site receptor locations ranged from 56.4 dBA L_{eq} (at receptor R3) to 68.3 dBA L_{eq} (at receptor R5), while the measured nighttime ambient noise levels ranged from 52.6 dBA L_{eq} (at receptor R2) to 62.8 dBA L_{eq} (at receptor R5). Based on field observation and the measured sound data, the current ambient noise environment in the vicinity of the Project Site is controlled primarily by vehicular traffic on local roadways (e.g., North Cahuenga Boulevard), commercial uses, and other typical urban noise. The existing ambient noise levels at all receptor locations currently exceed the City’s exterior presumed daytime ambient noise standard of 50 dBA (L_{eq}) and presumed nighttime ambient noise standard 40 dBA (L_{eq}), for residential uses. Therefore, consistent with the LAMC, the measured existing ambient noise levels are used as the baseline conditions for the purposes of determining the Project’s potential noise impacts.

Table 6. Existing Ambient Noise Levels

Receptor Location	Approximate Distance to Project Site, ^a Feet	Measured Ambient Noise Levels, dBA L _{eq}		CNEL, (24-hour)
		Daytime Hours (7 a.m. to 10 a.m.)	Nighttime Hours (10 p.m. to 7 a.m.)	
R1 – Single-family residential use located on the north side of La Mirada Avenue, north of the Project Site	35	57.8	58.8	63.3 ^b
R2 – Multi-family residential use on the north side of Lexington Avenue, adjacent to the Project Site to the east	Adjacent to the Project Site	57.0 ^c	52.6 ^c	60.4
R3 – Multi-family residential use on the south side of Lexington Avenue, south of the Project Site	50	56.4	55.2	60.1 ^b
R4 – Park use on the westside of North Cahuenga Boulevard, southwest of the Project Site	250	64.9	60.3	66.3 ^b
R5 – Multi-family residential use on the west side of North Cahuenga Boulevard, west of the Project Site	80	68.3	62.8	69.2 ^b

^a Distances are estimated based on Google Earth map and are referenced to the Project nearest boundary.

^b Estimated based on short-term (15-minute) noise measurement.

^c Levels shown for R2 represent the average for the entire daytime and nighttime periods.

3 IMPACT ANALYSIS

3.1 Methodology

3.1.1 *Temporary Construction Noise*

Potential construction noise impacts due to on-site construction activities associated with the Project were evaluated by calculating the construction-related noise levels at the representative receptor locations and comparing these estimated Project construction-related noise levels to the measured existing ambient noise levels (i.e., noise levels without construction noise from the Project). Construction noise associated with the Project was analyzed based on the Project's potential construction equipment inventory, construction durations, and construction schedule. The construction equipment noise levels are based on the published noise data (equipment source levels) by Federal Highway Administration (FHWA) "Roadway Construction Noise Model (FHWA 2006)". The construction noise levels were then calculated for the identified sensitive receptor locations based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance. For the noise analysis, a 5 dBA attenuation was assigned for receptor locations where the acoustic line-of-sight is just interrupted (i.e., around the edge of a building).

In addition, the potential construction-related off-site truck noise impacts were analyzed using the FHWA's Traffic Noise Model (TNM). The TNM noise model calculates the hourly L_{eq} noise levels generated by construction-related trucks. Potential noise impacts were determined by comparing the predicted noise level generated by construction-related off-site trucks with the existing ambient noise levels.

3.1.2 *Temporary Construction Vibration*

Ground-borne vibration impacts due to the Project's construction activities were evaluated by identifying potential vibration sources (i.e., construction equipment), estimating the vibration levels at the identified representative sensitive-receptor locations, and comparing the Project's vibration levels at those locations to the applicable vibration significance criteria, as described below.

Vibration levels were calculated based on the FTA published standard vibration velocities for various construction equipment operations. The vibration velocities were calculated based on a point source with standard distance propagation conditions, pursuant to FTA procedures. Construction of the Project would not use impact pile driving methods and as such, impact pile driving vibration is not included in this construction vibration analysis.¹⁶

¹⁶ FTA, "Transit Noise and Vibration Impact Assessment," Table 7-4, September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

3.1.3 Operation Noise

The Project's potential on-site stationary point-source noise impacts were evaluated by (1) identifying the noise levels that would be generated by the Project's stationary noise sources, such as rooftop mechanical equipment, outdoor activities (e.g., use of the outdoor courtyard, roof deck and terraces), and parking facilities; (2) calculating the noise level from each noise source at the identified surrounding representative sensitive-receptor property line locations; and (3) comparing such noise levels to the measured ambient noise levels to determine significance. The on-site stationary noise sources were calculated using SoundPLAN (version 8.2), a 3-dimensional computer noise prediction model, which calculates noise transference (propagation) using approved engineering procedures and incorporates national and international noise standards. This calculation tool is widely used by acoustical engineers as a noise modeling tool for environmental noise analysis.

The Project's potential off-site roadway noise was analyzed using the FHWA's TNM, based on the roadway traffic data provided in the Project's transportation study. The TNM is the current Caltrans standard computer noise model for traffic noise studies. The model allows for the input of roadway parameters, noise receivers, and sound barriers (if any). Roadway noise attributable to the Project's "existing plus project" scenario was calculated and compared to the "existing without project" scenario noise levels to determine the Project's potential off-site roadway noise impacts.

3.2 Thresholds of Significance

The City has determined to assess the significance of the Project's potential impacts based on the checklist items set forth in Appendix G to the State CEQA Guidelines. In accordance with the State CEQA Guidelines Appendix G, the Project would have a significant impact related to noise if it would result in the:

Threshold (a): Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies; or

Threshold (b): Generation of excessive groundborne vibration or groundborne noise levels; or

Threshold (c): For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

3.3 Project Design Features and Mitigation Measure Incorporated Into the Project

The Project incorporates the following Project Design Feature (PDF), and the Applicant has agreed to incorporate the following Mitigation Measure into the Project to avoid or reduce the Project's potential construction noise and vibration impacts.

Project Design Feature PDF-NOI-1: Project construction will not include the use of driven (impact) pile systems.

Project Design Feature PDF-NOI-2: Outdoor amplified sound systems, if any, will be designed so as not to exceed the maximum noise level of 80 dBA (L_{eq}) at a distance of 15 feet from the face of the loudspeakers, from all outdoor spaces. A qualified noise consultant will provide written documentation that the design of the system complies with this maximum noise level.

Mitigation Measure MM-NOI-1: A temporary and impermeable sound barrier shall be erected at the following locations, prior to the start of earth moving activities. At plan check, building plans shall include documentation prepared by a noise consultant verifying compliance with this measure.

- Along the northern property line of the Project Construction Site between the construction area and the residential uses to the north (represented by receptor location R1). The temporary sound barrier shall be designed to provide a minimum 12-dBA noise reduction at the ground level of receptor location R1.
- Along the southern property line of the Project Construction Site between the construction area and the residential use to the east (represented by receptor location R2). The temporary sound barrier shall be designed to provide a minimum 14-dBA noise reduction at the ground level of receptor location R2.
- Along the southern property line of the Project Construction Site between the construction area and the residential uses to the south (represented by receptor location R3). The temporary sound barrier shall be designed to provide a minimum 11-dBA noise reduction at the ground level of receptor location R3.
- Along the western property line of the Project Construction Site between the construction area and the residential uses to the west (represented by receptor location R5). The temporary sound barrier shall be designed to provide a minimum 7-dBA noise reduction at the ground level of receptor location R5.

Mitigation Measure MM-NOI-2: The following mitigation measures are provided to reduce the vibration impacts associated with potential human annoyance.

- The use of large construction equipment (i.e., large bulldozer, caisson drill rig, and/or loaded trucks) shall be a minimum of:

- 35 feet from the Project northern property line
- 30 feet from the Project southern property line
- 70 feet from the Project eastern property line (near the building at receptor R2)
- The use of jackhammer shall be a minimum of 35 feet from the Project eastern/southern property line (near the building at receptor R2).

3.4 Project Impacts

Threshold (a): Would the Project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

3.4.1 Temporary Construction Noise

Project construction would generate noise from on-site construction activities and from off-site construction traffic.

3.4.1.1 On-Site Construction Noise

Noise levels generated from on-site Project construction activities would be a function of the noise generated by construction equipment, the location of the equipment, the timing and duration of the noise-generating construction activities, and the relative distance to noise-sensitive receptors. Construction activities for the Project would generally include demolition, site grading, building construction, and landscaping. Each stage of construction would involve the use of various types of construction equipment and would, therefore, have its own distinct noise characteristics. Demolition generally involves the use of backhoes, front-end loaders, and heavy-duty trucks. Grading and excavation typically require the use of earth-moving equipment, such as excavators, front-end loaders, and heavy-duty trucks. Building construction typically involves the use of forklifts, concrete trucks, concrete pumps, and delivery trucks. Project construction equipment would generate both steady-state and episodic noise that could be heard at locations within and adjacent to the Project Site. Construction of the Project is anticipated to take approximately 19 months.

Individual pieces of construction equipment that would typically be used for construction produce maximum noise levels of 74 dBA to 90 dBA at a reference distance of 50 feet from the construction equipment, as shown in Table 7 (on page 21). It should be noted that pile drivers are not included in Table 6 because Project Design Feature PDF-1 prohibits their use. The construction equipment noise levels produced at the 50-foot distance (Reference Maximum Noise Levels at 50 Feet) shown in Table 6 are taken from the FHWA Roadway Construction Noise Model User's Guide (RCNM, 2006), which is a technical report containing

actual measured noise data for construction equipment.¹⁷ These maximum noise levels would occur when equipment is operating under full power conditions (i.e., the equipment engine at maximum speed). However, equipment used on construction sites often operates under less than full power conditions, or part power. To characterize construction-period noise levels more accurately, the average (Hourly L_{eq}) noise level associated with each construction stage is calculated based on the quantity, type, and usage factors for each type of equipment that would be used during each construction stage.¹⁸ These noise levels are typically associated with multiple pieces of equipment operating simultaneously.

Table 7. Construction Equipment Noise Emission Reference Levels and Usage Factors

Type of Equipment	Acoustical Usage Factor (%)	Reference Maximum Noise Levels at 50 Feet, ^a L_{max} (dBA)
Air Compressor	40	78
Backhoe	40	78
Cement and Mortar Mixer	50	80
Concrete Saw	20	90
Crane	16	81
Dozer	40	82
Dump/Haul Truck	40	76
Excavator	40	81
Forklift	20	75
Generator Set	50	81
Grader	40	85
Jackhammer	20	89
Man Lift	20	75
Paving Equipment	50	77
Roller	20	80
Rubber Tired Loader	40	79
Delivery Truck	40	74
Welders	40	74
Pneumatic Tool	50	85

^a Construction equipment noise levels are based on the FHWA RCNM.
Source: FHWA Roadway Construction Noise Model User's Guide, Table 1, 2006

Table 8 (on page 22) provides the Project's estimated construction noise levels without Project's incorporation of Mitigation Measure MM-NOI-1 for various construction phases at the identified off-site noise sensitive receptor locations. To present a conservative impact

¹⁷ FHWA, Roadway Construction Noise Model User's Guide, 2006. [Roadway Construction Noise Model User's Guide \(dot.gov\)](#)

¹⁸ Pursuant to the FHWA Roadway Construction Noise Model User's Guide, 2006, the usage factor is the percentage of time during a construction noise operation that a piece of construction is operating at full power.

analysis, the Project’s “without Mitigation Measure MM-NOI-1” estimated noise levels were calculated for a scenario in which all pieces of construction equipment were assumed to be operating simultaneously and to be located at the construction area nearest to the sensitive receptors. These assumptions represent the worst-case “without Mitigation Measure MM-1” noise scenario because construction activities would typically be spread out throughout the Project Site, and, thus, some equipment would be farther away from the affected sensitive receptors.

As reported in Table 8, the estimated “without Mitigation Measure MM-NOI-1” construction noise levels at off-site noise sensitive receptor locations R1, R2, R3 and R5 would exceed the significance criteria by up to 11.6, 13.8, 10.1, and 6.7 dBA, respectively.

**Table 8. Construction Noise Levels
(Without Incorporation of Mitigation Measure MM-NOI-1)**

Location	Estimated Noise Levels by Construction Phase, ^{a, b} dBA (L _{eq})					Significance Criteria, dBA (L _{eq})	Exceedance Over Significance Criteria, dBA (L _{eq})
	Demolition	Grading	Building Construction	Paving	Arch. Coating		
R1	86.6	86.1	80.9	81.9	77.1	75.0	11.6
R2	88.8	88.5	82.9	84.4	80.0	75.0	13.8
R3	85.1	84.5	79.7	80.1	74.0	75.0	10.1
R4	72.9	71.5	68.1	67.3	60.0	75.0	0.0
R5	81.7	80.8	76.5	76.5	69.9	75.0	6.7

^a Detailed calculation worksheets, are included in Appendix B.
^b **Bold-faced** represents noise levels exceeded the significance criteria.
Source: AES, 2022

However, as discussed above, the Applicant has agreed to, and the Project has incorporated, Mitigation Measure MM-NOI-1. As reported in Table 9 (on page 23), the Project’s on-site construction noise levels at receptor locations R1, R2, R3 and R5 would be a minimum of 12, 14, 11 and 7 dBA, respectively, lower than the noise levels shown in Table 8 (above), and less than significant, assuming incorporation of Mitigation Measure MM-NOI-1. Therefore, the Project’s potential temporary on-site construction noise impacts would be less than significant, with incorporation of mitigation measures.

**Table 9. Construction Noise Levels
(With Incorporation of Mitigation Measure MM-NOI-1)**

Location	Estimated Noise Levels by Construction Phase, ^{a, b} dBA (L _{eq})					Significance Criteria, dBA (L _{eq})
	Demolition	Grading	Building Construction	Paving	Arch. Coating	
R1	74.6	74.1	68.9	69.9	65.1	75.0
R2	74.8	74.5	68.9	70.4	66.0	75.0
R3	74.1	73.5	68.7	69.1	63.0	75.0
R4	72.9	71.5	68.1	67.3	60.0	75.0
R5	74.7	73.8	69.5	69.5	62.9	75.0

Source: AES, 2022

3.4.1.2 Off-Site Construction Noise

In addition to on-site construction noise sources, materials delivery, concrete mixing, and haul trucks (construction trucks), and construction worker vehicles would require access to the Project Site during the Project construction period. The major noise sources associated with offsite construction trucks would be from haul trucks during the site grading, which would require a total of approximately 906 haul trips, with approximately 40 trucks per day. Construction-related trucks would be fewer during other construction phases. Therefore, the noise analysis is based on the peak period (site grading phase) with a maximum of 40 trucks (80 truck trips) per day. Based on a six-hour haul period and a uniform distribution of trips, there would be 14 truck trips per hour. Haul trucks would generally access the Project Site via North Cahuenga Boulevard and Santa Monica Boulevard to the Hollywood Freeway (US-101).

Noise generated by construction trucks along the anticipated haul route, Santa Monica Boulevard and North Cahuenga Boulevard leading to the Project Site, would be approximately 60.3 dBA (hourly L_{eq}), which would be below the measured existing ambient noise environment of 64.9 dBA along North Cahuenga Boulevard Avenue (measured ambient at receptor R4). The existing ambient noise environment along Santa Monica Boulevard would be higher than that along North Cahuenga Boulevard, as Santa Monica Boulevard has higher traffic volume; therefore, the noise generated by construction trucks along Santa Monica Boulevard would also be below that street's existing ambient noise environment. As such, significant noise impacts would not be expected from off-site construction traffic, and no additional noise control measures are required.

3.4.2 Operation Noise

Noise associated with Project operation would include: (a) on-site stationary noise sources, including outdoor mechanical equipment (e.g., HVAC equipment), activities within the

proposed outdoor spaces (e.g., use of the outdoor courtyard, roof deck and terraces), and parking facilities; and (b) off-site mobile (roadway traffic) noise sources.

3.4.2.1 Mechanical Equipment

The Project would include new mechanical equipment (e.g., HVAC air ventilation equipment), which would be located at the roof level and/or within the building structure. Project-related outdoor mechanical equipment is required to be designed so as not to increase the existing ambient noise levels by 5 dBA in accordance with the City’s Noise Regulations (Section 112.02 of the LAMC). Table 10 (below) presents the estimated on-site mechanical equipment noise levels at the off-site receptor locations. As shown in Table 10, the estimated noise levels generated by the mechanical equipment would range from 34.2 dBA (L_{eq}) at receptor R2 to 45.5 dBA (L_{eq}) at receptor R5, which would be below the Project’s significance criteria and the existing ambient noise levels at all sensitive receptor locations; further, the Project noise level from the mechanical equipment added to the ambient noise level at each sensitive receptor location yields a noise level that would also be below the threshold for each sensitive receptor. As such, potential noise impacts from the Project mechanical equipment would be less than significant.

Table 10. Mechanical Equipment Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Project Mechanical Equipment, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Significance Criteria ^a dBA (L_{eq})	Exceed over Significance Criteria	Significant Impact?
R1	57.8	43.3	58.0	62.8	0.0	No
R2	52.6	34.2	52.7	57.6	0.0	No
R3	55.2	43.2	55.5	60.2	0.0	No
R4	60.3	40.3	60.3	65.3	0.0	No
R5	62.8	45.5	62.9	67.8	0.0	No

Notes:
^a Significance Criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.
 Source: AES, 2012

3.4.2.2 Outdoor Spaces

The Project’s outdoor amenities would include several common outdoor spaces, including: a courtyard at 1st Floor, two covered terraces at 2nd Floor (Building A), four exterior decks at 3rd Floor (Buildings A & C), and four exterior decks at the 4th Floor (Buildings A & C). Noise sources associated with outdoor uses typically include noise from people gathering and conversing. For this operational noise analysis, reference noise levels of 65 dBA for a male and 62 dBA for a female speaking in a raised voice were used for analyzing potential noise

impacts from people gathering at the outdoor spaces.¹⁹ The noise analysis assumed up to 120, 43, 328 and 578 people gathering at the outdoor spaces at 1st Floor, 2nd Floor, 3rd Floor, and 4th Floor, respectively. The number of people is calculated based on 15 square feet per person.

An additional potential noise source associated with outdoor spaces would be the use of an outdoor sound system (e.g., music or other sounds broadcast through an outdoor mounted speaker system) at the outdoor spaces. As set forth in the Project Design Feature PDF-NOI-2, if an amplified sound system is used, it would be designed so as not to produce sound exceeding the maximum noise level of 80 dBA L_{eq} at a distance of 15 feet from the face of the loudspeakers, at all outdoor spaces, which would ensure that the amplified sound system would not produce noise levels exceed the significance criteria (i.e., an increase of 5 dBA L_{eq}) at any off-site noise sensitive receptor location.

Table 11 (below) presents the estimated noise levels at the off-site sensitive receptors resulting from the use of the Project's outdoor areas. The estimated noise levels were calculated based on the assumption that the outdoor spaces would be fully occupied and operating concurrently, to represent a worst-case noise analysis. As presented in Table 11, the estimated noise levels from the outdoor spaces would range from 49.1 dBA (L_{eq}) at receptor location R2 to 58.0 dBA (L_{eq}) at receptor location R5, which levels would be below the Project's significance criteria and the ambient noise levels at all sensitive receptor locations other than R3; further, the Project noise level from the outdoor areas added to the ambient noise level at each sensitive receptor location yields a noise level that would also be below the threshold for each sensitive receptor. Therefore, noise impacts from the outdoor uses would be less than significant, and no mitigation measures are required.

Table 11. Outdoor Uses Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Outdoor Uses, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Significance Criteria ^a dBA (L_{eq})	Exceed over Significance Criteria	Significant Impact?
R1	57.8	50.9	58.6	62.8	0.0	No
R2	52.6	49.1	54.2	57.6	0.0	No
R3	55.2	56.6	59.0	60.2	0.0	No
R4	60.3	51.6	60.8	65.3	0.0	No
R5	62.8	58.0	64.0	67.8	0.0	No

Notes:
^a Significance Criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.

3.4.2.3 Parking Facilities

Parking for the Project would be provided within two at-grade levels (in Buildings A and C) and two below-grade levels (in Buildings A and B) that would provide a total of approximately 156 parking spaces. The parking garage would be partially shielded to the exterior with the wall along the parking garages. Table 12 (below) presents the estimated noise levels from parking garage at the offsite receptor locations. As indicated in Table 12, the estimated noise levels from the parking garage would range from 27.5 dBA (L_{eq}) at receptor location R4 to 41.2 dBA (L_{eq}) at receptor location R1, which would be below the Project significance criteria. Therefore, noise impacts from the parking garage would be less than significant, and no mitigation measures are required.

Table 12. Parking Facilities Noise Levels

Receptor Location	Existing Ambient Noise Levels, dBA (L_{eq})	Estimated Noise from Project Parking, dBA (L_{eq})	Ambient + Project Noise Levels, dBA (L_{eq})	Significance Criteria ^a dBA (L_{eq})	Exceed over Significance Criteria	Significant Impact?
R1	57.8	41.2	57.9	62.8	0.0	No
R2	52.6	28.0	52.6	57.6	0.0	No
R3	55.2	36.0	55.3	60.2	0.0	No
R4	60.3	27.5	60.3	65.3	0.0	No
R5	62.8	36.1	62.8	67.8	0.0	No

Notes:
^a Significance criteria are equivalent to the measured daytime or nighttime ambient noise levels, whichever is lower plus 5 dBA, per the City of Los Angeles Noise Regulations.
 Source: AES, 2022

3.4.2.4 Off-Site Traffic

Potential Project-generated traffic noise impacts were evaluated by comparing the increase in noise levels from the “existing” condition scenario to the “existing plus project” condition scenario, in the Traffic Assessment, against the Project’s significance threshold. Traffic noise levels at the off-site noise sensitive receptor locations were calculated using FHWA’s Traffic Noise Model and the Project’s traffic volume data from the Traffic Assessment.²⁰ The traffic noise impact analysis is based on the 24-hour CNEL noise descriptor.

Table 13 (on page 28) provides a summary of the off-site traffic noise analysis. As shown in Table 13, traffic from the Project would result in a maximum noise increase of 0.1 dBA along Fountain Avenue (between Wilcox Avenue and North Cahuenga Boulevard) and along Lexington Avenue (between North Cahuenga Boulevard and Vine Street), which is considered

²⁰ Overland Traffic Consultants, Inc., email dated 8/24/2022.

a negligible increase. In addition, the cumulative traffic volumes would result in a maximum increase of 0.8 dBA CNEL along North Cahuenga Boulevard (between De Longpre Avenue and Fountain Avenue) and along Fountain Avenue (between North Cahuenga Boulevard and Vine Street); again, however, the Project's contribution would be negligible and, therefore, not cumulatively considerable. Generally, a minimum 3 dBA change in the ambient noise environment (increase and/or decrease) is considered to be at the threshold of human perception, which the City has adopted as its threshold of significance. The estimated noise increases would be below the 3 dBA significance threshold under both Project and Cumulative level. Therefore, off-site traffic noise impacts associated with the Project would be less than significant.

Table 13. Off-Site Roadway Traffic Noise Impacts

Roadway Segment	Calculated Traffic Noise Levels, ^a CNEL (dBA)			Increase in Noise Levels, CNEL (dBA)		Significant Impact?

3.4.2.5 Composite Noise Impacts from Project Operations

An evaluation of composite noise levels, including all Project related noise sources, was conducted to identify the potential maximum Project-related noise level increase that may occur at the Project noise-sensitive receptor locations. The overall sound environment at the areas surrounding the Project Site would include contributions from each on-site individual noise source associated with the typical daily operation of the Project. Principal on-site noise sources associated with the Project would include the mechanical equipment, the parking facilities, and outdoor uses. Table 14 (below) presents the estimated composite noise levels from Project-related noise sources. As reported in Table 14, the Project’s composite noise levels would range from 55.0 dBA at receptor R2 to 62.6 dBA at receptor R5, which would be similar to the existing ambient noise levels. In addition, the Project plus ambient noise levels would be below the significance criteria at all receptor locations. Therefore, the composite noise level impacts due to Project operation would be less than significant.

Table 14. Composite Noise Impacts

Receptor Location	Calculated Project-Related Noise Levels, CNEL (dBA)				Project Composite Noise Levels, CNEL (dBA)	Ambient Noise Levels, CNEL (dBA)	Ambient Plus Project Composite Noise Levels, CNEL (dBA)	Significance Criteria ^a , CNEL (dBA)
	Traffic	Mechanical	Parking	Outdoor Uses				
R1	44.9	50.0	47.9	55.0	57.0	63.3	64.2	68.3
R2	49.5	40.9	34.7	53.2	55.0	60.4	61.5	65.4
R3	49.5	49.9	42.7	60.7	61.4	60.1	63.8	65.1
R4	44.9	47.0	34.2	55.7	56.6	66.3	66.7	71.3
R5	44.9	52.2	42.8	62.1	62.6	69.2	70.1	72.2

^a Significance criteria are equivalent to the existing ambient plus 3 dBA if the estimated noise levels (ambient plus Project) fall within the “normally unacceptable” or “clearly unacceptable” land use categories or ambient plus 5 dBA if the estimated noise levels fall within the “normally acceptable” or “conditionally acceptable” land use categories, per the City of Los Angeles Noise Element. If the estimated noise levels exceed those significance criteria, a noise impact is identified.
Source: AES, 2022

Threshold (b): Would the Project result in the exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?

3.4.3 Temporary Construction Vibration

Construction activities can generate varying degrees of ground vibration, depending on the construction procedures and the type of construction equipment used. The operation of construction equipment generates vibrations that spread through the ground and diminish in amplitude with distance from the source. The effect on buildings located in the vicinity of the construction site often varies, depending on soil type, ground strata, and construction characteristics of the receptor buildings.

The Project would generate ground-borne construction vibration forces during building demolition and site excavation/grading activities when heavy construction equipment, such as large bulldozers/excavators and loaded trucks, would be used. The FTA has published standard vibration velocities levels for various construction equipment operations. It is noted that²¹, pursuant to PDF-NOI-1, the Project construction would not use impact pile driving methods; therefore, impact pile driving vibration is not included in the on-site construction vibration analysis.

3.4.3.1 Building Damage

The City currently does not have any adopted standards, guidelines, or thresholds for assessing the significance of vibration impacts with respect to building damage. Therefore, the City utilizes criteria from the Federal Transit Administration (FTA) as threshold to assess the significance of impacts associated with potential building damage.²²Table 15 (on page 31) provides the estimated vibration levels at the nearest off-site buildings. As indicated in Table 15, the estimated vibration velocity levels from construction equipment would be below the significance criteria at the nearest off-site buildings. Therefore, the on-site vibration impacts, pursuant to the significance criteria for building damage, during construction of the Project would be less than significant.

²¹ FTA, "Transit Noise and Vibration Impact Assessment," September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

²² FTA, "Transit Noise and Vibration Impact Assessment," September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](#)

Table 15. Construction Vibration Impacts – Building Damage

Receptor Location	Estimated Vibration Velocity Levels at the Off-Site Buildings, PPV, ^a					Significance Criteria, VdB	Sig. Impacts?
	Large Bulldozer	Caisson Drilling	Loaded Trucks	Jack-hammer	Small Bulldozer		
FTA Reference Vibration Levels at 25 feet	0.089	0.089	0.076	0.035	0.003	--	--
Single-story residential buildings to the North	0.037	0.037	0.032	0.015	0.001	0.3 ^b	No
Single- and three-story residential buildings to the South	0.032	0.032	0.027	0.012	0.001	0.3 ^b	No
Three-story residential building to the East	0.244	0.244	0.208	0.096	0.008	0.5 ^c	No
Single- and two-story residential buildings to West	0.016	0.016	0.013	0.006	0.001	0.3 ^b	No

^a Vibration level calculated based on FTA reference vibration level at a 25-foot distance. Detailed calculation worksheets, are included in Appendix B.

^b FTA criteria for engineered concrete and masonry buildings.

^c FTA criteria for reinforced concrete, steel or timber buildings.

Source: FTA, 2018; AES, 2022

3.4.3.1 Human Annoyance

The City currently does not have any adopted standards, guidelines, or thresholds relative to vibration impacts with respect to human annoyance. Therefore, criteria from the Federal Transit Administration (FTA) are utilized as thresholds to assess impacts associated with potential human annoyance.²³ Per FTA guidance, the significance criterion for human annoyance is 72 VdB for sensitive uses, including residential, assuming there are a minimum of 70 vibration events occurring during a typical construction day.

Table 16 (on page 32) presents the estimated vibration velocity levels (in terms of VdB) due to construction equipment at the identified representative off-site vibration sensitive receptors. The estimated vibration levels at receptor R4 are provided for information only, as there are no applicable vibration criteria for the outdoor park use. To present a worst-case analysis, the estimated vibration levels were calculated with the construction equipment assumed to be operating at the closest distance to the off-site sensitive receptors. As indicated in Table 16, the estimated vibration levels due to on-site construction equipment would be below the significance threshold for human annoyance at off-site receptor location R5. However, the estimated vibration levels would exceed the significance thresholds at off-site receptor locations R1, R2 and R3. Therefore, human annoyance vibration impacts, pursuant to the

²³ FTA, "Transit Noise and Vibration Impact Assessment," September 2018. [Transit Noise and Vibration Impact Assessment Manual \(dot.gov\)](https://www.fta.dot.gov/Transit-Noise-and-Vibration-Impact-Assessment-Manual)

significance criteria for human annoyance, due to on-site construction activities of the Project would be potentially significant without mitigation.

**Table 16. Construction Vibration Impacts – Human Annoyance
(Without Incorporation of Mitigation Measure MM-NOI-2)**

Off-Site Receptor Location	Estimated Vibration Velocity Levels at the Nearest Off-Site Sensitive Receptors from the Project Construction Equipment, ^{a,b} VdB					Significance Criteria, VdB	Sig. Impacts?
	Large Bulldozer	Caisson Drilling	Loaded Trucks	Jack-hammer	Small Bulldozer		
R1	79.3	79.3	78.3	71.3	50.3	72	Yes
R2	98.9	98.9	97.9	90.9	69.9	72	Yes
R3	78.0	78.0	77.0	70.0	49.0	72	Yes
R4	57.0	57.0	56.0	49.0	28.0	n/a ^c	No
R5	71.1	71.1	70.1	63.1	42.1	72	No

^a Vibration levels calculated based on FTA reference vibration level at 25-foot distance.
^b **Bold-faced** represents noise levels exceeded the significance criteria.
^c Not applicable, as there are no applicable vibration criteria for outdoor spaces.
Source: FTA, 2018; AES, 2022.

However, as discussed above, the Applicant has agreed to and the Project has incorporated Mitigation Measure MM-NOI-2. As reported in Table 17 (below), the Project's on-site construction vibration levels at receptor locations R1, R2, and R3 would be reduced to below the significance criteria with the incorporation of Mitigation Measure MM-NOI-2. Therefore, the Project's potential temporary on-site construction vibration impacts with respect to human annoyance would be less than significant.

**Table 17. Construction Vibration Impacts – Human Annoyance
(With Incorporation of Mitigation Measure MM-NOI-2)**

Off-Site Receptor Location	Estimated Vibration Velocity Levels at the Nearest Off-Site Sensitive Receptors from the Project Construction Equipment, ^a VdB					Significance Threshold, VdB	Sig. Impacts?
	Large Bulldozer	Caisson Drilling	Loaded Trucks	Jack-hammer	Small Bulldozer		
R1	71.8	71.8	70.8	71	50.3	72	No
R2	71.8	71.8	70.8	71.3	69.9	72	No
R3	71.8	71.8	70.8	70.0	49.0	72	No
R4	57.0	57.0	56.0	49.0	28.0	n/a ^b	No
R5	71.1	71.1	70.1	63.1	42.1	72	No

^a Vibration levels calculated based on FTA reference vibration level at 25-foot distance.
^b Not applicable, as there are no applicable vibration criteria for outdoor spaces.

Threshold (c): For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

3.4.4 Airport Noise

The nearest airport is the Hollywood-Burbank Airport, located approximately 7.1 miles northeast of the Project Site. Since the Project is not located within an airport land use plan, within two miles of a public airport or public use airport, or within the vicinity of a private airstrip, impacts with regard to airport-related noise would not occur. Therefore, no impacts with respect to Threshold (c) would occur.

Construction Vibration Impacts

Reference Levels at 25 feet are based on FTA, 2006 (Transit Noise and Vibration Impact Assessment)

Calculations using FTA procedure with

n= 1.5 (for receptors 25 feet or greater)

n= 1.1 (for receptors less than 25 feet, per Caltrans procedure)

ON-SITE CONSTRUCTION ACTIVITIES

Table 1: Construction Equipment Vibration Levels (PPV) - Building Damage

Equipment	Reference Vibration Levels at 25 ft., PPV	Estimated Vibration Levels at nearest off-site building structures, distance in feet, PPV									
		One-Story Buildings to the North		1- and 3-Story Buildings to the South		3-Story Building to the East		1- and 2-Story Buildings to the West			
		Distance	Level	Distance	Level	Distance	Level	Distance	Level

EXECUTIVE SUMMARY

Introduction

Overland Traffic Consultants has prepared this assessment of the potential California Environmental Quality Act (CEQA) transportation impacts and potential Non-CEQA deficiencies for a proposed creative office project located at 1200-1210 North Cahuenga Boulevard, 6337-6357 West Lexington Avenue and 6332-6356 West La Mirada Avenue (Project), in the Hollywood Community Plan Area. See the aerial view for the Project's location on the following page.

Project Description

The proposed Project is located on the northeast corner of North Cahuenga Boulevard and West Lexington Avenue. The Project would replace and refurbish an existing vacant private school complex (previously with 200 students) to provide three buildings (building A, B and C) with a total 74,762 square feet of creative office and 500 square feet of ground floor retail uses, for a total of 75,262 square feet. As such, the Project would demolish the vacant private school's free-standing subterranean parking lot and access ramp, topped with a recreation field and basketball court, and two playgrounds. The Project would also demolish 8,941 square feet of an existing approximately 28,389 square foot, two-story school building, but would preserve and upgrade with a few exterior modifications the remaining approximately 19,448 square feet of the building and its subterranean parking garage to be a creative office building (Building B). Building A would be a new four-story creative office building of approximately 35,000 square feet located along the northern border of the Project Site with one level of at-grade parking and one level of subterranean parking. Building C is proposed as a new four-story building located at the southwest corner of the Project Site with approximately 20,814 square feet of creative office and the accessory retail. The retail component of the Project would be provided primarily for the use of the office employees and their guests. Building C would include at-grade parking on its first level, along with the retail use and creative office use.

Project Parking and Access

The Project proposes a total of 156 vehicle parking spaces. There would be 55 vehicle parking spaces at grade level and 101 parking spaces in the below-grade level. The Project would provide 2-level cantilevered vehicle parking lifts on the below-grade parking level under Building A. Vehicular access to the Project Site would be provided via a two-way entry/exit driveway on La Mirada Avenue, the existing two-way entry/exit driveway on Lexington Avenue and an at-grade on-site drop off area to serve both rideshare arrivals/departures in the surface parking lot on Lexington Avenue. The Project is required, and would provide, a minimum of 22 bicycle parking spaces (8 short term and 14 long term). In addition, 4 showers and 14 lockers would be provided.

Transportation Assessment CEQA and NON – CEQA Review

On July 30, 2019, the City of Los Angeles adopted vehicle miles traveled (VMT) as its criterion for determining transportation impacts under the California Environmental Quality Act (CEQA). These changes are mandated by requirements of the State of California Senate Bill 743 (SB 743) and the State’s CEQA Guidelines.

The new CEQA guidelines for evaluating transportation impacts no longer focus on measuring automobile delay and level of service (LOS). Instead, SB 743 directed lead agencies to revise transportation assessment guidelines to include a transportation performance metric that promotes: the reduction of greenhouse gas emissions, the development of multimodal networks, and access to diverse land uses.

The July 2020 Los Angeles Department of Transportation (LADOT) Traffic Assessment Guidelines (TAG) is the City document providing guidance for conducting both CEQA and non-CEQA transportation analyses for land development projects. The TAG identifies three CEQA thresholds for identifying significant transportation impacts that are applicable to the Project.

- Threshold T-1: Conflicting with Plans, Programs, Ordinances, or Policies
- Threshold T-2.1: Causing Substantial Vehicle Miles Traveled (VMT)
- Threshold T-3: Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use

The City’s adopted process also requires additional non-CEQA analysis and review for land development projects. The purpose of this review is to evaluate how projects affect vehicular access, circulation, and safety for all users of the transportation system. A Memorandum of Understanding (MOU) was prepared and approved by LADOT establishing the traffic assessment parameters for the study. A copy of the MOU is provided in Appendix A.

Transportation Demand Management (TDM) Program

The Project includes bike parking and shower amenities as a part of the Project's design features. The proposed Project with inclusion of these Project Design Features creates no significant Work VMT impacts. These strategies, as described by LADOT'S TAG, are listed below:

PROJECT DESIGN FEATURES

- BICYCLE INFRASTRUCTURE – Include Bike Parking per Los Angeles Municipal Code (LAMC) - This strategy involves implementation of short and long-term bicycle parking to support safe and comfortable bicycle travel by providing parking facilities at destinations under existing LAMC regulations applicable to the Project. The Project is required to, and will provide, a minimum of 22 bicycle parking spaces.
- BICYCLE INFRASTRUCTURE – Include Bike Parking and Showers - This strategy involves implementation of additional end of trip bicycle facilities to support safe and comfortable bicycle travel by providing amenities at the Project. This Project will provide up to 4 showers along with 14 lockers.

The proposed Project, with inclusion of these Project Design Features, creates no significant Work VMT impacts. No CEQA mitigation is required for the Project.

Findings

Based on the following review discussed in Chapters 2 and 3, no significant CEQA impacts or significant circulation, access, and safety deficiencies (non-CEQA) were identified for the Project.

The Bureau of Engineering (BOE)/ Department of City Planning (DCP) Planning Case Referral Form (PCRF) details street classifications per the Mobility Plan 2035, current street dedications and widths and the street dedication and improvement requests of the Project. Pursuant to LAMC Section 12.37, the Project is seeking the following waiver to dedicate and improve the following along the Project frontages:

- La Mirada Avenue – 5-foot dedication and 3-foot widening;

- Lexington Avenue – variable dedication and 3-foot widening;
- Cahuenga Boulevard – 1-foot widening; and,
- Southeast Corner of Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius dedication.

However, the dedications and widening are not currently necessary to meet the City's mobility needs and would disrupt street frontages and potentially create hazardous situations. The Project requests to maintain the current dedications and roadways. The BOE PCRFR required widening and dedications are unlikely on neighboring properties and improvements would not extend the entire block. Discontinues improvements does not yield practical benefits to the City's mobility needs and may hinder movement with street frontages that are not uniform.

Potential conflicts with other proposed land development projects have been reviewed to assess cumulative impacts that may result from the proposed Project in combination with other development projects in the study area. No cumulative development project impacts have been identified that would preclude the City's ability to provide transportation mobility in the area.

CHAPTER 1

PROJECT DESCRIPTION

The proposed Project is located on the northeast corner of North Cahuenga Boulevard and Lexington Avenue. There is Project frontage on North Cahuenga Boulevard to the west, La Mirada Avenue to the north, residential to the east and Lexington Avenue to the south. The location of the proposed Project is provided on Figure 1.

Currently, the Project site consists of 44,563 square feet of private school buildings and amenities for up to 200 students and an existing underground parking garage. The school was permanently closed on August 13, 2021. The proposed Project would provide three buildings with a total 74,762 square feet of creative office and 500 square feet of retail. A total of 156 parking spaces will be provided for the Project.

The proposed Project would replace and refurbish the existing vacant private school complex to provide three buildings (Building A, B and C) with a total 74,762 square feet of creative office and 500 square feet of ground floor retail uses, for a total of 75,262 square feet. Building A would be a new four-story creative office building of approximately 35,000 square feet located along the northern border of the Project Site, with one at-grade parking level and one subterranean parking level. The Project would demolish the school's free-standing subterranean parking lot and access ramp, topped with a recreation field and basketball court, and two playgrounds. The Project would also demolish 8,941 square feet of the existing approximately 28,389 square foot, two-story school building. The remaining approximately 19,448 square feet of the building would be preserved, along with its subterranean garage, and upgraded with a few exterior modifications to be a creative office building (Building B). Building C is proposed as a new four-story building located at the southwest corner of the Project Site with approximately 20,814 square feet of creative office and the accessory retail. The retail component of the Project would be provided primarily for the use of the office employees and their guests. The first level of Building C would include at-grade parking, the retail use and creative office use.

Project Vehicle Parking and Access

Vehicle Parking - Los Angeles Municipal Code (LAMC) Section 12.21A requires 151 vehicle parking spaces. It is permissible for up to 5 vehicle parking spaces to be replaced with bicycle parking at a ratio of four bicycle spaces per vehicle parking space for a total of 146 vehicle parking spaces. The Project proposes to provide 72 existing on-site parking spaces and 84 new parking spaces for a total of 156 vehicle parking spaces. The Project will provide 55 at-grade level parking spaces and 101 parking spaces located below-grade connected by internal vehicle ramps and access from Lexington Avenue. A 2-level cantilevered vehicle parking lift system will be provided in the below-grade parking under Building A. Thirty-six at-grade parking spaces will be accessed from a new driveway on La Mirada Avenue, 101 subterranean parking spaces will be accessed from an existing driveway on Lexington Avenue near the east end of the site, and 19 at-grade parking spaces will be accessed from a new driveway on Lexington Avenue between North Cahuenga Boulevard and the east Lexington driveway. Parking areas will be assigned so that circulation through the lots to find an open space will not be required.

Bike Parking - The Project is required to provide a total of 22 bicycle parking spaces (8 short term and 14 long term) with 1 long term per 5,000 square feet and 1 short term space per 10,000 square feet for the new creative office construction. The new retail requires 1 short and 1 long term bicycle parking space per 2,000 square feet with a minimum of 2 each. The Project will provide, at a minimum, 22 commercial bicycle parking spaces with 14 lockers and up to 4 showers provided.

Figure 2 illustrates the Project Site plan.

CHAPTER 2

CEQA TRANSPORTATION ASSESSMENT

The scope for this study was reviewed and approved by LADOT in accordance with the City CEQA requirements as contained in the LADOT TAG, adopted in July 2020. A copy of the LADOT approved MOU is provided in Appendix A.

The TAG is the City document that establishes procedures and methods for conducting CEQA transportation analyses for land development projects. The TAG identifies three CEQA thresholds for identifying significant transportation impacts.

- Threshold T-1: Conflicting with Plans, Programs, Ordinances, or Policies;
- Threshold T-2.1: Causing Substantial Vehicle Miles Traveled (VMT);
- Threshold T-3: Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use.

Project Initial VMT Screening

This is the first step in evaluating whether conditions exist that might indicate an environmental impact. A project is reviewed through a series of screening criteria to determine whether further CEQA analysis is required to address the threshold questions.

If the development project requires a discretionary action, and the answer is yes to any of the following threshold questions, further analysis is required to assess whether the proposed project would negatively affect the transportation system for all travel modes including pedestrian, bicycle, or transit facilities

1. Does the Project involve a discretionary action that would be under review by the Department of Planning?

Yes, the Project is requesting a General Plan Amendment and Zone Change approval.

2. Would the Project generate a net increase of 250 or more daily vehicle trips?

Yes, using the LADOT VMT calculator (version 1.3) for screening purposes, the Project

will generate an increase of 259 net daily vehicle trips with credits for removal of the existing 200 student private school and without any TDM strategies. TDM strategies are not considered in the screening criteria.

3. Is the Project proposing to, or required to, make any voluntary or required, modifications to the public right-of-way (i.e., street dedications, reconfigurations of curb lines, etc.)?

Yes, according to the BOE PCRF and Mobility Element, street standards La Mirada Avenue, which is designated as a local street, would require a 5-foot dedication and 3-foot widening along the northern boundary of the Project. Lexington Avenue, which is designated as a local street, would require a variable dedication and 3-foot widening along the eastern side of the property. Cahuenga Boulevard would require a 1-foot widening along the western boundary of the site. A 15-foot by 15-foot corner cut construction or 20-foot radius dedication on the southeast corner of Cahuenga Boulevard and La Mirada Avenue is required. A waiver under LAMC 12.37 from noted dedication and improvements will be requested.

4. Is the Project's frontage along a street classified as an Avenue, Boulevard or Collector (as designated in the City's General Plan) 250 linear feet or more, or is the Project's frontage encompassing an entire block along an Avenue or Boulevard (as designated in the City's General Plan)?

No, the frontage along North Cahuenga Boulevard, which is designated as an Avenue II, is approximately 202 feet in length.

5. Would the Project generate a net increase in daily VMT?

Yes, using the LADOT VMT calculator, the Project would generate 2,271 daily VMT after credits for the portion of the existing that will be removed. TDM strategies are not considered in the screening criteria. Appendix D contains the VMT reports.

6. Would the Project be located within a one-half mile of a fixed-rail or fixed-guideway transit station and replace an existing number of residential units with a smaller number of residential units?

No, the location of the Project is not within a half mile of a fixed-rail or fixed-guideway transit station. There are not any existing residential units existing or proposed.

7. Is the project proposing new driveways, or introducing new vehicle access to the property from the public right-of-way?

Yes, the Project is proposing two new driveways to the property from the public right-of-way. However, the Project will be reducing the overall number of driveways from five to three. Two existing driveways on La Mirada Avenue will be removed. A new driveway will be constructed to Building A parking. There are three existing driveways on Lexington Avenue. One driveway near the eastern boundary of the site with access to the subterranean parking at Building B will be retained. Two existing driveways on Lexington Avenue will be removed and one new driveway will be constructed at Building C.

8. Does the land use project include the construction of 50 dwelling units or guest rooms or combination thereof or 50,000 square feet of non-residential space?

Yes. The Project does not include any residential space but will provide the addition of 55,314 square feet of new commercial office and 500 square feet of retail along with the retention of 19,448 square feet of private school buildings renovated to creative office.

The TAG also provides screening criteria for consistency in accordance with CEQA Section 15064.3 subdivision (b)(2) on VMT impacts from Transportation Projects. The screening criteria for Transportation Projects is determined from the following question below.

Criteria for Transportation Projects - Would the Transportation Project include the addition of through traffic lanes on existing or new highways, including general purpose lanes, high-occupancy vehicle (HOV) lanes, peak period lanes, auxiliary lanes, and lanes through grade-separated interchanges (except managed lanes, transit lanes, and auxiliary lanes of less than one mile in length designed to improve roadway safety)?

Not Applicable - This analysis for Transportation Projects is not applicable to land
1200 N. Cahuenga Bl. Page 7 December 2021
Transportation Assessment CEQA TA

development projects and the Project is not a transportation project because the Project is a land development project. Therefore, the transportation project analysis is not part of the Project's CEQA review.

Based on the Project VMT Initial Screening Criteria on pages 5 through 7 for land development projects, further analysis is required to assess whether the Project would negatively affect the transportation system. Screening criteria presented in the TAG document specific to each area of analysis is contained in Appendix B.

I. Conflicts with Plans, Programs, Ordinances or Policies (Threshold T-1)

To guide the City's Mobility Plan 2035, the City adopted programs, plans, ordinances, and policies that establish the transportation planning framework for all travel modes, including vehicular, transit, bicycle, and pedestrian facilities. Land development projects shall be evaluated for conformance with these City adopted transportation plans, programs, and policies.

Per the TAG guidelines, a project would not be shown to result in an impact merely based on whether a project would not implement a program, policy, or plan. Rather, it is the intention of this threshold test to ensure that proposed development does not conflict with nor preclude the City from implementing adopted programs, plans, and policies.

The TAG provides a list of key City plans, policies, programs, and ordinances for consistency review, see Table 1. Projects that generally conform with and do not conflict with the City's development policies and standards addressing the circulation system, will generally be considered consistent.

Table 1
Consistency Check with Key City Plans, Programs, Ordinances or Policies

TAG Table 2.1-1: City Documents that Establish the Regulatory Framework				
	Plan or Policy	Consistent?	Notes	Preclude City Implementation?
1.	LA Mobility Plan 2035	No	La Mirada Avenue is designated as a Local Street in the Mobility Plan 2035. Currently La Mirada Avenue is dedicated to 30 feet in width and is required to provide 60 feet. Lexington Avenue is designated as a Local Street and is currently dedicated to 50 and 55 feet in width along the Project frontage. A Local Street requires a 60-foot dedication. The western half of the property is dedicated to 30'-half street. A 15-foot by 15-foot corner cut or 20' radius dedication would be required at the southeast corner of North Cahuenga Boulevard and La Mirada Avenue. The Project proposes to seek a WDI for La Mirada Avenue – 5-foot dedication and 3-foot widening, Lexington Avenue – variable dedication and 3-foot widening, North Cahuenga Boulevard – 1-foot widening; and, southeast corner of North Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius.	Yes
2.	Plan for Healthy LA	Yes	The Project would support Policy 5.7, Land Use Planning for Public Health and Greenhouse Gas (GHG) Emission Reduction, by reducing single-occupant vehicle trips by its proximity to transit service and on-site amenities for the employees. The Project would not conflict with other policies in the Plan for Healthy LA.	No
3.	Land Use Element of the General Plan (35 Community Plans)	Yes	The Project is in the Hollywood Community Plan area. The Project would be in substantial conformance with the purposes, intent, and provisions of the General Plan and the Community Plan.	No
4.	Specific Plans	Not Applicable	The Project is not within a Specific Plan area.	No
5.	LAMC Section 12.21A.16 (Bicycle Parking)	Yes	The Project will, at a minimum, comply with the required of short- and long-term bicycle parking pursuant to LAMC Section 12.21. A.16.	No
6.	LAMC Section 12.26J (TDM Ordinance)	Yes	LAMC Section 12.26J for Transportation Demand Management and Trip Reduction Measures applies to the construction of new non-residential floor area greater than 25,000 sf. The Project will comply with this requirement.	No
7.	LAMC Section 12.37 (Waivers of Dedications and Improvement)	Yes	A waiver of dedication and improvements is requested for La Mirada Avenue, Lexington Avenue and North Cahuenga Boulevard with request to retain existing uniform street frontages, unlikely neighboring dedication and improvements and avoidance of creating hazards.	Yes

	Plan or Policy	Consistent?	Notes	Preclude City Implementation?
8.	Vision Zero Action Plan	Yes	The Project will reduce the number of vehicle driveways at the site. Instead of the three existing driveways on Lexington Avenue and two existing driveways on La Mirada Avenue, the Project will retain one existing and create one new driveway on Lexington Avenue. The two existing driveways on La Mirada Avenue will be removed and one new driveway on La Mirada Avenue will be created. The Project would not preclude or conflict with the implementation of future Vision Zero projects in the public right-of-way.	No
9.	Vision Zero Corridor Plan	Yes	The Project would not preclude or conflict with the implementation of future Vision Zero projects in the public right-of-way	No
10.	Citywide Design guidelines	Yes	Per Guideline 1-3 below.	No
	Guideline 1: Promote a safe, comfortable, and accessible pedestrian experience for all	Yes	The Project will create a continuous and straight sidewalk clear of obstructions for pedestrian travel. The Project will provide adequate sidewalk width and right-of-way that accommodates pedestrian flow and activity. Pedestrian access will be provided at street level with direct access to the surrounding neighborhood and amenities.	No
	Guideline 2: Carefully incorporate vehicular access such that it does not degrade the pedestrian experience.	Yes	The Project complies with the Citywide Design Guidelines incorporating vehicle access locations that do not discourage and/or inhibit the pedestrian experience. Vehicular access and parking are located on the local streets only. The Project vehicular access complies with driveway location standards. No vehicular access is provided on North Cahuenga Boulevard.	No
	Guideline 3: Design projects to actively engage with streets and public space and maintain human scale.	Yes	The building design uses attractive architectural elements. The Project would not preclude or conflict with the implementation of future streetscape projects in the public right-of-way.	No

As summarized above in Table 1, the Project would not conflict with most key City planning documents. The Bureau of Engineering (BOE)/ Department of City Planning (DCP Planning Case Referral Form (PCRF) details street classifications per the Mobility Plan 2035, current street dedications and widths and the street dedication and improvement requests of the Project. Pursuant to LAMC Section 12.37, the Project is seeking the following waiver to dedicate and improve the following along the Project frontages:

- La Mirada Avenue – 5-foot dedication and 3-foot widening;
- Lexington Avenue – variable dedication and 3-foot widening;
- North Cahuenga Boulevard – 1-foot widening; and,
- Southeast Corner of North Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius dedication.

The waiver is justified because the dedications and widening are not currently necessary to meet the City’s mobility needs and would disrupt street frontages and potentially create hazardous situations. The Project requests to maintain the current dedications and roadways.

La Mirada Avenue is a short segment of Local Street between North Cahuenga Boulevard and Vine Street that is currently developed with residential homes. The proposed Office and small Commercial uses will not disrupt the traffic flow. La Mirada Avenue is not a primary east-west connector road such as Santa Monica Boulevard which is one block south of the Project Site. Further dedications would be required from the 11 single-family homes on the north side La Mirada Avenue with multiple ownerships with unlikely dedications and improvements. The current narrower roadway may discourage cut-through traffic.

Lexington Avenue is a Local Street located one block north of Santa Monica Boulevard with multiple zero-lot line buildings including a commercial building and hotel constructed in the 1920s. These buildings are located on the same block as the Project. These buildings would negate the ability to provide widening the entirety of the block.

North Cahuenga Boulevard is currently wider than required by the Mobility Plan 2035 and is a uniform roadway width serving the City needs. Widening it by one foot would result in significant disruption in traffic and may create unnecessary blind spots for turning vehicles and pedestrians, thereby creating hazardous situations.

The BOE PCRf-required widening and dedications are unlikely to be achieved on neighboring properties and the improvements would not extend the entire block. Discontinuous improvements do not yield practical benefits to the City's mobility needs and may hinder movement with street frontages that are not uniform. As the widening and dedication required along La Mirada Avenue, Lexington Avenue and North Cahuenga Boulevard are unnecessary, would disrupt uniform street frontages and potentially create hazardous situations, the requirement to construct the 15-foot by 15-foot corner cut or a 20-foot radius improvement would be unnecessary. Instead, the Project requests to maintain the current corner cut on the southeast corner of North Cahuenga Boulevard and La Mirada Avenue.

The TAG also provides a list of questions to guide the Project's consistency review. These questions and answers relative to the Project are provided in Appendix C. As demonstrated in Appendix C, with approval of the requested waiver, the potential impacts would be less than significant. Improvements along these connecting segments of La Mirada Avenue, Lexington Avenue and North Cahuenga Boulevard have not been made at this time and are not likely to be made in the near future.

Cumulative Consistency Check

Pursuant to the TAG, each of the plans, programs, ordinances, and policies to assess potential conflicts with proposed projects should be reviewed to assess cumulative impacts that may result from the Project in combination with other nearby development projects.

A cumulative impact could occur if the Project, with other future development projects located on the same block were to cumulatively preclude the City's ability to serve transportation user needs as defined by the City's transportation policy framework¹. The results of the Project's VMT calculation (as shown in Appendix D) would not exceed the City's APC VMT impact thresholds and as such, the Project's contribution to the cumulative VMT impact is adequate to demonstrate there is no cumulative VMT impact. No cumulative impact has been identified with this Project that would preclude the City's implementation of any transportation related policies, programs, or standards.

Therefore, the Project does not have a significant transportation impact under CEQA Threshold T-1 (Conflicting with Plans, Programs, Ordinances, or Policies).

II. Causing Substantial Vehicle Miles Traveled (Threshold T - 2.1)

The intent of this threshold question is to assess whether a land development project causes a substantial VMT impact. CEQA Guidelines Section 15064.3(b) relates to use of VMT as the methodology for analyzing transportation impacts.

To address this question, LADOT's TAG identified significant VMT impact thresholds for each of seven Area Planning Commission (APC) sub-areas in the City. A project's VMT is compared against the City's APC threshold goals for household VMT per capita and work VMT per employee to evaluate the significance of the project's VMT.

A development project will have a potential impact if the development project would generate VMT exceeding 15% below the existing average VMT for the Area Planning Commission (APC) area in which the project is located per TAG Table 2.2-1.

The Project is in the Central APC sub-area which limits daily household VMT per capita to a threshold value of above 6.0 and a daily work VMT per employee to a threshold value of above 7.6 (15% below the existing VMT for the Central APC).

² Framework includes LA Mobility Plan 2035, Plan for Healthy LA, Specific Plans, LAMC Section 12.21.a.16. LAMC Section 12.26J, Vision Zero Action Plan, Vision Zero Corridor Plans, Streetscape Plans, Citywide Design guidelines as noted in the LADOT July 2020 TAG page 2-3.

As a project design feature, the Project proposes to provide a sufficient number of bicycle parking spaces to meet City of Los Angeles bicycle parking requirements per LAMC Section 12.21.A.16 with 8 short term bicycle parking spaces, 14 long term bicycles spaces, and provide 4 showers and a total of 14 secure lockers.

Results of the Project's VMT calculation (as shown in Appendix D) provides an estimate based on the Project's land uses, size and TDM program strategies that are included as Project design features (i.e. bike parking per LAMC, showers and secure lockers). There is no Project household VMT per capita impact because no housing is proposed. The Project's work VMT per employee is estimated as 7.6.

Thus, the Project does not propose any housing and does not create a household VMT impact. The Project does not have a significant work VMT impact in the Central APC because the household VMT is 7.6 which is below the CEQA Threshold T-2.1 (Causing Substantial Vehicle Miles Traveled) of above 7.6. There are no remaining significant traffic impacts.

The Project's VMT analysis worksheets are provided in Appendix D.

TDM Program Project Design Features

Project Design Feature: The Project includes two TDM measures that reduce trips and VMT through TDM strategies and are included in the VMT analysis for the Project. These TDM project features, as described by LADOT'S TAG, are listed below:

BICYCLE INFRASTRUCTURE – Include Bike Parking per LAMC - This strategy involves implementation of short and long-term bicycle parking to support safe and comfortable bicycle travel by providing parking facilities at destinations under existing LAMC regulations applicable to the Project. The Project is required to, and will provide, a minimum of 22 bicycle parking spaces.

BICYCLE INFRASTRUCTURE – Include Bike Parking and Showers - This strategy involves implementation of additional end of trip bicycle facilities to support safe and comfortable bicycle travel by providing amenities at the Project. This Project will provide up to 4 showers and 14 secure lockers.

As stated in the City of Los Angeles VMT Calculator User Guide, November 2019

(Chapter 4, page 16), the effectiveness (reduction in Project VMT) of each TDM strategy/Project Design Feature included in the VMT Calculator is based primarily on research documented in the 2010 California Air Pollution Control Officers Association (CAPCOA) publication, Quantifying Greenhouse Gas Mitigation Measures (CAPCOA, 2010). No significant household or work impact is identified and no mitigation is required of the Project.

Summary:

- Household VMT per Capita Threshold is above 6.0
- There is NO residential component to the Project.
NO HOUSEHOLD VMT IMPACT

- Work VMT per Employee Threshold is above 7.6
- Work VMT per Employee is 7.6 with Project Features
- NO WORK VMT IMPACT

Cumulative VMT Consistency Check

Cumulative VMT impacts are evaluated through a consistency check with the Southern California Association of Governments' (SCAG) Regional Transportation Plan/Sustainable Communities Strategy (2016-2040 RTP/SCS) plan. The RTP/SCS is the regional plan that demonstrates compliance with air quality conformity requirements and greenhouse gas (GHG) reduction targets.

Per the City's TAG, projects that are consistent with the RTP/SCS plan in terms of development location and density are part of the regional solution for meeting air pollution and GHG goals. Projects that have less than a significant VMT impact are deemed to be consistent with the SCAG's 2016-2040 RTP/SCS and would have a less-than-significant cumulative impact on VMT.

As shown, the Project VMT impact would not exceed the City's Central APC VMT impact thresholds with mitigation and as such, the Project's contribution to the cumulative VMT impact is adequate to demonstrate there is no cumulative VMT impact.

III. Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use (Threshold T- 3.1)

Impacts regarding the potential increase of hazards due to a geometric design feature generally relate to the design of access points to and from the project site, and may include safety, operational, or capacity impacts. Impacts can be related to vehicle conflicts as well as to operational delays caused by vehicles slowing and/or queuing to access a project site.

No deficiencies are apparent in the site access plans which would be considered significant. This determination considers the following factors:

1. No vehicular access is proposed on North Cahuenga Boulevard, a designated Modified Avenue II roadway.
2. Vehicle access to the parking will be from the adjacent Local Streets of La Mirada Avenue and Lexington Avenue.
3. There is reduction in the number of driveways on to the city streets. Currently there are 2 driveways for the site on Lexington Avenue. One driveway will be removed, one driveway will remain and one new driveway will be constructed. The two existing driveways on La Mirada Avenue will be removed and one driveway will be constructed. By providing one less driveway, the Project will reduce the number of potential hazard points with pedestrians, cyclists and other vehicles.
4. The Project's local street access is consistent with LADOT driveway placement and location per LADOT Manual of Policies and Procedures, Section 321, Driveway Design.

A review of the Project Site plans does not present any hazardous geometric design features. Therefore, the Project does not have a significant transportation impact under CEQA Threshold T-3.1 (Substantially Increasing Hazards Due to a Geometric Design Feature).

Cumulative Access Evaluation

According to the TAG, an evaluation of site access plans for related projects with access points proposed along the same blocks as the proposed project must be reviewed for potential cumulative access impacts.

The proposed Project will have vehicle access from La Mirada Avenue and Lexington Avenue, both local streets. No other related projects were identified along the same block in the Project area. No cumulative impacts were identified.

CHAPTER 3

NON-CEQA TRANSPORTATION ASSESSMENT

In addition to conducting a CEQA review of development projects pursuant to SB743, LAMC Section 16.05 (Site Plan Review) authorizes a non-CEQA transportation analysis of development projects to identify deficiencies that may occur in the area due to the project. Additional authority is sited in other discretionary processes (e.g. conditional use permits) where the City is required to make findings to support approval of development projects. LADOT retains the ability to impose development conditions to improve operational safety and access around a project site and to better assess how proposed projects may affect the City's transportation system under the non-CEQA assessment.

Pursuant to the TAG, a delay-based analysis has been used to evaluate if the Project would contribute to potential circulation and access deficiencies that require specific operational improvements to the circulation system.

To assist in the non-CEQA evaluation, the following information provides the environmental conditions in which the Project is located.

ENVIRONMENTAL SETTING

Land Use

The Project site is in the Hollywood Community Plan area located approximately 5 miles northwest of downtown Los Angeles. The Community Plan area is located predominately north of Melrose Avenue west of the City of West Hollywood, south of Mulholland Drive, Barham Boulevard and Forest Lawn Drive and west of the Silver Lake-Echo Park – Elysian Valley and the Northeast Los Angeles Community Plan areas. The Project is located within a Transit Priority Area (TPA) and Enterprise Zone. Appendix E contains the Hollywood Community Plan land use map.

Transportation Facilities

The City of Los Angeles has adopted the Mobility Plan 2035 as an update to the City's General Plan Transportation Element to incorporate the complete streets principles for integrating multi-mode transportation networks. The Mobility Plan 2035 dictates the street

standards and designations for all users. Appendix F provides a map of the area roadway designations, roadway design standards and aerials of nearby signalized locations.

Pursuant to the City of Los Angeles Mobility Element, arterial roadways are designated as Boulevards and Avenues. Avenues may vary in their land use context, with some streets passing through both residential and commercial areas. The roadway standard for a Modified Avenue II is a right-of-way width of 80 feet and a roadway width of 56 feet. Non-arterial roadways connect arterial roadways to local residential neighborhoods or industrial areas. Non-arterial roadways are designated collector or local streets. The standard for a Local Street is a right-of-way width of 60 feet and a roadway width of 36 feet.

Regional access to Project area is provided by the Hollywood Freeway (US-101). The north-south Hollywood Freeway is located approximately 1.1 miles east of the Project. The Hollywood Freeway is accessible via Lexington Avenue with a southbound off ramp, a northbound on ramp on Western Avenue north of Lexington Avenue, and a southbound on ramp and northbound off ramp on Santa Monica Boulevard.

The Hollywood Freeway carries approximately 258,000 vehicles per day (VPD) with 15,300 vehicles per hour (VPH) at Santa Monica Boulevard. Freeway traffic volumes are provided by Caltrans in the 2017 Traffic Volumes Book. The Hollywood Freeway is typically congested during the morning and afternoon commute hours.

Major roadways in this area of Hollywood generally follow an overall grid pattern with some curves. Key east - west streets providing access to the immediate project area include Fountain Avenue and Lexington Avenue. Key north - south streets serving the study area include North Cahuenga Avenue and Vine Street.

Fountain Avenue is an east - west roadway designated a Collector Street in the Mobility Plan 2035. Fountain Avenue, in the Project study area, is identified as part of the City of Los Angeles Neighborhood Enhanced (NEN) from close Street West and from Gower Street East. It is identified as part of the Pedestrian Enhanced District (PED) between Gower Street and North Cahuenga Boulevard and west of Cole Street. In the

Project Study area, one traffic lanes in each direction is provided with yellow lane striping. Parking is generally provided on both sides of the street.

North Cahuenga Boulevard is a north – south roadway designated as a Modified Avenue II provides two lanes in each direction. Left turn movements are conducted from a shared through lane at Fountain Avenue, La Mirada Avenue and Lexington Avenue. There is a signalized pedestrian crossing signal at North Cahuenga Boulevard and Lexington Avenue with a yellow crosswalk on the south leg. Parking is generally permitted with 1 hour parking between 8AM to 6PM weekdays on the east and west side of North Cahuenga Boulevard and restrictions for no parking from 10 AM to 1 PM for street cleaning on Monday on the east side of the street and Tuesday on the west side of the Street. North Cahuenga Boulevard creates the western boundary of the Project site. Thirty Miles per Hour (MPH) speed limit signs are posted in the area.

Vine Street is a north - south roadway designated an Avenue II in the Mobility Plan 2035. Highland Avenue is identified as part of the City's High Injury Network (HIN) and Tier 2 Bicycle Lane Network. In the Project study area, two traffic lanes are provided in each direction. The southbound curb lane is identified as a shared bicycle/vehicle lane. South of Melrose Avenue, two traffic lanes and one bicycle lane in each direction are provided. Parking is generally permitted on the east and west side of the street. The roadway is posed with a 35 MPH speed limit sign.

La Mirada Avenue is an east - west roadway designated a Local Street in the Mobility Plan 2035. In the Project area, La Mirada Avenue is a discontinuous roadway and extends from Vine Street to North Cahuenga Boulevard with off-set intersections at both roadways. One lane in each direction is provided. No parking is permitted on La Mirada Avenue between Vine Street and North Cahuenga Boulevard. La Mirada Avenue creates the northern boundary of the Project site.

Lexington Avenue is an east - west roadway designated a Local Street in the Mobility Plan 2035. One lane in each direction if provided in the Project study area. The Lexington Avenue and Vine Street intersection is controlled with a full traffic signal. The Lexington Avenue and North Cahuenga Boulevard is controlled with stop signs on

Lexington and a pedestrian signal on North Cahuenga Boulevard. Lexington Avenue creates the southern boundary of the Project site.

Transit Information

The proposed Project is a creative office complex. Some public transportation opportunities are provided in the Project Site vicinity within walking distance.

Public transportation in the study area is provided by the Metropolitan Transportation Authority (Metro). There is a Metro B Line (previously Red Line) Hollywood/Vine Metro station located approximately 3,200 feet northeast of the site and the Hollywood/Highland Metro station located approximately 4,600 feet northwest of the site. These stations are accessible by walking, cycling or other transit services in the area. Metro B line provides service between North Hollywood, Universal City, Hollywood, Vermont area, Wilshire area, and downtown Los Angeles.

Metro and LADOT provides local and rapid bus lines through this area of Hollywood.

Metro local and rapid lines provide service along Santa Monica Boulevard in the Project area which include:

-Route 4 and Rapid 704 (with fewer stops along route) operates between Santa Monica, West Los Angeles, West Hollywood, Hollywood and downtown Los Angeles. There is a stop for Route 4 at Santa Monica Boulevard & Wilcox Avenue approximately 1,230 feet southwest of the site. There is a stop for Route 4 and Rapid 704 at Santa Monica Boulevard & Vine Street approximately 1,100 feet southeast of the site.

LADOT provides circuitous DASH service in the Project area along Fountain Avenue. The service includes:

DASH Hollywood provides circuitous service between the Project area along Fountain Avenue to Highland Avenue, north to the Highland/Hollywood D Line Station, northeast to Las Palms & Franklin Avenue, east to Whitley Street, south to Hollywood, east again to the Hollywood/Vine D Line Station, north back to Franklin Avenue east to

Vermont Avenue, south to Santa Monica Boulevard and then east along Santa Monica Boulevard, Fountain Avenue and Sunset Boulevard back to the Project area. There is a bus stop on the northeast and southwest corner of Fountain Avenue and North Cahuenga Boulevard approximately 420 feet from the site.

Transfer opportunities are available to/from this area of Hollywood from the local and regional lines. The transit and metro lines are illustrated in Appendix G.

Complete Streets Mobility Networks (Vehicle, Bicycle, Transit and Neighborhood)

The Mobility Plan Element establishes a layered network of street standards that are designed to emphasize mobility modes within the larger system. This approach maintains the primary function of the streets that exist but identifies streets for potential alternative transportation modes providing a range of options available when selecting the appropriate design elements. Street may be listed in several networks with the goal of selecting a variety of mobility enhancements.

Network layers have been created for the Complete Street Network that prioritizes a certain mode within each layer with the goal of providing better connectivity. The network layers are: Vehicle Enhanced Network, Transit Enhanced Network, Bicycle Enhanced Network and Neighborhood Enhanced Network. Definitions of these networks per the Complete Street Design Guidelines are provide below. Mobility Element maps, Walkability Index maps, bicycle plan maps, and pedestrian destination maps are included in Appendix H.

Vehicle Enhanced Network (VEN) - The VEN includes a select number of arterials that carry high volume of traffic for long distance travel on corridors with freeway access. Moderate enhancements typically include technology upgrades and peak-hour restrictions for parking and turning movements. Comprehensive enhancements can include improvements to access management, all-day lane conversions of parking, and all-day turning movement restrictions or permanent access control.

- The closest VEN to the Project is north of the site on Sunset Boulevard between Highland Avenue and the Hollywood Freeway.

Transit Enhanced Network (TEN) - The TEN is comprised of streets that prioritize travel for transit riders.

- Santa Monica Boulevard – located south of the Project, is identified as part of the TEN.

Bicycle Enhanced Network (BEN) – The BEN is comprised of a network of low – stressed protected bike lanes (Tier 1) and bike paths prioritize bicycle travel by providing specific bicycle facilities and improvements. The BEN proposes bike facilities on arterial roadways with a striped separation. Tier 1 corresponding to protected bicycle lanes, and Tier 2 and Tier 3 bicycle lanes on arterial roads with a striped separation that are differentiated only by their potential implementation phasing. The difference between Tier 2 and Tier 3 implies probability that some lanes are not expected to be implemented by 2035.

- Vine Street – located east of the Project, is identified as part of the BEN – Tier 2.
- Santa Monica Boulevard – located south of the Project is identified as part of the BEN – Tier 3.
- Sunset Boulevard – located north of the Project is identified as part of the BEN – Tier 3.

The City of Los Angeles adopted a 2010 Bicycle Master Plan to encourage alternative modes of transportation throughout the City of Los Angeles. The Master Plan was developed to provide a network system that is safe and efficient to use in coordination with the vehicle and pedestrian traffic on the City street systems. The Master Plan has mapped out the existing, funded, and potential future Bicycle Paths, Bicycle Lanes, and Bicycle Routes. Copies of the Bicycle Plan maps dated 2010 are provided in Appendix H for reference. A brief definition of the bicycle facilities is provided below:

Bicycle Path – A bicycle path is a facility that is separated from the vehicular traffic for the exclusive use of the cyclist (although sometimes combined with a pedestrian lane). The designated path can be completely separated from vehicular traffic or cross the vehicular traffic with right-of-way assigned through signals or stop signs.

- No bicycle paths are provided in the immediate area.

Bicycle Lane – A bicycle lane is typically provided on street with a designated lane striped on the street for the exclusive use of the cyclist. The bicycle lanes are occasionally curbside, outside the parking lane, or along a right turn lane at intersections.

Bicycle Route – A bicycle route is a designated route in a cycling system where the cyclist shares the lane with the vehicle. Cyclist would follow the route and share the right-of-way with the vehicle.

Neighborhood Enhanced Network (NEN) - NEN is comprised of local streets intended to benefit from pedestrian and bicycle related safety enhancements for more localized travel of slower means of travel while preserving the connectivity of local streets to other enhanced networks. These enhancements encourage lower vehicle speeds, providing added safety for pedestrians and bicyclists.

- Fountain Avenue, located north of the Project site, identified as part of the Tier 2 NEN.
- Cole Street, located west of the Project site, from Melrose Avenue northerly is identified as part of the Tier 2 NEN.
- Gower Street, located east of the Project site, is identified as part of the Tier 2 NEN

Pedestrian Enhanced District (PEDs) - In addition to these street networks, many arterial streets that could benefit from additional pedestrian features to provide better walking connections are identified as Pedestrian Enhanced Districts. The PED segments provided in the mobility map identify streets where pedestrian improvements on arterial streets could be prioritized to provide better walking connections to and from the major destinations within communities.

- Fountain Avenue between Gower Street and North Cahuenga Boulevard and west of Cole Avenue is identified as part of the PED.
- North Cahuenga Boulevard to Gower Street except between Fountain Avenue and La Mirada Avenue is identified as part of the PED.

- Cole Avenue from North Cahuenga Boulevard in the north to Fountain Avenue and then again from La Mirada Avenue to Romaine Street is identified as part of the PED.

The Complete Streets guide acknowledges that adding pedestrian design features and street trees encourages people to take trips on foot instead of by car. Thereby helping to reduce the volume of cars on the road and emissions, increases economic vitality, and make the City feel like a more vibrant place.

PROJECT TRAFFIC GENERATION

As part of the Non-CEQA assessment, an operational analysis of the peak hour traffic flow with the Project is required. This evaluation is based on peak hour traffic flow level of service (LOS) methodologies which determines vehicle delay using current traffic volume data, traffic signal and street characteristics.

Traffic generating characteristics of land uses have been studied by the Institute of Transportation Engineers (ITE). The results of these studies are published in ITE Trip Generation, 11th Edition Handbook. The Project is retaining 19,448 square feet of existing structures that were provided for a recently vacated 200 student private school. An additional 55,314 square feet new creative office (for a total of 74,762 square feet of creative office) and 500 square feet retail will be constructed. Creative office uses tend to differ from standard offices in that the employees keep non-traditional hours. However, the ITE Trip Generation Manual does not differentiate between types office so the general office rate was used to estimate the creative office trip generation. The small retail/restaurant shop will be established primarily for the use of office employees or their guests.

Traffic rates used in this analysis are presented in Table 2. Table 3 shows the Project's peak hour trip estimate. Note that the Project is within a Transit Priority Area (TPA) with services provided along Fountain Avenue (DASH) with service to the Metro D Line, Santa Monica Boulevard (Route 4 and 704) and Hollywood Boulevard (Metro D

Line). A 15% transit credit was incorporated for the Creative office and prior Private School.

Table 2
Project Trip Generation Rates

Description	ITE CODE	Daily Traffic	AM Peak Hour			PM Peak Hour		
			Total	In	Out	Total	In	Out
Private School	532	2.48	0.79	63%	37%	0.17	43%	57%
Office	710	10.84	1.52	88%	12%	1.44	17%	83%
Coffee/Donut Shop wo Drive Thru	936	626.85	93.08	51%	49%	32.29	50%	50%

General office rate used for Creative Office, no small Retail/Restaurant; used coffee/donut shop (no daily rate used 5XAM+PM)
 Rater per 1,000 sf for Office & Restaurant, per student for school

Table 3
Estimated Project Traffic Generation

NET TRIPS (PROPOSED-EXISTING)			344	(25)	6	(31)	67	5	62

* Small Retail is for the primary use of the office employees/visitors, 75% internal conservatively estimated

Table 3 shows the Project traffic estimates using ITE traffic rates. It is estimated that the Project will generate an increase of 344 net daily trips with 25 fewer vehicle trips during the AM Peak Hour and 67 more trips during the PM Peak Hour on the nearby street network.

A primary factor affecting trip direction is the distribution of population and employment which would generate project trip origins and destinations. The estimated project directional trip distribution is also based on the study area roadway network, freeway access points, traffic flow patterns in and out of this area of Hollywood, driveway

locations and consistency with previously approved traffic studies for this area. The Project's vehicle trips are analyzed at the nearby intersections in the Project Access, Safety and Circulation Evaluation section of this report starting on page 31.

PEDESTRIAN, BICYCLE AND TRANSIT ACCESS ASSESSMENT

Purpose - The pedestrian, bicycle and transit assessments are intended to determine a project's potential effect on pedestrian, bicycle, and transit facilities in the vicinity of the Project site. Any deficiencies could be physical (through removal, modification, or degradation of facilities) or demand-based (by adding pedestrian or bicycle demand to inadequate facilities).

Removal or Degradation of Facilities

The Project will not remove, modify, or degrade any pedestrian, bicycle, and transit facility in the vicinity of the Project Site. In fact, any damaged or off-grade sidewalk, curb and gutter along the property frontage(s) will be repaired under Section 12.37 of the Los Angeles Municipal Code (LAMC).

Project Intensification of Use

Generally, projects that contribute to efficient land use patterns enabling higher levels of walking, cycling, and transit as well as lower than average trip length are considered to have a less than significant impact on transportation. These projects include, for example, projects in transit priority areas, projects consisting of residential infill or those located in low VMT areas.

The Project is located within a TPA with a bus stop for DASH Hollywood 420 feet north of the Project site. This local service provides a circuitous route in the Hollywood area and provides stops at the Metro D line. The Project's frontage on North Cahuenga Boulevard is designated as a Modified Avenue II roadway and is included in the Pedestrian Enhanced District. Vine Street, to the east of the site is identified as a Tier 2 Bicycle Network improvement and has an existing shared vehicle/bicycle lane along the west curb lane.

Transit Facilities -The number of additional transit users created by the Project were estimated based on the ITE Trip Generation Manual 10th Edition Supplement, February 2020 (ITE Supplement). This ITE Supplement provides estimated transit trip ends for some land uses including the proposed office. Restaurant land uses were not included and shopping center was used to replicate transit activity created by the retail/restaurant. Note that the retail/restaurant is proposed primarily for convenient use by the office employees and their guests. The ITE Supplement transit trip end rates have varying number of sample sizes and reliance. The Dense Multi-Use Urban rates per 1,000 square feet were used for this Project. This category provides a conservative estimate of transit trips. Table 4a, on the following page, provides the transit trip end rates and trips.

Table 4a
Transit Trip Rates and Trip Ends

Transit Trip Generation Rates

ITE Code	Description	AM Peak Hour Total	PM Peak Hour Total
710	Office	0.15	0.14
820	Shopping Center*	0.91	0.64

* No restaurant transit trip generation available, estimated using shopping center

Transit Trips

ITE Code	PROJECT TRANSIT TRIPS Description	Size	AM Peak Hour Total	PM Peak Hour Total
	<u>Proposed New Construction</u>			
710	Office	74,762 sf	11	10
820	Retail/Restaurant	500 sf	0	0
NEW Transit TRIPS TOTAL			11	10

As mentioned previously, the Project is served by local transit. Metro Route 4 along Santa Monica Boulevard and DASH Hollywood have bus stops within 1/4 mile of the Project site. These local lines provide transit to major destination points including

Santa Monica, West Los Angeles, West Hollywood, Hollywood and downtown Los Angeles the Metro D Line stations at Hollywood/Vine and at Hollywood/Highland. Transfer opportunities from the local lines provides regional access.

Based on the schedule provided on Metro.net and LADOT, the bus services in the area have a range of 6 to 8 minutes headways (service between buses) in both the AM and PM Peak Hours for Route 4 and 10 to 12 minutes for the DASH services. Therefore, there would be 8 to 10 buses in each direction along Route 4 and 5 to 6 buses for DASH Hollywood. These two services will provide 21 buses in a single hour (8 buses X 2 directions + 5 buses). Metro buses have 40 seats on a low floor bus and 43 seats for a traditional high-floor bus. Larger articulated busses provide 56-60 seats. DASH buses tend to be in the lower range with approximately 40 seats. Conservatively, this would equate to a total of 840 seats during the peak hour (21 buses X 40 seats). This does not include standing capacity. The Project could create a 1.31% increase in ridership during the AM and PM Peak Hour (11 riders/840 seats for the AM Peak Hour and 10 riders/840 seats for the PM Peak Hour). The projected level of new transit ridership shown in Table 4a, with 11 during the AM Peak Hour and 10 during the PM Peak Hour, is not expected to create a deficiency to the current transit services in the area.

Bike Facilities -No bike facilities are currently located along the Project frontage of North Cahuenga Boulevard. Project employees may make use of the cycling in the area along Vine Street and including the Project's cycling storage. Showers will be available for those who cycle and want to make use of these. The number of additional cyclists created by the Project were estimated based on the ITE Supplement. This ITE Supplement provides estimated bike trip ends for some land uses including the proposed office. Restaurant land uses were not included and shopping center was used to replicate the bicycle use generation. Note that the small retail/restaurant is proposed primarily for convenient use by the office employees and their guests. The ITE Supplement's bike trip end rates have been estimated using the Dense Multi-Use Urban rates per 1,000 square feet for the office and Retail/Restaurant. Table 4b provides the bicycle trip end rates and trips.

Table 4b
Bicycle Trip Rates and Trip Ends

Bike Trip Generation Rates

ITE Code	Description	AM Peak Hour Total	PM Peak Hour Total
710	Office	0.02	0.01
820	Shopping Center*	0.27	0.03

* Not restaurant bike trip generation available, estimated using shopping center

Bike Trips

ITE Code	PROJECT BIKE TRIPS Description	Size	AM Peak Hour Total	PM Peak Hour Total
	<u>Proposed New Construction</u>			
710	Office	74,762 sf	1	1
820	Retail/Restaurant	500 sf	0	0
NEW Bike TRIPS TOTAL			1	1

The projected level of cyclists shown above in Table 4b is not expected to create a deficiency to the current cycling services in the area.

Pedestrian - After construction of the Project, there will be additional pedestrians in the area created by the employees and guests of the Project. As with the transit and bike trips, the ITE Supplement Dense Multi-Use Urban rates per unit for the office and restaurant (using shopping center rate) were used to provide the estimated pedestrian trip end rates and trips. Table 4c on the following page provides the pedestrian trip end rates and trips.

Table 4c
Pedestrian Trip Rates and Trip Ends

Walk Trip Generation Rates

ITE Code	Description	Daily	AM Peak Hour Total	PM Peak Hour Total
710	Office	5X(AM+PM)	0.16	0.17
932	High Turnover Restaurant	5X(AM+PM)	0.45	0.45

Walk Trip Generation

ITE Code	PROJECT PEDESTRIAN TRIPS Description	Size	Daily	AM Peak Hour Total	PM Peak Hour Total
<u>Proposed New Construction</u>					
710	Office	74,762 sf	105	12	13
932	Retail/Restaurant	500 sf	2	0	0
NEW Pedestrian TRIPS TOTAL			107	12	13

A map of the various pedestrian destinations and facilities within ¼ mile is provided in Appendix H.

Street frontage along Lexington Avenue, North Cahuenga Boulevard and La Mirada Avenue will be improved with new landscaping and repaired or improved sidewalks along the Project frontages. An existing pedestrian traffic signal at North Cahuenga Boulevard and Lexington Avenue is striped with continental (crosshatch) crosswalks along the north leg of the intersection. A full traffic signal is provided at Vine Street & Lexington Avenue and North Cahuenga Boulevard & Fountain Avenue provides continental crosswalks on all 4 legs of the intersections.

High Injury Network

Vision Zero Los Angeles identified a strategic plan to reduce traffic deaths to zero by focusing on engineering, enforcement, education, and evaluation. The priority identified in the report is safety with a goal to make the streets of the City of Los Angeles the safest in the nation. As part of an effort to achieve this goal, LADOT identified a High Injury Network (HIN) of city streets. The HIN identifies streets with a high number of traffic-related severe injuries and deaths across all modes of travel with emphasis on those involving pedestrians and cyclists.

Although North Cahuenga Boulevard is designated as part of the HIN north of Fountain Avenue to Sunset Boulevard, the segment of North Cahuenga Boulevard along the Project frontage is NOT included in the HIN, as shown on the HIN map in Appendix H. However continental crosswalks are currently provided at the pedestrian signal on North Cahuenga Boulevard and Lexington Avenue along south leg, on the traffic signal controlled intersection of North Cahuenga Boulevard and Fountain Avenue along all legs of the intersection and on the traffic signal controlled North Cahuenga Boulevard and Santa Monica Boulevard along all legs.

PROJECT ACCESS, SAFETY AND CIRCULATION EVALUATION

Purpose – Project access and circulation is evaluated for safety, operational, and capacity constraints using vehicle level of service to identify circulation and access deficiencies that may require specific operational improvements.

Operational Evaluation

Criteria - Per the TAG, the Transportation Assessment should include a quantitative evaluation of the project's expected access and circulation operations. Project access is considered constrained if the project's traffic would contribute to unacceptable queuing on at project driveway(s) or would cause or substantially extend queuing at nearby signalized intersections. Unacceptable or extended queuing may be defined as follows:

- Spill over from turn pockets into through lanes.
- Block cross streets or alleys.
- Contribute to “gridlock” congestion. For the purposes of this section, “gridlock” is defined as the condition where traffic queues between closely - spaced intersections and impedes the flow of traffic through upstream intersections.

Evaluation - The following traffic conditions evaluation has been prepared to identify any new circulation and access deficiencies that may require specific operational improvements. The circulation level of service evaluation has been prepared using the Highway Capacity Manual (HCM) methodology which calculates the amount of delay per vehicle based upon the intersection traffic volumes, lane configurations, and signal timing. Highway Capacity Software (HCS) was utilized to conduct the evaluation.

Once the vehicle delay value has been calculated, operating characteristics are assigned a level of service grade (A through F) to estimate the level of congestion and stability of the traffic flow. The term "Level of Service" (LOS) is used by traffic engineers to describe the quality of traffic flow. Definitions of the intersection LOS grades in terms of vehicle delay are shown in Table 5.

Table 5
Signalized Intersection Level of Service Definitions

<u>LOS</u>	<u>HCM (delay in seconds)</u>	<u>Operating Conditions</u>
A	Less than 10	No loaded cycles and few are even close. No approach phase is fully utilized with no delay.
B	>10 to 20	A stable flow of traffic.
C	>20 to 35	Stable operation continues. Loading is intermittent. Occasionally drivers may have to wait more on red signal and backups may develop behind turning vehicles.
D	>35-55	Approaching instability. Delays may be lengthy during short time periods within the peak hour. Vehicles may be required to wait through more than one signal cycle.
E	>55 to 80	At or near capacity with possible long queues for left-turning vehicles. Full utilization of every signal cycle is seldom attained.
F	> 80	Gridlock conditions with stoppages of long duration.

Analysis of Existing and Future Traffic Conditions

This Existing and Future Traffic analysis is for Non-CEQA evaluation to determine if there are potential access and circulation deficiencies. This analysis does not affect the CEQA VMT Impact analysis. Baseline historic traffic counts were obtained from LADOT. New traffic data cannot be collected during the COVID-19 shutdown, as directed by LADOT. The traffic counts for North Cahuenga Boulevard & Fountain Avenue, Vine Street & Fountain Avenue, and Vine Street & Lexington Avenue was conducted on May 16, 2018, and for North Cahuenga Boulevard and Lexington Avenue on October 26, 2017. These baseline traffic counts have been increased by 1 percent per year ambient growth to year 2021 to reflect existing conditions and does not change the CEQA analysis.

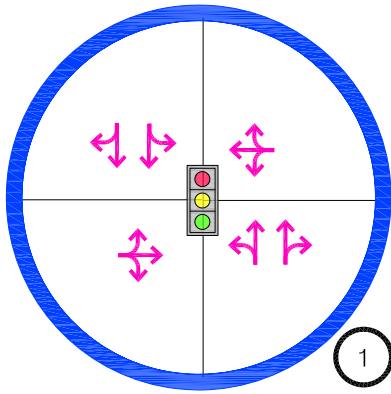

The intersections analyzed include:

1. North Cahuenga Boulevard and Fountain Avenue (traffic signal controlled);
2. North Cahuenga Boulevard and Lexington Avenue (pedestrian signal and stop sign controlled);
3. Fountain Avenue and Vine Street (traffic signal controlled); and
4. Lexington Avenue and Vine Street (traffic signal controlled).

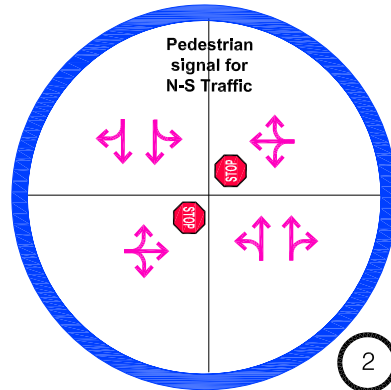

In addition, the West and East Driveways on Lexington Avenue and the Driveway on La Mirada Avenue were evaluated separately.

The lane configurations at the study intersections are provided in Figure 3. Regionally Project trips were distributed to the study area and are provided in Figure 4. The detailed distribution and Project trips at the study intersections and driveways is provided in Figure 5.

The LOS calculations summary, on the following pages, in Tables 6 and 7 shows the Project's traffic Existing and Future delay with and without the Project at the signalized intersections. Note that the pedestrian signal at North Cahuenga Boulevard and Lexington Avenue has been studied as a stop sign controlled intersection since side street traffic does not trigger the pedestrian signal. The driveways are evaluated separately.

Table 6 contains the results of the Existing (2021) and Existing + Project traffic conditions at the study intersections. In evaluation of the Existing conditions, the addition of Project traffic does not change the LOS at the nearby signalized locations. The pedestrian signal and stop sign controlled intersection of North Cahuenga Boulevard and Lexington Avenue is evaluated as a two way stop sign controlled intersection. The stop sign controlled intersections provide a delay in seconds and LOS for key moves.

Table 6
Existing Traffic Conditions – Without and With Project

No.	Intersection	Peak Hour	DIR	Existing 2021		Existing+ Project	
				Delay (s)	LOS	Delay (s)	LOS
1	N. Cahuenga Boulevard & Fountain Avenue	AM		16.1	B	16.2	B
		PM		17.1	B	17.2	B
2	N. Cahuenga Boulevard & Lexington Avenue	AM	NBL	10.8	B	10.8	B
			SBL	9.2	A	9.2	A
			WB	355.2	F	332.8	F

		PM		20.7	C	20.8	B
4	Lexington Avenue & Vine Street	AM		5.6	A	5.5	A
		PM		7.7	A	8.2	A

DIR = DIRECTION - ONLY NEEDED FOR STOP SIGN CONTROLLED INTERSECTION
s = seconds

The AM Peak Hour delay in the Existing + Project delay is lower than the Existing Project delay in some of the analysis results due to the fewer vehicle trips exiting the site than was created by the prior 200 student private school.

A review of the HCS worksheets indicated no poor operating conditions at North Cahuenga Boulevard and Fountain Avenue, Fountain Avenue and Vine Street or

Lexington Avenue and Vine Street. However, the worksheets for North Cahuenga Boulevard and Lexington Avenue indicate the following:

- AM Peak Hour
- Existing and Existing + Project
 - Westbound traffic on the minor street is operating at LOS F
- PM Peak Hour
- Existing and Existing + Project
 - Eastbound traffic on the minor street is operating at LOS F

The Project does not create this circulation deficiency at the intersection. A traffic signal warrant analysis has been conducted at North Cahuenga Boulevard and Lexington Avenue to determine if a full traffic signal is currently and with the Project warranted. This analysis is provided on pages 46-50 of the report.

HCS worksheets are provided in Appendix J. Figure 6 displays the Existing Traffic Volumes and Figure 7 displays the Existing + Project Traffic Volumes.

For the future traffic conditions in 2024, traffic generated by other projects identified in the Hollywood area within half mile radius of the Project have been added to the base counts to reflect potential growth in area. Twenty-two other related projects were included for this growth forecast. In addition, a one percent annual growth has been included to 2024 to account for other unknown projects or projects outside the study area. These adjustments provide a conservative traffic flow estimate for the study area and may overstate actual levels of congestion. The map and list of and locations of related projects (Figure 8) and the related projects' peak hour trips generated at the study locations (Figure 9) are provided in Appendix I.

Table 7 contains the results of the future cumulative plus Project traffic conditions at the study intersections for the 2024 study year. In evaluation of the Future conditions, the addition of Project traffic does not change the LOS at the nearby signalized locations.

**Table 7
Future Traffic Conditions – Without and With Project**

No.	Intersection	Peak Hour	DIR	Future (2024) Without Project		Future (2024) With Project	
				Delay (s)	LOS	Delay (s)	LOS
				1	N. Cahuenga Boulevard & Fountain Avenue	AM	
		PM		22.9	C	13.1	C
2	N. Cahuenga Boulevard & Lexington Avenue	AM	NBL	11.4	B	11.4	B

4	Lexington Avenue & Vine Street	AM		6.2	A	6.1	A
		PM		9.0	A	9.7	A

DIR = DIRECTION - ONLY NEEDED FOR STOP SIGN CONTROLLED INTERSECTION
s = seconds

The AM Peak Hour delay in the Future with Project delay is lower than the Future without Project delay in some of the analysis results due to the fewer vehicle trips exiting the site than was created by the prior 200 student private school.

A review of the HCS worksheets indicated no poor operating conditions at North Cahuenga Boulevard and Fountain Avenue, Fountain Avenue and Vine Street or Lexington Avenue and Vine Street. However, the worksheets for North Cahuenga Boulevard and Lexington Avenue indicate the following:

- AM Peak Hour
- Future Without Project and Future With Project
 - Westbound traffic on the minor street is operating at LOS F
- PM Peak Hour
- Future Without Project and Future With Project

Note that no information is provided on the worksheets for Eastbound or Westbound traffic and presumed to be operating at LOS F.

The Project does not create this circulation deficiency at the intersection. A traffic signal warrant analysis has been conducted at North Cahuenga Boulevard and Lexington Avenue to determine if a full traffic signal is currently and with the Project warranted. This analysis is provided on pages 46-50 of the report.

HCS worksheets are provided in Appendix J. Figure 10 displays the Future Without Traffic Volumes and Figure 11 displays the Future With Project Traffic Volumes.

Traffic Signal Analysis

The pedestrian signal and stop sign controlled intersection on Lexington Avenue at North Cahuenga Boulevard was found to be operating poorly under existing and future conditions without and with the Project. This intersection has been evaluated to determine if a full traffic signal is warranted and if the addition of the Project traffic creates a need for a full traffic signal.

The State of California has established “Warrants” to determine if traffic signal control is required at an intersection. A signal analysis was conducted utilizing LADOT Traffic Signal Warrant Worksheets (revised 8-2020) based on the State Warrants incorporating size of the community, traffic volumes, lane configurations, speed limits, distances to other controls, peak hour delay, accidents, number of pedestrians and number of cyclists.

It is common traffic engineering practice to use the Signal Warrant Analysis as a tool to determine if a traffic signal is needed. Meeting one or even more than one traffic signal warrant does not necessarily mean that a traffic signal is the preferred approach to improve traffic conditions at a location. Other items are also considered including potential degradation to progression, alternative improvements such as widening or other traffic controls. The input information for the signal analysis is similar to the intersection analysis. A minimum of eight hours of peak hour traffic data are considered for potentially meeting traffic signal warrants. The eight hours of traffic data collected during the AM and PM peak periods (7 to 10 AM and 3 to 6 PM) was input into the software, comparisons to the relevant tables and graphs were conducted to determine if a traffic signal was warranted.

The traffic lanes, traffic volumes, and pedestrians, as indicated in the count information and the count information + future growth + project were used in the signal analysis.

A brief explanation of each of the warrants² is provided on the following pages.

² Based on Warrants 8 User Guide – Copyright 2011 Trafficware Ltd. Page 5-29. LADOT Traffic Signal Warrants Sheets Used in Analysis

Warrant 1 – Eight-Hour Vehicular Volume

There are two conditions for this warrant. Condition A is the Minimum Vehicular Volume Warrant intended for applications at intersections where large volumes of traffic are the principal reason to consider a new traffic signal. Condition B is the Interruption of Continuous Traffic intended for use at intersection where the Minimum Vehicular Volume warrant isn't likely to be met but the main street volumes are high and create excessive delay or conflict for minor street traffic. Either or both conditions may be met for this warrant to be satisfied.

Warrant 2 – Four Hour Vehicular Volume

This warrant's conditions are intended to be met when the high volume of peak hour intersecting traffic is the primary reason for the need of a traffic signal. Four hours of data are evaluated under this warrant.

Warrant 3 – Peak Hour

The Peak Hour Warrant is intended for use at a location where the minor street encounters undue delay when entering or crossing the major street for a at least one hour of a typical day.

Warrant 4 – Pedestrian Volume

Two conditions are required to be met for the Pedestrian Volume warrant to be considered met. At least 100 pedestrians are required for a minimum of four hours or at least 190 pedestrians within one hour. The second condition checks if a new signal will restrict traffic flow and if there are adequate gaps for pedestrians to cross. The Pedestrian Volume warrant is intended for use when high volumes of pedestrians encounter extensive delay in crossing a high volume major street.

Warrant 5 – School Crossing

This warrant is for use when school children are crossing a major street. The School Crossing Warrant is intended for use where school children crossing the intersection are the primary reason for considering installation of a new traffic signal. The Project is not adjacent to a school.

Warrant 6 – Coordinated Signal System

Occasionally, in order to maintain proper progressive movement of vehicles through a signal system, it is necessary to install a new traffic signal at a location where it would not otherwise be necessary.

Warrant 7 – Crash Experience

Locations where there are frequent and severe accidents are occasionally considered for installation for a traffic signal if such installation will reduce the frequency and/or severity of the accidents. Traffic accident data was based on City of Los Angeles RoadSafe GIS.

Warrant 8 – Roadway Network

This Warrant uses information from Warrants 1, 2 and 3. It would be met if the new traffic signal would encourage concentration and organization of traffic flow on a roadway network.

Warrant 9 – Intersection Near a Grade Crossing

This Warrant is considered when an intersection is near a grade crossing. The intersection of Lexington Avenue and North Cahuenga Boulevard is not near a grade crossing and this Warrant is not applicable.

Warrant 10 – Bicycles

This Warrant considers the traffic and cyclist volume, accidents including cyclists and the roadway configurations in the area.

Warrant 11 – Activated Pedestrian Warning Device

The location is already improved with a pedestrian traffic signal.

Signal warrants analysis was conducted under existing and future conditions with and without the Project. Traffic counts were conducted from 7 AM to 10 AM and from 3 PM to 6PM. These are historic counts with 1% per year growth added to estimate Existing 2021 and Future 2024 traffic volumes. At the time of the writing of this report, travel patterns have not settled back to a “normal” conditions and historic counts only are being used in order to better simulate future conditions. This is 2 hours short of the 8 hours

typically needed for signal warrant analysis. As shown in Table 8, Signal warrant analysis of this pedestrian signalized intersection indicates that 6 hours of the Eight-Hour Vehicle Volume Warrant 1. B-Interruption of Continuous Traffic and 4-hour Vehicle Volume Warrant are met. An additional two hours of data would be needed to assure that the Eight-Hour Vehicle Volume Warrant is met. The traffic signal warrants are met without the Project and with the Project. The Project does not create this potential need. As stated previously, meeting one or even more than one traffic signal warrant does not necessarily mean that a traffic signal is the preferred approach to improve traffic conditions at a location. This location is currently improved with a pedestrian signal and a full traffic signal may interrupt traffic flow along North Cahuenga Boulevard. The Project adds the following peak hour percentage of traffic³ to the overall volume at the intersections during the existing and future traffic conditions with the Project:

	Existing + Project	Future with Project
North Cahuenga Bl. & Lexington Av.	0.22%	0.20%

The detailed signal warrant sheets are provided in Attachment J. A summary of the findings is presented in Table 8.

³ 8 hours of project traffic added (3X AM Peak + 3X PM Peak from Figure 6) were divided by 6 hours of total peak hour volumes at the intersection X 100 for % Project trips in intersection.

Table 8
 Summary of Traffic Signal Warrant Analysis
 Existing, Existing+ Project, Future Without and With Project

Driveway Queue Evaluation

At total of 156 parking spaces will be provided for the Project. Driveway queue evaluation has been conducted using the projected future Project traffic volumes in and out of the Project driveways. One existing driveway on La Mirada Avenue and one existing driveways on Lexington Avenue will be removed. A new driveway on La Mirada Avenue will be created near the eastern boundary of the site. This will provide access to 36 parking spaces (approximately 23% of the total number of parking spaces). A new driveway on Lexington Avenue will be created east of North Cahuenga Boulevard. This driveway will provide access to 19 parking spaces (approximately 12% of the total number of parking spaces). One existing driveway near the east end of the site on Lexington Avenue will remain. This driveway will provide parking to the basement area with 101 parking spaces (65% of the total number of parking spaces. HCS analysis along La Mirada Avenue and Lexington Avenue with the Project driveway volumes in and out of the parking areas has been conducted. The driveways are forecast to operate well as shown in Table 9.

Table 9
Future Driveway Conditions With Project

No.	Intersection	Peak Hour	Future (2024) With Project	
			Delay (s)	LOS
A	Project Driveway & La Mirada Avenue	AM	9.9	A
		PM	8.8	A
B	West Project Driveway & Lexington Avenue	AM	9.9	A
		PM	8.9	A
C	East Project Driveway & Lexington Avenue	AM	10.2	B
		PM	9.1	A

s = Seconds

The HCS analysis also provides the forecasted number of vehicles in the turning lanes at the driveways as shown in Table 10 on the following page.

Table 10
 Future Queues at the Project's New Driveway

No.	Intersection	Peak Hour	With Project TYPICAL QUEUE LENGTH	
			DIRECTION	# of Cars
A	Project Driveway & La Mirada Avenue	AM	WBL	0
			NB	0
		PM	WBL	0
			NB	0 to 1
B	West Project Driveway & Lexington Avenue	AM	EBL	0
			SB	0
		PM	EBL	0
			SB	0
C	East Project Driveway & Lexington Avenue	AM	EBL	0 to 1
			SB	0 to 1
		PM	EBL	0
			SB	0 to 1

NB=Northbound, SB=Southbound,
 EBL=Eastbound Left, WBL=Westbound Left

No Project driveway deficiencies have been identified in this analysis.

Access & Circulation Summary Findings

Based on the traffic conditions analysis, no Project access and circulation constraints have been identified. The Project's traffic would not contribute to unacceptable queuing on along the Project driveways on La Mirada Avenue or Lexington Avenue. The results of this evaluation show that the Project will not create any non-CEQA traffic deficiencies at the Project driveways.

Safety Evaluation

Providing access on the local street only will not increase vehicle conflicts with pedestrians, and bicycles along North Cahuenga Boulevard and no deficiencies are apparent in the site access plans which would be considered significant. All emergency ingress/egress associated with the Project would be designed and constructed in conformance to all applicable City Building and Safety Department, LADOT, and LAFD standards and requirements for design and construction. This would also ensure pedestrian safety. There are adequate sidewalks and crosswalks serving the Project Site. There is a pedestrian signal at North Cahuenga Boulevard and Lexington Avenue along the west boundary of the site, a full signal-controlled intersection at North Cahuenga Boulevard and Fountain Avenue approximately 500 feet north of the Project Site and at Vine Street and Lexington Avenue approximately 400 feet east of the site that provides traffic controlled crossing with continental crosswalks. The Project would not affect these facilities.

No access deficiencies are apparent in the site access plans which would be considered significant.

Passenger Loading Evaluation

All parking is located on-site in surface and basement parking garage areas. A passenger loading zone is proposed. There will be an at-grade on-site drop off area to serve both rideshare arrivals/departures in the surface parking lot on Lexington Avenue.

State Facility Evaluation –

The proposed Project is approximately 1.1 miles west of the Hollywood Freeway (US 101). This facility has been evaluated for potential deficiencies with the Project.

Based on LADOT, Department of City Planning and Traffic Consultant representatives' team collaboration in addition to Caltrans comments from other projects,

LADOT provided Interim Guidance for Freeway Safety Analysis on May 1, 2020. This guidance has been prepared to aid in evaluation of State Facilities. The guidelines include 8 steps which include (generally) 1) screening to determine if project trips on the off-ramps exceed 25 peak hour trips, 2) if screening is over 25 project trips on an off ramp, guidance on preparation of a “Future with Project” queuing analysis, 3) process for evaluation of existing and future ramp storage lengths, 4) determination of number of project vehicles that may exceed queue lengths including screening for over two or more vehicles, 5) speed differential evaluation, 6) screening for 30 miles per hour (mph) or more, 7) if more than 30 mph there are recommendations for corrective measures, 8) if the cost of the changes are substantial, contribution guidelines are provided.

For this Project, the following ramps were evaluated:

- Hollywood Freeway Southbound Off Ramp to Lexington Avenue north of Santa Monica Boulevard; and,
- Hollywood Freeway Northbound Off Ramp to Santa Monica Boulevard.

As required by the LADOT screening of the number of project trips (#1 in the process) has been conducted. In full, #1 states:

Identify the number of Project trips expected to be added to nearby off ramps serving the site. If the Project adds 25 or more trips to any off ramp in either the morning or afternoon peak hour, then that ramp should be studied for potential queueing impacts following the steps below. If the project is not expected to generate more than 25 or more peak hour trips at any freeway off ramps, then a freeway ramp analysis is not required.

Project trips were distributed to the nearby off ramps according to the traffic patterns in the area and previously approved distribution. Table 11 displays the results of this evaluation.

Table 11
Study Off Ramp Distribution and Trips

#	Location	Peak Hour	Project Trips In	# of Trips	Over 25 Peak Hour Trips?
A	Hollywood Freeway SB Off Ramp to Lexington Avenue	AM	15%	1	NO
		PM	15%	1	NO
B	Hollywood Freeway NB Off Ramp to Santa Monica Boulevard	AM	15%	1	NO
		PM	15%	1	NO

As shown in Table 11, fewer than 25 Project trips will be utilizing the nearby off ramps during the peak hours. No further analysis and no deficiencies have been identified at the off ramps.

Construction Overview

Project construction is evaluated to determine if activities substantially interfere with pedestrian, bicycle, transit, or vehicle mobility. Factors to be considered are the location of the Project Site, the functional classification of the adjacent street affected, temporary loss of bus stops or rerouting of transit lines, and the loss of vehicle, bicycle, or pedestrian access. LADOT’s TAG considers three areas to be considered when evaluating project construction activities.

Temporary Transportation Constraints

As part of the Project’s construction, the City may require a Construction Traffic Management Plan (Plan) to be implemented during the construction phase to minimize potential conflicts with vehicles, pedestrians, bicycle, and transit facilities associated with the Project’s construction. The Plan should include a construction schedule, the location of any traffic lane or sidewalk closures, any traffic detours, haul routes, hours of operation, access plans to abutting properties, and contact information.

Construction workers are typically expected to arrive at the Project Site before 7:00 AM and depart before or after the weekday peak hours of 4:00 to 6:00 PM. Deliveries of construction materials will be coordinated to non-peak travel periods, to the extent

possible and occur from the parking lane along the Project's La Mirada Avenue and Lexington Avenue frontages.

For off-site activities, Worksite Traffic Control Plans would be prepared for any temporary traffic lane or sidewalk closures in accordance with City guidelines. These worksite plans will require a formal review and approval by the City prior to the issuance of any construction permits. In addition, the City will require a Truck Haul Route plan including permitted hauling hours and a haul route to and from the landfill.

No detours around the construction site are expected; however, flagmen would be used to control traffic movement during the ingress and egress of construction trucks.

Since Project construction would not substantially interfere with pedestrian, bicycle or vehicle mobility, the construction impacts would be less than significant.

1. Temporary Loss of Access

Vehicular access to the adjacent properties will be maintained. Safe pedestrian circulation paths adjacent to or around the work areas will be provided by covered pedestrian walkways if necessary and will be maintained as required by City-approved Work Area Traffic Control Plans.

Since Project construction would not result in complete loss of vehicular or pedestrian access, the construction impacts on loss of access would be less than significant.

2. Temporary Loss of Bus Stops or Rerouting of Bus Lines

No bus stops are located within the work zone adjacent to the Project Site that would need to be temporarily relocated. There will be no loss of pedestrian access to transit stops.

Since Project construction would not require relocation of bus stops or bus lines, the construction impacts on transit operations would be less than significant.

The Project applicant will be required to submit formal Work Area Traffic Control Plans for review and approval by the City prior to the issuance of any construction permits.

RESIDENTIAL STREET CUT-THROUGH ANALYSIS

A neighborhood street impact analysis method is included in the LADOT TAG. The objective of the residential street impact analysis is to determine potential increases in average daily traffic associated with cut-through traffic that can result from a project and impact residential streets. Cut-through trips are defined by the TAG as those which feature travel along a street classified as a Local Street in the City's General Plan, with residential land-use frontage, as an alternative to a higher classification street segment (e.g., Collector, Avenue, or Boulevard as designated in the City's General Plan) to access a destination that is not within the neighborhood within which the Local Street is located.

Due to the Project's location between North Cahuenga Boulevard and Vine Street, a pedestrian only traffic signal on Lexington Avenue and North Cahuenga Boulevard, and the lack of traffic signals on La Mirada Avenue on Vine Street or La Mirada Avenue there is small likelihood for cut through traffic on La Mirada Avenue or Lexington Avenue. No adjacent residential street segments would likely be used for cut-through trips as a viable alternative route. A residential cut-through analysis is not required.

APPENDIX A

LADOT Approved MOU

Transportation Assessment Memorandum of Understanding (MOU)

This MOU acknowledges that the Transportation Assessment for the following Project will be prepared in accordance with the latest version of LADOT’s Transportation Assessment Guidelines:

I. PROJECT INFORMATION

Project Name: 1200 Cahuenga Bl

Project Address: 1200-1210 N.Cahuenga Bl, 6337-6357W.Lexington Av, 6332-6356W.LaMiranda Av.

Project Description: Removal of portion of 200 student private school buildings (retain & renovate 19,448sf as creative office), construct new 55,814sf creative office & 500sf retail

LADOT Project Case Number: _____ Project Site Plan attached? (Required) Yes No

II. TRANSPORTATION DEMAND MANAGEMENT (TDM) MEASURES

Select any of the following TDM measures, which may be eligible as a Project Design Feature¹, that are being considered for this project:

Reduced Parking Supply ²	<input checked="" type="checkbox"/>	Bicycle Parking and Amenities	<input type="checkbox"/>	Parking Cash Out	<input type="checkbox"/>
-------------------------------------	-------------------------------------	-------------------------------	--------------------------	------------------	--------------------------

List any other TDM measures (e.g. bike share kiosks, unbundled parking, microtransit service, etc.) below that are also being considered and would require LADOT staff’s determination of its eligibility as a TDM measure. LADOT staff will make the final determination of the TDM measure's eligibility for this project.

- | | |
|---------|---------|
| 1 _____ | 4 _____ |
| 2 _____ | 5 _____ |
| 3 _____ | 6 _____ |

III. TRIP GENERATION

(ITE Manual Sheets attached)

Trip Generation Rate(s) Source: ITE 10th Edition / Other 11th Edition ITE

Trip Generation Adjustment (Exact amount of credit subject to approval by LADOT)	Yes	No
Transit Usage	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Existing Active or Previous Land Use	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Internal Trip	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Pass-By Trip	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Transportation Demand Management (See above)	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Trip generation table including a description of the existing and proposed land uses, rates, estimated morning and afternoon peak hour volumes (ins/outs/totals), proposed trip credits, etc. attached? (Required) Yes No

	<u>IN</u>	<u>OUT</u>	<u>TOTAL</u>
AM Trips	<u>6</u>	<u>-31</u>	<u>-25</u>

<u>344</u>	DVT (ITE11 th Ed.)
<u>259</u>	DVT (VMT Calculator ver. 1.3)

¹ At this time Project Design Features are only those measures that are also shown to be needed to comply with a local ordinance, affordable housing incentive program, or State law.

²Select if reduced parking supply is pursued as a result of a parking incentive as permitted by the City’s Bicycle Parking Ordinance, State Density Bonus Law, or the City’s Transit Oriented Community Guidelines.

IV. STUDY AREA AND ASSUMPTIONS

Project Buildout Year: 2024 Ambient Growth Rate: 1 % Per Yr.

Related Projects List, researched by the consultant and approved by LADOT, attached? (Required) Yes No

STUDY INTERSECTIONS and/or STREET SEGMENTS:
(May be subject to LADOT revision after access, safety, and circulation evaluation.)

- 1 CAHUENGA BOULEVARD & FOUNTAIN AVENUE 4. LEXINGTON AVENUE & VINE STREET
- 2 CAHUENGA BOULEVARD & LEXINGTON AVENUE a-b 2 PROJECT DRIVEWAYS ON LEXINTON AVENUE
- 3 FOUNTAIN AVENUE & VINE STREET c 1 PROJECT DRIVEWAY ON LA MIRADA AVENUE

Provide a separate list if more than six study intersections and/or street segments.

Is this Project located on a street within the High Injury Network? Yes No

If a study intersection is located within a ¼-mile of an adjacent municipality’s jurisdiction, signature approval from said municipality is required prior to MOU approval.

V. ACCESS ASSESSMENT

- a. Does the project exceed 1,000 net DVT? Yes No
- b. Is the project’s frontage 250 linear feet or more along an Avenue or Boulevard as classified by the City’s General Plan? Yes No
- c. Is the project’s building frontage encompassing an entire block along an Avenue or Boulevard as classified by the City’s General Plan? Yes No

VI. ACCESS ASSESSMENT CRITERIA

If Yes to any of the above questions a., b., or c., complete **Attachment C.1: Access Assessment Criteria**.

ANSWER TO ABOVE a., b. and c. no - ATTACHMENT C.1 NOT ATTACHED

VII. SITE PLAN AND MAP OF STUDY AREA

Please note that the site plan should also be submitted to the Department of City Planning for cursory review.

Does the attached site plan and/or map of study area show	Yes	No	Not Applicable
Each study intersection and/or street segment	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Bicycle parking offsite (in public right-of-way)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

*For mixed-use projects, also show the project trips and project trip distribution by land use category.

VIII. FREEWAY SAFETY ANALYSIS SCREENING

Will the project add 25 or more trips to any freeway off-ramp in either the AM or PM peak hour? YES NO

Provide a brief explanation or graphic identifying the number of project trips expected to be added to the nearby freeway off-ramps serving the project site. If Yes to the question above, a freeway ramp analysis is required.

CITY OF LOS ANGELES VMT CALCULATOR

Report 1: Project & Analysis Overview

Date: November 4, 2021

Project Name: Creative Office

Project Scenario:

Project Address: 1200 N CAHUENGA BLVD, 90038

Version 1.3

Analysis Results			
Total Employees: 300			
Total Population: 0			
Proposed Project		With Mitigation	
566	Daily Vehicle Trips	566	Daily Vehicle Trips
4,138	Daily VMT	4,138	Daily VMT
0	Household VMT per Capita	0	Household VMT per Capita
7.6	Work VMT per Employee	7.6	Work VMT per Employee
Significant VMT Impact?			
APC: Central			
Impact Threshold: 15% Below APC Average			
Household = 6.0			
Work = 7.6			
Proposed Project		With Mitigation	
VMT Threshold	Impact	VMT Threshold	Impact
Household > 6.0	No	Household > 6.0	No
Work > 7.6	No	Work > 7.6	No

VMT Calculator User Agreement

The Los Angeles Department of Transportation (LADOT), in partnership with the Department of City Planning and Fehr & Peers, has developed the City of Los Angeles Vehicle Miles Traveled (VMT) Calculator to estimate project-specific daily household VMT per capita and daily work VMT per employee for land use development projects. This application, the VMT Calculator, has been provided to You, the User, to assess vehicle miles traveled (VMT) outcomes of land use projects within the City of Los Angeles. The term “City” as used below shall refer to the City of Los Angeles. The terms “City” and “Fehr & Peers” as used below shall include their respective affiliates, subconsultants, employees, and representatives.

The City is pleased to be able to provide this information to the public. The City believes that the public is most effectively served when they are provided access to the technical tools that inform the public review process of private and public land use investments. However, in using the VMT Calculator, You agree to be bound by this VMT Calculator User Agreement (this Agreement).

VMT Calculator Application for the City of Los Angeles. The City’s consultant calibrated the VMT Calculator’s parameters in 2018 to estimate travel patterns of locations in the City, and validated those outcomes against empirical data. However, this calibration process is limited to locations within the City, and practitioners applying the VMT Calculator outside of the City boundaries should not apply these estimates without further calibration and validation of travel patterns to verify the VMT Calculator’s accuracy in estimating VMT in such other locations.

Limited License to Use. This Agreement gives You a limited, non-transferrable, non-assignable, and non-exclusive license to use and execute a copy of the VMT Calculator on a computer system owned, leased or otherwise controlled by You in Your own facilities, as set out below, provided You do not use the VMT Calculator in an unauthorized manner, and that You do not republish, copy, distribute, reverse-engineer, modify, decompile, disassemble, transfer, or sell any part of the VMT Calculator, and provided that You know and follow the terms of this Agreement. Your failure to follow the terms of this Agreement shall automatically terminate this license and Your right to use the VMT Calculator.

Ownership. You understand and acknowledge that the City owns the VMT Calculator, and shall continue to own it through Your use of it, and that no transfer of ownership of any kind is intended in allowing You to use the VMT Calculator.

Warranty Disclaimer. In spite of the efforts of the City and Fehr & Peers, some information on the VMT Calculator may not be accurate. The VMT Calculator, OUTPUTS AND ASSOCIATED DATA ARE PROVIDED “as is” WITHOUT WARRANTY OF ANY KIND, whether expressed, implied, statutory, or otherwise including but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

Limitation of Liability. It is understood that the VMT Calculator is provided without charge. Neither the City nor Fehr & Peers can be responsible or liable for any information derived from its use, or for any delays, inaccuracies, incompleteness, errors or omissions arising out of your use of the VMT Calculator or with respect to the material contained in the VMT Calculator. You understand and agree that Your sole remedy against the City or Fehr & Peers for loss or damage caused by any defect or failure of the

VMT Calculator, regardless of the form of action, whether in contract, tort, including negligence, strict liability or otherwise, shall be the repair or replacement of the VMT Calculator to the extent feasible as determined solely by the City. In no event shall the City or Fehr & Peers be responsible to You or anyone else for, or have liability for any special, indirect, incidental or consequential damages (including, without limitation, damages for loss of business profits or changes to businesses costs) or lost data or downtime, however caused, and on any theory of liability from the use of, or the inability to use, the VMT Calculator, whether the data, and/or formulas contained in the VMT Calculator are provided by the City or Fehr & Peers, or another third party, even if the City or Fehr & Peers have been advised of the possibility of such damages.

This Agreement and License shall be governed by the laws of the State of California without regard to their conflicts of law provisions, and shall be effective as of the date set forth below and, unless terminated in accordance with the above or extended by written amendment to this Agreement, shall terminate on the earlier of the date that You are not making use of the VMT Calculator or one year after the beginning of Your use of the VMT Calculator.

By using the VMT Calculator, You hereby waive and release all claims, responsibilities, liabilities, actions, damages, costs, and losses, known and unknown, against the City and Fehr & Peers for Your use of the VMT Calculator.

Before making decisions using the information provided in this application, contact City LADOT staff to confirm the validity of the data provided.

Print and sign below, and submit to LADOT along with the transportation assessment Memorandum of Understanding (MOU).

Data Plot and Equation

APPENDIX B

SCREENING CRITERIA

TAG SCREENING CRITERIA	
If the answer is yes to any of the following threshold questions, further analysis will be required for that question to assess whether the proposed Project would negatively affect the transportation system for all travel modes including pedestrian, bicycle, or transit facilities.	
Screening Criteria	Determination
Threshold T-1 Conflicting with Plans, Programs, Ordinances, or Policies	
Does the project require a discretionary action that requires the decision maker to find that the decision substantially conforms to the purpose, intent, and provisions of the General Plan?	Yes , Project is requesting Zone Change and Height District change, Site Plan Review, and Zoning Administrators Adjustment.
Is the project known to directly conflict with a transportation plan, policy, or program adopted to support multimodal transportation options or public safety?	Yes , the Project will inconsistent be with the Mobility Plan 2035. A waiver to dedicate and improve will be requested for La Mirada Av & Lexington Avenue and waiver to improve requested for Cahuenga Boulevard.
Is the Project proposing to, or required to, make any voluntary or required, modifications to the public right-of-way (i.e. street dedications, reconfigurations of curb lines, etc.)?	Yes , according to the BOE PCRF & Mobility Element street dedication and improvements are shown below. <ul style="list-style-type: none"> • La Mirada Avenue – 5-foot dedication and 3-foot widening; • Lexington Avenue – variable dedication and 3-foot widening; • Cahuenga Boulevard – 1-foot widening; and, • Southeast Corner of Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius dedication. A WDI will be requested.
Threshold T-2.1 Causing Substantial Vehicle Miles Traveled – Would the project conflict or would it be inconsistent with California Environmental Quality Act (CEQA) Guidelines section 15064.3 subdivision (b)(1)?	
Would the Project generate a net increase of 250 or more daily vehicle trips?	Yes , using the LADOT VMT calculator (version 1.3) for screening purposes, the Project will generate an increase of 259 more daily vehicle trips without any Transportation Demand Management (TDM) strategies. TDM strategies are not considered in the screening criteria.

Would the project generate a net increase in daily VMT?	Yes , using the LADOT VMT calculator, the Project would generate 2,271 daily VMT. TDM strategies are not considered in the screening criteria.
If the project includes retail uses, does the retail portion of the project exceed a net 50,000 square feet?	No , the Project will provide 500 square feet of Retail/Restaurant.
Would the Project located within a one-half mile of a fixed-rail or fixed-guideway transit station replace an existing number of residential units with a smaller number of residential units?	No , the location of the Project is not within a half mile of a fixed rail or fixed guideway transit station.
Threshold T- 3.1: Substantially Increasing Hazards Due to a Geometric Design Feature or Incompatible Use	
Is the Project proposing new driveways, or introducing new vehicle access to the property from the public right-of-way?	Yes , the Project will provide access with one new driveway on La Mirada Av, one new driveway Lexington Av and use of an existing on Lexington Av. Two driveways on Lexington Av and one on La Mirada Av will be removed. This will provide one fewer driveway than now exists. No driveway is proposed from North Cahuenga Bl.
Is the Project proposing to, or required to make any voluntary or required, modifications to the public right-of-way (i.e., street dedications, reconfigurations of curb line, etc.)?	Yes , according to the BOE PCRF & Mobility Element street dedication and improvements are shown below. <ul style="list-style-type: none"> • La Mirada Avenue – 5-foot dedication and 3-foot widening; • Lexington Avenue – variable dedication and 3-foot widening; • Cahuenga Boulevard – 1-foot widening; and, • Southeast Corner of Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius dedication. A WDI will be requested.
Pedestrian, Bicycle and Transit Access Assessment (Non-CEQA Transportation Analysis)	
Does the land use project involve a discretionary action that would be	Yes , Project is requesting General Plan Amendment and Zone Change.

under review by the Department of City Planning?	
Does the land use project include the construction, 50 dwelling units or guest rooms or combination thereof or 50,000 square feet of non-residential space?	Yes , the Project will include retention of 19,448 square feet of existing school space for a total 74,762 square feet of new office and 500 square feet of new retail/restaurant.
Would the Project generate a net increase of 1,000 or more daily vehicle trips? Is the Project's frontage along an Avenue, Boulevard or Collector (as designated in the City's General Plan) 250 linear feet or more, or is the Project's frontage encompassing an entire block along an Avenue or Boulevard (as designated in the City's General Plan)?	No , using the LADOT VMT calculator (version 1.3) for screening purposes, the Project will generate an increase of 259 more daily vehicle trips without any Transportation Demand Management (TDM) strategies.). The portion of Cahuenga Boulevard adjacent to the Project Site is designated as a Modified Avenue II roadway. The Project's Cahuenga Boulevard frontage is approximately 195 in length.
Project Access, Safety and Circulation Evaluation (Non-CEQA Transportation Analysis)	
Does the land use project involve a discretionary action that would be under review by the Department of Planning?	Yes , Project is requesting Zone Change and Height District change, Site Plan Review, and Zoning Administrators Adjustment.
Would the Project generate a net increase of 250 or more daily vehicle trips?	Yes , using the LADOT VMT calculator (version 1.3) for screening purposes, the Project will generate an increase of 259 more daily vehicle trips (572 Project trips minus 313 prior trips) without any Transportation Demand Management (TDM) strategies

APPENDIX C

PLANS, PROGRAMS, ORDINANCE AND POLICY CONSISTENCY Threshold Question T-1

Plans, Policies and Programs Consistency Worksheet

The worksheet provides a structured approach to evaluate the threshold T-1 question below that asks whether a project conflicts with a program, plan, ordinance, or policy addressing the circulation system. The intention of the worksheet is to streamline the project review by highlighting the most relevant plans, policies and programs when assessing potential impacts to the City's circulation system.

Threshold T-1: Would the project conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadways, bicycle, and pedestrian facilities?

I. SCREENING CRITERIA FOR POLICY ANALYSIS

If the answer is 'yes' to any of the following questions, further analysis will be required:

Does the project require a discretionary action that requires the decision maker to find that the project would substantially conform to the purpose, intent, and provisions of the General Plan?

Yes

Is the project known to directly conflict with a transportation plan, policy, or program adopted to support multimodal transportation options or public safety?

Yes

Is the project required to, or proposing to, make any voluntary modifications to the public right-of-way (i.e., dedications and/or improvements in the right-of-way, reconfigurations of curb line, etc.)?

Yes, a
WDI will be requested

II. PLAN CONSISTENCY ANALYSIS

A. Mobility Plan 2035 Classification Standards for Dedications and Improvements

A.1 Does the project include additions or new construction along a street designated as a Boulevard I, and II, and/or Avenue I, II, or III on property zoned for R3 or less restrictive zone?

No

A.2 Is the project required to make additional dedications or improvements to the Public Right of Way as demonstrated by the street designation?

Yes
a WDI will be requested

A.3 Is the project making the dedications and improvements as necessary to meet the designated dimensions of the fronting street (Boulevard I, and II, or Avenue I, II, or III)?

No, a WDI will be requested

A.4 Is the project applicant asking to waive from the dedication standards?

Yes

Lists any streets subject to dedications or voluntary dedications and include existing roadway and sidewalk widths, required roadway and sidewalk widths, and proposed roadway and sidewalk width or waivers.

1. La Mirada Avenue – Local Street – Required 60’ ROW and 36’ Street (half 30’ ROW & 18’ half Street), Current: 25’ half street ROW & 15’ half street
Per BOE PCRf: 5’ dedication and 3’ roadway improvement required
2. Lexington Avenue – Local Street - Required 60’ ROW and 36’ Street (half 30’ ROW & 18’ half Street), Current: 25’ half street ROW & 15’ half street
Per BOE PCRf: variable dedication and 3’ roadway improvement required
3. Cahuenga Boulevard – Modified Avenue II – Required 80’ ROW and 56’ Street (half 40’ ROW & 28’ half Street), Current: 40’ -43’ half street ROW & 27’ half street,
Per BOE PCRf: 1’ roadway improvement required

Is the project within the service area of Metro Bike Share, or is there demonstrated demand for micro- mobility services?

No

B. Mobility Plan 2035 Policy Alignment with Project-Initiated Changes

B.1 Does the project physically modify the curb placement or turning radius and/or physically alter the sidewalk and parkways space that changes how people access a property?

Yes

Examples of physical changes to the public right-of-way include:

- widening the roadway,
- narrowing the sidewalk,
- adding space for vehicle turn outs or loading areas,
- removing bicycle lanes, bike share stations, or bicycle parking
- modifying existing bus stop, transit shelter, or another street furniture
- paving, narrowing, shifting, or removing an existing parkway or tree well

Driveway Access

Mobility Plan 2035 Program PL.1. Driveway Access. Require driveway access to buildings from non-arterial streets or alleys (where feasible) to minimize interference with pedestrian access and vehicular movement.

Project is following PL-1 Driveway Access

Citywide Design Guidelines - Guideline 2: Carefully incorporate vehicular access such that it does not degrade the pedestrian experience.

Project is following Design Guideline 2

Site Planning Best Practices:

- Prioritize pedestrian access first and automobile access second. Orient parking and driveways toward the rear or side of buildings and away from the public right-of-way. On corner lots, parking should be oriented as far from the corner as possible.
- Minimize both the number of driveway entrances and overall driveway widths.
- Do not locate drop-off/pick-up areas between principal building entrances and the adjoining sidewalks.
- Orient vehicular access as far from street intersections as possible.
- Place drive-thru elements away from intersections and avoid placing them so that they create a barrier between the sidewalks and building entrance(s).
- Ensure that loading areas do not interfere with on-site pedestrian and vehicular circulation by separating loading areas and larger commercial vehicles from areas that are used for public parking and public entrances.

Project is following Site Planning Best Practices

B.2 Does the project add new driveways along a street designated as an Avenue or a Boulevard that conflict with LADOT's Driveway Design Guidelines (See Sec. 321 in the Manual of Policies and Procedures) by any of the following?

- Locating new driveways for residential properties on an Avenue or Boulevard, and access is otherwise possible using an alley or a collector/local street, or
- Locating new driveways for industrial or commercial properties on an Avenue or Boulevard and access is possible along a collector/local street, or
- The total number of new driveways exceeds 1 driveway per every 200 feet along on the Avenue or Boulevard frontage, or
- Locating new driveways on an Avenue or Boulevard within 150 feet from the intersecting street, or
- Locating new driveways on a collector or local street within 75 feet from the intersecting street, or
- Locating new driveways near mid-block crosswalks, requiring relocation of the mid-block crosswalk

Project is following Driveway Design Guidelines

Impact Analysis

Once the project is reviewed relevant to plans and policies, and existing facilities that may be impacted by the project, the analysis will need to answer the following two questions in concluding if there is an impact due to plan inconsistency.

B.2.1 Would the physical changes in the public right of way or new driveways that

conflict with LADOT’s Driveway Design Guidelines degrade the experience of vulnerable roadway users such as modify, remove, or otherwise negatively impact existing bicycle, transit, and/or pedestrian infrastructure?

No

B.2.2 Would the physical modifications or new driveways that conflict with LADOT’s Driveway Design Guidelines preclude the City from advancing the safety of vulnerable roadway users?

No

C. Network Access

C. 1 Alley, Street and Stairway Access

C.1.1 Does the project propose to vacate or otherwise restrict public access to a street, alley, or public stairway?

No

C.2 New Cul-de-sacs

C.2.1 Does the project create a cul-de-sac or is the project located adjacent to an existing cul-de-sac?

No

C.2.2 If yes, will the cul-de-sac maintain convenient and direct public access to people walking and biking to the adjoining street network?

N/A

D. Parking Supply and Transportation Demand Management

D.1 Would the project propose a supply of onsite parking that exceeds the baseline amount as required in the Los Angeles Municipal Code or a Specific plan, whichever requirement prevails?

No

D.2 Would the project propose to actively manage the demand of parking by independently pricing the supply to all users (e.g. parking cash-out), or for residential properties, unbundle the supply from the lease or sale of residential units?

No

D.3. Would the project provide the minimum on and off-site bicycle parking spaces as required by Section 12.21 A.16 of the LAMC?

Yes

D.4. Does the Project include more than 25,000 square feet of gross floor area construction of new non- residential gross floor?

Yes

D.5 Does the project comply with the City’s TDM Ordinance in Section 12.26 J of the LAMC?

Yes

E. Consistency with Regional Plans

This section addresses potential inconsistencies with greenhouse gas (GHG) reduction

targets forecasted in the Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP) / Sustainable Communities Strategy (SCS).

- E.1 Does the Project apply one the City's efficiency-based impact thresholds (i.e. VMT per capita, VMT per employee, or VMT per service population) as discussed in Section 2.2.3 of the TAG? Yes

- E.2 Does the Project or Plan result in a significant VMT impact? No

- E.3 Does the Project result in a net increase in VMT? Yes

Table 2.1-2 Questions to Determine Project Applicability to Plans, Policies and Programs

1.	Does the project include additions or new construction along a street designated as a Boulevard I, II and/or Avenue I, II or III on property zoned for R3 or less restrictive zone?	LAMC Section 12.37 Highway and Collector Street Dedication and Improvement		No, the site is to be developed along North Cahuenga Boulevard, a Modified Avenue II roadway, but the site is not zoned R3
2.	Is project site along any network identified in the City's Mobility Plan?	MP 2.3 through 2.7		Yes
		MP 2.3 Pedestrian Infrastructure (Map F)		North Cahuenga Boulevard, along the Project frontage, is part of the PED Network. The Project has been designed to improve the landscaping and disrepair of pedestrian sidewalk providing a safe walkable sidewalk on this portion of the roadway.
		MP 2.4 Neighborhood Enhanced Network (Map C4)		No Project street frontages are part of the NEN. The Project is not proposing any changes along any streets that would prevent the City from installing additional features as part of the NEN, nor does the Project propose to modify any streets that would increase travel speeds on the neighborhood network.
		MP 2.5 Transit Network (Map B)		The Project is not located on any TEN roadways. The Project does not propose to remove or modify transit facilities in a manner that would negatively impact the reliability of existing transit service.
		MP 2.6 Bicycle Network (Map D2)		No, however Vine Street to the east is designated a Tier 2 BEN.
		MP 2.7 Vehicle Network (Map E)		The Project street frontages are not part of the VEN
3.	Are dedications or improvements needed to serve long-term mobility needs identified in the Mobility Plan 2035?	MP - Street Classifications; MP-Street Designations & Standard Roadway Dimensions	MP - 2.17 Street Widening	<p>Yes, according to the BOE PCRF & Mobility Element street dedication and improvements are shown below.</p> <ul style="list-style-type: none"> • La Mirada Avenue – 5-foot dedication and 3-foot widening; • Lexington Avenue – variable dedication and 3-foot widening; • Cahuenga Boulevard – 1-foot widening; and, • Southeast Corner of Cahuenga Boulevard & La Mirada Avenue – Construction of 15-foot by 15-foot corner cut or 20-foot radius dedication. <p>A WDI will be requested.</p>

4.	Does the project require placement of transit furniture in accordance with City's Coordinated Street Furniture and Bus Bench Program?			No
5.	Is project site in an identified Transit Oriented Community (TOC)?	MP - TEN; MP - PED; MP - BEN; TOC Guidelines		Yes
6.	Is project site on a roadway identified in City's High Injury Network?	Vision Zero	Mobility Plan 2035	No
7.	Does project propose repurposing existing curb space? (Bike corral, car-sharing, parklet, electric vehicle charging, loading zone, curb extension, etc.)	MP – 2.1 Adaptive Reuse of Streets; MP – 2.10 Loading Areas; MP – 3.5 Multi-Modal Features; MP – 3.8 Bicycle Parking; MP – 4.13 Parking & Land Use Management; MP – 5.4 Clean Fuels & Vehicles	MP – 2.3 Pedestrian Infrastructure; MP – 2.4 Neighborhood Enhanced Network; MP – 3.2 People with Disabilities; MP -4.1 New Technologies; MP 5.1 Substantial Transportation; MP – 5.5 Green Streets	No
8.	Does project propose paving, narrowing, shifting, or removing an existing parkway?	MP - 5.5 Green Streets; Sustainability Plan		No
9.	Does project propose modifying, removing or otherwise affect existing bicycle infrastructure? (ex: driveway proposed along street with bicycle facility)	MP- BEN; MP - 4.15 Public Hearing Process	Vision Zero	No
10.	Is project site adjacent to an alley? If yes, will project make use of, modify, or restrict alley access?	MP - 3.9 Increased Network Access; MP - ENG.9; MP - PL.1; MP - PL.13; MP - PS.3		No
11.	Does project create a cul-de-sac or is project site located adjacent to existing cul-de-sac? If yes, is cul-de-sac consistent with design goal in Mobility Plan 2035 (maintain through bicycle and pedestrian access)?	MP - 3.10 Cul-de-sacs		No, Not applicable
ACCESS: DRIVEWAYS AND LOADING				
12.	Does project site introduce a new driveway or loading access along an arterial (Avenue or Boulevard)?	MO - PL.1; MP - PK.10, CDG 4.1.02	Vision Zero	No
13.	If yes to 13, Is a non-arterial frontage or alley access available to serve the	MP - PL.1; MPP 321	Vision Zero	Not applicable

	driveway or loading access needs?			
14.	Does project site include a corner lot? (avoid driveways too close to intersections)	CDG 4.1.01		Yes. No driveways will be close to the intersections per MP&P
15.	Does project propose driveway width more than City standard?	MPP Sec. 321	Vision Zero; Sustainability Plan, MP - PED, MP - BEN; CDG 4.1.04	No
16.	Does project propose more driveways than permitted by the City maximum standard?	MPP - Sec No. 321 Driveway Design	Vision Zero; Healthy LA	No
17.	Are loading zones proposed as part of the project?	MP - 2.1 Loading Areas; MP - PK.1; MP - PK.7; MP - PK.8; MPP 321		No
18.	Does project include "drop-off" zones or areas? If yes, are such areas located to the side or rear of the buildings?	MP - 2.10 Loading Areas		No
19.	Does project propose modifying, limiting/restricting, or removing public access to a public right-of-way (e.g. vacating public right-of-way?)	MP - 2.3 Pedestrian Infrastructure; MP - 3.9 Increased Network Access		No

ATTACHMENT D.1: CITY PLAN, POLICIES AND GUIDELINES

The Transportation Element of the City’s General Plan, Mobility Plan 2035, established the “Complete Streets Design Guide” as the City’s document to guide the operations and design of streets and other public rights-of-way. It lays out a vision for designing safer, more vibrant streets that are accessible to people, no matter what their mode choice. As a living document, it is intended to be frequently updated as City departments identify and implement street standards and experiment with different configurations to promote complete streets. The guide is meant to be a toolkit that provides numerous examples of what is possible in the public right-of-way and that provides guidance on context-sensitive design.

The Plan for A Healthy Los Angeles (March 2015) includes policies directing several City departments to develop plans that promote active transportation and safety.

The City of Los Angeles Community Plans, which make up the Land Use Element of the City’s General Plan, guide the physical development of neighborhoods by establishing the goals and policies for land use. The 35 Community Plans provide specific, neighborhood-level detail for land uses and the transportation network, relevant policies, and implementation strategies necessary to achieve General Plan and community-specific objectives.

The stated goal of Vision Zero is to eliminate traffic-related deaths in Los Angeles by 2025 through several strategies, including modifying the design of streets to increase the safety of vulnerable road users. Extensive crash data analysis is conducted on an ongoing basis to prioritize intersections and corridors for implementation of projects that will have the greatest effect on overall fatality reduction. The City designs and deploys Vision Zero Corridor Plans as part of the implementation of Vision Zero. If a project is proposed whose site lies on the High Injury Network (HIN), the applicant should consult with LADOT to inform the project’s site plan and to determine appropriate improvements, whether by funding their implementation in full or by making a contribution toward their implementation.

The Citywide Design Guidelines (October 24, 2019) includes sections relevant to development projects where improvements are proposed within the public realm. Specifically, Guidelines one through three provide building design strategies that support the pedestrian experience. The Guidelines provide best practices in designing that apply in three spatial categories of site planning, building design and public right of way. The Guidelines should be followed to ensure that the project design supports pedestrian safety, access, and comfort as they access to and from the building and the immediate public right of way.

The City’s Transportation Demand Management (TDM) Ordinance (LA Municipal Code 12.26.J) requires certain projects to incorporate strategies that reduce drive-alone vehicle trips and improve access to destinations and services. The ordinance is revised and updated periodically and should be reviewed for application to specific projects as they are reviewed.

The City’s LAMC Section 12.37 (Waivers of Dedication and Improvement) requires certain

projects to dedicate and/or implement improvements within the public right-of-way to meet the street designation standards of the Mobility Plan 2035.

The Bureau of Engineering (BOE) Street Standard Dimensions S-470-1 provides the specific street widths and public right of way dimensions associated with the City's street standards.

Overland Traffic Consultants, Inc.

APPENDIX D

VMT ANALYSIS WORKSHEETS

CITY OF LOS ANGELES VMT CALCULATOR Version 1.3

Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project:

Scenario:

Address:

Is the project replacing an existing number of residential units with a smaller number of residential units AND is located within one-half mile of a fixed-rail or fixed-guideway transit station?

Yes No

Existing Land Use

Land Use Type	Value	Unit
School Private School (K-12)	200	Students

VMT Calculator User Agreement

The Los Angeles Department of Transportation (LADOT), in partnership with the Department of City Planning and Fehr & Peers, has developed the City of Los Angeles Vehicle Miles Traveled (VMT) Calculator to estimate project-specific daily household VMT per capita and daily work VMT per employee for land use development projects. This application, the VMT Calculator, has been provided to You, the User, to assess vehicle miles traveled (VMT) outcomes of land use projects within the City of Los Angeles. The term “City” as used below shall refer to the City of Los Angeles. The terms “City” and “Fehr & Peers” as used below shall include their respective affiliates, subconsultants, employees, and representatives.

The City is pleased to be able to provide this information to the public. The City believes that the public is most effectively served when they are provided access to the technical tools that inform the public review process of private and public land use investments. However, in using the VMT Calculator, You agree to be bound by this VMT Calculator User Agreement (this Agreement).

VMT Calculator Application for the City of Los Angeles. The City’s consultant calibrated the VMT Calculator’s parameters in 2018 to estimate travel patterns of locations in the City, and validated those outcomes against empirical data. However, this calibration process is limited to locations within the City, and practitioners applying the VMT Calculator outside of the City boundaries should not apply these estimates without further calibration and validation of travel patterns to verify the VMT Calculator’s accuracy in estimating VMT in such other locations.

Limited License to Use. This Agreement gives You a limited, non-transferrable, non-assignable, and non-exclusive license to use and execute a copy of the VMT Calculator on a computer system owned, leased or otherwise controlled by You in Your own facilities, as set out below, provided You do not use the VMT Calculator in an unauthorized manner, and that You do not republish, copy, distribute, reverse-engineer, modify, decompile, disassemble, transfer, or sell any part of the VMT Calculator, and provided that You know and follow the terms of this Agreement. Your failure to follow the terms of this Agreement shall automatically terminate this license and Your right to use the VMT Calculator.

Ownership. You understand and acknowledge that the City owns the VMT Calculator, and shall continue to own it through Your use of it, and that no transfer of ownership of any kind is intended in allowing You to use the VMT Calculator.

Warranty Disclaimer. In spite of the efforts of the City and Fehr & Peers, some information on the VMT Calculator may not be accurate. The VMT Calculator, OUTPUTS AND ASSOCIATED DATA ARE PROVIDED “as is” WITHOUT WARRANTY OF ANY KIND, whether expressed, implied, statutory, or otherwise including but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

Limitation of Liability. It is understood that the VMT Calculator is provided without charge. Neither the City nor Fehr & Peers can be responsible or liable for any information derived from its use, or for any delays, inaccuracies, incompleteness, errors or omissions arising out of your use of the VMT Calculator or with respect to the material contained in the VMT Calculator. You understand and agree that Your sole remedy against the City or Fehr & Peers for loss or damage caused by any defect or failure of the

VMT Calculator, regardless of the form of action, whether in contract, tort, including negligence, strict liability or otherwise, shall be the repair or replacement of the VMT Calculator to the extent feasible as determined solely by the City. In no event shall the City or Fehr & Peers be responsible to You or anyone else for, or have liability for any special, indirect, incidental or consequential damages (including, without limitation, damages for loss of business profits or changes to businesses costs) or lost data or downtime, however caused, and on any theory of liability from the use of, or the inability to use, the VMT Calculator, whether the data, and/or formulas contained in the VMT Calculator are provided by the City or Fehr & Peers, or another third party, even if the City or Fehr & Peers have been advised of the possibility of such damages.

This Agreement and License shall be governed by the laws of the State of California without regard to their conflicts of law provisions, and shall be effective as of the date set forth below and, unless terminated in accordance with the above or extended by written amendment to this Agreement, shall terminate on the earlier of the date that You are not making use of the VMT Calculator or one year after the beginning of Your use of the VMT Calculator.

By using the VMT Calculator, You hereby waive and release all claims, responsibilities, liabilities, actions, damages, costs, and losses, known and unknown, against the City and Fehr & Peers for Your use of the VMT Calculator.

Before making decisions using the information provided in this application, contact City LADOT staff to confirm the validity of the data provided.

Print and sign below, and submit to LADOT along with the transportation assessment Memorandum of Understanding (MOU).

NOTES

1. CITY COUNCIL MAY, BY ORDINANCE, ADOPT SPECIFIC STANDARDS FOR INDIVIDUAL STREETS THAT DIFFER FROM THESE OFFICIAL STANDARD STREET DIMENSIONS. COMMUNITY PLANS AND SPECIFIC PLANS SHOULD BE REVIEWED FOR FOOTNOTES, INSTRUCTIONS AND/OR MODIFIED STREET DIMENSIONS THAT WOULD REQUIRE STANDARDS DIFFERENT THAN THOSE INDICATED ON THIS STANDARD PLAN.
2. FOR ADDITIONAL GUIDANCE AS TO THE USE OF THE ROADWAY AND SIDEWALK AREA, PLEASE REFER TO THE COMPLETE STREET DESIGN GUIDE AND MANUALS.
3. FOR DISCRETIONARY PROJECTS REQUIRING ACTION FROM THE DEPARTMENT OF CITY PLANNING (PLANNING), PLANNING MAY INCLUDE SPECIFIC INFORMATION AS TO THE DESIGN AND UTILIZATION OF THE SIDEWALK AREA.
4. WHERE A DESIGNATED ARTERIAL CROSSES ANOTHER DESIGNATED ARTERIAL STREET AND THEN CHANGES IN DESIGNATION TO A STREET OF LESSER STANDARD WIDTH, THE ARTERIAL SHALL BE TAPERED IN A STANDARD FLARE SECTION ON BOTH SIDES, AS ON SHEET 3, TO MEET THE WIDTH OF LESSER DESIGNATION AND PROVIDE AN ORDERLY TRANSITION.
5. PRIVATE STREET DEVELOPMENT SHOULD CONFORM TO THE STANDARD PUBLIC STREET DIMENSIONS SHOWN ON THE SHEET, WHERE APPROPRIATE. VARIATIONS MAY BE APPROVED ON A CASE-BY-CASE BASIS BY THE CITY.
6. FIFTY-FOOT CURB RADII (INSTEAD OF THE STANDARD 35' CURB RADII) SHALL BE PROVIDED FOR CUL-DE-SACS IN INDUSTRIAL AREAS. SEE CUL-DE-SAC ILLUSTRATION FOR FURTHER DESIGN STANDARDS.
7. ALLEYS SHALL BE A MINIMUM OF 20' IN WIDTH AND INTERSECTIONS AND/OR DEAD-END TERMINUSES SHALL BE DESIGNED TO CONFORM TO THE ALLEY ILLUSTRATIONS INCLUDED HEREIN.
8. FOR INTERSECTIONS OF STREETS, THE FOLLOWING DEDICATIONS SHALL APPLY;
 - A. INTERSECTIONS OF ARTERIAL STREETS WITH ANY OTHER STREET: 15' X 15' CUT CORNER OR 20' CURVED CORNER RADIUS.
 - B. INTERSECTIONS ON NON-ARTERIAL AND/OR HILLSIDE STREETS: 10' X 10' CUT CORNER OR 15' CURVED CORNER RADIUS.
9. STREETS THAT ARE ACCOMPANIED BY A PARALLEL FRONTAGE AND/OR SERVICE ROAD ARE DEEMED TO MEET THE STREET STANDARDS SET FORTH HEREIN AND THE DEDICATION REQUIREMENT SHALL BE NO MORE THAN IS NECESSARY TO BRING THE ABUTTING SIDEWALK DIMENSION INTO COMPLIANCE WITH THE STREET STANDARD.
10. DUE TO THEIR UNIQUE CHARACTER AND DIMENSIONS ALL STREETS DESIGNATED AS DIVIDED ARE CONSIDERED TO HAVE MET THEIR STREET STANDARD AND THE DEDICATION SHALL BE NO MORE THAN IS NECESSARY TO BRING THE ABUTTING SIDEWALK DIMENSION COMPLIANT WITH THE STREET STANDARD.
11. THE DIMENSION OF ANY MEDIAN, DIVIDED STRIP AND/OR TRANSIT WAY SHALL BE INCLUDED WHEN DETERMINING THE RIGHT-OF-WAY DIMENSION.
12. THE LOCATION OF THE DRAINAGE GUTTER IS NOT RESTRICTED TO THE CENTER OF THE SHARED STREET AND CAN BE PLACED WHERE NECESSARY AS APPROVED BY THE CITY.
13. A SHARED STREET SHALL PROVIDE A DEDICATED PEDESTRIAN ACCESS ROUTE.

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Condition A or Condition B or combination of 80% of both parts A and B must be satisfied.
- b. A 6-hour Manual Count may be used in a determination that this warrant is not met. However, supplement manual counts should be taken during separate hours for a determination that this warrant is met.
- c. In applying each condition, the major street and minor street volumes shall be for the same hours. On the minor street, the higher volume does not need to be the same approach during each of the hours.
- d. The study should consider the effects of the right-turn vehicles from the minor-street approaches. Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count.
- e. Figure 4C-103(CA) should be used for new intersections, significantly reconstructed intersections, where near-term land development will result in increased volumes, or where it is not reasonable to use current traffic volumes.
- f. Engineering judgment should also be used in applying various traffic signal warrants to cases where approaches consist of one lane plus one left-turn or right-turn lane. This site-specific traffic characteristics should dictate whether an approach is considered as one lane or two lanes. For example, for an approach with one lane for through and right-turning traffic plus a left-turn lane, if engineering judgment indicates that it should be considered a one-lane approach because the traffic using the left turn lane is minor, the total traffic volume approaching the intersection should be applied against the signal warrants as a one-lane approach. The approach should be considered two lanes if approximately half of the traffic on the approach turns left and the left-turn lane is of sufficient length to accommodate all left-turn vehicles. Similar engineering judgment and rationale should be applied to a street approach with one through/left-turn lane plus a right-turn lane. In this case, the degree of conflict of minor-street right-turn traffic with traffic on the major street should be considered. Thus, right-turn traffic should not be included in the minor-street volume if the movement enters the major street with minimal conflict. The approach should be evaluated as a one-lane approach with only the traffic volume in the through/left-turn lane considered.
- g. At an intersection with a high volume of left-turn traffic from the major street, the signal warrant analysis may be performed in a manner that considers the higher volume of the major-street left-turn volumes plus the higher volume minor-street approach as the "minor street" volume and both approaches of the major street minus the higher of the major-street left-turn volume as "major street" volume. In these cases, engineering judgment should be used to determine if left-turn phasing is necessary to accommodate the high volume of left-turn traffic.

Pedestrian Volume

WARRANT
4

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Parts 1 and 2 shall be satisfied.
- b. The pedestrian volume criterion may be reduced by as much as 50% if the 15th percentile speed of the pedestrians is less than 3.5 feet/second.
- c. Estimated pedestrian volumes may be used where nearby, near-term land use development has been approved for construction.
- d. In applying each condition, the total vehicles per hour on the major street (on both approaches) and the total pedestrians per hour crossing the major street shall be for the same hours.
- e. The Pedestrian Volume signal warrants shall not be applied at locations where the distance to the nearest traffic control signal or STOP sign controlling the street that pedestrians desire to cross is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Traffic control signal may not be needed at the study location if adjacent coordinated traffic control signals consistently provide gaps of adequate length for pedestrians to cross the street.
- g. If it is considered at a non-intersection crossing, the traffic control signal should be installed at least 100 feet from side streets or driveways that are controlled by STOP or YIELD signs. If the traffic control signal is installed at a non-intersection crossing, at least one of the signal faces should be over the traveled way for each approach, parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the crosswalk or site accommodations should be made through curb extensions or other techniques to provide adequate sight distance, and the installation should include suitable standard signs and pavement markings.
- h. Bicycles may be counted as pedestrians.
- i. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

Figure 4C-10. Warrant 9, Intersection Near a Grade Crossing (Two or More Approach Lanes at the Track Crossing)

* 25 vph applies as the lower threshold volume

** VPH after applying the adjustment factors in Tables 4C-2, 4C-3, and/or 4C-4, if appropriate

The next two warrants are not included in the MUTCD (CA) standard warrants, but are added as optional warrants that an engineer may use with discretion to justify a traffic signal for special conditions where other traffic control devices could be considered, but where a traffic signal might be more appropriate

Bicycles

WARRANT
10

N/A	<input checked="" type="checkbox"/>
SATISFIED	YES <input type="checkbox"/>
	NO <input type="checkbox"/>

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- a. Part A and Part B shall be satisfied
- b. Per MUTCD (CA) Section 4C.01.15: "For signal warrant analysis, bicyclists may be counted as either vehicles or pedestrians."
- c. When performing a signal warrant analysis, bicyclists riding in the street with other vehicular traffic are usually counted as vehicles, and bicyclists who are clearly using pedestrian facilities are usually counted as pedestrians; however for this bicycle specific warrant, bicyclists are counted as bicyclists, regardless of where they are riding.
- d. Bicycle signal faces should be considered for use when this warrant is satisfied, with the final determination made during the signal design process. Refer to MUTCD (CA) Section 4D.104 (CA).
- e. Estimated peak hour bicycle volumes may be used for new intersections, significantly reconstructed intersections, or where new bicycle facilities or near-term land development are proposed which will result in increased bicycle volumes.

PART A and B must be satisfied	SATISFIED	YES	NO
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART A (1 or 2 below must be satisfied)	SATISFIED	YES	NO
1. Location meets the Department's guidelines for a marked crosswalk with Pedestrian Hybrid Beacons, where pedestrian units are replaced with bicyclists; AND the minor street is designated as part of the Neighborhood Enhanced Network in the Mobility Plan 2035 Element of the City's General Plan.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. The intersection features a two-way bicycle or pedestrian path or trail within the median or alongside one of the roadways.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART B (1, 2, or 3 below must be satisfied)	SATISFIED	YES	NO
1. Signal would be part of a corridor or area project to improve bicycle connectivity.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Signal is associated with a development project.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. There have been at least 3 correctable collisions involving bicyclists in the last 1 year, 2 per year for the last 2 years, or 5 in the last 3 years of available data. Specify dates of correctable bicycle collisions:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Period Dates	Dates of Correctable Bicycle Collisions		
1 year			
2 year			
3 year			

**The authority for a traffic signal justified using Part B.1 or B.2 shall be automatically rescinded three years after the date of approval if funding for construction of the traffic signal is not secured or project plans are not actively being reviewed for approval.*

Pedestrian Activated Yellow Flashing Beacons

N/A	<input checked="" type="checkbox"/>
SATISFIED YES	<input type="checkbox"/>
NO	<input type="checkbox"/>

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. All Parts shall be satisfied.
- b. This warrant should be applied when Pedestrian Activated Yellow Flashing Beacons are recommended within 600 feet BOTH upstream and downstream of existing traffic signals.

PART A	YES	NO
Location meets the guidelines for the installation of Pedestrian Activated Yellow Flashing Beacons as described in the LADOT Marked Crosswalk Guidelines.	<input type="checkbox"/>	<input type="checkbox"/>

PART B		YES	NO
MINIMUM REQUIREMENTS	DISTANCE TO NEAREST SIGNALS	YES	NO
≤ 600 ft	N _____ ft, S _____ ft, E _____ ft, W _____ ft	<input type="checkbox"/>	<input type="checkbox"/>

SIX HOURS OF

Eight-Hour Vehicular Volume

N/A

SATISFIED YES

NO

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- Condition A or Condition B or combination of 80% of both parts A and B must be satisfied.
- A 6-hour Manual Count may be used in a determination that this warrant is not met. However, supplement manual counts should be taken during separate hours for a determination that this warrant is met.
- In applying each condition, the major street and minor street volumes shall be for the same hours. On the minor street, the higher volume does not need to be the same approach during each of the hours.
- The study should consider the effects of the right-turn vehicles from the minor-street approaches. Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count.
- Figure 4C-103(CA) should be used for new intersections, significantly reconstructed intersections, where near-term land development will result in increased volumes, or where it is not reasonable to use current traffic volumes.
- Engineering judgment should also be used in applying various traffic signal warrants to cases where approaches consist of one lane plus one left-turn or right-turn lane. This site-specific traffic characteristics should dictate whether an approach is considered as one lane or two lanes. For example, for an approach with one lane for through and right-turning traffic plus a left-turn lane, if engineering judgment indicates that it should be considered a one-lane approach because the traffic using the left turn lane is minor, the total traffic volume approaching the intersection should be applied against the signal warrants as a one-lane approach. The approach should be considered two lanes if approximately half of the traffic on the approach turns left and the left-turn lane is of sufficient length to accommodate all left-turn vehicles. Similar engineering judgment and rationale should be applied to a street approach with one through/left-turn lane plus a right-turn lane. In this case, the degree of conflict of minor-street right-turn traffic with traffic on the major street should be considered. Thus, right-turn traffic should not be included in the minor-street volume if the movement enters the major street with minimal conflict. The approach should be evaluated as a one-lane approach with only the traffic volume in the through/left-turn lane considered.
- At an intersection with a high volume of left-turn traffic from the major street, the signal warrant analysis may be performed in a manner that considers the higher volume of the major-street left-turn volumes plus the higher volume minor-street approach as the "minor street" volume and both approaches of the major street minus the higher of the major-street left-turn volume as "major street" volume. In these cases, engineering judgment should be used to determine if left-turn phasing is necessary to accommodate the high volume of left-turn traffic.

Pedestrian Volume

WARRANT
4

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Parts 1 and 2 shall be satisfied.
- b. The pedestrian volume criterion may be reduced by as much as 50% if the 15th percentile speed of the pedestrians is less than 3.5 feet/second.
- c. Estimated pedestrian volumes may be used where nearby, near-term land use development has been approved for construction.
- d. In applying each condition, the total vehicles per hour on the major street (on both approaches) and the total pedestrians per hour crossing the major street shall be for the same hours.
- e. The Pedestrian Volume signal warrants shall not be applied at locations where the distance to the nearest traffic control signal or STOP sign controlling the street that pedestrians desire to cross is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Traffic control signal may not be needed at the study location if adjacent coordinated traffic control signals consistently provide gaps of adequate length for pedestrians to cross the street.
- g. If it is considered at a non-intersection crossing, the traffic control signal should be installed at least 100 feet from side streets or driveways that are controlled by STOP or YIELD signs. If the traffic control signal is installed at a non-intersection crossing, at least one of the signal faces should be over the traveled way for each approach, parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the crosswalk or site accommodations should be made through curb extensions or other techniques to provide adequate sight distance, and the installation should include suitable standard signs and pavement markings.
- h. Bicycles may be counted as pedestrians.
- i. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

* 25 vph applies as the lower threshold volume

** VPH after applying the adjustment factors in Tables 4C-2, 4C-3, and/or 4C-4, if appropriate

The next two warrants are not included in the MUTCD (CA) standard warrants, but are added as optional warrants that an engineer may use with discretion to justify a traffic signal for special conditions where other traffic control devices could be considered, but where a traffic signal might be more appropriate

Bicycles

WARRANT

10

N/A

SATISFIED YES

NO

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- a. Part A and Part B shall be satisfied
- b. Per MUTCD (CA) Section 4C.01.15: "For signal warrant analysis, bicyclists may be counted as either vehicles or pedestrians."
- c. When performing a signal warrant analysis, bicyclists riding in the street with other vehicular traffic are usually counted as vehicles, and bicyclists who are clearly using pedestrian facilities are usually counted as pedestrians; however for this bicycle specific warrant, bicyclists are counted as bicyclists, regardless of where they are riding.
- d. Bicycle signal faces should be considered for use when this warrant is satisfied, with the final determination made during the signal design process. Refer to MUTCD (CA) Section 4D.104 (CA).
- e. Estimated peak hour bicycle volumes may be used for new intersections, significantly reconstructed intersections, or where new bicycle facilities or near-term land development are proposed which will result in increased bicycle volumes.

PART A and B must be satisfied	SATISFIED	YES	NO
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART A (1 or 2 below must be satisfied)	SATISFIED	YES	NO
1. Location meets the Department's guidelines for a marked crosswalk with Pedestrian Hybrid Beacons, where pedestrian units are replaced with bicyclists; AND the minor street is designated as part of the Neighborhood Enhanced Network in the Mobility Plan 2035 Element of the City's General Plan.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. The intersection features a two-way bicycle or pedestrian path or trail within the median or alongside one of the roadways.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART B (1, 2, or 3 below must be satisfied)	SATISFIED	YES	NO
1. Signal would be part of a corridor or area project to improve bicycle connectivity.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Signal is associated with a development project.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. There have been at least 3 correctable collisions involving bicyclists in the last 1 year, 2 per year for the last 2 years, or 5 in the last 3 years of available data. Specify dates of correctable bicycle collisions:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Period Dates	Dates of Correctable Bicycle Collisions		
1 year			
2 year			
3 year			

**The authority for a traffic signal justified using Part B.1 or B.2 shall be automatically rescinded three years after the date of approval if funding for construction of the traffic signal is not secured or project plans are not actively being reviewed for approval.*

Pedestrian Activated Yellow Flashing Beacons

N/A	<input checked="" type="checkbox"/>
SATISFIED YES	<input type="checkbox"/>
NO	<input type="checkbox"/>

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. All Parts shall be satisfied.
- b. This warrant should be applied when Pedestrian Activated Yellow Flashing Beacons are recommended within 600 feet BOTH upstream and downstream of existing traffic signals.

PART A	YES	NO
Location meets the guidelines for the installation of Pedestrian Activated Yellow Flashing Beacons as described in the LADOT Marked Crosswalk Guidelines.	<input type="checkbox"/>	<input type="checkbox"/>

PART B		YES	NO
MINIMUM REQUIREMENTS	DISTANCE TO NEAREST SIGNALS		
≤ 600 ft	N _____ ft, S _____ ft, E _____ ft, W _____ ft	<input type="checkbox"/>	<input type="checkbox"/>

SIX HOURS OF

Eight-Hour Vehicular Volume

N/A

SATISFIED YES

NO

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- a. Condition A or Condition B or combination of 80% of both parts A and B must be satisfied.
- b. A 6-hour Manual Count may be used in a determination that this warrant is not met. However, supplement manual counts should be taken during separate hours for a determination that this warrant is met.
- c. In applying each condition, the major street and minor street volumes shall be for the same hours. On the minor street, the higher volume does not need to be the same approach during each of the hours.
- d. The study should consider the effects of the right-turn vehicles from the minor-street approaches. Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count.
- e. Figure 4C-103(CA) should be used for new intersections, significantly reconstructed intersections, where near-term land development will result in increased volumes, or where it is not reasonable to use current traffic volumes.
- f. Engineering judgment should also be used in applying various traffic signal warrants to cases where approaches consist of one lane plus one left-turn or right-turn lane. This site-specific traffic characteristics should dictate whether an approach is considered as one lane or two lanes. For example, for an approach with one lane for through and right-turning traffic plus a left-turn lane, if engineering judgment indicates that it should be considered a one-lane approach because the traffic using the left turn lane is minor, the total traffic volume approaching the intersection should be applied against the signal warrants as a one-lane approach. The approach should be considered two lanes if approximately half of the traffic on the approach turns left and the left-turn lane is of sufficient length to accommodate all left-turn vehicles. Similar engineering judgment and rationale should be applied to a street approach with one through/left-turn lane plus a right-turn lane. In this case, the degree of conflict of minor-street right-turn traffic with traffic on the major street should be considered. Thus, right-turn traffic should not be included in the minor-street volume if the movement enters the major street with minimal conflict. The approach should be evaluated as a one-lane approach with only the traffic volume in the through/left-turn lane considered.
- g. At an intersection with a high volume of left-turn traffic from the major street, the signal warrant analysis may be performed in a manner that considers the higher volume of the major-street left-turn volumes plus the higher volume minor-street approach as the "minor street" volume and both approaches of the major street minus the higher of the major-street left-turn volume as "major street" volume. In these cases, engineering judgment should be used to determine if left-turn phasing is necessary to accommodate the high volume of left-turn traffic.

WARRANT
4

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Parts 1 and 2 shall be satisfied.
- b. The pedestrian volume criterion may be reduced by as much as 50% if the 15th percentile speed of the pedestrians is less than 3.5 feet/second.
- c. Estimated pedestrian volumes may be used where nearby, near-term land use development has been approved for construction.
- d. In applying each condition, the total vehicles per hour on the major street (on both approaches) and the total pedestrians per hour crossing the major street shall be for the same hours.
- e. The Pedestrian Volume signal warrants shall not be applied at locations where the distance to the nearest traffic control signal or STOP sign controlling the street that pedestrians desire to cross is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Traffic control signal may not be needed at the study location if adjacent coordinated traffic control signals consistently provide gaps of adequate length for pedestrians to cross the street.
- g. If it is considered at a non-intersection crossing, the traffic control signal should be installed at least 100 feet from side streets or driveways that are controlled by STOP or YIELD signs. If the traffic control signal is installed at a non-intersection crossing, at least one of the signal faces should be over the traveled way for each approach, parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the crosswalk or site accommodations should be made through curb extensions or other techniques to provide adequate sight distance, and the installation should include suitable standard signs and pavement markings.
- h. Bicycles may be counted as pedestrians.
- i. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

* Note: 93 pph applies as the lower threshold volume

School Crossing

WARRANT
5

N/A

SATISFIED YES

NO

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. Part A and Part B shall be satisfied.
- b. For purposes of this warrant, schoolchildren include elementary through high school students.
- c. Estimated schoolchildren volumes may be used where a new school or expanded school has been approved for construction.
- d. The need for a traffic control signal shall be considered when an engineering study of the frequency and adequacy of gaps in the vehicular traffic stream as related to the number and size of groups of schoolchildren at an established school crossing across the major street shows that the number of adequate gaps in the traffic stream during the period when the schoolchildren are using the crossing is less than the number of minutes in the same period and there are a minimum of 20 schoolchildren during the highest crossing hour.
- e. The School Crossing signal warrant shall not be applied at locations where the distance to the nearest traffic control signal along the major street is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Non-intersectional schoolchildren crosswalk locations may be signalized when justified.
- g. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

* 25 vph applies as the lower threshold volume

** VPH after applying the adjustment factors in Tables 4C-2, 4C-3, and/or 4C-4, if appropriate

The next two warrants are not included in the MUTCD (CA) standard warrants, but are added as optional warrants that an engineer may use with discretion to justify a traffic signal for special conditions where other traffic control devices could be considered, but where a traffic signal might be more appropriate

Bicycles

WARRANT
10

N/A	<input checked="" type="checkbox"/>
SATISFIED	YES <input type="checkbox"/>
	NO <input type="checkbox"/>

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- a. Part A and Part B shall be satisfied
- b. Per MUTCD (CA) Section 4C.01.15: "For signal warrant analysis, bicyclists may be counted as either vehicles or pedestrians."
- c. When performing a signal warrant analysis, bicyclists riding in the street with other vehicular traffic are usually counted as vehicles, and bicyclists who are clearly using pedestrian facilities are usually counted as pedestrians; however for this bicycle specific warrant, bicyclists are counted as bicyclists, regardless of where they are riding.
- d. Bicycle signal faces should be considered for use when this warrant is satisfied, with the final determination made during the signal design process. Refer to MUTCD (CA) Section 4D.104 (CA).
- e. Estimated peak hour bicycle volumes may be used for new intersections, significantly reconstructed intersections, or where new bicycle facilities or near-term land development are proposed which will result in increased bicycle volumes.

PART A and B must be satisfied	SATISFIED	YES	NO
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART A (1 or 2 below must be satisfied)	SATISFIED	YES	NO
1. Location meets the Department's guidelines for a marked crosswalk with Pedestrian Hybrid Beacons, where pedestrian units are replaced with bicyclists; AND the minor street is designated as part of the Neighborhood Enhanced Network in the Mobility Plan 2035 Element of the City's General Plan.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. The intersection features a two-way bicycle or pedestrian path or trail within the median or alongside one of the roadways.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART B (1, 2, or 3 below must be satisfied)	SATISFIED	YES	NO
1. Signal would be part of a corridor or area project to improve bicycle connectivity.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Signal is associated with a development project.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. There have been at least 3 correctable collisions involving bicyclists in the last 1 year, 2 per year for the last 2 years, or 5 in the last 3 years of available data. Specify dates of correctable bicycle collisions:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Period Dates	Dates of Correctable Bicycle Collisions		
1 year			
2 year			
3 year			

**The authority for a traffic signal justified using Part B.1 or B.2 shall be automatically rescinded three years after the date of approval if funding for construction of the traffic signal is not secured or project plans are not actively being reviewed for approval.*

Pedestrian Activated Yellow Flashing Beacons

N/A	<input checked="" type="checkbox"/>
SATISFIED YES	<input type="checkbox"/>
NO	<input type="checkbox"/>

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. All Parts shall be satisfied.
- b. This warrant should be applied when Pedestrian Activated Yellow Flashing Beacons are recommended within 600 feet BOTH upstream and downstream of existing traffic signals.

PART A	YES	NO
Location meets the guidelines for the installation of Pedestrian Activated Yellow Flashing Beacons as described in the LADOT Marked Crosswalk Guidelines.	<input type="checkbox"/>	<input type="checkbox"/>

PART B		YES	NO
MINIMUM REQUIREMENTS	DISTANCE TO NEAREST SIGNALS		
≤ 600 ft	N _____ ft, S _____ ft, E _____ ft, W _____ ft	<input type="checkbox"/>	<input type="checkbox"/>

Eight-Hour Vehicular Volume  N/A SATISFIED YES NO

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- Condition A or Condition B or combination of 80% of both parts A and B must be satisfied.
- A 6-hour Manual Count may be used in a determination that this warrant is not met. However, supplement manual counts should be taken during separate hours for a determination that this warrant is met.
- In applying each condition, the major street and minor street volumes shall be for the same hours. On the minor street, the higher volume does not need to be the same approach during each of the hours.
- The study should consider the effects of the right-turn vehicles from the minor-street approaches. Engineering judgment should be used to determine what, if any, portion of the right-turn traffic is subtracted from the minor-street traffic count.
- Figure 4C-103(CA) should be used for new intersections, significantly reconstructed intersections, where near-term land development will result in increased volumes, or where it is not reasonable to use current traffic volumes.
- Engineering judgment should also be used in applying various traffic signal warrants to cases where approaches consist of one lane plus one left-turn or right-turn lane. This site-specific traffic characteristics should dictate whether an approach is considered as one lane or two lanes. For example, for an approach with one lane for through and right-turning traffic plus a left-turn lane, if engineering judgment indicates that it should be considered a one-lane approach because the traffic using the left turn lane is minor, the total traffic volume approaching the intersection should be applied against the signal warrants as a one-lane approach. The approach should be considered two lanes if approximately half of the traffic on the approach turns left and the left-turn lane is of sufficient length to accommodate all left-turn vehicles. Similar engineering judgment and rationale should be applied to a street approach with one through/left-turn lane plus a right-turn lane. In this case, the degree of conflict of minor-street right-turn traffic with traffic on the major street should be considered. Thus, right-turn traffic should not be included in the minor-street volume if the movement enters the major street with minimal conflict. The approach should be evaluated as a one-lane approach with only the traffic volume in the through/left-turn lane considered.
- At an intersection with a high volume of left-turn traffic from the major street, the signal warrant analysis may be performed in a manner that considers the higher volume of the major-street left-turn volumes plus the higher volume minor-street approach as the "minor street" volume and both approaches of the major street minus the higher of the major-street left-turn volume as "major street" volume. In these cases, engineering judgment should be used to determine if left-turn phasing is necessary to accommodate the high volume of left-turn traffic.

Peak Hour
WARRANT
3
(continued)

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

URBAN
Figure 4C-3. Warrant 3, Peak Hour

* Note: 150 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 100 vph applies as the lower threshold volume for a minor street approach with one lane.

RURAL
Figure 4C-4. Warrant 3, Peak Hour (70% Factor)
(COMMUNITY LESS THAN 10,000 POPULATION OR ABOVE 40 MPH ON MAJOR STREET)

* Note: 100 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor street approach with one lane.

Pedestrian Volume

WARRANT
4

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Parts 1 and 2 shall be satisfied.
- b. The pedestrian volume criterion may be reduced by as much as 50% if the 15th percentile speed of the pedestrians is less than 3.5 feet/second.
- c. Estimated pedestrian volumes may be used where nearby, near-term land use development has been approved for construction.
- d. In applying each condition, the total vehicles per hour on the major street (on both approaches) and the total pedestrians per hour crossing the major street shall be for the same hours.
- e. The Pedestrian Volume signal warrants shall not be applied at locations where the distance to the nearest traffic control signal or STOP sign controlling the street that pedestrians desire to cross is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Traffic control signal may not be needed at the study location if adjacent coordinated traffic control signals consistently provide gaps of adequate length for pedestrians to cross the street.
- g. If it is considered at a non-intersection crossing, the traffic control signal should be installed at least 100 feet from side streets or driveways that are controlled by STOP or YIELD signs. If the traffic control signal is installed at a non-intersection crossing, at least one of the signal faces should be over the traveled way for each approach, parking and other sight obstructions should be prohibited for at least 100 feet in advance of and at least 20 feet beyond the crosswalk or site accommodations should be made through curb extensions or other techniques to provide adequate sight distance, and the installation should include suitable standard signs and pavement markings.
- h. Bicycles may be counted as pedestrians.
- i. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

PART 1 (A or B must be satisfied)

SATISFIED	YES	NO
<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

A. FOUR-HOUR PEDESTRIAN VOLUMES	Hours			
	9am	10am	5pm	6pm
Vehicles per hour on major street for 4 hours	1816	1446	1426	1489
Pedestrians crossing major street per hour for highest 4 hours	31	27	30	27

PART 2

SATISFIED	YES	NO
<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

<u>AND</u> , The distance to the nearest traffic signal along the major street is greater than 300 ft	<input type="checkbox"/>	<input type="checkbox"/>
<u>OR</u> , The proposed traffic signal will not restrict progressive traffic flow along the major street	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Pedestrian Volume WARRANT 4 (continued)

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

SPEED ≤ 35 MPH
Figure 4C-5. Warrant 4, Pedestrian Four-Hour Volume

* Note: 107 pph applies as the lower threshold volume

SPEED > 35 MPH
Figure 4C-6. Warrant 4, Pedestrian Four-Hour Volume (70% Factor)

* Note: 75 pph applies as the lower threshold volume

Pedestrian Volume WARRANT 4 (continued)

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

SPEED ≤ 35 MPH
Figure 4C-7. Warrant 4, Pedestrian Peak Hour

* Note: 133 pph applies as the lower threshold volume

SPEED > 35 MPH
Figure 4C-8. Warrant 4, Pedestrian Peak Hour (70% Factor)

* Note: 93 pph applies as the lower threshold volume

School Crossing

WARRANT
5

N/A

SATISFIED YES

NO

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. Part A and Part B shall be satisfied.
- b. For purposes of this warrant, schoolchildren include elementary through high school students.
- c. Estimated schoolchildren volumes may be used where a new school or expanded school has been approved for construction.
- d. The need for a traffic control signal shall be considered when an engineering study of the frequency and adequacy of gaps in the vehicular traffic stream as related to the number and size of groups of schoolchildren at an established school crossing across the major street shows that the number of adequate gaps in the traffic stream during the period when the schoolchildren are using the crossing is less than the number of minutes in the same period and there are a minimum of 20 schoolchildren during the highest crossing hour.
- e. The School Crossing signal warrant shall not be applied at locations where the distance to the nearest traffic control signal along the major street is less than 300 feet, unless the proposed traffic control signal will not restrict the progressive movement of traffic.
- f. Non-intersectional schoolchildren crosswalk locations may be signalized when justified.
- g. Pedestrian Hybrid Beacons may be considered instead of a traffic signal if a device is recommended based upon pedestrian needs

PART A				SATISFIED	YES	NO
					<input type="checkbox"/>	<input checked="" type="checkbox"/>
Gap / Minutes and # of Children			Hour	YES	NO	
Gaps vs Minutes	Minutes Children Using Crossing		Gaps < Minutes AND Children ≥ 20/hr	<input type="checkbox"/>	<input type="checkbox"/>	
	Number of Adequate Gaps			<input type="checkbox"/>	<input type="checkbox"/>	
School Age Pedestrians Crossing Street / hr		0				
AND , Consideration has been given to less restrictive remedial measures				<input type="checkbox"/>	<input type="checkbox"/>	

PART B				SATISFIED	YES	NO
					<input checked="" type="checkbox"/>	<input type="checkbox"/>
				YES	NO	
The distance to the nearest traffic signal along the major street is greater than 300 ft				<input checked="" type="checkbox"/>	<input type="checkbox"/>	
OR , The proposed traffic signal will not restrict progressive movement of traffic				<input type="checkbox"/>	<input checked="" type="checkbox"/>	

Coordinated Signal System

WARRANT
6

N/A

SATISFIED YES

NO

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. The Coordinated Signal System signal warrant should not be applied where the resultant spacing of traffic control signals would be less than 1,000 feet.
- b. All Parts must be satisfied.

MINIMUM REQUIREMENTS	DISTANCE TO NEAREST SIGNAL	YES	NO
≥ 1000 ft	N <u>625</u> ft, S <u>625</u> ft, E <u>625</u> ft, W <u>2900</u> ft	<input type="checkbox"/>	<input checked="" type="checkbox"/>
On a one-way street or a street that has traffic predominantly in one direction, the adjacent traffic control signals are so far apart that they do not provide the necessary degree of vehicular platooning.		<input type="checkbox"/>	<input type="checkbox"/>
OR , On a two-way street, adjacent traffic control signals do not provide the necessary degree of platooning and the proposed and adjacent traffic control signals will collectively provide a progressive operation.		<input type="checkbox"/>	<input type="checkbox"/>

Crash Experience Warrant

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. All Parts must be satisfied.
- b. For locations that involve other agencies, crash data from other involved jurisdictions should be obtained.

		YES	NO
Adequate trial of alternatives with satisfactory observance and enforcement has failed to reduce the crash frequency		<input type="checkbox"/>	<input checked="" type="checkbox"/>
REQUIREMENTS	Number of crashes reported within a 12-month period susceptible to correction by a traffic signal:	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5 OR MORE	Indicate Date(s): 6/21/2015, 4/3/2017, 6/4/2018	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Intersection Near a Grade Crossing

N/A

SATISFIED YES

NO

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

- a. Both Parts A and B shall be satisfied.
- b. This Warrant shall only be applied after review and approval by the LADOT Railroad Crossing and Safety Section (RCOSS), subject to CPUC General Order approval.
- c. This Warrant does not apply for Pre-Signals and/or Queue-Cutter signals, as an alternative application of Pre-Signals (See 2012 CA MUTCD, Sec 8C.09). Pre-Signals shall only be applied after review and approval by RCOSS, subject to CPUC General Order approval.

	FULFILLED	
	YES	NO
<p>PART A</p> <p>A grade crossing exists on an approach controlled by a STOP or YIELD sign and the center of the track nearest to the intersection is within 140 feet of the stop line or yield line on the approach. Track Center Line to Limit Line _____ ft</p>	<input type="checkbox"/>	<input type="checkbox"/>
<p>PART B</p> <p>There is one minor street approach lane at the track crossing - During the highest traffic volume hour during which rail traffic uses the crossing, the plotted point falls above the applicable curve in Figure 4C-9.</p> <p>Major Street - Total of both approaches: _____ VPH Minor Street - Crosses the track (one direction only, approaching the intersection): _____ VPH X AF (Use Tables 4C-2, 3, & 4 below to calculate AF) = _____ VPH</p> <hr style="border-top: 1px dashed black;"/> <p>OR, There are two or more minor street approach lanes at the track crossing - During the highest traffic volume hour during which rail traffic uses the crossing, the plotted point falls above the applicable curve in Figure 4C-10.</p> <p>Major Street - Total of both approaches: _____ VPH Minor Street - Crosses the track (one direction only, approaching the intersection): _____ VPH X AF (Use Tables 4C-2, 3, & 4 below to calculate AF) = _____ VPH</p>	<input type="checkbox"/>	<input type="checkbox"/>

The minor street approach volume may be multiplied by up to three following adjustment factors (AF) as described in Section 4C-10.

- 1. Number of Rail Traffic per Day _____ Adjustment factor from Table 4C-2 _____
- 2. Percentage of High-Occupancy Buses on Minor Street Approach _____ Adjustment factor from Table 4C-3 _____
- 3. Percentage of Tractor-Trailer Trucks on Minor Street Approach _____ Adjustment factor from Table 4C-4 _____

NOTE: If no data is available or known, then use AF = 1 (no adjustment)

Table 4C-2. Warrant 9, Adjustment Factor for Daily Frequency of Rail Traffic

Rail Traffic per Day	Adjustment Factor
1	0.67
2	0.91
3 to 5	1.00
6 to 8	1.18
9 to 11	1.25
12 or more	1.33

Table 4C-3. Warrant 9, Adjustment Factor for Percentage of High-Occupancy Buses

% of High-Occupancy Buses * on Minor-Street Approach	Adjustment Factor
0 %	1.00
2 %	1.09
4 %	1.19
6 % or more	1.32

* A high-occupancy bus is defined as a bus occupied by at least 20 people

Intersection Near a Grade Crossing WARRANT 9 (continued)

★ The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal ★

Table 4C-4. Warrant 9, Adjustment Factor for Percentage of Tractor-Trailer Trucks

% of Tractor-Trailer Trucks on Minor-Street Approach	Adjustment Factor	
	D less than 70 feet	D of 70 feet or more
0% to 2.5%	0.50	0.50
2.6% to 7.5%	0.75	0.75
7.6% to 12.5%	1.00	1.00
12.6% to 17.5%	2.30	1.15
17.6% to 22.5%	2.70	1.35
22.6% to 27.5%	3.28	1.64
More than 27.5%	4.18	2.09

Figure 4C-9. Warrant 9, Intersection Near a Grade Crossing (One Approach Lane at the Track Crossing)

Figure 4C-10. Warrant 9, Intersection Near a Grade Crossing (Two or More Approach Lanes at the Track Crossing)

* 25 vph applies as the lower threshold volume

** VPH after applying the adjustment factors in Tables 4C-2, 4C-3, and/or 4C-4, if appropriate

The next two warrants are not included in the MUTCD (CA) standard warrants, but are added as optional warrants that an engineer may use with discretion to justify a traffic signal for special conditions where other traffic control devices could be considered, but where a traffic signal might be more appropriate

Bicycles

WARRANT

10

N/A

SATISFIED YES

NO

** The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal **

- a. Part A and Part B shall be satisfied
- b. Per MUTCD (CA) Section 4C.01.15: "For signal warrant analysis, bicyclists may be counted as either vehicles or pedestrians."
- c. When performing a signal warrant analysis, bicyclists riding in the street with other vehicular traffic are usually counted as vehicles, and bicyclists who are clearly using pedestrian facilities are usually counted as pedestrians; however for this bicycle specific warrant, bicyclists are counted as bicyclists, regardless of where they are riding.
- d. Bicycle signal faces should be considered for use when this warrant is satisfied, with the final determination made during the signal design process. Refer to MUTCD (CA) Section 4D.104 (CA).
- e. Estimated peak hour bicycle volumes may be used for new intersections, significantly reconstructed intersections, or where new bicycle facilities or near-term land development are proposed which will result in increased bicycle volumes.

PART A and B must be satisfied	SATISFIED	YES	NO
	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART A (1 or 2 below must be satisfied)	SATISFIED	YES	NO
1. Location meets the Department's guidelines for a marked crosswalk with Pedestrian Hybrid Beacons, where pedestrian units are replaced with bicyclists; AND the minor street is designated as part of the Neighborhood Enhanced Network in the Mobility Plan 2035 Element of the City's General Plan.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. The intersection features a two-way bicycle or pedestrian path or trail within the median or alongside one of the roadways.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

PART B (1, 2, or 3 below must be satisfied)	SATISFIED	YES	NO
1. Signal would be part of a corridor or area project to improve bicycle connectivity.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Signal is associated with a development project.*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. There have been at least 3 correctable collisions involving bicyclists in the last 1 year, 2 per year for the last 2 years, or 5 in the last 3 years of available data. Specify dates of correctable bicycle collisions:	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Period Dates	Dates of Correctable Bicycle Collisions		
1 year			
2 year			
3 year			

**The authority for a traffic signal justified using Part B.1 or B.2 shall be automatically rescinded three years after the date of approval if funding for construction of the traffic signal is not secured or project plans are not actively being reviewed for approval.*

Pedestrian Activated Yellow Flashing Beacons

N/A	<input checked="" type="checkbox"/>
SATISFIED YES	<input type="checkbox"/>
NO	<input type="checkbox"/>

* The satisfaction of a traffic signal warrant or warrants shall not in itself require the installation of a traffic control signal *

- a. All Parts shall be satisfied.
- b. This warrant should be applied when Pedestrian Activated Yellow Flashing Beacons are recommended within 600 feet BOTH upstream and downstream of existing traffic signals.

PART A	YES	NO
Location meets the guidelines for the installation of Pedestrian Activated Yellow Flashing Beacons as described in the LADOT Marked Crosswalk Guidelines.	<input type="checkbox"/>	<input type="checkbox"/>

PART B		YES	NO
MINIMUM REQUIREMENTS	DISTANCE TO NEAREST SIGNALS	YES	NO
≤ 600 ft	N _____ ft, S _____ ft, E _____ ft, W _____ ft	<input type="checkbox"/>	<input type="checkbox"/>

INITIAL STUDY

APPENDIX K.2: MEMORANDUM OF UNDERSTANDING

Transportation Assessment Memorandum of Understanding (MOU)

This MOU acknowledges that the Transportation Assessment for the following Project will be prepared in accordance with the latest version of LADOT’s Transportation Assessment Guidelines:

I. PROJECT INFORMATION

Project Name: 1200 Cahuenga Bl

Project Address: 1200-1210 N.Cahuenga Bl, 6337-6357W.Lexington Av, 6332-6356W.LaMiranda Av.

Project Description: Removal of portion of 200 student private school buildings (retain & renovate 19,448sf as creative office), construct new 55,814sf creative office & 500sf retail

LADOT Project Case Number: _____ Project Site Plan attached? (Required) Yes No

II. TRANSPORTATION DEMAND MANAGEMENT (TDM) MEASURES

Select any of the following TDM measures, which may be eligible as a Project Design Feature¹, that are being considered for this project:

Reduced Parking Supply ²	<input checked="" type="checkbox"/>	Bicycle Parking and Amenities	<input type="checkbox"/>	Parking Cash Out	<input type="checkbox"/>
-------------------------------------	-------------------------------------	-------------------------------	--------------------------	------------------	--------------------------

List any other TDM measures (e.g. bike share kiosks, unbundled parking, microtransit service, etc.) below that are also being considered and would require LADOT staff’s determination of its eligibility as a TDM measure. LADOT staff will make the final determination of the TDM measure's eligibility for this project.

- | | |
|---------|---------|
| 1 _____ | 4 _____ |
| 2 _____ | 5 _____ |
| 3 _____ | 6 _____ |

III. TRIP GENERATION

(ITE Manual Sheets attached)

Trip Generation Rate(s) Source: ITE 10th Edition / Other 11th Edition ITE

Trip Generation Adjustment (Exact amount of credit subject to approval by LADOT)	Yes	No
Transit Usage	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Existing Active or Previous Land Use	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Internal Trip	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Pass-By Trip	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Transportation Demand Management (See above)	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Trip generation table including a description of the existing and proposed land uses, rates, estimated morning and afternoon peak hour volumes (ins/outs/totals), proposed trip credits, etc. attached? (Required) Yes No

	<u>IN</u>	<u>OUT</u>	<u>TOTAL</u>
AM Trips	<u>6</u>	<u>-31</u>	<u>-25</u>
PM Trips	<u>5</u>	<u>62</u>	<u>67</u>

NET Daily Vehicle Trips (DVT)	
<u>344</u>	DVT (ITE11 th Ed.)
<u>259</u>	DVT (VMT Calculator ver. 1.3)

¹ At this time Project Design Features are only those measures that are also shown to be needed to comply with a local ordinance, affordable housing incentive program, or State law.

²Select if reduced parking supply is pursued as a result of a parking incentive as permitted by the City’s Bicycle Parking Ordinance, State Density Bonus Law, or the City’s Transit Oriented Community Guidelines.

IV. STUDY AREA AND ASSUMPTIONS

Project Buildout Year: 2024 Ambient Growth Rate: 1 % Per Yr.

Related Projects List, researched by the consultant and approved by LADOT, attached? (Required) Yes No

STUDY INTERSECTIONS and/or STREET SEGMENTS:
(May be subject to LADOT revision after access, safety, and circulation evaluation.)

- 1 CAHUENGA BOULEVARD & FOUNTAIN AVENUE 4. LEXINGTON AVENUE & VINE STREET
- 2 CAHUENGA BOULEVARD & LEXINGTON AVENUE a-b 2 PROJECT DRIVEWAYS ON LEXINTON AVENUE
- 3 FOUNTAIN AVENUE & VINE STREET c 1 PROJECT DRIVEWAY ON LA MIRADA AVENUE

Provide a separate list if more than six study intersections and/or street segments.

Is this Project located on a street within the High Injury Network? Yes No

If a study intersection is located within a ¼-mile of an adjacent municipality’s jurisdiction, signature approval from said municipality is required prior to MOU approval.

V. ACCESS ASSESSMENT

- a. Does the project exceed 1,000 net DVT? Yes No
- b. Is the project’s frontage 250 linear feet or more along an Avenue or Boulevard as classified by the City’s General Plan? Yes No
- c. Is the project’s building frontage encompassing an entire block along an Avenue or Boulevard as classified by the City’s General Plan? Yes No

VI. ACCESS ASSESSMENT CRITERIA

If Yes to any of the above questions a., b., or c., complete **Attachment C.1: Access Assessment Criteria**.

ANSWER TO ABOVE a., b. and c. no - ATTACHMENT C.1 NOT ATTACHED

VII. SITE PLAN AND MAP OF STUDY AREA

Please note that the site plan should also be submitted to the Department of City Planning for cursory review.

Does the attached site plan and/or map of study area show	Yes	No	Not Applicable
Each study intersection and/or street segment	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
*Project Vehicle Peak Hour trips at each study intersection	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
*Project Vehicle Peak Hour trips at each project access point	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
*Project trip distribution percentages at each study intersection	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Project driveways designed per LADOT MPP 321 (show widths and directions or lane assignment)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Pedestrian access points and any pedestrian paths	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Pedestrian loading zones	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Delivery loading zone or area	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
Bicycle parking onsite	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Bicycle parking offsite (in public right-of-way)	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

*For mixed-use projects, also show the project trips and project trip distribution by land use category.

VIII. FREEWAY SAFETY ANALYSIS SCREENING

Will the project add 25 or more trips to any freeway off-ramp in either the AM or PM peak hour? YES NO

Provide a brief explanation or graphic identifying the number of project trips expected to be added to the nearby freeway off-ramps serving the project site. If Yes to the question above, a freeway ramp analysis is required.

IX. CONTACT INFORMATION

Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project:

Scenario:

Address:

Is the project replacing an existing number of residential units with a smaller number of residential units AND is located within one-half mile of a fixed-rail or fixed-guideway transit station?

Yes No

Existing Land Use

Land Use Type	Value	Unit
School Private School (K-12)	200	Students

[Click here to add a single custom land use type \(will be included in the above list\)](#)

Proposed Project Land Use

Land Use Type	Value	Unit
Office General Office	74.762	ksf
Retail General Retail	0.5	ksf
Office General Office	74.762	ksf

[Click here to add a single custom land use type \(will be included in the above list\)](#)

Project Screening Summary

Existing Land Use	Proposed Project
313 Daily Vehicle Trips	572 Daily Vehicle Trips
1,919 Daily VMT	4,190 Daily VMT
Tier 1 Screening Criteria	
Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station. <input type="checkbox"/>	
Tier 2 Screening Criteria	
The net increase in daily trips < 250 trips	259 Net Daily Trips
The net increase in daily VMT ≤ 0	2,271 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	0.500 ksf
The proposed project is required to perform VMT analysis.

VMT Calculator User Agreement

The Los Angeles Department of Transportation (LADOT), in partnership with the Department of City Planning and Fehr & Peers, has developed the City of Los Angeles Vehicle Miles Traveled (VMT) Calculator to estimate project-specific daily household VMT per capita and daily work VMT per employee for land use development projects. This application, the VMT Calculator, has been provided to You, the User, to assess vehicle miles traveled (VMT) outcomes of land use projects within the City of Los Angeles. The term “City” as used below shall refer to the City of Los Angeles. The terms “City” and “Fehr & Peers” as used below shall include their respective affiliates, subconsultants, employees, and representatives.

The City is pleased to be able to provide this information to the public. The City believes that the public is most effectively served when they are provided access to the technical tools that inform the public review process of private and public land use investments. However, in using the VMT Calculator, You agree to be bound by this VMT Calculator User Agreement (this Agreement).

VMT Calculator Application for the City of Los Angeles. The City’s consultant calibrated the VMT Calculator’s parameters in 2018 to estimate travel patterns of locations in the City, and validated those outcomes against empirical data. However, this calibration process is limited to locations within the City, and practitioners applying the VMT Calculator outside of the City boundaries should not apply these estimates without further calibration and validation of travel patterns to verify the VMT Calculator’s accuracy in estimating VMT in such other locations.

Limited License to Use. This Agreement gives You a limited, non-transferrable, non-assignable, and non-exclusive license to use and execute a copy of the VMT Calculator on a computer system owned, leased or otherwise controlled by You in Your own facilities, as set out below, provided You do not use the VMT Calculator in an unauthorized manner, and that You do not republish, copy, distribute, reverse-engineer, modify, decompile, disassemble, transfer, or sell any part of the VMT Calculator, and provided that You know and follow the terms of this Agreement. Your failure to follow the terms of this Agreement shall automatically terminate this license and Your right to use the VMT Calculator.

Ownership. You understand and acknowledge that the City owns the VMT Calculator, and shall continue to own it through Your use of it, and that no transfer of ownership of any kind is intended in allowing You to use the VMT Calculator.

Warranty Disclaimer. In spite of the efforts of the City and Fehr & Peers, some information on the VMT Calculator may not be accurate. The VMT Calculator, OUTPUTS AND ASSOCIATED DATA ARE PROVIDED “as is” WITHOUT WARRANTY OF ANY KIND, whether expressed, implied, statutory, or otherwise including but not limited to, the implied warranties of merchantability and fitness for a particular purpose.

Limitation of Liability. It is understood that the VMT Calculator is provided without charge. Neither the City nor Fehr & Peers can be responsible or liable for any information derived from its use, or for any delays, inaccuracies, incompleteness, errors or omissions arising out of your use of the VMT Calculator or with respect to the material contained in the VMT Calculator. You understand and agree that Your sole remedy against the City or Fehr & Peers for loss or damage caused by any defect or failure of the

VMT Calculator, regardless of the form of action, whether in contract, tort, including negligence, strict liability or otherwise, shall be the repair or replacement of the VMT Calculator to the extent feasible as determined solely by the City. In no event shall the City or Fehr & Peers be responsible to You or anyone else for, or have liability for any special, indirect, incidental or consequential damages (including, without limitation, damages for loss of business profits or changes to businesses costs) or lost data or downtime, however caused, and on any theory of liability from the use of, or the inability to use, the VMT Calculator, whether the data, and/or formulas contained in the VMT Calculator are provided by the City or Fehr & Peers, or another third party, even if the City or Fehr & Peers have been advised of the possibility of such damages.

This Agreement and License shall be governed by the laws of the State of California without regard to their conflicts of law provisions, and shall be effective as of the date set forth below and, unless terminated in accordance with the above or extended by written amendment to this Agreement, shall terminate on the earlier of the date that You are not making use of the VMT Calculator or one year after the beginning of Your use of the VMT Calculator.

By using the VMT Calculator, You hereby waive and release all claims, responsibilities, liabilities, actions, damages, costs, and losses, known and unknown, against the City and Fehr & Peers for Your use of the VMT Calculator.

Before making decisions using the information provided in this application, contact City LADOT staff to confirm the validity of the data provided.

Print and sign below, and submit to LADOT along with the transportation assessment Memorandum of Understanding (MOU).

INITIAL STUDY

APPENDIX K.3: LADOT ASSESSMENT LETTER

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

1200 N Cahuenga Bl
DOT Case No. CEN21-51713

Date: September 14, 2022

To: Susan Jimenez, Administrative Clerk
Department of City Planning

From: 
Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **TRANSPORTATION ASSESSMENT FOR THE PROPOSED CREATIVE OFFICE PROJECT
LOCATED AT 1200 NORTH CAHUENGA BOULEVARD (CPC-2021-10170-GPA-ZC-WDI/
ENV-2021-10171-EAF)**

The Los Angeles Department of Transportation (LADOT) has reviewed the transportation assessment prepared by Overland Traffic Consultants, Inc. (OTC), dated December 2021 (Corrected August 4, 2022), for the proposed creative office project located at 1200-1210 North Cahuenga Boulevard, 6337-6357 West Lexington Avenue, and 6332-6356 West La Mirada Avenue in the Central Los Angeles Area Planning Commission. In compliance with Senate Bill (SB) 743 and the California Environmental Quality Act (CEQA), a vehicle miles traveled (VMT) analysis is required to identify the project's ability to promote the reduction of green-house gas emissions, the access to diverse land uses, and the development of multi-modal networks. The significance of a project's impact in this regard is measured against the VMT thresholds established in LADOT's Transportation Assessment Guidelines (TAG), as described below.

DISCUSSION AND FINDINGS

A. Project Description

On the block bordered by Cahuenga Boulevard to the west, La Mirada Avenue to the north, residential to the east, and Lexington Avenue to the south, the project proposes to replace and refurbish the existing vacant private school complex, which served 200 students and closed on August 13, 2021, in order to provide three buildings with a total of 74,762 square feet of creative office and 500 square feet of ground floor retail uses.

Building	Location	Proposed	Existing
A	Along northern border of project site fronting La Mirada Avenue	New four-story building with approximately 35,000 square feet (sf) creative office and one at-grade parking level and one subterranean level	Subterranean parking lot and access ramp, topped with a recreation field, basketball court, and two playgrounds to be demolished
B	Southeast corner of project site fronting Lexington Avenue	Preserved portion of the existing two-story building along with its subterranean garage and upgraded to provide 19,448 sf of creative office	Two-story building: 8,492 sf to be demolished and 19,448 sf to be preserved
C	Southwest corner of project site Cahuenga Boulevard and Lexington Avenue	New four-story building with 20,814 sf creative office, at-grade parking and 500 sf retail for the office employees and their guests	Two-story building to be demolished

The project would provide a total of 156 vehicle parking spaces accessed via a new driveway for Building A on La Mirada Avenue, an existing driveway for Building B on Lexington Avenue near the east end of the site, and a new driveway for Building C on Lexington Avenue between Cahuenga Boulevard and the east Lexington driveway as illustrated in **Attachment A**. The project will also provide, at minimum, 22 bicycle (8 short term and 14 long term) parking spaces, and up to four showers and 14 secure lockers. An at-grade on-site drop area will be provided in the surface parking lot on Lexington Avenue. The project is expected to be completed by 2024.

B. Freeway Safety Analysis

Per the Interim Guidance for Freeway Safety Analysis memorandum issued by LADOT on May 1, 2020 to address Caltrans safety concerns on freeways, the study addresses the project's effects on vehicle queuing on freeway off-ramps. Such an evaluation measures the project's potential to lengthen a forecasted off-ramp queue and create speed differentials between vehicles exiting the freeway off-ramps and vehicles operating on the freeway mainline. The evaluation identified the number of project trips expected to be added to nearby freeway off-ramps serving the project site. It was determined that project traffic at any freeway off-ramp will not exceed 25 peak hour trips. Therefore, a freeway ramp analysis is not required.

C. CEQA Screening Threshold

Prior to accounting for trip reductions resulting from the application of Transportation Demand Management (TDM) Strategies, a trip generation analysis was conducted to determine if the project would exceed the net 250 daily vehicle trips screening threshold. Using the City of Los Angeles VMT Calculator Version 1.3 tool, which draws upon trip rate estimates published in the Institute of Transportation Engineers (ITE) Trip Generation Manual, 9th Edition as well as applying trip generation adjustments when applicable, based on sociodemographic data and the built environment factors of the project's surroundings, it was determined that the project **does** exceed the net 250 daily vehicle trips threshold.

Additionally, the analysis included further discussion of the transportation impact thresholds:

- T-1 Conflicting with plans, programs, ordinances, or policies
- T-2.1 Causing substantial vehicle miles traveled
- T-3 Substantially increasing hazards due to a geometric design feature or incompatible use.

The assessment determined that the project would **not** have a significant transportation impact under Thresholds T-1 and T-3. A project's impacts per Threshold T-2.1 is determined by using the VMT calculator and is discussed further below. A copy of the VMT Calculator summary report is provided as **Attachment B** to this report.

D. Transportation Impacts

On July 30, 2019, pursuant to SB 743 and the recent changes to Section 15064.03 of the State's CEQA Guidelines, the City of Los Angeles adopted VMT as criteria in determining transportation impacts under CEQA. The new LADOT TAG provide instructions on preparing transportation assessments for land use proposals and defines the significant impact thresholds.

The LADOT VMT Calculator tool measures project impact in terms of Household VMT per Capita, and Work VMT per Employee. LADOT identified distinct thresholds for significant VMT impacts for each of the seven Area Planning Commission (APC) areas in the City. For the Central APC area, in which the project is located, the following thresholds have been established:

- Household VMT per Capita: 6.0
- Work VMT per Employee: 7.6

According to the VMT Analysis report, prepared by OTC, the project proposes to incorporate the TDM strategies of including bike parking per Los Angeles Municipal Code (LAMC) and including secure bike parking and showers as a project design features. With the application of these TDM strategies, the proposed project is projected to have no Household VMT and a Work VMT per employee of 7.6. Therefore, it is concluded that implementation of the project would result in no significant VMT impact. A copy of the VMT Calculator summary report is provided as **Attachment B**.

E. Access and Circulation

During preparation of the new CEQA guidelines, the State's Office of Planning and Research stressed that lead agencies can continue to apply traditional operational analysis requirements to inform land use decisions provided that such analyses were outside of the CEQA process. The authority for requiring non-CEQA transportation analysis and requiring improvements to address potential circulation deficiencies, lies in the City of Los Angeles' Site Plan Review authority as established in Section 16.05 of the LAMC. Therefore, LADOT continues to require and review a project's site access, circulation, and operational plan to determine if any access enhancements, transit amenities, intersection improvements, traffic signal upgrades, neighborhood traffic calming, or other improvements are needed. In accordance with this authority, the project has completed a circulation analysis using a "level of service" screening methodology that indicates that the trips generated by the proposed development will not likely result in adverse circulation conditions at several locations. Vehicular access to the project will be provided along La Mirada Avenue and Lexington Avenue. LADOT has reviewed this analysis and determined that it adequately discloses operational concerns. A copy of the circulation analysis table that summarizes these potential deficiencies is provided as **Attachment C** to this report.

PROJECT REQUIREMENTS

Non-CEQA Related Requirements and Considerations

To comply with transportation and mobility goals and provisions of adopted City plans and ordinances, the applicant should be required to implement the following:

1. Parking Requirements

The Project is supported by a 149 stall parking facility, consisting of a surface lot with 23 stalls and 126 stalls located on the roof of the warehouse. The applicant should check with the Departments of Building and Safety and City Planning on the number of parking spaces required for this project.

2. Highway Dedication and Street Widening Requirements
Per the new Mobility Element of the General Plan, **Cahuenga Boulevard**, a Modified Avenue II, would require a 28-foot half-width roadway within a 40-foot half-width right-of-way, and **Lexington Avenue** and **La Mirada Avenue**, both Local Streets, would require an 18-foot half-width roadway within a 30-foot half-width right-of-way. The applicant should check with the Bureau of Engineering's Land Development Group to determine if there are any other applicable highway dedication, street widening and/or sidewalk requirements for this project.
3. Project Access and Circulation
The conceptual site plan for the project (see **Attachment A**) is acceptable to LADOT. The project would be accessed via one driveway on La Mirada Avenue and two driveways on Lexington Avenue. Review of this study does not constitute a recommended approval of the dimensions for any new proposed driveway. Review and approval of the driveways should be coordinated with LADOT's Citywide Planning Coordination Section (201 North Figueroa Street, 5th Floor, Room 550, at 213-482-7024). In order to minimize and prevent last minute building design changes, the applicant should contact LADOT for driveway width and internal circulation requirements prior to the commencement of building or parking layout design. The applicant should check with City Planning regarding the project's vehicular access and design.
4. Worksite Traffic Control Requirements
LADOT recommends that a construction work site traffic control plan be submitted to LADOT's Citywide Temporary Traffic Control Section or Permit Plan Review Section for review and approval prior to the start of any construction work. Refer to <http://ladot.lacity.org/businesses/temporary-traffic-control-plans> to determine which section to coordinate review of the work site traffic control plan. The plan should show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. LADOT also recommends that all construction related truck traffic be restricted to off-peak hours to the extent feasible.
5. TDM Ordinance Requirement
The TDM Ordinance (LAMC 12.26 J) is currently being updated. The updated ordinance, which is currently progressing through the City's approval process, will:
 - Expand the reach and application of TDM strategies to more land uses and neighborhoods,
 - Rely on a broader range of strategies that can be updated to keep pace with technology, and
 - Provide flexibility for developments and communities to choose strategies that work best for their neighborhood context.

Although not yet adopted, LADOT recommends that the applicant be subject to the terms of the proposed TDM Ordinance update. The updated ordinance is expected to be completed prior to the anticipated construction of this project, if approved.
6. Development Review Fees
Section 19.15 of the LAMC identifies specific fees for traffic study review, condition clearance, and permit issuance. The applicant shall comply with any applicable fees per this ordinance.

If you have any questions, please contact Eileen Hunt of my staff at (213) 972-8481

CITY OF LOS ANGELES VMT CALCULATOR Version 1.3

Project Screening Criteria: Is this project required to conduct a vehicle miles traveled analysis?

Project Information

Project:

Scenario:

Address:

Is the project replacing an existing number of residential units with a smaller number of residential units AND is located within one-half mile of a fixed-rail or fixed-guideway transit station?

Yes No

Existing Land Use

Land Use Type	Value	Unit
School Private School (K-12)	200	Students
School Private School (K-12)		Students

Click here to add a single custom land use type (will be included in the above list)

Proposed Project Land Use

Land Use Type	Value	Unit
Office General Office	74.762	ksf
Retail General Retail Office	0.5	ksf
Office General Office	74.762	ksf

Click here to add a single custom land use type (will be included in the above list)

Project Screening Summary

Existing Land Use	Proposed Project
313 Daily Vehicle Trips	572 Daily Vehicle Trips
1,919 Daily VMT	4,190 Daily VMT

Tier 1 Screening Criteria

Project will have less residential units compared to existing residential units & is within one-half mile of a fixed-rail station.

Tier 2 Screening Criteria

The net increase in daily trips < 250 trips	259 Net Daily Trips
The net increase in daily VMT ≤ 0	2,271 Net Daily VMT
The proposed project consists of only retail land uses ≤ 50,000 square feet total.	0.500 ksf

The proposed project is required to perform VMT analysis.

**RE: 6445 Sunset Boulevard, Hollywood Community Plan
CASE NO.: CPC-2020-5407-VZC-HD-CUB-ZAA-RDP-SPR / ENV-2020-5408-EAF**

Dear Tribal Representative:

In conformance with the tribal consultation requirements of Assembly Bill (AB) 52, this letter is to inform you that the Los Angeles Department of City Planning is reviewing the proposed project described below. Per AB 52, the tribe has the right to consult on a proposed public or private project prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. The project description is as follows:

The Project proposes to demolish an existing two-story structure with general commercial and office uses and the construction of a new 13-story hotel with 175 rooms, with and second and rooftop level restaurant, bar and lounge area, four above ground parking levels, and a basement level. The project will be approximately 173 feet and have a floor area of approximately 59,655 square feet for a FAR of 6:1. The project includes grading and excavation resulting in the export of 7,500 cubic yards of soil necessary for the basement level which is approximately 25 feet below grade.

You have 30 calendar days from receipt of this letter to notify us in writing that you want to consult on this project. Please provide the lead contact person's contact information. Please mail or email your request to:

Alex Truong
City Planning Associate
Los Angeles Department of City Planning
Expedited Processing Section
200 N. Spring Street, Room 763
Los Angeles, CA 90012

213-978-3308

Telephone No.: (805) 367-5720

¹ Project address must include all addresses on the subject site (as identified in ZIMAS; <http://zimas.lacity.org>)

OVERVIEW

CEQA, or the California Environmental Quality Act, is a statute that requires state and local agencies to identify the significant environmental impacts of their actions and to avoid or mitigate those impacts, if feasible. CEQA requires public agencies to conduct environmental review before making a determination on a project. The environmental review process examines the potential impacts your project will have on the property and its surroundings, and makes recommendations (mitigation measures) on how to minimize or reduce those impacts that are found to be significant. The purpose of this application is to assist staff in determining the appropriate environmental clearance for your project. Please fill out this form completely. Missing, incomplete or inconsistent information will cause delays in the processing of your application.

1. PROJECT DESCRIPTION

- A. Briefly describe the entire project and any related entitlements (e.g. Tentative Tract, Conditional Use, Zone Change, etc.). The description must include all phases and plans for future expansion.

Demolish existing structure. Construct, use and maintain up to 173 feet high 13-story 175 room
hotel with 12,500 sq. ft of restaurant, bar, & lounge (including site sale of a full line of
alcohol). Project contains 59,655 sq ft of floor area and 72 parking spaces located on 4 above
ground levels. Project FAR of up to 6:1. See Attachment A for entitlement requests.

Additional information or Expanded Initial Study attached: YES NO

- B. Will the project require certification, authorization, clearance or issuance of a permit by any federal, state, county, or environmental control agency, such as Environmental Protection Agency, Air Quality Management District, Water Resources Board, Environmental Affairs, etc.? YES NO

If YES, please specify:

2. EXISTING CONDITIONS

A. Project Site.

Lot Area: 9,945 square feet
 Net Acres: .228 Gross Acres: .228

B. Zoning/Land Use.

	Existing	Proposed
Zoning	C4-2D-SN	C2-2-SN
Use of Land	Office, Commercial	Hotel, Restaurant, Bar, Lounge
General Plan Designation	Regional Center Commercial	Same

C. Structures.

1. Does the property contain any vacant structure? YES NO
 If YES, describe and state how long it has been vacant: _____

2. Will any structures be removed/demolished as a result of the project? YES NO
 If YES, provide the number: 1, type: Commercial
 _____, total square footage: 9,636.00
 and age: 64 years old of structures to be removed.

If residential dwellings (apartments, single-family, condominiums etc.) are being removed indicate the number of units: N/A

D. Trees.

Are there any trees on the property, and/or within the public right-of-way next to the property, that will be removed or impacted* as a result of the project? YES NO

If YES complete the following:

Tree Status	Quantity Existing	Tree Types	Quantity Removed	Quantity Relocated	Quantity Replaced	Quantity Impacted*
Non-Protected (8" trunk diameter and greater)						
Protected (4" trunk diameter and greater)	0	Oak Tree (excluding Scrub Oak)				
	0	Southern California Black Walnut				
	0	Western Sycamore				
	0	California Bay				

* Impacted means that grading or construction activity will be conducted within five (5) feet of, or underneath the tree's canopy.

Additional information attached: YES NO

*If a protected tree (as defined in Section 17.02 of the LAMC) will be removed, replaced, relocated, or impacted, a **Tree Report** is required.*

E. Slope. State the percent of property which is:

Less than 10% slope: 100 10-15% slope: 0 over 15% slope: 0

*If slopes over 10% exist, a **Topographic Map** will be required.*

F. **Grading.** Specify the total amount of dirt being moved:

0-500 cubic yards More than 500 cubic yards

If more than 500 cubic yards (indicate amount): Approximately 8,750 cubic yards

G. **Import/Export.** Indicate the amount of dirt to be imported or exported:

Imported: 0 cubic yards Exported: 8,750 cubic yards

Location of disposal site: TBD

Location of borrow site: TBD

Is the Project Site located within a Bureau of Engineering (BOE) Special Grading Area? YES NO

If YES, a **Haul Route** is required.

H. **Hazardous Materials and Substances.** Is the project proposed on land that is or was developed with a dry cleaning, automobile repair, gasoline station, or industrial/manufacturing use, or other similar type of use that may have resulted in site contamination? YES NO

If YES, describe: Former bus depot and repair/ service station on the subject property.

If YES, a **Phase I Environmental Site Assessment (ESA)** is required.

I. **Historic, Cultural and/or Architecturally Significant Site or Structure.** Does the project involve any structures, buildings, street lighting systems, spaces, sites or components thereof which are designated or may be eligible for designation in any of the following? If YES, please check and describe:

National Register of Historic Places: N/A

California Register of Historic Resources: N/A

City of Los Angeles Cultural Historic Monument: N/A

Located within a City of Los Angeles Historic Preservation Overlay Zone (HPOZ): N/A

Identified on SurveyLA: N/A

Identified in HistoricPlacesLA: N/A

Does the Project affect any structure 45 or more years old that does not have a local, state, or federal designation for cultural or historic preservation? YES NO

J. **Miscellaneous.** Does the property contain any easements, rights-of-way, Covenant & Agreements, contracts, underground storage tanks or pipelines which restrict full use of the property? YES NO
If YES, describe: _____

_____ and indicate the sheet number on your plans showing the condition: _____.

3. **PROPOSED DEVELOPMENT**

In the sections below, describe the entire project, not just the area in need of the entitlement request. If the project involves more than one phase or substantial expansion or changes of existing uses, please document each portion separately, with the total or project details written below. Attach additional sheets as necessary to fully describe the project.

A. **ALL PROJECTS**

*Up to 20% reduction pursuant to LAMC 12.32.P and 15% bicycle parking reduction for hotel uses.

i. **Parking.**

Vehicular Parking

Required: 72* + Guest: 0

Proposed: 72 + Guest: 0

Bicycle Parking:

Required Long-Term: 25 Required Short-Term: 25

Proposed Long-Term: 35 Proposed Short-Term: 25

ii. **Height.**

Number of stories (not including mezzanine levels): 13 Maximum height: 173 Feet

Are Mezzanine levels proposed? YES NO

If YES, indicate on which floor: N/A,

If YES, indicate the total square feet of each mezzanine: N/A

*New construction resulting in a height in excess of 60 feet may require a **Shade/Shadow Analysis**. This does not apply to projects that are located within a Transit Priority Area (TPA) as defined by ZI-2452 (check the Planning and Zoning tab in ZIMAS for this information <http://ZIMAS.lacity.org>).*

iii. **Project Size.**

What is the total floor area of the project? 59,655 gross square feet

iv. **Lot Coverage.** Indicate the percent of the total project that is proposed for:

Building footprint: 100 %

Paving/hardscape: _____ %

Landscaping: _____ %

v. **Lighting.** Describe night lighting of project: Security lighting.

B. RESIDENTIAL PROJECT

If no portion of the project is residential check -N/A and continue to next section

i. Number of Dwelling Units.

Single Family: _____, Apartment: _____, Condominium: _____

ii. Recreational Facilities. List recreational facilities for project: _____

iii. Open Space.

Does the project involve new construction resulting in additional floor area and units? YES NO

Does the project involve six or more residential units? YES NO

If YES to both, complete the following

Pursuant to LAMC 12.21.G	Required	Proposed
Common Open Space (Square Feet)		
Private Open Space (Square Feet)		
Landscaped Open Space Area (Square Feet)		
Number of trees (24 inch box or greater)		

iv. Utilities. Describe the types of appliances and heating (gas, electric, gas/electric, solar): _____

v. Accessory Uses. Describe new accessory structures (detached garage, guest house, swimming pool, fence, stable, etc.) and/or additions: _____

C. COMMERCIAL, INDUSTRIAL OR OTHER PROJECT

If the project is residential only check -N/A and continue to next section

i. Type of Use. Hotel, Restaurant, Bar, and Lounge uses.

ii. Project Size. Does the project only involve the remodel or change of use of an existing interior space or leasehold? YES NO

If YES, indicate the total size of the interior space or leasehold: N/A square feet

iii. Hotel/Motel. Identify the number of guest rooms: 175 guest rooms

iv. **Days of operation.** 7 Days a week
Hours of operation. 24/7

v. **Special Events.** Will there be special events not normally associated with a day-to-day operation (e.g. fund raisers, pay-for-view events, parent-teacher nights, athletic events, graduations)? YES NO
If YES, describe events and how often they are proposed Occasional fundraisers,
occasional business gatherings and hotel holiday events in the restaurant, lounge and bar areas.

vi. **Occupancy Limit.** Total Fire Department occupancy limit: TBD
a. Number of fixed seats or beds TBD
b. Total number of patrons/students TBD
c. Number of employees per shift TBD, number of shifts _____
d. Size of largest assembly area TBD square feet

v. **Security.** Describe security provisions for the project No security guard proposed for restaurant, bar,
and lounge uses. TBD for hotel.

4. SELECTED INFORMATION

A. **Circulation.** Identify by name all arterial road types (i.e. Boulevard I, II, Avenue I, II, III) and freeways within 1,000 feet of the proposed Project; give the approximate distances (check <http://navigatela.lacity.org> for this information). Sunset Boulevard - Avenue I - Adjacent to the property
Cahuenga Boulevard - Avenue II - Approximately 170 feet east of the property.
Wilcox Avenue - Modified Avenue III - Approximately 250 feet west of the property.
Vine Street - Avenue II - Approximately 1,000 feet east of the property.
Cole Avenue - Modified Avenue II - Approximately 880 feet south of the property.

B. **Green building certification.** Will the project be LEED-certified or equivalent? YES NO
If YES, check appropriate box:
 Certified Equivalent Silver Gold Platinum Other _____

C. **Fire sprinklers.** Will the Project include fire sprinklers? YES NO

5. CLASS 32 URBAN INFILL CATEGORICAL EXEMPTION (CE) REQUEST

The Class 32 "Urban Infill" Categorical Exemption (Section 15332 of the State CEQA Guidelines), is available for development within urbanized areas. This class is not intended to be applied to projects that would result in any significant traffic, noise, air quality, or water quality impacts.

Check this box if you are requesting a Class 32 Exemption, and:

- You have read DCP's Specialized Instructions for the Class 32 Categorical Exemption (CP-7828) and,
- You have submitted the written justifications identified in the Specialized Instructions, and any supporting documents and/or technical studies to support your position that the proposed Project is eligible for the Class 32 Exemption and the project does not fall under any of the Exceptions pursuant to CEQA Section 15300.2.

Note that requesting the Urban Infill CE does not guarantee that the request will be accepted. The City may require additional studies and information if necessary to process the CE. The City reserves all rights to determine the appropriate CEQA clearance, including using multiple clearances and requiring an EIR if necessary.

RE: AB 52 Tribal Consultation Process
(Case No. CPC-2020-5407-VZC-HD-CUB-ZAA-RDP-SPR)

Dear Andrew Salas:

The Department of City Planning has received your letter dated April 6, 2021. The Gabrieleño Band of Mission Indians – Kizh Nation have made a formal request for consultation on the Proposed Project. This letter memorializes the start of the AB 52 tribal consultation process. The City looks forward to consulting with the Gabrieleño Band of Mission Indians – Kizh Nation regarding potential impacts to tribal cultural resources. We would like to schedule a consultation meeting or conference call with your representatives within the next two weeks.

In addition, if you have information or evidence regarding tribal cultural resources at or near the project site, it would be helpful submit that information/evidence to the City prior to any consultation meeting so the City has time to review it prior to the meeting. As the lead agency, we further ask that the City be invited to be part of any future discussion between you and the applicant as it pertains to the presence of tribal cultural resources. Please direct all communications regarding this project consultation process to: Alex Truong, City Planning Associate, alexander.truong@lacity.org

Respectfully,

Alexander Truong

APPENDIX L.2: NAHC SACRED LANDS FILE RECORD

NATIVE AMERICAN HERITAGE COMMISSION

December 14, 2021

Jenny Mailhot
EcoTierra Consulting, Inc.Via Email to: jenny@ecotierraconsulting.com**Re: 1200 Cahuenga Project, Los Angeles County**

Dear Ms. Mailhot:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green
Cultural Resources Analyst

1. INTRODUCTION

1.1. PROJECT DESCRIPTION

The 1200 N. Cahuenga Boulevard Project (the “Project”) is located at 1200 – 1210 N. Cahuenga Boulevard, 6337 – 6357 W. Lexington Avenue, and 6332 – 6356 W. La Mirada Avenue (the “Project Site”) in the City of Los Angeles. The Project proposes to replace an existing, vacant private school campus, the Stratford School, at the Project Site with an approximately 75,262 square-foot creative office campus with ground-floor retail uses. The Project would be comprised of three buildings, Buildings A, B, and C, with an outdoor courtyard located between the buildings. The Project would demolish the school’s subterranean parking lot and access ramp, topped with a recreational field and basketball court, and two playgrounds. The Project would also demolish 8,941 square feet of the existing approximately 28,389 square-foot private school building, but would otherwise preserve and upgrade with a few exterior modifications the remaining approximately 19,448 square feet of the building and its subterranean parking garage to be a creative office building (Building B). Building A would be new, located along the northern border of the Project Site, would contain 35,000 square feet, and would be four stories and a maximum of 57’ 1” in height. Building C would be new, occupy the southwest corner of the Project Site, would contain approximately 20,814 square feet, and would be four stories and a maximum of 60’ 11” in height. Building B would consist of 19,448 square feet of the existing two-story, 42’ 6” tall school building; Building B’s unusually tall first story would place its second story approximately in line with the third stories on Buildings A and C. All three buildings would provide decks and balconies adjacent to the creative offices. The buildings would surround an outdoor courtyard for the use of the buildings’ tenants. The Project would provide 156 vehicular parking spaces and 22 bicycle spaces within the Project’s one-level subterranean parking garage, which would extend under both Buildings A and B, and two at-grade parking areas on the first floors of Buildings A and C. The subterranean garage under Building A would contain automated parking stackers. The Project would be built on the 53,557 square-foot Project Site, resulting in a site-wide Floor Area Ratio (FAR) of approximately 1.41 to 1 and a total floor area of 75,262 square feet. The anticipated outbound haul route from the Project Site would be from Vine Street to Santa Monica Boulevard to the 101 freeway. Approximately 12,678 cubic yards of dirt is expected to be excavated and exported from the Project Site during construction.

1.2. SCOPE OF WORK

As a part of the Mitigated Negative Declaration for the Project, the purpose of this report is to analyze the potential impact of the Project to the existing water infrastructure systems.

2. REGULATORY FRAMEWORK

The City of Los Angeles Department of Water and Power (LADWP) is responsible for providing water supply to the City while complying with local, State, and Federal regulations.

Below are the pertinent State and Regional water supply regulations:

- California Code of Regulations (CCR), Title 20, Chapter 4, Article 4, Section 1605 establishes water efficiency standards for all new plumbing fixtures and Section 1608 prohibits the sale of fixtures that do not comply with the regulations.
- 2013 California Green Building Standards Code, CCR, Title 24, Part 11, adopted on January 1, 2014 (CALGreen), requires a water use reduction of 20% above the baseline cited in the CALGreen code book. The code applies to family homes, state buildings, health facilities, and commercial buildings.
- California Urban Water Management Planning Act of 1984 requires water suppliers to adopt an Urban Water Management Plan (UWMP).
- Metropolitan Water District (MWD) official reports and policies as outlined in its Regional UWMP, Water Surplus and Drought Management Plan, Water Supply Allocation Plan, and Integrated Resources Plan.
- LADWP's 2020 UWMP outlines the City's long-term water resources management strategy. The 2020 UWMP was approved by the LADWP Board of Water and Power Commissioners on June 7, 2016.
- Senate Bill 610 and Senate Bill 221, approved on October 9, 2001, require land use agencies to perform a detailed analysis of available water supply when approving large developments. Historically, public water suppliers (PWS) simply provided a "will serve" letter to developers. SB 610, Public Resources Code (PRC) and Section 10910-10915 of the State Water Code requires lead agencies to request a Water Supply Assessment (WSA) from the local water purveyor prior to project approval. If the projected water demand associated with a proposed development is included in the most recent UWMP, the development is considered to have sufficient water supply per California Water Code Section 10910, and a WSA is not required. All projects that meet any of the following criteria require a WSA:
 - 1) A proposed residential development of more than 500 dwelling units.
 - 2) A proposed shopping center or business establishment of more than 500,000 square feet of floor space or employing more than 1,000 persons
 - 3) A proposed commercial office building of more than 250,000 square feet of floor space or employing more than 1,000 persons

- 4) A proposed hotel or motel of more than 500 rooms
- 5) A proposed industrial, manufacturing, or processing plant or industrial park of more than 40 acres of land, more than 650,000 square feet of floor area, or employing more than 1,000 persons
- 6) A mixed-use project that falls in one or more of the above-identified categories
- 7) A project not falling in one of the above-identified categories but that would demand water equal or greater than the amount required by a 500-dwelling unit project.

This Project does not trigger one of the above thresholds, therefore a WSA was not performed by the Los Angeles Department of Water and Power.

3. EXISTING CONDITION

The Project Site is located within the East Hollywood Neighborhood Subarea in the Hollywood Community Plan. The Project Site is approximately 53,557 sq. ft. (1.23 acres) and is currently occupied by the now-vacant Stratford School. The Project fronts Lexington Avenue, N. Cahuenga Boulevard, and La Mirada Boulevard. LADWP owns and maintains the water infrastructure to the Project Site.

3.1. DOMESTIC INFRASTRUCTURE

Based on a water service map provided by the city (Exhibit 3), there is a 36-inch water main and a 12-inch water main in N. Cahuenga Boulevard, an 8-inch water main and an abandoned 4-inch water main on Lexington Avenue, and a 12-inch water main in La Mirada Avenue.

Water consumption estimates have been prepared based on 100 percent of the City of Los Angeles Bureau of Sanitation (BOS) sewerage generation factors and are summarized in Table 1 below.

Table 1 – Estimated Existing Water Consumption			
Land Use	Units	Consumption Rate (gpd/unit) ⁽¹⁾	Total Water Consumption (gpd)
Existing			
School	200 Students ⁽²⁾	9 GPD/Student	1,800
Subtotal Existing			1,800
⁽¹⁾ Consumption rates per Bureau of Sanitation – Sewer Generation Factors for Residential and Commercial Categories https://engpermitmanual.lacity.org/sites/default/files/documents/Sewage%20Generation%20Factors%20Chart.pdf			
⁽²⁾ The total number of students was approximated based on the area footprint of the existing school.			

3.2. FIRE INFRASTRUCTURE

Based on a water service map provided by the city (Exhibit 3), there is a 36-inch water main and a 12-inch water main in N. Cahuenga Boulevard, an 8-inch water main and an abandoned 4-inch water main on Lexington Avenue, and a 12-inch water main in La Mirada Avenue. Exhibit 3 shows the location of four (4) hydrants within the vicinity of the Project. See Exhibit 1 for the IFFAR Results.

4. SIGNIFICANCE THRESHOLDS

In accordance with Appendix G of the State CEQA Guidelines, a Project would have a significant impact related to water infrastructure capacity if it would:

- Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects; or
- Not have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

In assessing impacts related to water infrastructure capacity in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City’s 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide identifies the following factors to evaluate water capacity infrastructure:

- The total estimated water demand for the project;

- Whether sufficient capacity exists in the water infrastructure that would serve the project, taking into account the anticipated conditions at project buildout;
- The amount by which the project would cause the projected growth in population, housing or employment for the Community Plan area to be exceeded in the year of the project completion; and
- The degree to which scheduled water infrastructure improvements or project design features would reduce or offset service impacts.
- This guidance is applicable to the Project and as such are used to determine if the Project would have significant water impacts.

Based on these factors, the Project would have a significant impact if the City's water infrastructure would not adequately serve the Project or water distribution capacity would be inadequate to serve the proposed use after appropriate infrastructure improvements have been installed.

5. METHODOLOGY

The methodology for determining the significance of a project as it relates to a project's impact on water infrastructure capacity and distribution infrastructure is based on the *L.A. CEQA Thresholds Guide*. This methodology involves a review of the project's environmental setting, project impacts, cumulative impacts, and mitigation measures (if required). The following has been considered as part of the significance determination for this Project:

Environmental Setting

- Description of major water infrastructure serving the Project site, including the type of facilities, location and sizes, and any planned improvements.
- Description of the water conditions for the Project area and known improvement plans.

Project Impacts

- Evaluate the Project's water demand, taking into account design or operational features that would reduce or offset water demand.
- Determine what improvements would be needed, if any, to adequately serve the Project.
- Describe the degree to which presently scheduled off-site improvements offset impacts.

This report analyzes the potential impacts of the Project on the existing public water infrastructure by comparing the estimated Project demand with the calculated available capacity of the existing facilities.

The existing and proposed water demands are based upon available site and Project information and utilize 100 percent of the BOS sewerage generation factors.

LADWP performed a hydraulic analysis of their water system to determine if adequate fire flow is available to the fire hydrants surrounding the Project Site. LADWP's approach consists of analyzing their water system model near the Project Site. Based on the results, LADWP determines whether they can meet the Project fire hydrant flow needs based on existing infrastructure. See Exhibit 1 for the submitted Information of Fire Flow Availability Request (IFFAR).

In addition, LADWP performed a flow test to determine if available water conveyance exists for future development. LADWP's approach consists of data ranging from available static pressure (meaning how much pressure is available at the source before applying the project's demand), to the available pressure at the maximum demand needed for the Project. Based on the results, LADWP determines whether they can meet the Project's needs based on existing infrastructure. See Exhibit 2 for the results of the Service Advisory Requests (SARs).

6. PROJECT IMPACTS

6.1. CONSTRUCTION

Water for construction of the Project would be required for dust control, cleaning of equipment, excavation/export, removal, and re-compaction, etc. Based on construction projects of similar size and duration, a conservative estimate of construction water use ranges from 1,000 to 2,000 gallons per day (gpd). The estimated construction-period demand is significantly less than the Project's estimated operational demand, which as described below, can be accommodated by the existing infrastructure. It is therefore anticipated that the existing water infrastructure would similarly meet the limited and temporary water demand associated with construction of the Project. Impacts on the water infrastructure due to construction activity would therefore be less than significant.

The Project will require construction of new, on-site water distribution lines to serve the new buildings. Construction impacts associated with the installation of water distribution lines would primarily involve trenching to place the water distribution lines below surface and would be limited to on-site water distribution, and minor off-site work associated with connections to the public main. Prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. LADWP would be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service. Further, construction associated with new water distribution lines would occur as part of Project construction generally, which, as concluded in the MND, would result in less than significant impacts.

6.2. OPERATION

6.2.1. INFRASTRUCTURE CAPACITY

When analyzing the Project for infrastructure capacity, the projected demands for both fire suppression and domestic water are considered. Although domestic water demand is the Project's main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity. Nevertheless, a conservative analysis for both fire suppression and domestic water flows has been completed by LADWP for the Project. See Exhibit 2 for the results of the SAR, which demonstrates that adequate water infrastructure capacity exists. See Exhibit 1 for the submitted Information of Fire Flow Availability Request (IFFAR).

6.2.2. FIRE WATER DEMAND

Article 7 of the Fire Protection and Prevention, Section 57.507 of the LAMC sets the fire flow requirements for the Project. These guidelines, in addition to the requirements set by the City Fire Chief, will prescribe the fire flow requirements and hydrant spacing requirements for the Project. Per Section 57.513, the Fire Chief also determines the supplemental fire protection systems that will be required for the Project. Supplemental fire protection systems consist of the following:

- Fire protection signaling systems
- Fire hydrants
- Automatic fire extinguishing systems
- Smoke removal systems
- Standpipe systems

Based on fire flow standards set forth in Section 57.507.3 of the LAMC, the Project Site falls within high density residential neighborhood commercial, which requires 4,000 gallons per minute (gpm) from 4 adjacent hydrants flowing simultaneously. This translates to 1,000 gpm flowing from each hydrant and a minimum residual pressure of 20 pounds per square inch (psi). See Exhibit 1 for the submitted IFFAR.

The Project will incorporate a fire sprinkler suppression system to reduce or eliminate the demands on public hydrants, which will be subject to Fire Department review and approval during the design and permitting of the Project. Based on Section 94.2020.0 of the LAMC that adopts by reference NFPA 14-2013 including Section 7.10.1.1.5, the maximum allowable fire sprinkler demand for a fully or partially sprinklered building would be 1,250 gpm. As noted, an SAR and IFFAR were submitted to LADWP, to determine if the existing public water infrastructure could meet the demands of the Project. The SAR results show that 2,500 gpm can be delivered to the Project with a

minimum residual pressure of 88 psi. See Exhibit 1 & 2 for the results of the IFFAR and SAR respectively. As shown by the SAR, fire flow impacts to LADWP’s water infrastructure capacity would be less than significant.

6.2.3. DOMESTIC WATER DEMAND

Water consumption estimates have been prepared based on 100 percent of the City of LA Bureau of Sanitation sewerage generation factors for commercial categories and are summarized in Table 2 below. The Project proposes to make one 3-inch connection for domestic water and one 8-inch connection for fire water to the existing 12-inch main in North Cahuenga Boulevard. There are two types of connections that can be made to the City main. One type of connection is a combo service, which has one connection to the main and splits to serve both fire and domestic. The second type of connection is to have independent connections for fire and domestic. Lastly, the services will include backflow preventers and will be metered separately per City requirements. Therefore, the Project’s impacts on water infrastructure capacity would be less than significant.

Table 2 – Estimated Proposed Water Consumption			
Land Use	Units	Consumption Rate (gpd/unit) ⁽¹⁾	Total Water Consumption (gpd)
Existing			
School	200 Students ⁽²⁾	9 GPD/Student	1,800
<i>Subtotal Existing</i>			1,800
Proposed			
Retail Area (less than 100,00 SF)	592 SF	25 KGsf	15
Office Building	71,035 SF	120 KGsf	8,524
<i>Gross Water Consumption</i>			8,539
<i>Subtotal Existing</i>			1,800
<i>Net Increase</i>			6,739
⁽¹⁾ Consumption rates per Bureau of Sanitation – Sewer Generation Factors for Residential and Commercial Categories https://engpermitmanual.lacity.org/sites/default/files/documents/Sewage%20Generation%20Factors%20Chart.pdf			
⁽²⁾ The total number of students was conservatively approximated based on the area footprint of the existing school.			

6.3. CUMULATIVE IMPACTS

The geographic context for the cumulative impact analysis on water infrastructure is the LADWP service area, which includes the entirety of the City. LADWP, as a public water service provider, is required to prepare and periodically update a UWMP to plan and provide for water infrastructure to serve existing and projected demands. The 2020 UWMP prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2045.⁵

There are 22 related projects, which consist of, but are not limited to, residential, restaurants, office, pharmacy, and retail. The total increase in water demand for the related projects is approximately 0.943 million gallons per day (MGD). Combined with the Project, the increase in water demand is approximately 1.09 MGD. Refer to Exhibit 4 for a breakdown of the related projects and associated water consumption. The 2020 UWMP has estimated a water demand of 475 mgd by the year 2025, which means the Project combined with the related projects would account for approximately 0.23 percent of the total daily demand.

Based on the above, it is anticipated that LADWP would have adequate infrastructure to accommodate the Project as well as related Projects. Therefore, impacts on water infrastructure capacity would be less than significant.

7. LEVEL OF SIGNIFICANCE

Based on the analysis contained in this report, no significant impacts have been identified to water infrastructure for this Project.

Exhibit 2 – Related Projects Sewer Generation Table

1. INTRODUCTION

1.1 PROJECT DESCRIPTION

The 1200 N. Cahuenga Boulevard Project (the “Project”) is located at 1200 – 1210 N. Cahuenga Boulevard, 6337 – 6357 W. Lexington Avenue, and 6332 – 6356 W. La Mirada Avenue (the “Project Site”) in the City of Los Angeles. The Project proposes to replace an existing, vacant private school campus, the Stratford School, at the Project Site with an approximately 75,262 square-foot creative office campus with ground-floor retail uses. The Project would be comprised of three buildings, Buildings A, B, and C, with an outdoor courtyard located between the buildings. The Project would demolish the school’s subterranean parking lot and access ramp, topped with a recreational field and basketball court, and two playgrounds. The Project would also demolish 8,941 square feet of the existing approximately 28,389 square-foot private school building, but would otherwise preserve and upgrade with a few exterior modifications the remaining approximately 19,448 square feet of the building and its subterranean parking garage to be a creative office building (Building B). Building A would be new, located along the northern border of the Project Site, would contain 35,000 square feet, and would be four stories and a maximum of 57’ 1” in height. Building C would be new, occupy the southwest corner of the Project Site, would contain approximately 20,814 square feet, and would be four stories and a maximum of 60’ 11” in height. Building B would consist of 19,448 square feet of the existing two-story, 42’ 6” tall school building; Building B’s unusually tall first story would place its second story approximately in line with the third stories on Buildings A and C. All three buildings would provide decks and balconies adjacent to the creative offices. The buildings would surround an outdoor courtyard for the use of the buildings’ tenants. The Project would provide 156 vehicular parking spaces and 22 bicycle spaces within the Project’s one-level subterranean parking garage, which would extend under both Buildings A and B, and two at-grade parking areas on the first floors of Buildings A and C. The subterranean garage under Building A would contain automated parking stackers. The Project would be built on the 53,557 square-foot Project Site, resulting in a site-wide Floor Area Ratio (FAR) of approximately 1.41 to 1 and a total floor area of 75,262 square feet. The anticipated outbound haul route from the Project Site would be from Vine Street to Santa Monica Boulevard to the 101 freeway. Approximately 12,678 cubic yards of dirt is expected to be excavated and exported from the Project Site during construction.

1.2 SCOPE OF WORK

As a part of the Mitigated Negative Declaration for the Project, the purpose of this report is to analyze the Project’s impact on the City’s existing wastewater infrastructure system.

2. REGULATORY FRAMEWORK

The City of Los Angeles has one of the largest sewer systems in the world including approximately 6,439 miles of sewers serving a population of more than four million. The Los Angeles sewer system is comprised of three smaller systems: Hyperion Sanitary Sewer System, Terminal Island Water Reclamation Plant Sanitary Sewer System, and Regional Sanitary Sewer System.¹

The Project Site lies within the Hyperion Service Area served by the Hyperion Sanitary Sewer System and the Hyperion Treatment Plant. In January 2019, a Sewer System Management Plan (SSMP) was prepared for the Hyperion Sanitary Sewer System pursuant to the State Water Control Board's (SWRCB) May 2, 2006 Statewide General Waste Discharge Requirements (WDRs).²

Sewer permit allocation for projects that discharge into the Hyperion Treatment Plant is regulated by Ordinance No. 166,060 adopted by the City in 1990. This Ordinance established an additional annual allotment of 5.0 million gallons per day, of which 34.5 percent (1.725 million gallons per day) is allocated for priority projects, 8 percent (0.4 million gallons per day) for public benefit projects, and 57.5 percent (2.875 million gallons per day) for non-priority projects (of which 65 percent is for residential projects and 35 percent for non-residential projects).

The City of Los Angeles Municipal Code (LAMC) includes regulations that allow the City to assure available sewer capacity for new projects and require fees for improvements to the infrastructure system. LAMC Section 64.15(i) requires that the City perform a Sewer Capacity Availability Request (SCAR) analysis when any person seeks a sewer permit to connect a property to the City's sewer collection system, proposes additional discharge through their existing public sewer connection, or proposes a future sewer connection or future development that is anticipated to generate 10,000 gallons or more of sewage per day. A SCAR is an analysis of the existing sewer collection system to determine if there is adequate capacity existing in the sewer collection system to safely convey the newly generated sewage to the appropriate sewage treatment plant.

LAMC Section 64.11.2 requires the payment of fees for new connections to the sewer system to assure the sufficiency of sewer infrastructure. New connections to the sewer system are assessed a Sewerage Facilities Charge. The rate structure for the Sewerage Facilities Charge is based upon wastewater flow strength, as well as volume. The determination of wastewater strength for each applicable project is based on City guidelines for the average wastewater concentrations of two parameters (biological oxygen demand and suspended solids) for each type of land use. Fees paid to the

¹ City of Los Angeles Department of Public Works, LA Sanitation, Sewer System Management Plan, Hyperion Sanitary Sewer System, January 25, 2019.

<https://www.lacitysan.org/cs/groups/public/documents/document/y250/mdm1/~edisp/cnt035427.pdf>, Accessed October 31, 2022

² Ibid.

Sewerage Facilities Charge fees are deposited in the City's Sewer Construction and Maintenance Fund for sewer and sewage-related purposes, including but not limited to industrial waste control and water reclamation purposes.

In addition, the City establishes design criteria for sewer systems to assure that new infrastructure provides sewer capacity and operating characteristics to meet City Standards (Bureau of Engineering Special Order No. SO06-0691). Per this Special Order, laterals sewers, which are sewers 18 inches or less in diameter, must be designed for a planning period of 100 years. The Special Order also requires that sewers be designed so that the peak dry weather flow depth during their planning period shall not exceed one-half the pipe diameter.³

In 2006 the City approved the Integrated Resources Plan, which incorporates a Wastewater Facilities Plan.⁴ The Integrated Resources Plan was developed to meet future wastewater needs of more than 4.3 million residents expected to live within the City by 2020. In 2018, the City approved the *One Water LA 2040 Plan* which builds on the success of the Water IRP and extends the planning horizon to year 2040.⁵ In order to meet future demands posed by increased wastewater generation, the City has chosen to expand its current overall treatment capacity, while maximizing the potential to reuse recycled water through irrigation, and other approved uses.

3. EXISTING CONDITIONS

The Project Site consists of an existing but vacant school with a total area of approximately 53,557 square feet (1.23 acres). Sanitary sewer service to the Project Site from the surrounding streets is provided by the Bureau of Sanitation (BOS).

The Project Site is located within the Hyperion Sewer System Service Area, which is operated and maintained by the City's Bureau of Sanitation (BOS). The existing design capacity of the Hyperion Sewer System Service Area is approximately 550 million gallons per day (consisting of 450 MGD at the Hyperion Treatment Plant, 80 MGD at the Donald C. Tillman Water Reclamation Plant, and 20 MGD at the Los Angeles–Glendale Water Reclamation Plant).⁶

There are existing residential developments to the north, south, and east of the Project Site. The Project Site is bounded by N. Cahuenga Blvd. to the west, La Mirada Ave. to

³ City of Los Angeles, L.A. CEQA Thresholds Guide, Your Resource for Planning CEQA Analysis in Los Angeles, M-Public Utilities, 2006. <http://www.environmentla.org/programs/thresholds/M-Public%20Utilities.pdf>.

⁵ City of Los Angeles, Department of Public Works, LA Sanitation, One Water LA 2040 Plan, Executive Summary, April 2018.

⁶ City of Los Angeles Department of Public Works, Bureau of Sanitation, Sewer System Management Plan Hyperion Sanitary Sewer System, January 25 2019, <https://www.lacitysan.org/cs/groups/public/documents/document/y250/mdm1/~edisp/cnt035427.pdf>, accessed August 22, 2022.

the north, and Lexington Ave. to the South. Based on available record data provided by the City, there is an 8-inch vitrified clay pipe (VCP) sewer line in La Mirada Ave. beginning at La Mirada Ave that flows west towards N. Cahuenga Blvd. There is a 12-inch concrete, 8-inch VCP and a 12-inch VCP sewer line in N. Cahuenga Blvd. All three pipes run from the intersection of La Mirada Ave. and N. Cahuenga Blvd., to the intersection of N. Cahuenga Blvd. and Lexington Ave. There is a 15-inch concrete and 8-inch VCP sewer line in Lexington Ave. The 15-inch concrete pipe runs from the intersection of Lexington Ave. and Lillian Way to the intersection of N. Cahuenga Blvd and Lexington Ave. The 8-inch VCP runs from the intersection of Lexington Ave. and Lillian Way and terminates upstream on Lexington Ave. Based on the City of Los Angeles Bureau of Engineering’s online Navigate LA database, the 8-inch sewer main in La Mirada Ave has a calculated capacity of 1.0063 cubic feet per second (cfs) (0.65038 million gallons per day (MGD)), the 12-inch sewer main in N. Cahuenga Blvd is 4.28807 cfs (2.77145 MGD), and the 8-inch sewer line in Lexington Ave is approximately 0.86917 cubic feet per second (cfs) (0.56175 MGD).⁷ Available records indicate that the 8-inch main in La Mirada has twelve (12) sewer wyes and twelve (12) laterals, the 12-inch main in N. Cahuenga Blvd. has zero (0) sewer wyes and sixteen (16) laterals, and the 8-inch main in Lexington Avenue has thirteen (13) wyes and ten (10) laterals.

Wastewater generation estimates for the existing Project Site have been prepared based on BOS sewerage generation factors, as summarized in Table 1 below.

Table 1 – Estimated Existing Wastewater Generation			
Land Use	Units	Generation Rate (gpd/unit) ⁽¹⁾	Total Sewage Generation (gpd)
Existing			
Elementary School	200 Students ⁽²⁾	9 GPD/Student	1,800
Subtotal Existing			1,800

⁽²⁾ The total number of students was approximated based on the area footprint of the existing school.			

⁷ <https://navigatela.lacity.org/navigatela/>

4. SIGNIFICANCE THRESHOLDS

In accordance with Appendix G of the State CEQA Guidelines, a Project would have a significant impact related to wastewater supply if it would:

- Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunication facilities, the construction or relocation of which could cause significant environmental effects; or
- Not have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

In assessing impacts related to wastewater infrastructure in this section, the City will use Appendix G as the thresholds of significance. The analysis utilizes factors and considerations identified in the City's 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions. The L.A. CEQA Thresholds Guide identifies the following factors to evaluate wastewater capacity and infrastructure:

- The total estimated wastewater demand for the project;
- Whether sufficient capacity exists in the wastewater infrastructure that would serve the project, taking into account the anticipated conditions at project buildout;
- The amount by which the project would cause the projected growth in population, housing or employment for the Community Plan area to be exceeded in the year of the project completion; and
- The degree to which scheduled wastewater infrastructure improvements or project design features would reduce or offset service impacts.

This guidance is applicable to the Project and as such are used to determine if the Project would have significant wastewater impacts.

5. METHODOLOGY

The methodology for determining the significance of a project under the Appendix G thresholds as it relates to a project's impact on wastewater collection and treatment infrastructure is based on the *L.A. CEQA Thresholds Guide*. This methodology involves a review of the project's environmental setting, project impacts, cumulative impacts, and mitigation measures (if required). The following has been considered as part of the significance determination for this Project:

Environmental Setting

- Location of the Project and appropriate points of connection to the wastewater collection system on the pertinent Wye Map;
- Description of the existing wastewater system which would serve the Project, including its capacity and current flows.
- Summary of adopted wastewater-related plans and policies that are relevant to the Project area.

Project Impacts

- Evaluate the Project wastewater needs (anticipated daily average wastewater flow), taking into account design or operational features that would reduce or offset service impacts;
- Compare the Project's wastewater needs to the appropriate sewer's capacity and/or the wastewater flows anticipated in the Wastewater Facilities Plan or General Plan.

This report analyzes the potential impacts of the Project on the existing public sewer infrastructure by comparing the estimated Project wastewater generation with the calculated available capacity of the existing facilities.

Pursuant to LAMC Section 64.15, BOS Wastewater Engineering Division made a preliminary analysis of the local and regional sewer conditions to determine if available wastewater conveyance and treatment capacity exists for future development of the Project Site. BOS's approach consisted of a worst-case scenario envisioning peak demands from the relevant facilities occurring simultaneously on the wastewater system. A combination of flow gauging data and computed results from the City's hydrodynamic model were used to project current and future impacts due to additional sewer discharge. The data used in this report are based on the findings of the BOS analysis. Refer to Exhibit 1 for the approved SCAR Application for the Project, which contains the results of the BOS analysis.

6. PROJECT IMPACTS

6.1. CONSTRUCTION

Wastewater generation would occur incrementally throughout construction of the Project as a result of construction workers on-site. However, construction workers would utilize portable restrooms, which would not contribute to wastewater flows to the City's wastewater system. Thus, wastewater generation from Project construction activities is not anticipated to cause any increase in wastewater flows. Therefore, Project impacts associated with construction-period wastewater generation would be less than significant.

The Project will require construction of new on-site infrastructure to serve the new building, and potential upgrade and/or relocation of existing infrastructure. Construction impacts associated with wastewater infrastructure would primarily be confined to

trenching for miscellaneous utility lines and connections to public infrastructure. Installation of wastewater infrastructure will be limited to on-site wastewater distribution, and minor off-site work associated with connections to the public main. Although no upgrades to the public main are anticipated, minor off-site work is required in order to connect to the public main. Therefore, as part of the Project, a construction management plan would be implemented to reduce any temporary pedestrian and traffic impacts during construction, ensuring safe vehicle travel and safe pedestrian and emergency vehicle access. Overall, construction of any required wastewater infrastructure would be done in connection with construction of the Project, would be of a relatively short-term duration (i.e., months) and would cease to occur once the construction is complete. Therefore, Project impacts associated with construction of wastewater facilities and infrastructure would be less than significant.

6.2. OPERATION

In accordance with the *L.A. CEQA Thresholds Guide*, the estimated sewer flows were based on the sewer generation factors for the Project’s uses. Based on the type of use and generation factors, the Project will generate a net increase of approximately 150,739 gallons per day (gpd) of wastewater. Wastewater generation estimates have been prepared based on the City of LA Bureau of Sanitation sewerage generation factors and are summarized in Table 2 below.

Table 2 – Estimated Proposed Wastewater Generation			
Land Use	Units	Generation Rate (gpd/unit) ⁽¹⁾	Total Wastewater Generation (gpd)
Existing			
School	200 Students ⁽²⁾	9 GPD/Student	1,800
Subtotal Existing			1,800
Proposed			
Retail Area (Less than 100,000 SF)	592 SF	25 KGsf	15
Office Building	71,035 SF	120 KGsf	8,524
Sewage Ejector	144,000 GPD	1	144,000
Gross Wastewater Generation			152,539
Subtotal Existing			1,800
Net Increase			150,739 ⁽³⁾

(1) Generation Rates per Bureau of Sanitation – Sewer Generation Factors for Residential and Commercial Categories

<https://engpermitmanual.lacity.org/sites/default/files/documents/Sewage%20Generation%20Factors%20Chart.pdf>

(2) The total number of students was conservatively approximated based on the area footprint of the existing school.

(3) The approved SCAR displays a proposed total flow that is greater than the Net Increase displayed herein. Although the two numbers are different, the approved SCAR is still valid, as the Sewer infrastructure can accommodate a flow higher than what the Project proposes.

The SCAR was submitted to see whether the existing public infrastructure can accommodate the Project. The Bureau of Sanitation has analyzed the Project demands in conjunction with existing conditions and forecasted growth, and has approved the Project to discharge up to 152,539 gpd. Therefore, impacts on wastewater would be less than significant. See Exhibit 1 for sewer will serve letter.

As further discussed above, the existing design capacity of the Hyperion Service Area is approximately 550 million gallons per day (consisting of 450 MGD at the Hyperion Treatment Plant, 80 MGD at the Donald C. Tillman Water Reclamation Plant, Reclamation Plant, and 20 MGD at the Los Angeles–Glendale Water Reclamation Plant).¹⁴ The Project’s proposed wastewater generation is approximately 0.151 MGD. Currently up to 300 MGD is treated at the Hyperion Treatment Plant resulting in a treatment capacity of 150 MGD, which means the project would account for approximately 0.10 percent of the available capacity. Consequently, impacts on wastewater treatment capacity are less than significant.

Although the Project’s net increase in sewage generation is approximately 150,739 GPD (0.15 MGD), the total sewage generation will be split between the sewer mains located in Lexington Ave, La Mirada, and N. Cahuenga Blvd respectively. The existing capacity of the 8-inch sewer line in Lexington Ave is approximately 0.869 cubic feet per second (cfs) (0.56 MGD); the proposed sewerage flow into the main is approximately 0.0041 cfs (0.003 MGD). The existing capacity of the 8-inch sewer line in La Mirada is approximately 1.00 cfs (0.64 MGD); the proposed sewerage flow into the main is approximately 0.22 cfs (0.144 MGD). The existing capacity of the 12-inch main in Cahuenga Blvd. is 4.28 cfs (2.76 MGD); the proposed sewerage flow into the main is approximately 0.0037 cfs (0.002 MGD). The Project sewerage discharge would account for 0.06%, 22%, 0.08%, of the available capacity of Lexington Ave, La Mirada Ave, and N. Cahuenga Blvd respectively. Due to these facts, and the approved SCAR generated by the Bureau of Sanitation-Wastewater Engineering Services Division, impacts on wastewater infrastructure would be less than significant.

¹⁴ City of Los Angeles Department of Public Works, Bureau of Sanitation, Sewer System Management Plan Hyperion Sanitary Sewer System, January 25 2019, <https://www.lacitysan.org/cs/groups/public/documents/document/y250/mdm1/~edisp/cnt035427.pdf>, accessed August 22, 2022.

6.3. CUMULATIVE IMPACTS

The Project will result in the additional generation of sewer flow. However, as discussed above, BOS has conducted an analysis of existing and planned capacity as it related to the Project. Similarly, future projects connecting to the same sewer system are required to obtain a sewer connection permit and submit a SCAR to BOS during the design phase of the project.¹⁵ The analysis by BOS takes into consideration previously approved SCARs as part of their review. If system upgrades are required as a result of a given project's additional flow, arrangements would be made between the related project and BOS to construct the necessary improvements.

In addition to the City's SCAR analysis, a related projects list has been generated. There are 22 related projects, which consist of, but are not limited to, residential, restaurants, office, pharmacy, and retail. The total increase in wastewater generation for the related projects is approximately 0.943 million gallons per day (MGD). Combined with the Project, the increase in wastewater generation is approximately 1.09 MGD. Refer to Exhibit 2 for a breakdown of the related projects and associated wastewater generation.

Wastewater generated by the Project, would be conveyed via the existing wastewater conveyance systems for treatment at the Hyperion Treatment Plant system. As previously stated, based on information from BOS, the existing design capacity of the Hyperion Service Area is approximately 550 million gallons per day (MGD)¹⁶ and the existing average daily flow for the system is approximately 300 MGD.¹⁷ The estimated wastewater generation increase of the Project would be 0.152 MGD, which represents approximately 0.050 percent of the available capacity in the system. The estimated wastewater generation increase of the Project and related projects combined would be 1.09 MGD, which represents approximately 0.36 percent of the available capacity in the system. The related projects would also be required to adhere to the BOS's annual wastewater flow increase allotment. Therefore, cumulative impacts on wastewater treatment capacity are less than significant.

7. LEVEL OF SIGNIFICANCE

Based on the analysis contained in this report no significant impacts have been identified to wastewater infrastructure for this Project.

Sewer Capacity Availability Request (SCAR)

To: Bureau of Sanitation

The following request is submitted to you on behalf of the applicant requesting to connect to the public sewer system. Please verify that the capacity exists at the requested location for the proposed developments shown below. The results are good for 180 days from the date the sewer capacity approval from the Bureau of Sanitation. Lateral connection of development shall adhere to Bureau of Engineering Sewer Design Manual Section F 480. **If not listed in the Proposed Facility Description section of the SCAR, sewer ejector use is prohibited.**

SEWER CAPACITY AVAILABILITY REVIEW FEE (SCARF) - Frequently Asked Questions

SCAR stands for Sewer Capacity Availability Review that is performed by the Department of Public Works, Bureau of Sanitation. This review evaluates the existing sewer system to determine if there is adequate capacity to safely convey sewage from proposed development projects, proposed construction projects, proposed groundwater dewatering projects and proposed increases of sewage from existing facilities. The SCAR Fee (SCARF) recovers the cost, incurred by the City, in performing the review for any SCAR request that is expected to generate 10,000 gallons per day (gpd) of sewage.

The SCARF is based on the effort required to perform data collection and engineering analysis in completing a SCAR. A brief summary of that effort includes, but is not limited to, the following:

1. Research and trace sewer flow levels upstream and downstream of the point of connection.
2. Conduct field surveys to observe and record flow levels. Coordinate with maintenance staff to inspect sewer maintenance holes and conduct smoke and dye testing if necessary.
3. Review recent gauging data and in some cases closed circuit TV inspection (CCTV) videos.
4. Perform gauging and CCTV inspection if recent data is not available.
5. Research the project location area for other recently approved SCARs to evaluate the cumulated impact of all known SCARs on the sewer system.
6. Calculate the impact of the proposed additional sewage discharge on the existing sewer system as it will be impacted from the approved SCARs from Item 6 above. This includes tracing the cumulative impacts of all known SCARs, along with the subject SCAR, downstream to insure sufficient capacity exist throughout the system.
7. Correspond with the applicant for additional information and project and clarification as necessary.
8. Work with the applicant to find alternative sewer connection points and solutions if sufficient capacity does not exist at the desired point of connection.

Questions and Answers:

1. When is the SCARF applied, or charged?

It applies to all applicants seeking a Sewer Capacity Availability Review (SCAR). SCARs are generally required for Sewer Facility Certificate applications exceeding 10,000 gpd, or request from a property owner seeking to increase their discharge thru their existing connection by 10,000 gpd or more, or any groundwater related project that discharges 10,000 gpd or more, or any proposed or future development for a project that could result in a discharge of 10,000 gpd.

2. Why is the SCARF being charged now when it has not been in the past?

The City has seen a dramatic increase in the number of SCARs over 10,000 gpd in the last few years and has needed to increase its resources, i.e., staff and gauging efforts, to respond to them. The funds collected thru SCARF will help the City pay for these additional resources and will be paid by developers and property owners that receive the benefit from the SCAR effort.

3. Where does the SCARF get paid?

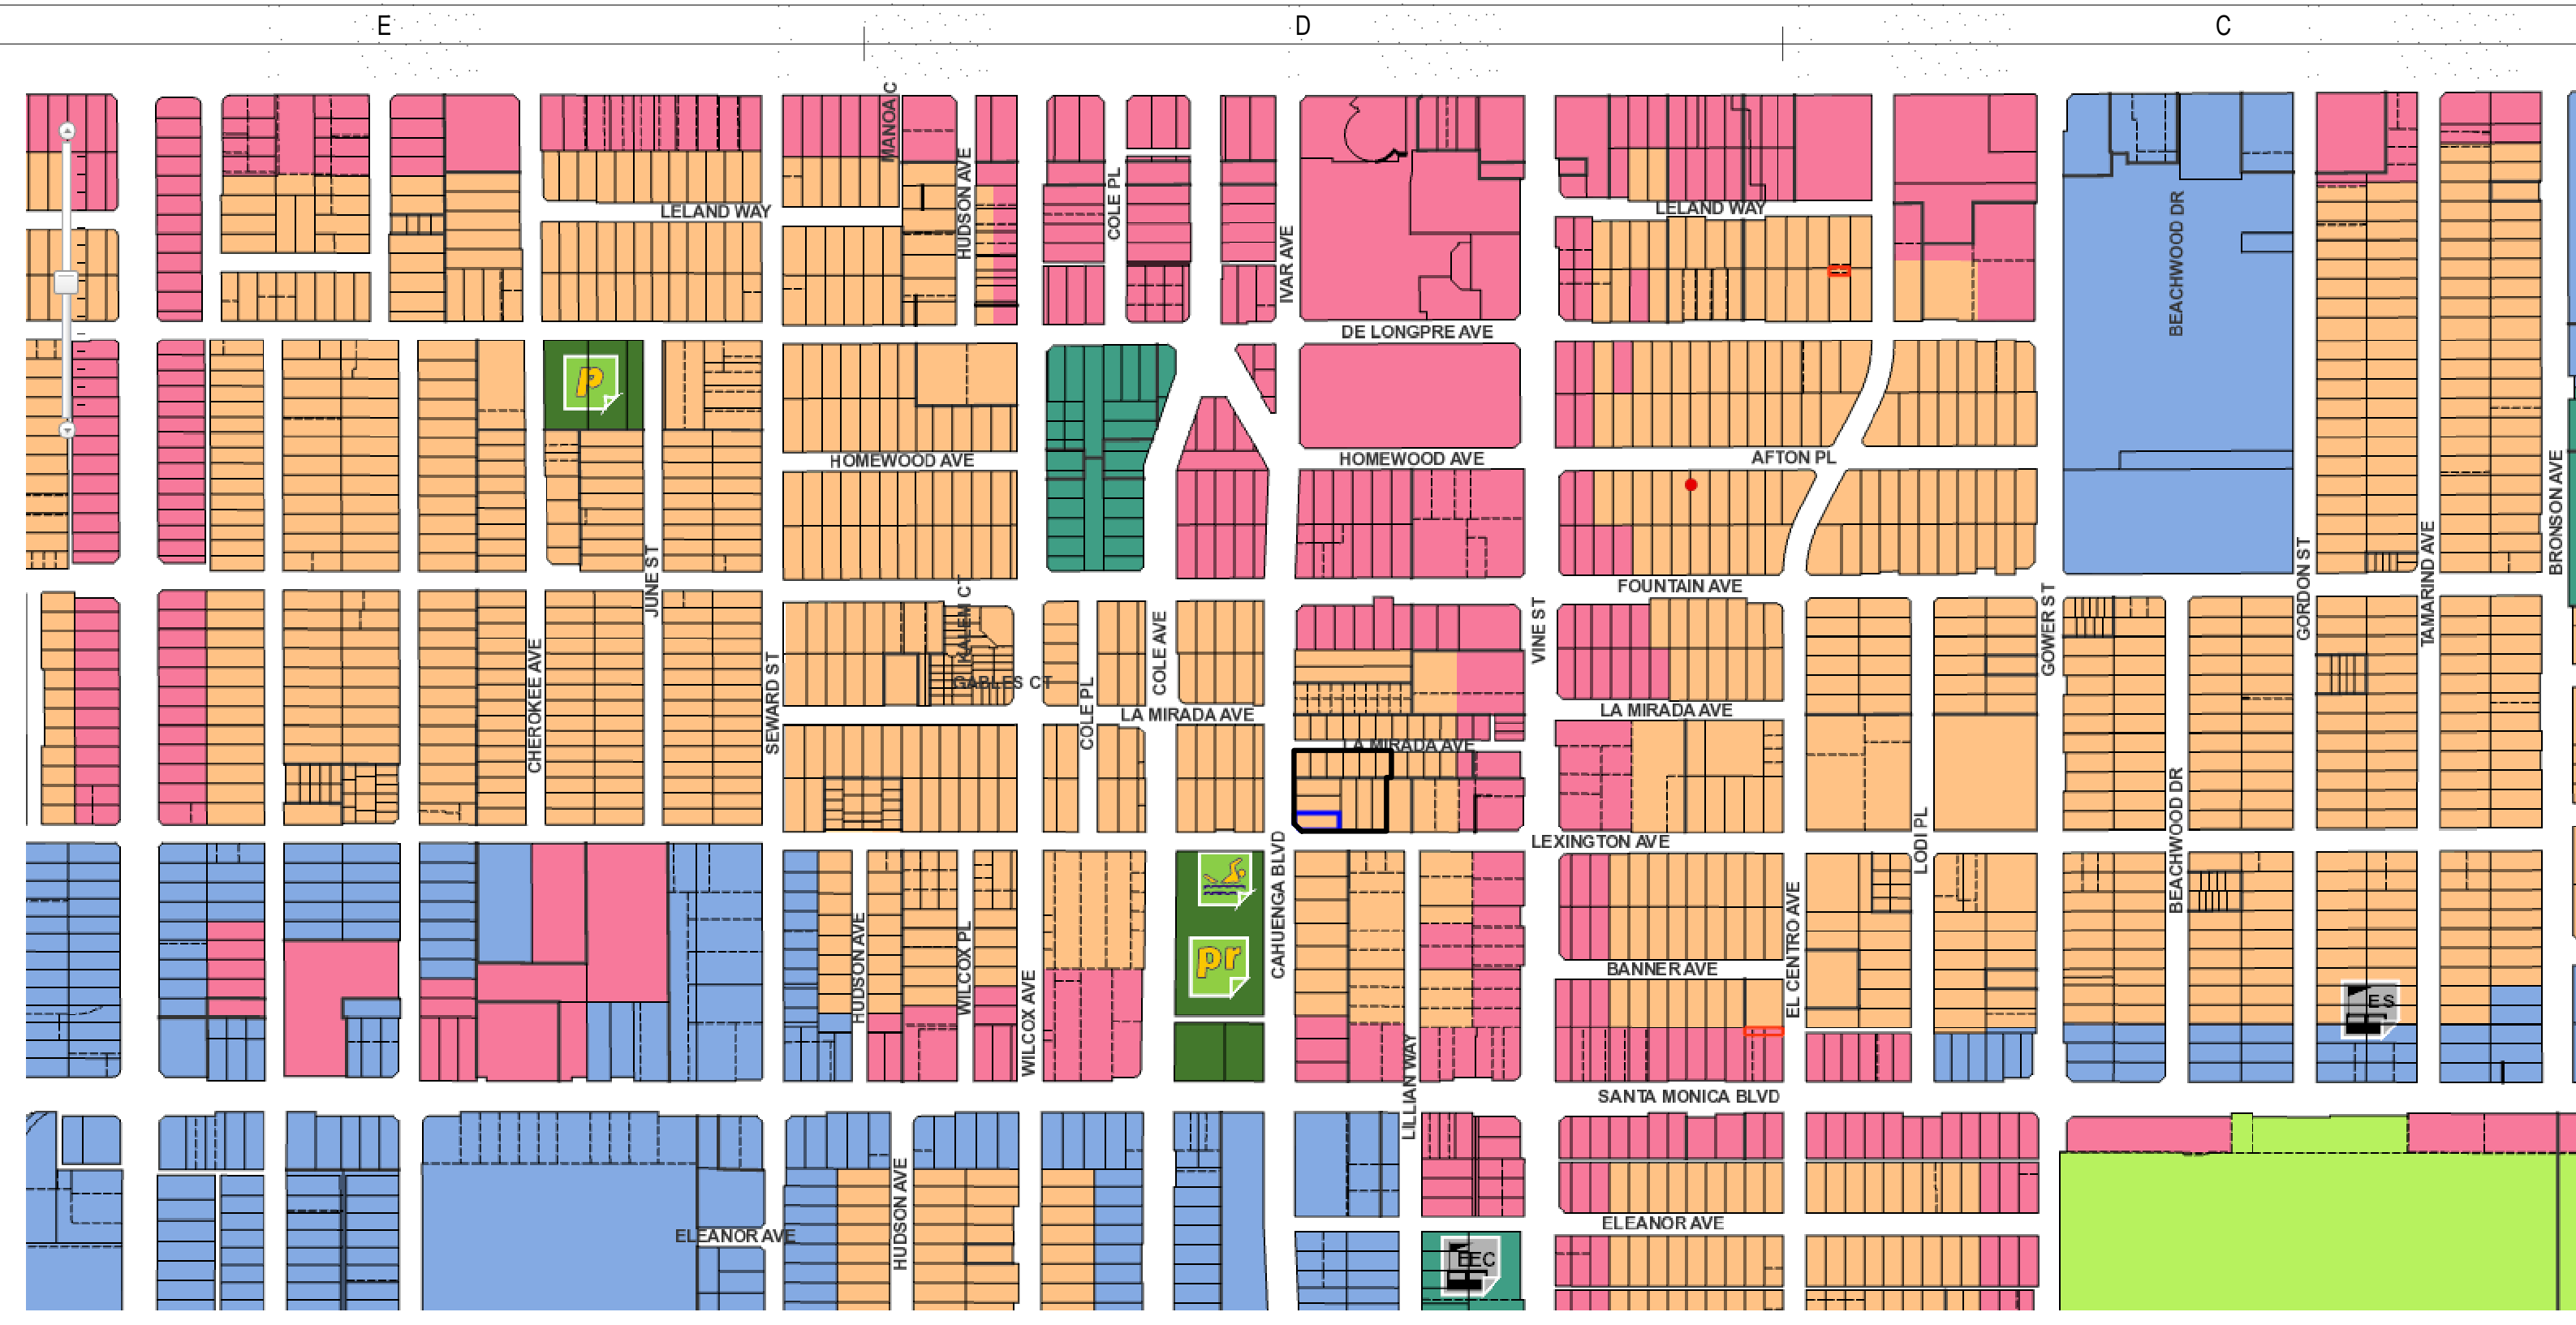

The Department of Public Works, Bureau of Engineering (BOE) collects the fee at its public counters. Once the fee is paid then BOE prepares a SCAR request and forwards it to the BOS where it is reviewed and then returned to BOE. BOE then informs the applicant of the result. In some cases, BOS works directly with the applicant during the review of the SCAR to seek additional information and work out alternative solutions
